Annotatsiya. *Yarimo'tkazgich qurilmalarining uzluksiz kichrayib borishi yuqori dielektrik singdiruvchanlikka ega materiallardan foydalanishni taqozo etadi. Shu nuqtai nazardan, titan dioksidi (TiO_2) o'zining yuqori dielektrik singdiruvchanligi tufayli metall–dielektrik–yarimo'tkazgich (MDY) tuzilmalarida istiqbolli material hisoblanadi. Biroq TiO_2 qatlamining kremniy asos bilan bevosita kontakti chegara sirt nuqsonlari zichligining ortishiga, oqish toki kuchayishiga hamda sig'im–kuchlanish (C–V) xarakteristikalarida gisterezis hodisasining yuzaga kelishiga olib keladi. Mazkur ishda kremniy asos va TiO_2 dielektrik qatlam orasiga yupqa kremniy dioksidi (SiO_2) oraliq qatlamini kiritish orqali chegara sirt sifatini yaxshilash masalasi ko'rib chiqildi. Taklif etilayotgan Si/SiO_2/TiO_2/metal tuzilma doirasida oraliq qatlamning zaryad tutuvchi markazlar zichligi (D_{it}), oqish toki va elektrofizik xossalarga ta'siri nazariy jihatdan tahlil qilinadi.*

Kalit so'zlar. *MOS-kondensator, titan dioksidi (TiO_2), kremniy dioksidi (SiO_2), oraliq qatlam, chegara sirt nuqsonlari, zaryad tutuvchi markazlar, oqish toki, sig'im–kuchlanish xarakteristikasi, gisterezis, dielektrik qatlam.*

EFFECT OF AN INTERFACIAL SIO_2 LAYER ON CHARGE TRAPPING AND LEAKAGE CURRENT MECHANISMS AT THE SEMICONDUCTOR–DIELECTRIC INTERFACE

Abstract. *The continuous scaling of semiconductor devices requires the use of materials with high dielectric permittivity. In this regard, titanium dioxide (TiO_2), due to its high dielectric constant, is considered a promising material for metal–dielectric–semiconductor (MDS) structures. However, the direct contact of the TiO_2 layer with the silicon substrate leads to an increase in the density of interface states, an increase in leakage current, and the appearance of hysteresis in capacitance–voltage (C–V) characteristics. In this work, the improvement of interface quality by introducing a thin silicon dioxide (SiO_2) interfacial layer between the silicon substrate and the TiO_2 dielectric layer is considered. Within the proposed Si/SiO_2/TiO_2/metal structure, the effect of the interfacial layer on the density of charge trapping centers (D_{it}), leakage current, and electrophysical properties is analyzed theoretically.*

Keywords. *MOS capacitor, titanium dioxide (TiO_2), silicon dioxide (SiO_2), interfacial layer, interface states, charge trapping centers, leakage current, capacitance–voltage characteristics, hysteresis, dielectric layer*

ВЛИЯНИЕ МЕЖСЛОЙНОГО СЛОЯ SIO_2 В ОБЛАСТИ ГРАНИЦЫ ПОЛУПРОВОДНИК–ДИЭЛЕКТРИК НА МЕХАНИЗМЫ ЗАХВАТА ЗАРЯДА И ТОКА УТЕЧКИ

Аннотация. *Непрерывная миниатюризация полупроводниковых приборов требует использования материалов с высокой диэлектрической проницаемостью. В этом отношении диоксид титана (TiO_2), благодаря своей высокой диэлектрической проницаемости, рассматривается как перспективный материал для металл–диэлектрик–полупроводник (МДП) структур. Однако непосредственный контакт слоя TiO_2 с кремниевой подложкой приводит к увеличению плотности интерфейсных состояний, росту тока утечки, а также к появлению гистерезиса в характеристиках ёмкость–напряжение (C–V). В данной работе рассмотрена возможность улучшения качества интерфейса путём введения тонкого межслойного слоя диоксида кремния (SiO_2) между кремниевой подложкой и диэлектрическим слоем TiO_2. В рамках предлагаемой структуры Si/SiO_2/TiO_2/metal теоретически проанализировано влияние межслойного слоя на плотность центров захвата заряда (Dit), ток утечки и электрофизические свойства.*

Ключевые слова. *MOS-конденсатор, диоксид титана (TiO_2), диоксид кремния (SiO_2), межслойный слой, интерфейсные дефекты, центры захвата заряда, ток утечки, характеристики ёмкость–напряжение, гистерезис, диэлектрический слой.*

Kirish. Zamonaviy mikro- va nanoelektronikaning jadal rivojlanishi yarimo‘tkazgich qurilmalarining o‘lchamlarini keskin kamaytirishni hamda ularning elektr samaradorligini oshirishni talab etmoqda. Bu esa, o‘z navbatida, metall–dielektrik–yarimo‘tkazgich (MDY) tuzilmalarida qo‘llaniladigan dielektrik materiallarning xossalariga bo‘lgan talabni yanada kuchaytiradi[1,2]. An’anaviy kremniy dioksidi (SiO_2) dielektrik qatlam sifatida keng qo‘llanilgan bo‘lsada, uning past dielektrik singdiruvchanligi sababli yuqori sig‘im qiymatlarini ta’minlashda cheklovlar yuzaga keladi. Shu sababli so‘nggi yillarda yuqori dielektrik singdiruvchanlikka ega materiallar, jumladan titan dioksidi (TiO_2), MDY tuzilmalarida dielektrik qatlam sifatida keng o‘rganilmoqda. TiO_2 o‘zining yuqori dielektrik doimiysi, keng energiya taqiqlangan zonasi va texnologik moslashuvchanligi bilan ajralib turadi[3]. Bu xususiyatlar uni yuqori sig‘imli va kichik o‘lchamli qurilmalarni yaratishda istiqbolli materialga aylantiradi. Biroq TiO_2 asosidagi MDY tuzilmalarda asosiy muammolardan biri — bu titan dioksidi qatlamining kremniy asos bilan bevosita tutashgan chegara sirtida katta miqdorda nuqsonlar va zaryad tutuvchi markazlarning hosil bo‘lishidir[4,5]. Ushbu chegara sirt nuqsonlari sig‘im–kuchlanish (C–V) xarakteristikalarining cho‘zilishiga, gisterezis hodisasining paydo bo‘lishiga hamda oqish toki zichligining ortishiga olib keladi. Natijada qurilmaning elektr barqarorligi va ishonchliligi pasayadi[6,7].

Tadqiqot usullari. Mazkur tadqiqotda metall–dielektrik–yarimo‘tkazgich tuzilmasi sifatida kremniy asos, yupqa kremniy dioksidi (SiO_2) oraliq qatlam, titan dioksidi (TiO_2) asosiy dielektrik qatlam hamda metall elektroddan tashkil topgan ko‘p qatlamli tizim taklif etiladi. Taklif etilayotgan tuzilma quyidagi ketma-ketlikda ifodalanadi: **Al/TiO_2/SiO_2/Si.** Ushbu tuzilmada SiO_2 oraliq qatlam yarimo‘tkazgich va yuqori dielektrik qatlam orasidagi chegara sirt sifatini yaxshilash vazifasini bajaradi. Yarimo‘tkazgich asos — n-tip legirlangan kremniy (Si), zaryad tashuvchilarning qayta taqsimlanishi sodir bo‘ladigan muhitni tashkil etadi. Oraliq qatlam — 0,5–3 nm qalinlikdagi kremniy dioksidi (SiO_2), chegara sirtni passivatsiyalash uchun xizmat qiladi. Asosiy dielektrik qatlam — 10–25 nm qalinlikdagi titan dioksidi (TiO_2), yuqori dielektrik singdiruvchanlik hisobiga katta sig‘im qiymatini ta’minlaydi. Metall elektrod — (Al), tashqi kuchlanishni uzatish va elektr maydon hosil qilish vazifasini bajaradi. Taklif etilayotgan tuzilmaning muhim xususiyati — SiO_2 oraliq qatlamining mavjudligi bo‘lib, u TiO_2 va kremniy orasidagi to‘g‘ridan-to‘g‘ri kontaktni bartaraf etadi va chegara sirt nuqsonlarini kamaytiradi.

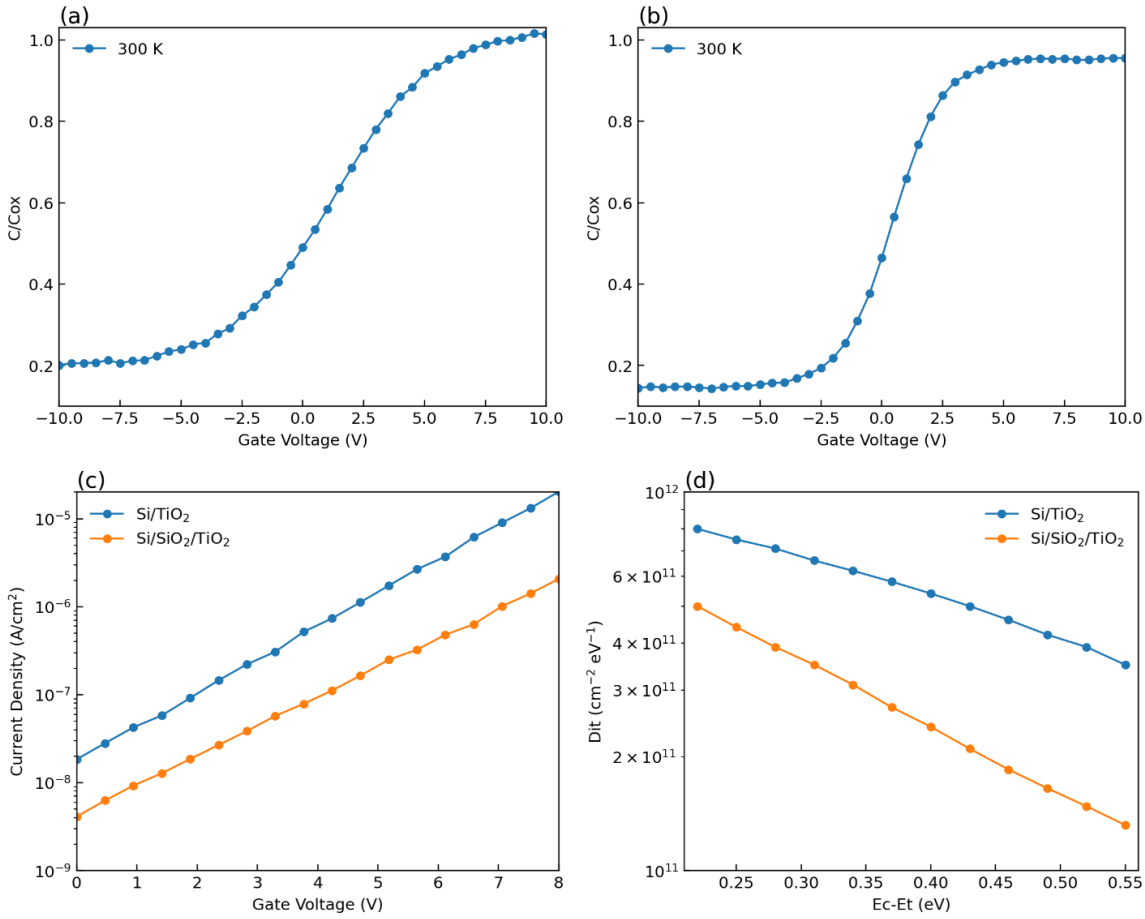
MDY tuzilmani shakllantirish quyidagi texnologik bosqichlarda amalga oshiriladi: Avvalo n-tip kremniy plastina yuzasi organik va noorganik iflosliklardan tozalanadi. So‘ngra tabiiy oksid qatlamini olib tashlash uchun suyultirilgan HF eritmasi bilan qisqa muddatli ishlov beriladi. Bu bosqich sirtning tozaligi va keyingi qatlamlarning sifatli hosil bo‘lishi uchun muhim hisoblanadi. Kremniy yuzasida 0,5–3 nm qalinlikda yupqa SiO_2 qatlam hosil qilinadi. Ushbu qatlam termik oksidlanish yoki boshqa mos texnologik usullar orqali shakllantiriladi. Qatlam qalinligi spektroskopik ellipsometriya yordamida nazorat qilinadi. SiO_2 qatlam ustiga 10–25 nm qalinlikda TiO_2 dielektrik qatlam atom qatlamli cho‘ktirish (ALD) usuli yordamida hosil qilinadi. Ushbu usul qatlam qalinligini aniq nazorat qilish va yuqori sifatli, bir jinsli qatlam olish imkonini beradi. TiO_2 qatlam ustiga metall elektrod (Al) fizik bug‘ fazasidan cho‘ktirish (PVD) usuli yordamida qoplanadi. Metall qatlam tashqi elektr signalini uzatish uchun xizmat qiladi. Hosil qilingan tuzilma 300–400°C haroratda azot muhitida termik ishlovdan o‘tkaziladi. Ushbu jarayon chegara sirt sifatini yaxshilaydi, nuqsonlarni kamaytiradi va dielektrik qatlamning elektr xossalarini barqarorlashtiradi.

Muhokama va tadqiqot natijalari. MDY sutrukturada nuqsonlar mavjud bo‘lganda C–V egri chizig‘ining cho‘zilishi, kuchlanishga bog‘liq sig‘imning sekin o‘zgarishi , gisterezis (oldinga va orqaga yurishda farq) hodisasi kuzatiladi. Gisterezis hodisasi zaryadlarning tutib qolishi va qayta taqsimlanishining nosimmetrik bo‘lishi bilan izohlanadi. SiO_2 oraliq qatlam qo‘llanilganda esa chegara sirt holatlari kamayadi, zaryad almashinuvi tezlashadi, C–V xarakteristika ideal holatga yaqinlashadi va natijada qurilmaning elektr barqarorligi oshadi. 1(a)-rasmda oraliq qatlam mavjud bo‘lmagan Si/TiO_2 tuzilma uchun C–V xarakteristika ko‘rsatilgan. Ushbu holatda egri chiziqning sezilarli darajada cho‘zilishi kuzatiladi, bu esa yuqori chegara sirt nuqsonlari zichligi (D_{it}) bilan izohlanadi. Zaryad tashuvchilarning chegara sirt holatlari orqali tutib qolinish va kechikib bo‘shatilishi C–V xarakteristikaning noideal shaklga ega bo‘lishiga olib keladi. 1(b)-rasmda SiO_2 oraliq qatlam kiritilgan Si/SiO_2/TiO_2 tuzilma uchun C–V xarakteristika keltirilgan. Bu holatda egri chiziq ancha tiklashgan bo‘lib, bu chegara sirt nuqsonlari zichligining kamayganini bildiradi. Bundan tashqari, C–V xarakteristikaning kuchlanish bo‘yicha siljishi kuzatiladi, bu sirt zaryadlari va ichki elektr maydonning qayta taqsimlanishi bilan bog‘liq. Shu bilan birga, maksimal sig‘im qiymatining biroz kamayishi SiO_2 qatlamining qo‘shimcha dielektrik sifatida ishtirok etishi bilan tushuntiriladi.

MOS-kondensatorlarda oqish toki dielektrik qatlam orqali zaryad tashuvchilarning o‘tishi natijasida yuzaga keladi. Bu jarayon bir nechta fizik mexanizmlar orqali amalga oshishi mumkin. TiO_2 asosidagi tuzilmalarda quyidagi asosiy

mexanizmlar namoyon bo‘ladi: bevosita tunnel effekti ya’ni yupqa dielektrik qatlamlarda zaryad tashuvchilar energiya to‘sig‘idan tunnellanish yo‘li bilan o‘tadi. Bu holat asosan kichik qalinliklarda kuzatiladi. Fowler–Nordheim tunnel effekti ya’ni kuchli elektr maydon ta’sirida zaryad tashuvchilar potensial to‘siq orqali tunnellanish yo‘li bilan o‘tadi. Bu jarayon yuqori kuchlanishlarda yuzaga keladi. Poole–Frenkel emissiyasi bu esa dielektrik ichidagi nuqsonlar bilan bog‘liq bo‘lib, zaryad tashuvchilar nuqson markazlaridan elektr maydon ta’sirida ajralib chiqadi va o‘tkazuvchanlikka hissa qo‘shadi. TiO_2 qatlamida nuqsonlar ko‘pligi sababli aynan nuqson orqali o‘tish asosiy rol o‘ynaydi. SiO_2 oraliq qatlamining kiritilishi esa energetik to‘siq balandligini oshiradi, nuqsonlar sonini kamaytiradi, o‘tkazuvchanlik yo‘llarini uzadi. Natijada oqish toki sezilarli darajada kamayadi. 1(c)-rasmda I–V xarakteristikalar taqqoslanadi. Ko‘rinib turibdiki, SiO_2 oraliq qatlam mavjud bo‘lgan holatda oqish toki zichligi sezilarli darajada kamayadi. Bu energetik to‘siq balandligining ortishi va nuqson orqali o‘tish mexanizmlarining susayishi bilan izohlanadi.

Metall–dielektrik–yarimo‘tkazgich tuzilmalarida dielektrik qatlam va yarimo‘tkazgich orasidagi chegara sirt qurilmaning elektrofizik xossalarini belgilovchi asosiy omillardan biridir. Ideal holatda ushbu chegara sirt mukammal bo‘lishi lozim, biroq amalda atomlararo bog‘lanishlarning uzilishi, kristall panjara buzilishlari va kimyoviy nomutanosibliklar natijasida turli xil nuqsonlar hosil bo‘ladi. Ushbu nuqsonlar zaryad tutuvchi markazlar sifatida namoyon bo‘lib, ular energiya taqiqlangan zonada joylashgan holatlar orqali zaryadlarni vaqtincha ushlab turish xususiyatiga ega. Bu markazlarning zichligi odatda chegara sirt nuqsonlari zichligi (D_{it}) bilan ifodalanadi. TiO_2 va kremniy orasidagi bevosita kontakt holatida Dit qiymati yuqori bo‘lib, bu zaryadlarning tutib qolishi va kechikib bo‘shatilishi, sig‘im–kuchlanish xarakteristikasining cho‘zilishi, gisterezis hodisasining yuzaga kelishi, qurilma parametrlarining vaqt bo‘yicha o‘zgarishiga olib keladi. SiO_2 oraliq qatlamining kiritilishi kremniy yuzasidagi erkin bog‘lanishlarni passivatsiyalash orqali chegara sirt nuqsonlarini sezilarli darajada kamaytiradi. Natijada D_{it} qiymati pasayadi va zaryad tutish jarayonlari cheklanadi. 1(d)-rasmda chegara sirt nuqsonlari zichligi D_{it} ning energiya bo‘yicha taqsimoti ko‘rsatilgan. SiO_2 oraliq qatlam kiritilganda D_{it} qiymati barcha energiya diapazonida kamayishi kuzatiladi. Bu kremniy yuzasining passivatsiyalanishi va erkin bog‘lanishlarning kamayishi bilan bog‘liq.



1-rasm. *Si/TiO_2 va $Si/SiO_2/TiO_2$ MDY tuzilmalar elektrofizik xarakteristikalari.*

SiO_2 oraliq qatlam qalinligi qurilmaning asosiy parametrlariga sezilarli ta’sir ko‘rsatadi. **Juda yupqa qatlamda (0,5 nm dan kichik)** yetarli passivatsiya, ta’minlanmaydi, nuqsonlar saqlanib qoladi **Optimal qatlam (1–2 nm)** chegara sirt maksimal darajada passivatsiyalanadi, D_{it} kamayadi. **Juda qalin qatlam (3 nm dan katta)** umumiy dielektrik qalinlik ortadi va sig‘im kamayadi Shuning uchun SiO_2 qatlam qalinligini optimallashtirish orqali sig‘im va elektr barqarorligi o‘rtasida

muvozanatga erishish mumkin. Taklif etilayotgan $Si/SiO_2/TiO_2$/metal MOS tuzilmaning elektrofizik xossalari tahlil qilindi hamda oraliq SiO_2 qatlamning qurilma ishlashiga ta'siri baholandi.

Gisterezis hodisasi zaryadlarning dielektrik qatlam yoki chegara sirtida tutib qolinishi va kechikib bo'shatilishi natijasida yuzaga keladi. TiO_2 asosidagi tuzilmalarda yuqori D_{it} qiymati, nuqson markazlarining ko'pligi, zaryadlarning "tuzoqlarda" ushlanishi tufayli gisterezis yuqori bo'ladi. SiO_2 oraliq qatlam chegara sirtni passivatsiyalaydi, zaryad tutuvchi markazlar sonini kamaytiradi, zaryad almashinuvi jarayonini tezlashtiradi. Natijada gisterezis hodisasi sezilarli darajada kamayadi va qurilmaning qayta ishlash xususiyatlari yaxshilanadi.

Xulosa. TiO_2 asosidagi metall–dielektrik–yarimo'tkazgich (MOS) kondensatorlarda kremniy asos va dielektrik qatlam orasiga yupqa SiO_2 oraliq qatlamini kiritish orqali chegara sirt xossalarini yaxshilash imkoniyatlari tahlil qilindi. Tahlillar shuni ko'rsatadiki, TiO_2 va kremniy orasidagi bevosita kontakt yuqori zichlikdagi chegara sirt nuqsonlarining hosil bo'lishiga olib keladi, bu esa oqish toki ortishi, sig'im–kuchlanish xarakteristikalarida gisterezis paydo bo'lishi va qurilma barqarorligining pasayishiga sabab bo'ladi. SiO_2 oraliq qatlamning kiritilishi esa kremniy yuzasini passivatsiyalash orqali ushbu nuqsonlarni kamaytiradi va zaryad tutish jarayonlarini cheklaydi. Natijada taklif etilgan $Si/SiO_2/TiO_2$ tuzilma uchun quyidagi ijobiy o'zgarishlar kutiladi:

- oqish toki zichligining kamayishi;
- chegara sirt nuqsonlari zichligining pasayishi;
- sig'im–kuchlanish xarakteristikasining barqarorlashuvi;
- gisterezis hodisasining sezilarli kamayishi.

Bundan tashqari, SiO_2 oraliq qatlam qalinligining optimallashtirilishi qurilmaning sig'imi va elektr barqarorligi o'rtasida muvozanatni ta'minlashda muhim omil ekanligi ko'rsatildi. Nazariy tahlillarga ko'ra, 1–2 nm diapazon optimal hisoblanadi.

***Keywords:** lattice Schrödinger operator, two-particle system, essential spectrum, discrete spectrum, Fredholm determinant, critical operators.*

Introduction

Discrete Schrödinger operators on lattices play an important role in mathematical physics and operator theory (see, e.g., [1, 2]). Owing to the bounded dispersion relation, these operators exhibit specific spectral features, in particular, the possible appearance of discrete eigenvalues outside the essential spectrum. The spectral theory of few-particle lattice Hamiltonians has been extensively developed (see, e.g., [3-5]). In particular, threshold effects and properties of the discrete spectrum have been studied in various settings (see, e.g., [6-8]).

However, the problem of determining the number and location of discrete eigenvalues, as well as a geometric description of the parameter space, remains incomplete, even in the one-dimensional case (see [9]). In this paper, we consider a two-particle lattice Schrödinger operator on the one-dimensional lattice Z with finite-range interactions depending on three coupling constants. Using fiber decomposition with respect to the total quasi-momentum, the problem is reduced to a family of parameter-dependent operators.

The analysis is based on the Fredholm determinant approach. We introduce critical operators defined by the degeneration of the leading terms of the determinant. The corresponding critical sets form algebraic surfaces in $\mathbb{R}^3$ that partition the parameter space into regions with a constant number of discrete eigenvalues. Crossing these surfaces leads to eigenvalue transitions.

The paper is organized as follows. Section 2 introduces the model. Section 3 presents the method. Section 4 describes the critical surfaces. Section 5 contains the main results.

2. Fiber Hamiltonians and spectral setting

Let $\mathbb{T} = (-\pi, \pi]$ be the one-dimensional torus equipped with the normalized Haar measure $dv(p) = \frac{dp}{2\pi}$. We consider the Hilbert space $L^{2,e}(\mathbb{T})$ of square-integrable even functions on $\mathbb{T}$ endowed with the inner product

$$\langle f, g\rangle = \int_{\mathbb{T}} f(t)\overline{\{g(t)\}}\, dv(t)\ , f, g \in L^{2,e}(\mathbb{T}).$$

For each value of the total quasi-momentum $K \in \mathbb{T}$, the corresponding two-particle Hamiltonian is represented by the fiber operator

$$H_{\boldsymbol{\mu}}(K): L^{2,e}(\mathbb{T}) \to L^{2,e}(\mathbb{T}),\ H_{\boldsymbol{\mu}}(K) = H_0(K) + V_{\boldsymbol{\mu}},$$

where $\boldsymbol{\mu} = (\mu_1, \mu_2, \mu_3) \in \mathbb{R}^3$ is the vector of coupling constants.

For any $L^{2,e}(\mathbb{T})$, the free part $H_0(K)$ acts as a multiplication operator:

$$(H_0(K)f)(p) = \mathcal{E}_K(p)\, f(p), \qquad \mathcal{E}_K(p) = 4(1 - \cos\frac{K}{2}\cos p).$$

The interaction term $V_{\boldsymbol{\mu}}$ is a finite-rank operator of the form

$$(V_{\boldsymbol{\mu}} f)(p) = \sum_{i=1}^{3} \mu_i \langle \phi_i, f\rangle\, \phi_i(p).$$

Here, the functions $\{\phi_i\}_{i=1}^3$ constitute an orthonormal system given by

$$\phi_1(t) = 1, \qquad \phi_2(t) = \sqrt{2}\cos t, \qquad \phi_3(t) = \sqrt{2}\cos 2t, \qquad t \in \mathbb{T}.$$

The spectrum of the free operator $H_0(K)$ forms a single interval,

$$\sigma(H_0(K)) = [\mathcal{E}_{\min}(K), \mathcal{E}_{\max}(K)],$$

where the endpoints are determined by

$$\mathcal{E}_{\min}(K) = 4(1 - \cos\frac{K}{2}), \qquad \mathcal{E}_{\max}(K) = 4(1 + \cos\frac{K}{2}).$$

Since $V_{\boldsymbol{\mu}}$ is a perturbation of finite rank, it does not affect the essential spectrum. Hence,

$$\sigma_{\text{ess}}(H_{\boldsymbol{\mu}}(K)) = [\mathcal{E}_{\min}(K), \mathcal{E}_{\max}(K)].$$

As a consequence, any discrete eigenvalues of $H_{\boldsymbol{\mu}}(K)$ can only appear outside the essential spectrum, that is,

$$(-\infty, \mathcal{E}_{\min}(K)) \cup (\mathcal{E}_{\max}(K), +\infty).$$

Furthermore, due to the bound $rank(V_{\boldsymbol{\mu}}) \le 3$, the number of discrete eigenvalues is finite and satisfies

$$n(H_{\boldsymbol{\mu}}(K)) \le 3, \qquad K \in \mathbb{T}.$$

3. Fredholm determinant and threshold asymptotics

3.1 The transposed Lippmann–Schwinger operator. In the particular case $\boldsymbol{K = 0}$, the essential spectrum reduces to the interval $\boldsymbol{\sigma(H_0(0)) = [0, 8]}$. Therefore, for any $\boldsymbol{z \in \mathbb{R}\backslash[0, 8]}$, the resolvent of the free operator

$$R_0(0, z) := (H_0(0) - zI)^{-1}$$

is well-defined and bounded.

Definition 3.1 *Let $z \in \mathbb{R}\backslash[0,8]$, The transposed Lippmann–Schwinger operator corresponding to $H_{\boldsymbol{\mu}}(0)$ is introduced by*

$$L_{\boldsymbol{\mu}}(0, z) := -V_{\boldsymbol{\mu}} R_0(0, z). \qquad (1)$$

The next result describes the equivalence between the spectral properties of $H_{\boldsymbol{\mu}}(0)$ and the associated Lippmann–Schwinger operator.

Lemma 3.2 *A number $z \in \mathbb{R}\backslash[0,8]$ is an eigenvalue of $H_{\boldsymbol{\mu}}(0)$ of multiplicity m if and only if 1 is an eigenvalue of $L_{\boldsymbol{\mu}}(0, z)$ with the same multiplicity.*

Proof. The equation $H_{\boldsymbol{\mu}}(0)\psi = z\psi$ can be rewritten in the form

$$(H_0(0) - z)\psi = -V_{\boldsymbol{\mu}}\psi.$$

Applying the resolvent $R_0(0, z)$ to both sides, we obtain

$$\psi = -R_0(0, z)V_{\boldsymbol{\mu}}\psi,$$

which shows that ψ is an eigenvector of $L_{\boldsymbol{\mu}}(0, z)$ corresponding to the eigenvalue 1. The reverse implication is obtained by the same argument.

Lemma 3.3 *A point $z \in \mathbb{R} \setminus [0,8]$ is an eigenvalue of $H_{\boldsymbol{\mu}}(0)$ if and only if*

$$\Delta_{\boldsymbol{\mu}}(z) = 0,$$

where the Fredholm determinant is given by

$$\Delta_{\boldsymbol{\mu}}(z) := det(I - L_{\boldsymbol{\mu}}(0, z)) = det\left(\delta_{ij} + \mu_j a_{ij}(z)\right)_{i,j=1}^{3}.$$

The matrix elements $a_{ij}(z)$ are defined as

$$a_{ij}(z) := \langle R_0(0,z)\varphi_j, \varphi_i \rangle = \int_{\mathbb{T}} \frac{\varphi_i(t)\varphi_j(t)}{\mathcal{E}_0(t) - z} d\nu(t), \qquad i,j = 1,2,3. \quad ,$$

Moreover $\Delta_{\boldsymbol{\mu}}(\cdot)$ has at most three zeros (counting multiplicities) in $z \in \mathbb{R}\backslash[0,8]$.

Proof. Since $L_{\boldsymbol{\mu}}(0,z)$ is a finite-rank operator, the condition $1 \in \sigma(L_{\boldsymbol{\mu}}(0,z))$ is equivalent to the vanishing of the Fredholm determinant

$$\Delta_{\boldsymbol{\mu}}(z) = det(I - L_{\boldsymbol{\mu}}(0,z)).$$

In the basis $\{\varphi_i\}_{i=1}^3$, the operator $L_{\boldsymbol{\mu}}(0,z)$ admits the representation

$$(L_{\boldsymbol{\mu}}(0,z)\varphi)_i = -\sum_{j=1}^{3} \mu_j a_{ij}(z)\varphi_j,$$

which yields the matrix representation above.

By the estimate $n(H_{\boldsymbol{\mu}}(K)) \le 3$ the determinant $\Delta_{\boldsymbol{\mu}}(z)$ has at most three zeros in $z \in \mathbb{R}\backslash[0,8]$, counting multiplicities

Lemma 3.3 *The functions $a_{ij}(z)$, $i,j = 1,2,3$, possess the following symmetry and asymptotic behavior.*

(i) Parity property.

$$a_{ij}(8-z) = (-1)^{i+j+1} a_{ij}(z), \quad i,j \in \{1,2,3\}.$$

(ii) Asymptotics near the spectral edges.

$$a_{ij}(z) = \begin{cases} \dfrac{\phi_i(0)\phi_j(0)}{2\sqrt{2}\zeta_0(z)} + A_{ij} + O(\zeta_0(z)), & z \nearrow 0, \\ -\dfrac{\phi_i(\pi)\phi_j(\pi)}{2\sqrt{2}\zeta_8(z)} - A_{ij} + O(\zeta_8(z)), & z \searrow 8, \end{cases}$$

where $\zeta_0(z) = \sqrt{-z}$ for $z < 0$ and $\zeta_8(z) = \sqrt{z-8}$ for $z > 8$. The regular part is given by the matrix

$$A = \begin{pmatrix} 0 & -\dfrac{\sqrt{2}}{4} & -\dfrac{\sqrt{2}}{2} \\ -\dfrac{\sqrt{2}}{4} & -\dfrac{1}{2} & -1 \\ -\dfrac{\sqrt{2}}{2} & -1 & -1 \end{pmatrix}.$$

Proof. The parity relation

$$a_{ij}(8-z) = (-1)^{i+j+1} a_{ij}(z)$$

follows from the identities

$$\mathcal{E}_0(t+\pi) = 8 - \mathcal{E}_0(t), \qquad \phi_k(t+\pi) = (-1)^{k+1}\phi_k(t),$$

together with the change of variables $t \mapsto t + \pi$ in the integral representation of $a_{ij}(z)$.

The asymptotic expansions are obtained by analyzing the singular behavior of the integrand near the points $t = 0$ and $t = \pi$, which correspond to the lower and upper edges of the spectrum, respectively.

Lemma 3.4 (Determinant asymptotics) *For any $\boldsymbol{\mu} \in \mathbb{R}^3$, the Fredholm determinant admits the asymptotic expansions*

$$\Delta_{\boldsymbol{\mu}}(z) = \begin{cases} C^-(\boldsymbol{\mu})\dfrac{1}{2\sqrt{2}\zeta_0(z)} + D^-(\boldsymbol{\mu}) + O\big(\zeta_0(z)\big), & z \nearrow 0, \\ C^+(\boldsymbol{\mu})\dfrac{1}{2\sqrt{2}\zeta_8(z)} + D^+(\boldsymbol{\mu}) + O\big(\zeta_8(z)\big), & z \searrow 8, \end{cases}$$

where $\zeta_0(z) = \sqrt{-z}$ for $z < 0$ and $\zeta_8(z) = \sqrt{z-8}$ for $z > 8$, and the coefficients are given by

$$\begin{aligned} C^{\pm}(\boldsymbol{\mu}) &= \mp\Big(\mu_1 + 2\mu_2 + 2\mu_3 + \tfrac{1}{4}\mu_1\mu_2\mu_3\Big) + \tfrac{1}{2}\mu_1\mu_2 + \mu_1\mu_3 + \mu_2\mu_3, \\ D^{\pm}(\boldsymbol{\mu}) &= \pm\Big(\tfrac{1}{2}\mu_2 + \mu_3 + \tfrac{1}{8}\mu_1\mu_2\mu_3\Big) + 1 - \tfrac{1}{2}\mu_2\mu_3 - \tfrac{1}{8}\mu_1\mu_2 - \tfrac{1}{2}\mu_1\mu_3. \end{aligned} \tag{2}$$

Proof. The result follows directly from Lemma 3.3 combined with straightforward algebraic computations.

4. Geometric classification of critical parameters

4.1 Threshold polynomials. The polynomials $\boldsymbol{C}^{\pm}(\boldsymbol{\mu})$ defined in (2) determine the threshold behavior of the operator $\boldsymbol{H}_{\boldsymbol{\mu}}(\boldsymbol{0})$. Their zero sets

$$\Gamma^{\pm} := \{\boldsymbol{\mu} \in \mathbb{R}^3 : C^{\pm}(\boldsymbol{\mu}) = 0\} = \bigcup_{\alpha} \Gamma_{\alpha}^{\pm}$$

form critical surfaces in the parameter space, across which spectral transitions occur.

Remark 4.1 *The polynomials $C^{\pm}$ satisfy the symmetry relation*

$$C^{+}(\mu_1,\mu_2,\mu_3) = C^{-}(-\mu_1,-\mu_2,-\mu_3),$$

which reflects the invariance of the model under the transformation $\boldsymbol{\mu} \mapsto -\boldsymbol{\mu}$. This symmetry allows one to deduce the geometric structure of Γ^{+} from that of Γ^{-}.

A key structural property of $C^{\pm}$ is its affine dependence on μ_1.

Lemma 4.2 *The polynomial $C^{\pm}(\boldsymbol{\mu})$ admits the affine representation*

$$C^{\pm}(\boldsymbol{\mu}) = Q_0^{\pm}(\mu_2,\mu_3) + \mu_1 Q_1^{\pm}(\mu_2,\mu_3),$$

where

$$Q_0^{\pm} = \mu_2\mu_3 \mp 2(\mu_2+\mu_3), \quad Q_1^{\pm} = \mu_3 + \frac{1}{2}\mu_2 \mp (1+\frac{1}{4}\mu_2\mu_3).$$

The equation $Q_1^{\pm}(\mu_2,\mu_3) = 0$ defines the curve

$$\mu_2 = -\frac{4(\mu_3 \mp 1)}{2 \mp \mu_3}, \quad \mu_3 \neq \pm 2,$$

which partitions the (μ_2,μ_3)-plane into regions where $Q_1^{\pm}$ has a constant sign.

For all (μ_2,μ_3) such that $Q_1^{\pm}(\mu_2,\mu_3) \neq 0$, the equation $C^{\pm}(\boldsymbol{\mu}) = 0$ uniquely determines μ_1 as

$$\mu_1 = -\frac{Q_0^{\pm}(\mu_2,\mu_3)}{Q_1^{\pm}(\mu_2,\mu_3)}.$$

Proof. The statement follows directly from the explicit form of $C^{\pm}$ by collecting the terms with respect to μ_1.

4.2 Discrete spectrum classification. In this subsection, we characterize the relationship between the geometric regions $\boldsymbol{\mathcal{C}_{\alpha}^{\pm}}$ and the number of discrete eigenvalues of the operator. In particular, the spectral behavior of the system is governed by the position of the interaction parameters with respect to the critical surfaces $\boldsymbol{\Gamma^{\pm}}$.

Combining the invariance of the number of eigenvalues and their explicit determination established in Theorems 3.5 and 3.6 of [9], we obtain the following result.

Lemma 4.3 *Let $\mathcal{C} = \mathcal{C}_{\alpha}^{-}$ (respectively, $\mathcal{C} = \mathcal{C}_{\alpha}^{+}$), where $\alpha \in \{0,1,2,3\}$. Then the number of eigenvalues of $H_{\boldsymbol{\mu}}(0)$ lying below 0 (respectively, above 8) is constant throughout the region $\mathcal{C}$ and is given by*

$$n_{-}(H_{\boldsymbol{\mu}}(0)) = \alpha \quad \text{if} \mathcal{C} = \mathcal{C}_{\alpha}^{-},$$

$$n_{+}(H_{\boldsymbol{\mu}}(0)) = \alpha \quad \text{if} \mathcal{C} = \mathcal{C}_{\alpha}^{+}.$$

5. Spectral transitions and global results

5.1 Criticality and discontinuity. In this subsection, we analyze the spectral behavior at the edges of the essential spectrum. We introduce the notion of criticality and describe the mechanism of spectral transitions, showing how eigenvalues appear or disappear as the interaction parameters cross the critical surfaces $\boldsymbol{\Gamma^{\pm}}$.

We denote by

$$E_{-} = 0, \qquad E_{+} = 8$$

the lower and upper edges of the essential spectrum, respectively.

Definition 5.1 *$H_{\boldsymbol{\mu}}(0)$ is critical at the lower threshold $z = 0$ (resp. the upper threshold $z = 8$) if the counting function*

$$n_{-}(H_{\boldsymbol{\mu}}(0)) := trE_{H_{\boldsymbol{\mu}}(0)}((-\infty,0)), \quad \text{resp.} \quad n_{+}(H_{\boldsymbol{\mu}}(0)) := trE_{H_{\boldsymbol{\mu}}(0)}((8,+\infty))$$

is discontinuous at $\boldsymbol{\mu}$.

Theorem 5.2 *$H_{\boldsymbol{\mu}}(0)$ is critical at the threshold $E_{\pm}$ if and only if $\boldsymbol{\mu} \in \Gamma^{\pm}$. This criticality is equivalent to the existence of a finite limiting determinant:*

$$\Delta_{\boldsymbol{\mu}}^{*}(E_{\pm}) := \lim_{\substack{z \to E_{\pm} \\ z \in \mathbb{R}\setminus[0,8]}} \Delta_{\boldsymbol{\mu}}(z) < \infty$$

Proof. If $\boldsymbol{\mu} \in \Gamma^{\pm}$, then $C^{\pm}(\boldsymbol{\mu}) = 0$, and by Lemma 3.4 the singular term in the asymptotic expansion vanishes, so the limit $\Delta_{\boldsymbol{\mu}}(z)$ as $z \to E_{\pm}$ is finite.

Moreover, by Theorem 4.3, the number of eigenvalues $n_{\pm}$ is constant on each region $\mathcal{C}_{\alpha}^{\pm}$ and changes by one when passing from one region to an adjacent one across $\Gamma^{\pm}$. This implies that the counting function is discontinuous at $\boldsymbol{\mu}$.

Conversely, if $H_{\boldsymbol{\mu}}(0)$ is critical, then the counting function $n_{\pm}$ is discontinuous at $\boldsymbol{\mu}$. Since $n_{\pm}$ is constant within each region $\mathcal{C}_{\alpha}^{\pm}$, such a discontinuity can occur only at points separating these regions, that is, on the surfaces $\Gamma^{\pm}$. Hence, $\boldsymbol{\mu} \in \Gamma^{\pm}$.

Theorem 5.3 (One-sided continuity) *Let Γ_{α}^{-}, $\alpha = 0,1,2$, be a critical surface separating $\mathcal{C}_{\alpha}^{-}$ and $\mathcal{C}_{\alpha+1}^{-}$, and let $\boldsymbol{\mu}^{0} \in \Gamma_{\alpha}^{-}$*

1. If $\boldsymbol{\mu} \in \mathcal{C}_\alpha^-$ approaches $\boldsymbol{\mu}^0$, then
$$\lim_{\substack{\boldsymbol{\mu}\to\boldsymbol{\mu}^0 \\ \boldsymbol{\mu}\in\mathcal{C}_\alpha^-}} n_-(H_{\boldsymbol{\mu}}(0)) = n_-(H_{\boldsymbol{\mu}^0}(0)) = \alpha.$$

2. If $\boldsymbol{\mu} \in \mathcal{C}_{\alpha+1}^-$ approaches $\boldsymbol{\mu}^0$, then
$$\lim_{\substack{\boldsymbol{\mu}\to\boldsymbol{\mu}^0 \\ \boldsymbol{\mu}\in\mathcal{C}_{\alpha+1}^-}} n_-(H_{\boldsymbol{\mu}}(0)) = \alpha + 1 > n_-(H_{\boldsymbol{\mu}^0}(0)) = \alpha.$$

Analogous statements hold for n_+ and Γ_α^+.

Proof sketch. By Theorem 4.3, the function n_- is constant on each region $\mathcal{C}_\alpha^-$ and $\mathcal{C}_{\alpha+1}^-$. Let $\boldsymbol{\mu}^0 \in \Gamma_\alpha^-$.

If $\boldsymbol{\mu} \in \mathcal{C}_\alpha^-$ tends to $\boldsymbol{\mu}^0$, then the number of eigenvalues below 0 remains equal to α, and hence
$$n_-(H_{\boldsymbol{\mu}}(0)) \to n_-(H_{\boldsymbol{\mu}^0}(0)) = \alpha.$$

If $\boldsymbol{\mu} \in \mathcal{C}_{\alpha+1}^-$ tends to $\boldsymbol{\mu}^0$, then one eigenvalue approaches 0 and is no longer counted at $\boldsymbol{\mu}^0$. Therefore,
$$\lim_{\substack{\boldsymbol{\mu}\to\boldsymbol{\mu}^0 \\ \boldsymbol{\mu}\in\mathcal{C}_{\alpha+1}^-}} n_-(H_{\boldsymbol{\mu}}(0)) = \alpha + 1 > n_-(H_{\boldsymbol{\mu}^0}(0)) = \alpha.$$

Thus, the one-sided limits differ, and the counting function is discontinuous at $\boldsymbol{\mu}^0$.

Kirish

Hozirgi kunda dunyoda zamonaviy nanoelektronika asboblari va fotoelektrik qurilmalarning xususiyatlarini yaxshilash, ularning tez ishlashi shuningdek yuqori samaradorlikka ega bo‘lishlarini ta’minlash uchun eng so‘nggi fan va texnologiya yutuqlaridan samarali foydalangan holda, yupqa qatlamli plyonkalar, 2D va 3D o‘lchamdagi p-n-o‘tishli diodlar, fotodetektorlar va quyosh fotoelementlarini olish muhim vazifalardan biri hisoblanadi. Xususan, 2D va 3D o‘lchamdagi p-n-o‘tishli diodlarni samaradorligini oshirish uchun ularning elektr xususiyatlariga o‘ta yuqori chastotali maydon, deformatsiya va yorug‘lik ta’sirlarini e’tiborga olish, hamda foydali ish koeffisientlarini oshirish maqsadga muvofiq. Shuningdek, o‘ta yuqori chastotali maydon, deformatsiya va yorug‘lik ta‘siridagi p-n-o‘tishda hosil bo‘ladigan generatsiya va rekombinatsiya toklariga alohida e’tibor qaratilmoqda.

Adabiyotlar tahlili

So‘ngi yillarda ikki o‘lchamli (2D) yarimo‘tkazgichli materiallar ko‘p qirrali elektron qurilmalarni ishlab chiqarishda imkoniyatlari yuqori bo‘lganligi sababli elektronika sohasida katta qiziqishlar uyg‘otib kelmoqda. Yarimo‘tkazgichli 2D materiallari yorug‘lik yutilishining samarali bo‘lishini ko‘rsatadi. Shuning uchun, bu materiallar optoelektronik asboblar, ayniqsa, fotodetektorlar uchun asosiy manba hisoblanadi [1-4]. 2D materiallaridan WSe_2 ning xususiyatlari va amalda qo‘llanilishi tajriba va nazariy jixatdan [5] ishda solishtirilgan. Atom jixatdan yupqa MoS_2ning ikki o‘lchamli tabiati va kam quvvatli elektronika potensiali yangi yaratilgan nanoelektronika ayniqsa, kosmosga bog‘langan elektronika uchun muhim

ahamiyat kasb etadi. Bularni inobatga olib, [6] ishda ikki o'lchamli MoS_2 maydon tranzistorlariga vakuumli ultrabinafsha nurlanish ta'sirini tajriba natijalari keltirilgan. [7] ishda akustik fononning cheklangan xarakatchanligini n - tipli ikki o'lchamli MoS_2 da T<100K harorat va zaryad tashuvchi zichligi uchun Bolsman tenglamasi va akustik elektron-fonon o'zaro ta'siridan foydalangan holda o'rganilgan. Uzluksiz elastik model bilan birgalikda deformatsiya potensiali va pyezoelektrik o'zaro ta'sirlar uchun analitik ifodalar keltirilgan. MoS_2 kabi qatlamli materiallarning atomik nozik plyonkalari elektrostatik maydon orqali ikki o'lchamli fazali o'tishlarni o'rganishga katta qiziqish uyg'otmoqda. Bunday fazali o'tishlarga erishish uchun zaryad tashuvchi zichligiga kirish imkonini beruvchi elektrostatik maydon usullari kerak. [8] ishda bir necha qatlamli MoS_2 da $4 \cdot 10^{14} sm^{-2}$ maksimal n – tipning zichligiga erishishga imkon beruvchi elektrostatik maydon usulini ishlab chiqilgan. Bundan tashqari, zaryad tashuvchining zichligi ortib borishi bilan izolyatorni metallga o'tishini va MoS_2 da to'liq bo'lmagan metallni o'tkazgichga o'tishi kritik xarorat 10K bo'lganda keltirib chiqarilgan va o'ta o'tkazuvchanlik boshlangandan so'ng, o'tkazgich o'tish xarorati MoS_2 ikki qatlamli yupqa namunalar uchun zaryad tashuvchining zichligiga bog'liq emasligi keltirilgan.

2D o'lchamdagi nanomateriallar va ularning geterostrukturalariga asoslangan yangi materialshunoslik sohasining rivojlanishi yigirma birinchi asrning ikkinchi o'n yilligida sezilarli darajada kuzatildi [9-12]. Individual nanostrukturali 2D materiallari elektron xususiyatlarining keng doirasiga qo'shimcha ravishda, yuqori sirt maydoni, sirt xolatining tabiati, spin-orbital bog'lanish xususiyatlari va kvant spin Holl effektlari kabi juda qiziqarli xususiyatlarni o'z ichiga oladi [13-15].

Zamonaviy yarimo'tkazgichli elektronika atom jixatdan nozik p-n-o'tishlarini yaratishda qora fosfor, kremniy, germaniy va metall o'tishli dixalkogenidlar oilasini o'rganishni boshladi [16].

2D materiallarining o'ta nozik tabiatidan foydalanib, 3D p-n-o'tishlari erisha olmaydigan imkoniyatlarga 2D o'lchamdagi p-n-o'tishlari yordamida erishish mumkin. Bulardan, elektron va optoelektron qurilmalar, tranzistorlar, quyosh batareyalari, fotodetektorlar va boshqalar yaratishda foydalanish [17] ishda ko'rsatilgan. [18] ishda metall o'tishli dixalkoginit ikki o'lchamli yarimo'tkazgich qurilmalarda sig'imi hamda maydonlarning chiziqli zichligning tashuvchi statistikasiga ta'siri tadqiq qilingan va tajriba ma'lumotlari bilan taqqoslangan.

Biroq, yuqorida keltirilgan ishlarda 2D p-n o'tish VAX ning yorug'lik chastotasiga bog'liqligi yetarli darajada o'rganilmagan.

Ishning maqsadi, 2D p-n o'tish VAX ning yorug'lik chastotasiga bog'liq holda o'zgarishi, yorug'lik intensivligining kuchlanish funksiyasi sifatida o'rganish hamda salt yurish kuchlanishi va qisqa tutashuv tokining kuchlanishga bog'liqligini o'rganishdan iborat.

Tadqıqot metodologıyası.

Ushbu ishda 2D p-n o'tish volt-amper xarakteristikasini nazariy modellashtirish orqali tahlil qilishga e'tibor qaratildi. Modellash asosida p-n o'tish VAX ning yorug'lik chastotasiga bog'liqligi, shuningdek, yorug'lik intensivligining kuchlanish funksiyasi sifatida o'rganish hamda salt yurish kuchlanishi va qisqa tutashuv tokining kuchlanishga bog'liqligi hisobga olindi. 2D p-n o'tish VAX ni yorug'lik ta'sirida o'zgarish ifodalari keltirib chiqarildi va Maple dasturi yordamida grafiklari olindi

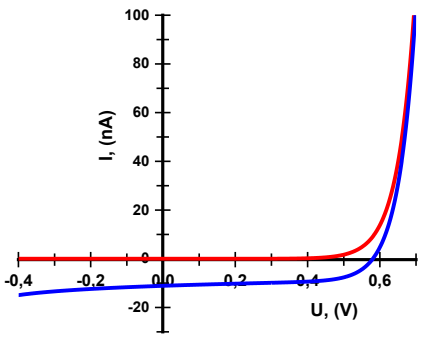
Tahlil va natijalar.

2D o'lchamli p-n-o'tish VAX ning yorug'lik chastotasiga bog'liqligi

Yarimo'tkazgichli 2D materiallarga asoslangan fotodetektorlar uchun yarimo'tkazgich volt-amper xarakteristikasining yorug'lik chastotasiga bog'liq holda o'zgarishini ko'rib chiqamiz. Bunda 2D o'lchamli p-n-o'tishning umumiy tokini hisoblash uchun Shokli tenglamasidan foydalanish mumkin [19]:

$$I_{ds} = \frac{mU_T}{R_s} f\left(\frac{I_S R_s}{mU_T} \exp\left(\frac{U_{ds}+I_S R_s}{mU_T}\right)\right) - I_s \qquad (1)$$

ifodadan foydalanib, 2D o'lchamdagi p-n-o'tishning volt-amper xarakteristikasini olishimiz mumkin (1-rasm).



1-rasm. 2D o'lchamdagi p-n-o'tish volt - amper xarakteristikasi

2D o'lchamdagi fotodiodning umumiy tokini (1) ifodadan foydalangan holda quyidagicha keltirib chiqaramiz:

$$I_{ds} = \frac{mU_T}{R_s} f\left(\frac{I_s R_s}{mU_T} exp\left(\frac{U_{ds}+I_s R_s}{mU_T}\right)\right) - I_s - I_c, \quad (2)$$

bunda, $I_c = eI_0(1-\beta_0)$, $I_0 = \alpha G(1-R)$ – yorug'likning intensivligi, $\alpha = A(h\nu - E_g - \Delta\varepsilon)^r$ bo'lganda, $h\nu \geq E_g$shart bajarilishini inobatga olamiz

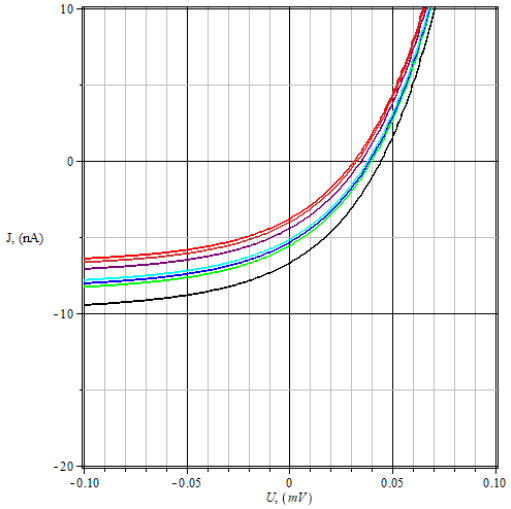
Yuqoridagilarni hisobga olib, (2.14) ifodani quyidagicha yozish mumkin:

$$I_c = \frac{eNL_s(1-R)A(h\frac{c}{\lambda}-E_g-\Delta\varepsilon)^r}{(L_s+L)}, \quad (3)$$

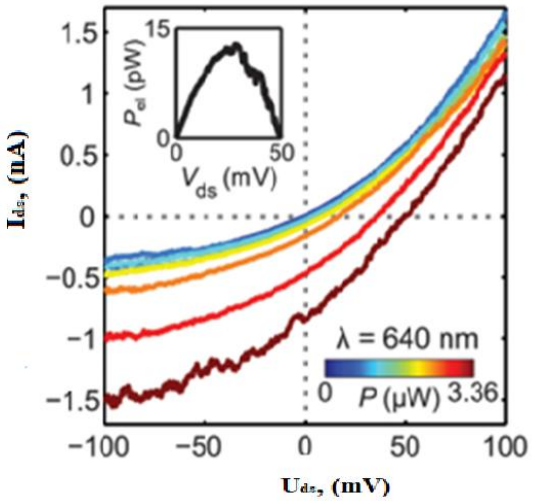
(3) tenglikni (2) ifodaga qo'yib,

$$I_{ds} = \frac{mU_T}{R_s} f\left(\frac{I_s R_s}{mU_T} exp\left(\frac{U_{ds}+I_s R_s}{mU_T}\right)\right) - I_s - \frac{eN(1-R)A(h\nu-E_g-\Delta\varepsilon)^r}{1+\frac{L}{L_s}}, \quad (4)$$

ifodani hosil qilamiz. Ushbu ifodadan foydalanib, 2D o'lchamdagi yarimo'tkazgich volt-amper xarakteristikasi uchun 2-rasmda keltirilgan grafikka Nazariy jihatdan olingan (4) ifoda yordamida 2D o'lchamdagi p-n-o'tish volt-amper xarakteristikasining yorug'lik chastotasiga bog'liq holda o'zgarish grafigini olib (3-rasm) va olingan natijani tajriba [19] natijalari (3-rasm) bilan solishtirdik.ega bo'lamiz.



2-rasm. 2D o'lchamdagi p-n-o'tish volt - amper xarakteristikasi



3-rasm. 2D o'lchamdagi p-n-o'tish volt - amper xarakteristikasining to'lqin uzunligiga bog'liqligi [20; 4785–4791-b].

Ushbu solishtirishlardan, nazariy va tajriba natijalari sifat jixatdan mos tushishi ko'rsatildi. 2-rasmda nazariy jixatdan ko'rilgan yorug'lik chastotasiga mos ravishda teskari tok o'zgarib borayotganini tajriba natijalari ko'rsatib turibdi. Bu fotovoltaik mexanizmga mos keladi va hosil bo'lgan fototok teskari tokni chastotasiga bog'liq holda kamaytirdi.

Diodning quvvatini $P_{el} = I_{Ds}U_{Ds}$**ifodadan foydalanib** keltirib chiqaramiz:

W energiyani esa intensivlik I bilan bog'laymiz $W = IS$

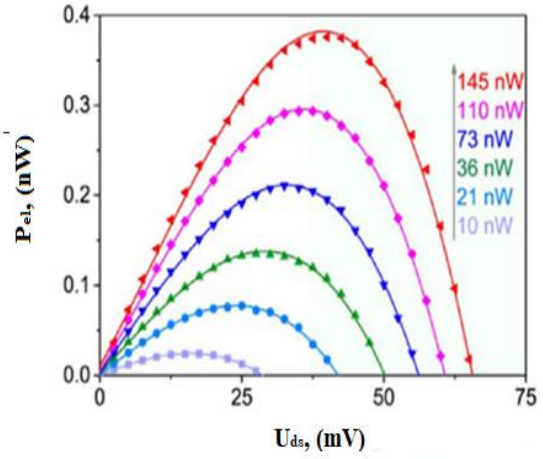
$$P_{el} = IU = \left(\frac{mU_T}{R_s} IS\left(\frac{I_s R_s}{mU_T} exp(\frac{U_{ds}+I_s R_s}{mU_T})\right) - I_s - \frac{eIS\lambda L_s(1-R)A(\Delta\varepsilon)^r}{(L_s+L)\cdot hc}\right)\cdot U \quad (7)$$

Diod quvvatining kuchlanishga bog'liqligining tajriba natijalari [20] 4-rasmda keltirilgan. Nazariy jixatdan olingan (7) formula yordamida diod quvvatining turli yorug'lik intensivliklarida kuchlanishga bog'liqlik natijalari esa 5-rasmda keltirilgan. 4-5-rasmlardan ko'rinib turibdiki, 10 nW quvvatdan boshlab, 2D o'lchamli yarimo'tkazgichlar yorug'likni seza boshlaydi. Yorug'lik intensivligi ortgan sari fotovoltaik mexanizm kuzatiladi.

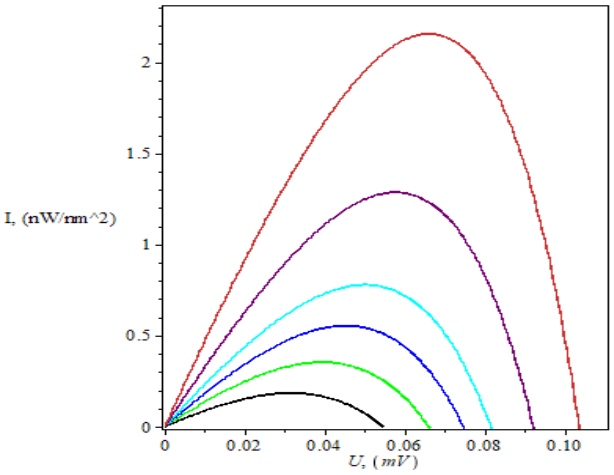
Xulosa qilib aytganda, 2D o'lchamdagi (BP/WSe_2/$MoTe_2$) materiallarda yorug'lik bilan ishlaydigan p-n-o'tishli diodlar uchun yorug'lik intensivligining ortib borishi bilan teskari tok o'zgarib borayotganini [20] tajriba natijalari bilan nazariy qilingan hisob-kitob natijalari sifat jixatdan mos tushishi ko'rsatib berildi va bu fotovoltaik mexanizmga mos kelishi, hosil bo'lgan fototok teskari tokni orttirishi ko'rsatib berildi. Maple dasturi asosida yorug'likning intensivligini kuchlanishga qanday bog'langanini va intensivlik va fototokni o'zgarishini ko'rib chiqdik. Intensivlikni oshirganimiz sari kuchlanishni keskin ortib borishini ko'rdik.

Intensivlik kamaysa umumiy tok ham kamayishini, intensivlik ortgani sari esa umumiy tok ham ortishini ko'rib chiqdik.

Bu esa kam energiya iste'moli bilan ishlaydigan yangi optoelektronik qurilmalarni ishlab chiqarishda asosiy omillardan biri bo'ladi.



4-rasm. P_{el} turli yorug'lik quvvatlarida U_{DS} ning funksiyasi sifatida [20]



5-rasm. P_{el} turli yorug'lik Intensivliklarida U_{DS}ning funksiyasi sifatida.

Salt yurish kuchlanishi va qisqa tutashuv tokini yorug'lik quvvati funksiyasi sifatida [20] ishda ko'rsatib berilgan (6-rasm).

(4) ifodani nolga tenglab, p-n-o'tish salt yurish kuchlanishi ifodasini keltirib chiqaramiz:

$$\frac{mU_T}{R_s} W\left(\frac{I_S R_S}{mU_T} exp\left(\frac{U_{xx}+I_S R_S}{mU_T}\right)\right) - I_s - \frac{eW\lambda L_S(1-R)A(\Delta\varepsilon)^r}{(L_S+L)\cdot hc} = 0, \quad (8)$$

(8) ifodada $L = \left(\frac{2\varepsilon\varepsilon_0}{e}\frac{n_n+p_p}{n_n p_p}\right)(\phi_0 + U_{xx}))^{\frac{1}{2}}$ – xajmiy zaryad qatlami kengligi, $L_s = \frac{D_e}{s}$, s- rekombinatsiya tezligi [21]. Bundan quyidagi transendent tenglamaga ega bo'lamiz:

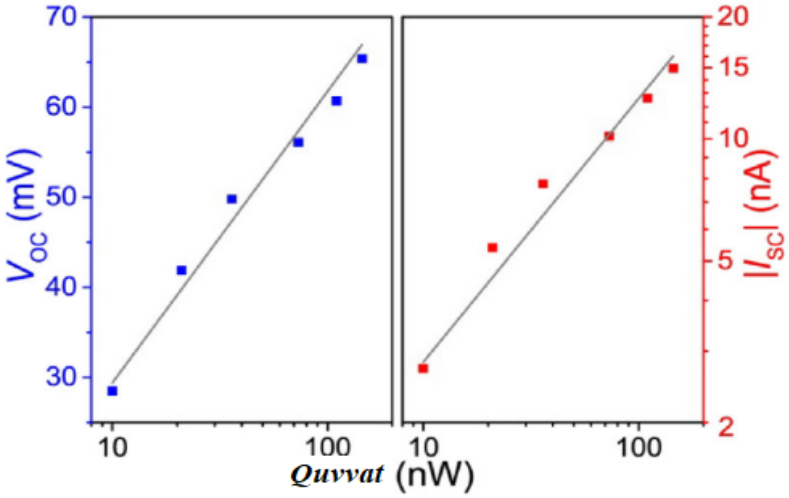
$$\frac{mU_T}{R_s} W\left(\frac{I_S R_S}{mU_T} exp\left(\frac{U_{xx}+I_S R_S}{mU_T}\right)\right) - I_s = \frac{eW\lambda L_S(1-R)A(\Delta\varepsilon)^r}{1+\left(\frac{2\varepsilon\varepsilon_0}{e}\frac{n_n+p_p}{n_n p_p}(\phi_0+U_{xx})\right)^{\frac{1}{2}}\frac{s}{D_e}}, \quad (9)$$

(9) ifodadagi $U_{xx} = 0$ bo'lgan*da* 2D o'lchamdagi p-n-o'tish uchun qisqa tutashuv tokiga ega bo'lamiz:

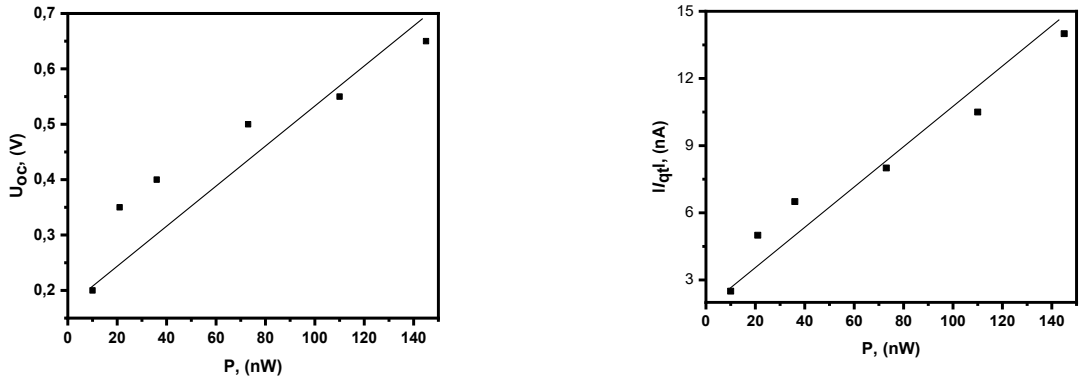
$$I_{qt} = \frac{mU_T}{R_s} W\left(\frac{I_S R_S}{mU_T} exp\left(\frac{I_S R_S}{mU_T}\right)\right) - I_s - \frac{eW\lambda L_S(1-R)A(\Delta\varepsilon)^r}{1+\left(\frac{2\varepsilon\varepsilon_0}{e}\frac{n_n+p_p}{n_n p_p}(\phi_0)\right)^{\frac{1}{2}}\frac{s}{D_e}}. \quad (10)$$

(9) va (10) ifodalardan foydalanib, salt yurish kuchlanishi va qisqa tutashuv tokini yorug'lik quvvatining funksiyasi sifatida tushuntirish mumkin.

6- va 7-rasmlardan ko'rish mumkinki, salt yurish kuchlanishi va qisqa tutashuv toki yorug'lik quvvatiga chiziqli bog'liq bo'ladi. 2D o'lchamdagi p-n-o'tish salt yurish kuchlanishi va qisqa tutashuv toki yorug'lik quvvatiga mos ravishda ortib boradi. Bu esa optoelektronik asboblarning ishlash prinsipini yaxshilashga imkon beradi.



6-rasm. Salt yurish kuchlanishi va qisqa tutashuv tokining quvvatga bog'liqligi [20].



7-rasm. Salt yurish kuchlanishi va qisqa tutashuv tokining quvvatga bog'liqligi

Xulosa

2D o'lchamdagi (BP/WSe2/MoTe2) materiallarda yorug'lik bilan ishlaydigan p-n-o'tishli diodlar uchun yorug'lik quvvatining ortib borishi bilan teskari tok o'zgarib borayotganini tajriba natijalari bilan nazariy qilingan hisob-kitob natijalari sifat jixatdan mos tushishi ko'rsatib berildi va bu fotovoltaik mexanizmga mos kelishi, hosil bo'lgan fototok teskari tokni orttishi bilan tushuntirildi.

Tasdiqlash

Ish FZ-20200929243 "Yarimo`tkazgichli quyosh fotoelementlar va nanostrukturalarning xarakteristikalaruga kuchli elektromagnit maydonda qizigan elektron va fononlarning ta`siri" fundamental tadqiqot grantlari asosida amalga oshirildi.

Annotatsiya. *Ushbu tadqiqotda D18 donor va Y6 akseptor polimeri asosidagi turli qalinliklarda tayyorlangan faol qatlamlarning optik va fotovoltaik xossalari tahlil qilindi. Yutilish, fotolyuminessensiya va tashqi kvant samaradorligi natijalari asosida D18:Y6 aralashmasining yorug'likni samarali yutishi hamda zaryad tashuvchilarni ajratish qobiliyati tadqiq qilingan. Tadqiqot natijalarimizda polimer quyosh elementlari uchun 90 nm qalinlikdagi faol qatlam eng optimal ekanligini va natijada D18:Y6 faol qatlamning yuqori samarali, barqaror va istiqbolli material ekanini ko'rsatdi.*

Kalit so'zlar: *D18 polimer, Y6 akseptor, faol qatlam qalinligi, optik xossalar, tashqi kvant samaradorligi.*

THE INFLUENCE OF ACTIVE LAYER THICKNESS ON THE EFFICIENCY OF POLYMER SOLAR CELLS

Abstract*. In this study, the optical and photovoltaic properties of active layers with different thicknesses, fabricated using D18 donor and Y6 acceptor polymers, were analyzed. Based on the results of absorption, photoluminescence, and external quantum efficiency, the efficient light absorption and charge carrier separation ability of the D18:Y6 blend were investigated. Our findings demonstrate that an active layer thickness of 90 nm is optimal for polymer solar cells, indicating that the D18:Y6 active layer is a highly efficient, stable, and promising material.*

Keywords: *D18 polymer, Y6 acceptor, active layer thickness, optical properties, external quantum efficiency.*

ВЛИЯНИЕ ТОЛЩИНЫ АКТИВНОГО СЛОЯ НА ЭФФЕКТИВНОСТЬ ПОЛИМЕРНЫХ СОЛНЕЧНЫХ ЭЛЕМЕНТОВ

Аннотация. *В данном исследовании были проанализированы оптические и фотоэлектрические свойства активных слоёв различной толщины, изготовленных на основе полимера-донора D18 и полимера-акцептора Y6. На основе результатов измерений поглощения, фотолюминесценции и внешней квантовой эффективности была исследована способность смеси D18:Y6 эффективно поглощать свет и разделять заряды. Полученные результаты показывают, что оптимальной толщиной активного слоя для полимерных солнечных элементов является 90 нм, а активный слой D18:Y6 представляет собой высокоэффективный, стабильный и перспективный материал.*

Ключевые слова: *D18 полимер, Y6 акцептор, толщина активного слоя, оптические свойства, внешняя квантовая эффективность.*

Kirish. So'nggi yillarda qayta tiklanuvchi energiya manbalariga bo'lgan talabning ortishi natijasida polimer quyosh element (PQE)lari fotovoltaik texnologiyalar orasida muhim o'rin egallashi olimlar tomonidan istiqbolli deb qaralmoqda. PQElarning asosiy afzalliklari past ishlab chiqarish xarajati, moslashuvchanlik, yengil konstruksiya hamda yarim shaffoflik imkoniyati an'anaviy kremniy asosidagi elementlarga nisbatan ko'plab sohalarda yetakchilik qilishi kutilmoqda[1, 2]. PQElarning umumiy samaradorligi esa asosan faol qatlam sifatida ishlatiladigan donor-akseptor aralashmalarning optik

va elektr xossalariga bog‘liqdir. An’anaviy fullerenga asoslangan akseptorlar o‘rnini yangi avlod fullerensiz akseptor materiallari egalladi[3]. Bu esa o‘z navbatida, yuqori samarali donor polimerlariga bo‘lgan ehtiyojni kuchaytirganini ko‘rishimiz mumkin. Shunday istiqbolli materiallardan biri bu - D18 donor polimeri hisoblanadi. D18-bu konjugatsiyalangan polimer bo‘lib, uning asosiy strukturasida benzodithiophene (BDT) bloklari va fluorlangan tirazol fragmentlari mavjud[4]. Ushbu tuzilma polimerning keng spektrda yorug‘lik yutish qobiliyatini yaxshilanishini ta’minlaydi[5]. D18 polimerining asosiy afzalliklari qilib quyidagilarni aytishimiz mumkin. D18 donor polimerning optik yutish diapazoni 500-800 nm oralig‘ida yorug‘likni samarali qamrab oladi. Ionlanish potensiali va HOMO darajasi D18 polimerining energiya darajalari Y6 kabi fullerensiz akseptorlar bilan yaxshi mos keladi[6], bu esa samarali zaryad ajralishini ta’minlaydi. Zaryad tashuvchanligi yuqori darajadagi kovak harakatchanlik tufayli yorug’lik ta’sirida hosil bo’lgan zaryadlarni tashish imkonini beradi. PQElarining samaradorligi donor va akseptor materiallar o‘rtasidagi energetik moslikka hamda ularning yorug‘likni yutish xususiyatiga bog‘liqdir[7]. Yuqori samaradorlikka erishish maqsadida ishlab chiqilgan D18 donor va Y6 akseptor polimerlari kombinatsiyasi hozirgi kunda eng istiqbolli tizimlardan biri sifatida tan olingan[8-12]. Fullerensiz akseptor Y6 yadro-qo‘shilgan elektron akseptor molekula bo‘lib, uning markazida planar π-konjugatsiyalangan tizim mavjud. Bunday tuzilma elektronlarning erkin harakatini kuchaytiradi va zaryad tashuvchanlikni yaxshilaydi. Y6 fullerensiz akseptor kichik taqiqlangan soha energiyasi, yuqori elektron tashuvchanlik hamda 600 nm to‘lqin uzunligi sohasidan katta bo’lgan sohalarda yutilish intensivligi bilan mashhur hisoblanadi. D18 polimeri ko‘pincha Y6 akseptor bilan juftlikda ishlatiladi[13]. Bu kombinatsiya quyosh spektrining keng qismini yutish va samarali elektron-holat mosligini ta’minlaydi. Natijada, laboratoriya sharoitida tayyorlangan D18:Y6 asosidagi PQElari yaxshi fotovoltaik samaradorlikka erishgan. Ushbu ikki polimerning o‘zaro uyg‘unligi natijasida D18:Y6 asosidagi faol qatlamlar yuqori zaryad ajralish samaradorligi va energiya o’zgarish samaradorligi (EO’S)ga ega bo’ladi. Tadqiqotlar shuni ko‘rsatadiki, faol qatlam qalinligi, tayyorlanish sharoitlari va issiqlik bilan ishlov berish bosqichlari optik yutilish, tashqi kvant samaradorligi (TKS) va fotovoltaik natijalarga sezilarli darajada ta’sir ko‘rsatadi[14-16]. Shuning uchun D18:Y6 asosidagi PQElarda optik xususiyatlar va fotovoltaik samaradorlik o‘zgarishlarini tahlil qilish ularning optimal parametrlarini aniqlash hamda kelgusida samaradorlikni oshirish yo‘llarini belgilashda muhim ilmiy asos yaratadi.

Tadqiqot usullari

Faol qatlamlarni tayyorlash uchun donor material sifatida D18 polimeri va akseptor sifatida Y6 qabul qilinib, ular 1:1 massa ulushi nisbatida aralashtirildi. Buning uchun D18 donor polimeri va Y6 akseptoridan har biridan 10 mg miqdorda olinib, 1 ml toluol erituvchisida eritildi. Hosil bo‘lgan aralashma xona temperaturasida magnitli aralashtirgich yordamida 6 soat davomida aralashtirilib, hajm bo‘ylab bir tekis konsentratsiyaga ega bo‘lgan gomogen eritma hosil qilindi.

Organik quyosh elementlarini (OQE) tayyorlash jarayoni bir necha ketma-ket bosqichlarda amalga oshirildi. Dastlab ITO (indiy-qalay oksidi) qoplangan shisha tagliklar sirtini ifloslikdardan tozalash maqsadida ketma-ket ravishda deionizatsiyalangan suv, atseton va etil spirtida ultratovushli vannada har biri 15 daqiqadan yuvildi. Tozalangan tagliklar azot (N_2) gazi oqimi yordamida quritildi.

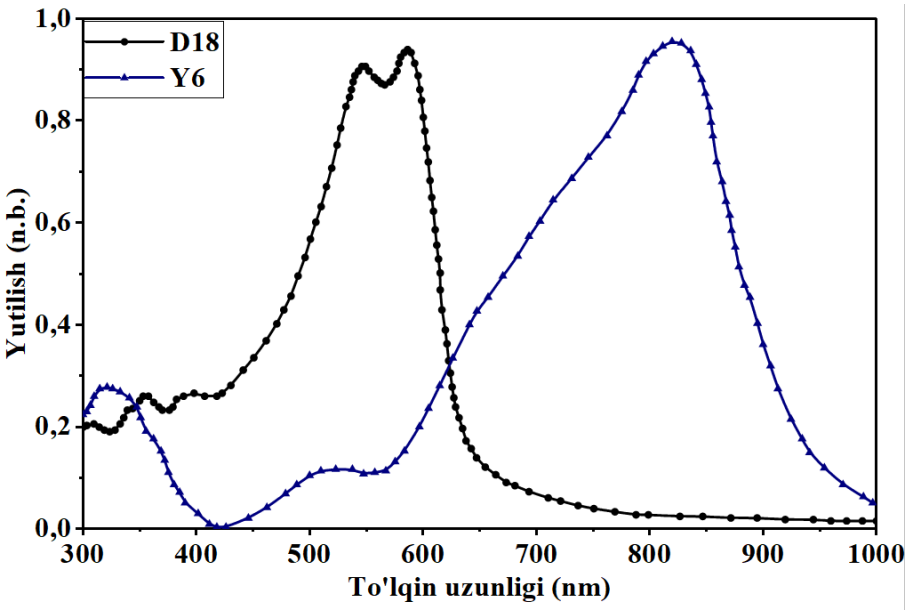
Keyingi bosqichda kovak tashuvchi qatlam sifatida PEDOT:PSS polimeri ITO qoplangan shisha tagliklar ustiga “spin coating” usuli yordamida yotqizildi. Bunda aylanish tezligi 4000 ayl/min bo‘lib, jarayon 20 soniya davomida amalga oshirildi va natijada taxminan 40 nm qalinlikdagi qatlam hosil qilindi. Hosil bo‘lgan shisha/ITO/PEDOT:PSS struktura 150 ℃ temperaturada 15 daqiqa davomida termik ishlov berildi. Termik ishlovdan so‘ng shisha/ITO/PEDOT:PSS qatlamlar oksidlanishni oldini olish maqsadida argon gazi bilan to‘ldirilgan qo‘lqopli (glovebox) muhitga ko‘chirildi va keyingi jarayonlar shu inert muhitda davom ettirildi. Shisha/ITO/PEDOT:PSS tagliklari ustiga faol qatlam sifatida D18:Y6 aralashmasidan iborat yupqa qatlamlar “spin coating” usuli yordamida 60 nm, 70 nm, 80 nm, 90 nm, 100 nm va 110 nm qalinliklarda yotqizildi[17].

Faol qatlam hosil qilingandan so‘ng elektron tashuvchi qatlam sifatida PDINO materiali “spin coating” usulida 3000 ayl/min tezlikda 25 soniya davomida qoplandi. PQElar tayyorlanishining yakuniy bosqichida yuqori elektrod sifatida alyuminiy (Al) katod vakuumli bug‘lantirish usuli yordamida yotqizildi. Metall elektrodning qalinligi 100 nm bo‘lib, bug‘lantirish jarayoni taxminan 2×10^{-4}Pa bosimga ega vakuum kamerada amalga oshirildi.

Natijada Shisha/ITO/PEDOT:PSS/D18:Y6/PDINO/Al tuzilishga ega bo‘lgan organik quyosh elementlari hosil qilindi.

Natijalar va muhokama

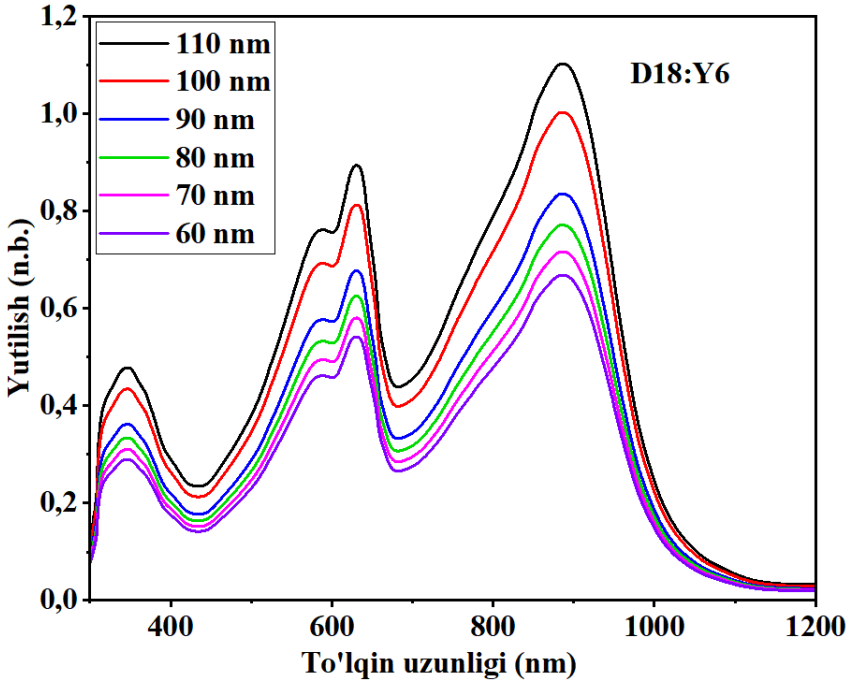
1-rasmda D18 donor va Y6 akseptor polimerlarning yutilish spektrlari keltirilgan. Ushbu polimer materiallar turli spektral sohalarda yorug‘likni yutadi, bu esa ularning organik (polimer) quyosh elementlarida bir-birini to‘ldiruvchi optik xossalarga ega ekanligini ko‘rsatadi. Grafikdan ko‘rinib turibdiki, D18 polimeri asosan ko‘rinadigan spektrning 450–620 nm oralig‘ida kuchli yutilish xususiyatini namoyon qildi. Ayniqsa, 520–600 nm atrofida yutilish maksimumi kuzatildi. Bu holat donor polimer zanjirlarida mavjud bo‘lgan π–π* elektron o‘tishlari bilan bog‘liq bo‘lib, konjugatsiyalangan polimer strukturasida elektronlarning yuqori energetik orbitalga o‘tishi natijasida yuzaga keladi. 600 nm dan keyin D18 ning yutilishi keskin kamayadi, bu esa donor materialning taqiqlangan soha kengligi bilan bog‘liq.



1-rasm. D18 donor va Y6 akseptor polimerlarning yutilish spektrlari

Y6 akseptor polimeri esa spektrning uzun to‘lqin uzunligi qismida (600–900 nm) kuchli yutilish ko‘rsatdi. Grafikdan ko‘rish mumkinki, Y6 ning asosiy yutilish maksimumi taxminan 800–830 nm atrofida joylashgan. Bu holat Y6 molekulasining kuchli intramolekulyar donor–akseptor (D–A) tuzilishi bilan bog‘liq bo‘lib, u intramolekulyar zaryad o‘tishi jarayonini kuchaytiradi. Natijada material pastroq energiyali (uzun to‘lqinli) fotonlarni ham samarali yuta oladi. Qisqa to‘lqinli sohada esa Y6 ning yutilishi ancha past bo‘lib, bu uning asosiy optik faol hududi yaqin infraqizil (NIR) sohada joylashganini ko‘rsatadi.

Ushbu grafikdan xulosa qiladigan bo’lsak, D18 va Y6 spektrlari bir-birini yaxshi to‘ldiradi. D18 polimeri ko‘rinadigan spektrning yashil-qizil sohasida fotonlarni yutsa, Y6 polimeri esa qizil va yaqin infraqizil sohada yutilishni ta’minlaydi. Natijada D18:Y6 donor–akseptor aralashmasi quyosh spektrining kengroq qismini qamrab oladi, bu esa organik quyosh elementlarida ko‘proq fotonlarni yutish va yuqori fototok hosil bo‘lishiga olib keladi.

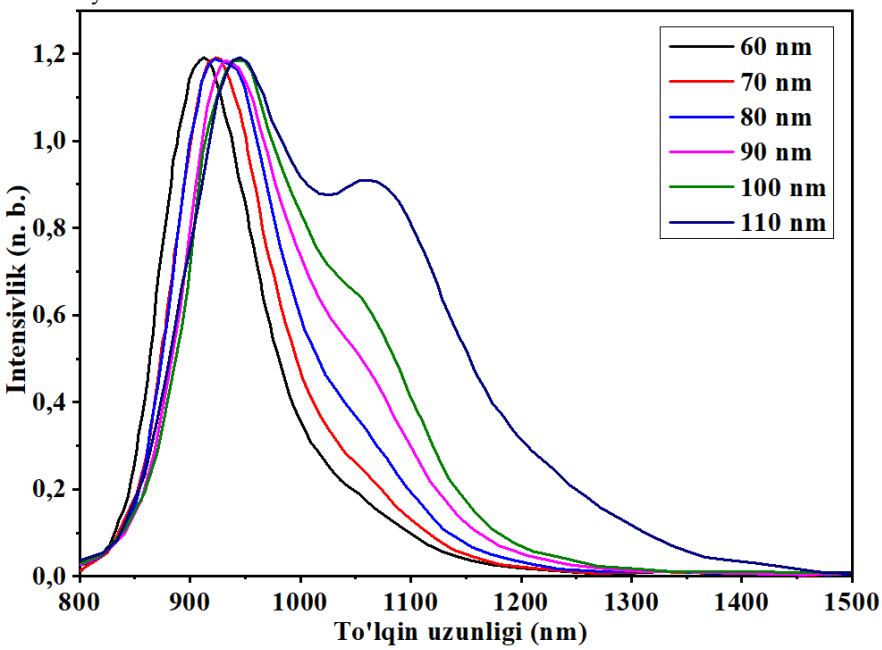


2-rasm. Turli qalinliklarda tayyorlangan D18:Y6 asosidagi faol qatlamlarning yutilish spektrlari

2-rasmda D18:Y6 donor–akseptor aralashmasi asosidagi polimer faol qatlamlarning turli qalinliklarda olingan optik yutilish spektrlari keltirilgan. Grafikdan ko‘rinib turibdiki, qatlam qalinligi 60 nm dan 110 nm gacha ortishi bilan yutilish intensivligi butun spektr bo‘ylab ortib boryapti. Bu holat polimer yupqa qatlamlarda qalinlik oshishi bilan material ichida yorug‘likning optik yo‘li uzayishi va natijada ko‘proq fotonlarning yutilishi bilan izohlanadi. Yutilish spektri grafigida 370-400 nm oralig’ida kuzatilgan kichik pik yuqori energiyali π-π* elektron o’tishlar bilan bog’liq bo’lib, u asosan polimer zanjiridagi aromatik fragmentlarning elektron tuzilishiga xosdir. 550–650 nm oralig‘ida kuzatiladigan yutilish maksimumi asosan D18 donor polimerining konjugatsiyalangan zanjirlaridagi π–π* elektron o‘tishlari bilan bog‘liq. Ushbu sohada

polimerning konjugatsiya darajasi va molekulyar tartiblanishi muhim rol o‘ynaydi. Spektrning uzun to‘lqinli qismida, ya’ni 800–900 nm atrofida kuzatiladigan kuchli maksimum esa asosan Y6 akseptor molekulasining intramolekulyar zaryad o‘tishi bilan bog‘liq. Y6 molekulasi donor–akseptor tipidagi kuchli konjugatsiyalangan tuzilishga ega bo‘lgani sababli u past energiyali fotonlarni, ya’ni qizil va yaqin infraqizil sohadagi nurlarni samarali yuta oladi. Natijada D18:Y6 aralashmasi quyosh spektrining kengroq qismida yutilishni ta’minlaydi.

Grafikdan yana ko‘rinadiki, qatlam qalinligi ortgan sari barcha spektral maksimumlarning intensivligi oshadi, biroq ularning joylashuvi deyarli o‘zgarmaydi. Bu holat qalinlikning asosan optik yutilish miqdoriga ta’sir qilishini, ammo materialning elektron energetik tuzilishini o‘zgartirmasligini ko‘rsatadi. Eng katta yutilish 110 nm qalinlikdagi faol qatlamda kuzatilgan bo‘lib, bu qatlamda yorug‘likning yutilish ehtimoli yuqoriroq ekanligini bildiradi. Biroq juda qalin faol qatlamlar tashuvchi zarralarning diffuziya uzunligi va tashilish samaradorligi kamayishiga olib keladi. Shu sababli PQElar samaradorligi uchun optimal qalinlik 90-100 nm atrofida bo’lishi maqsadga muvofiqdir. D18:Y6 aralashmasining keng spektral qamrovi va qalinlikka bog’liq holda yutilishning oshishi ushbu materialni YSH-OQElari uchun istiqbolli faol qatlam qatorida ekanligini tavsiflaydi.



3-rasm. Turli qalinliklarda tayyorlangan D18:Y6 asosidagi faol qatlamlarning FL spektrlari

3-rasmda turli qalinliklarda tayyorlangan D18:Y6 asosidagi faol qatlamlarning fotolyuminessensiya (FL) spektrlari keltirilgan. Grafikdan ko‘rinib turibdiki, barcha faol qatlamlar uchun FL spektrining maksimum piklari taxminan 920–960 nm oralig‘ida joylashgan. Bu hodisa polimer materiallarda elektronlarning qo‘zg‘algan holatdan asosiy holatga qaytishi jarayonida foton chiqishi bilan bog‘liq. Polimerlarda molekulyar zanjirlarning π-elektron tizimi mavjud bo‘lib, yorug‘lik yutilgandan so‘ng elektronlar yuqori energiyali holatga o‘tadi va keyinchalik radiatsion rekombinatsiya natijasida lyuminessensiya hosil qiladi. Faol qatlam qalinligi ortib borgani sari spektr shaklining sezilarli darajada o‘zgarishi kuzatildi. Xususan, 60–70 nm qalinlikdagi faol qatlamlarda FL spektri nisbatan tor va asosiy maksimum qisqaroq to‘lqin uzunliklarida joylashgan. Bu holat yupqa qatlamlarda optik yo‘l uzunligi kichik bo’lishi va interferensiya effektlarining nisbatan kamroq namoyon bo’lishi bilan tushuntiriladi. Qatlam qalinligi 80–110 nm gacha oshirilganda esa spektrning uzun to‘lqinli qismida, ya’ni 1000–1100 nm atrofida qo‘shimcha “shoulder” (yelkacha) paydo bo‘la boshlaydi va asta-sekin kuchayadi. Bu hodisa polimer materiallarda zanjirlararo o‘zaro ta’sir kuchayishi, eksitonlarning delokalizatsiyasi hamda PQElar ichidagi optik interferensiya va qayta yutilish jarayonlari bilan bog‘liq bo‘lishi mumkin. Shuningdek, qalin qatlamlarda FL spektrining uzun to‘lqinli qismi ancha cho‘zilganini ko‘rish mumkin. Bu polimer tizimlarida ko‘pincha molekulyar agregatsiya va zanjirlararo o‘zaro ta’sirlarning kuchayishi bilan izohlanadi. Qalinlik oshishi bilan polimer zanjirlari orasidagi masofa kamayib, ular orasida elektron to‘lqin funksiyalarining qisman qoplanishi sodir bo‘ladi va natijada energiyasi pastroq bo‘lgan radiatsion o’tishlar yuzaga keladi. Shu sababli spektrning qizil tomonga kengayishi va siljishi kuzatiladi.

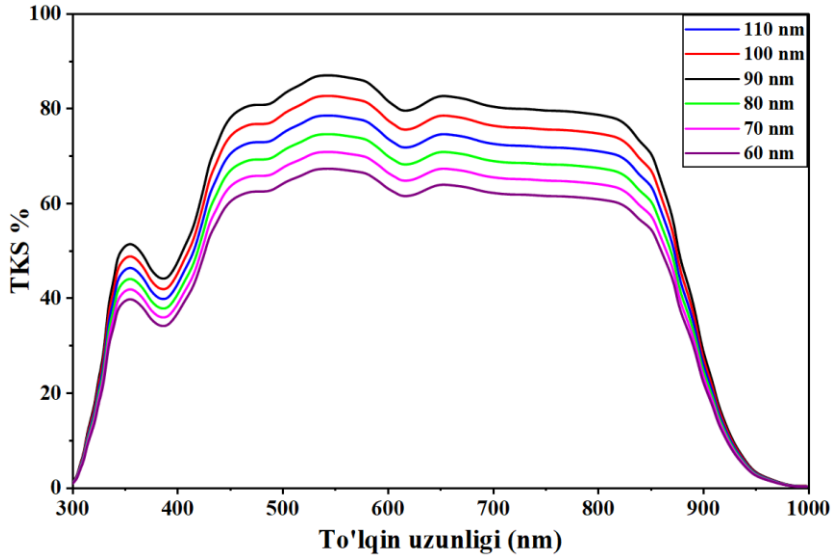
Umuman olganda, grafik polimer asosidagi faol qatlamlarda aktiv qatlam qalinligi optik va elektron jarayonlarga sezilarli ta’sir ko‘rsatishini namoyish etadi. Yupqa qatlamlarda FL intensivligi asosan birlamchi eksiton rekombinatsiyasi bilan belgilanadi, qalin qatlamlarda esa interferensiya, zanjirlararo o‘zaro ta’sir, agregatsiya va qayta yutilish kabi qo‘shimcha jarayonlar spektr shaklini sezilarli darajada o‘zgartiradi. Natijada FL spektrining intensivligi, kengligi va maksimum holati faol qatlam qalinligiga bog‘liq ravishda o’zgaradi.

Bu FL spektr grafiklarida qalinligi 90 nm bo'lgan faol qatlam eng yuqori FL intensivligi va spektral barqarorlikni ko'rsatdi. Bu esa 90 nm qalinlikda eksitonlarning samarali ajralishi va eksiton diffuziyasi uchun optimal sharoit shakllanishini ko'rsatadi. Aksincha, qalin faol qatlamlarda 100-110 nm fotolyuminessensiya intensivligining sezilarli susayishi eksitonlarning yo'qotilishi ortganini bildiradi. Shu bois, D18:Y6 faol qatlam uchun taxminan 90 nm qalinlik optimal hisoblanib, yuqori samarali foton-yutilish va zaryad tashuvchi dinamikasini ta'minlash mumkinligini ko'rsatadi.

1-Jadval. Turli qalinliklarda tayyorlangan D18:Y6 asosidagi OQElarning fotovoltaik parametrlari.

Qalinligi (nm)	V_{oc} (V)	J_{sc} (mA/sm²)	FF (%)	EO'S
60	0,84	23,48	71,8	14,2
70	0,84	23,58	72,3	14,3
80	0,84	24,21	73.4	15.1
90	0,85	25,87	75,8	16,7
100	0,84	23,65	70,3	14.1
110	0,84	23,12	68,9	13,4

1-jadvalda turli qalinliklarda tayyorlangan D18:Y6 asosidagi OQElarning fotovoltaik parametrlari keltirilgan. Jadvaldan ko'rinib turibdiki, ochiq zanjir kuchlanishi (V_{OC}) qiymati barcha qalinliklarda deyarli o'zgarmas bo'lib, 0,84–0,85 V oralig'ida saqlanib qolgan. Bu holat V_{OC} asosan donor va akseptor polimer materiallarning energiya darajalari, ya'ni HOMO va LUMO energetik sathlari bilan bog'liq. Qatlam qalinligi o'zgarishi ushbu energetik darajalarga sezilarli ta'sir ko'rsatmagani sababli V_{OC} qiymati deyarli bir xil saqlanadi. Bunday hodisa polimer asosidagi organik quyosh elementlari uchun xos hisoblanadi[18]. Qisqa tutashuv toki zichligi (J_{SC}) esa qalinlik 90 nm ga yetganda maksimal 25,87 mA/cm² gacha oshdi, keyin esa qalinlik optimaldan oshishi bilan kamaydi. Bu polimer qatlamining optik yutilishi va eksitonlar hosil bo'lishi bilan bog'liq, qalinroq qatlam ko'proq yorug'likni yutadi, lekin ortiqcha qalinlik eksitonlarning rekombinatsiyasiga sabab bo'ladi. Shu bilan bir qatorda to'ldirish faktori (FF) qiymati 60 nm qalinlikda tayyorlangan faol qatlamda 71,8 % bo'lsa, 90 nm qalinlikda 75.8 % ga yetdi, lekin qalinlikni 100nm va 110 nm ga oshirganimizda FF qiymati pasayib ketdi. Bu holat faol qatlamning morfologik tuzilishi va zaryad tashuvchilarning harakatchanligi bilan bog'liq. Optimal qalinlikdagi qatlamlarda donor va akseptor fazalarining o'zaro taqsimlanishi yaxshilanishi hamda zaryad tashuvchilarning rekombinatsiya ehtimoli kamayishi mumkin. Natijada ichki qarshilik kamayib, OQElarning volt-amper xarakteristikasi yaxshilanadi va FF qiymati ortadi. Jadvaldan ko'rish mumkinki, eng yuqori EO'S qiymati 90 nm qalinlikda tayyorlangan OQElarda (16.7 %) kuzatildi. Buning sababi shundaki, juda yupqa qatlamlarda yorug'lik yetarli darajada yutilmaydi va eksitonlar kam hosil bo'ladi. Juda qalin qatlamlarda esa zaryad tashuvchilarning harakat yo'li uzayadi, natijada rekombinatsiya ehtimoli ortadi va zaryadlar elektrodga yetib bormasdan yo'qolishi mumkin. Shu sababli faol qatlam qalinligi uchun ma'lum bir optimal qiymat mavjud bo'lib, bu holatda yorug'lik yutilishi va zaryad tashuvchilar harakati o'rtasida muvozanat yuzaga keladi. Umuman olganda, jadval natijalari faol qatlam qalinligi OQElarning fotovoltaik xususiyatlariga sezilarli ta'sir ko'rsatishini ko'rsatadi. Qalinlik oshishi bilan yorug'lik yutilishi va fototok ortadi, biroq juda katta qalinliklarda zaryad tashuvchilarning rekombinatsiyasi kuchayishi mumkin. Shu sababli faol qatlam qalinligi 90 nm atrofida bo'lishi optimal bo'lib, bu holatda OQElarning EO'S qiymati maksimal natijaga erishdi.



4-rasm. Turli qalinliklarda tayyorlangan D18:Y6 asosidagi OQElarning TKS spektrlari.

4-rasmda turli qalinliklarda tayyorlangan D18:Y6 asosidagi OQElarning TKS spektrlari keltirilgan. Grafikka qaraydigan bo'lsak, 60-70 nm qalinlikda tayyorlangan faol qatlamlarda yorug'lik yetarli darajada yutilmaganligi hisobiga kamroq eksitonlar hosil bo'ladi va zaryad tashuvchilar generatsiyasi nisbatan past bo'ladi. Shu sababli ushbu qalinliklarda TKS qiymati ham pastroq natija ko'rsatdi. Qatlam qalinligi 80–90 nm ga yetganda TKS qiymati maksimal darajada ko'tarildi. Bu holat faol qatlam tomonidan yorug'lik yutilishi sezilarli darajada ortganligi hisobiga ko'proq eksitonlar hosil bo'lishi va donor–akseptor interfeysida ularning samarali dissotsiatsiyalanishi bilan izohlanadi. Biroq faol qatlam qalinligi 100–110 nm ga yetganda TKS qiymatining kamayishi kuzatildi. Bu holat qalin qatlamlarda zaryad tashuvchilarning elektrodgacha bo'lgan harakat masofasi ortishi bilan izohlanadi. Harakat yo'li uzaygani sari zaryad tashuvchilarning rekombinatsiya ehtimoli ortadi, ya'ni elektron va kovaklar elektrodga yetib bormasdan o'zaro qayta birikishi mumkin. Natijada hosil bo'lgan barcha zaryad tashuvchilar samarali ravishda tokka aylanmaydi va kvant samaradorligi pasayadi.

Natijalardan D18:Y6 asosidagi faol qatlamlar uchun 90 nm qalinlik optimal ekanligini va bu qalinlikda yorug'lik yutilishi yetarlicha katta bo'lib, shu bilan birga zaryad tashuvchilarning harakat yo'li ham uzun emas. Natijada eksiton generatsiyasi va zaryad tashuvchilar yig'ilishi o'rtasida optimal muvozanat yuzaga keladi va TKS maksimal qiymatga erishadi deya xulosa qilamiz.

Xulosa. Xulosa qilib aytadigan bo'lsak, olib borilgan tadqiqotlar natijasida D18 donor polimeri va Y6 akseptori asosidagi organik quyosh elementlarida faol qatlam qalinligi PQElarning optik va fotovoltaik parametrlariga sezilarli ta'sir ko'rsatishi aniqlandi. Tadqiqotlar davomida faol qatlam qalinligi o'zgartirilib tahlil qilindi va PQElar uchun optimal qalinlik 90 nm atrofida ekanligi aniqlandi. Shu tariqa, D18:Y6 asosidagi PQElarda faol qatlam qalinligini optimallashtirish PQElarning samaradorligini oshirishda muhim ahamiyatga ega ekanligi ko'rsatildi.

Minnatdorchilik. Ushbu maqoladagi olingan natijalar Oliy ta'lim, fan va innovatsiyalar vazirligi tomonidan moliyalashtirilgan Ф-ФА-2021-509-raqamli — "Noorganik (Ti, W, WO_x, TiO_2, Si, SiO_2) va organik (polimerlar) materiallarni metall ionlari bilan implantasiyalaganda va aktiv organik birikmalar molekulalari bilan adsorbsiyalaganda yuzasida ko'pkomponentli nanostrukturalarning shakllanish mexanizmlari" mavzusidagi fundamental loyiha doirasida bajarilgan.

BUZILADIGAN PARABOLIK TENGLAMA UCHUN BOSHLANG'ICH-CHEGARAVIY MASALA

N.T. Xoshimova
Namangan davlat universiteti talabasi
E-mail: nozimaxoshimova2005@gmail.com

Annotatsiya: *Ushbu maqolada buziladigan parabolik tenglama uchun boshlang'ich-chegaraviy masala qaralgan. Tenglamaning o'ziga xos xususiyati shundaki, fazoviy ikkinchi tartibli hosila oldidagi koeffitsiyent vaqt o'zgaruvchisining biror darajasi ko'rinishida bo'lib, vaqt nolga intilganda bu koeffitsiyent nolga aylanadi. Shu sababli tenglama vaqtning boshlang'ich momentida o'zining parabolik xususiyatini yo'qotadi, ya'ni buziladi. Furye usuli yordamida berilgan chekli sohada klassik yechimning mavjudligi isbotlangan. Yechimning yagonaligi va undan kelib chiqadigan ayrim funksiyalarning yopiq sohada uzluksizligi ham ko'rsatilgan.*

Kalit so'zlar: *boshlang'ich-chegaraviy masala, spektral masala, Furye usuli, qator.*

INITIAL-BOUNDARY VALUE PROBLEM FOR A DEGENERATE PARABOLIC EQUATION

Abstract: *This paper considers an initial-boundary value problem for a degenerate parabolic equation. The distinctive feature of the equation is that the coefficient of the second-order spatial derivative is a power of the time variable, and this coefficient vanishes when time approaches zero. Therefore, the equation loses its parabolic property at the initial moment of time, i.e., it degenerates. Using the Fourier method, the existence of a classical solution in a given finite domain is proved. The uniqueness of the solution and the continuity of certain related functions in the closed domain are also established.*

Keywords*: initial-boundary problem, spectral problem, Fourier method, series.*

КРАЕВАЯ ЗАДАЧА ДЛЯ ВЫРОЖДАЮЩЕГОСЯ ПАРАБОЛИЧЕСКОГО УРАВНЕНИЯ

Аннотация: *В данной статье рассматривается начально-краевая задача для вырождающегося параболического уравнения. Отличительной особенностью уравнения является то, что коэффициент при второй пространственной производной представляет собой степень временной переменной, и этот коэффициент обращается в ноль при стремлении времени к нулю. Вследствие этого уравнение теряет свои параболические свойства в начальный момент времени, то есть вырождается. С помощью метода Фурье доказано существование классического решения в заданной конечной области. Также установлены единственность решения и непрерывность некоторых связанных с ним функций в замкнутой области.*

Ключевые слова: *Начально-краевая задача, спектральная задача, метод Фурье, ряды.*

Biz berilgan $D = \{(x,t): 0 < x < l, 0 < t < T\}$ sohada bir jinsli

$$u_t = t^{\beta} u_{xx}, \qquad (1)$$

o'zgaruvchan koeffitsiyentli issiqlik tarqalish tenglamasining

$$u|_{t=0} = \varphi(x), \quad 0 \le x \le l, \qquad (2)$$

boshlang'ich va

$$u|_{x=0} = 0, \quad u|_{x=l} = 0, \quad t \in [0,T] \qquad (3)$$

chegaraviy shartlarni qanoatlantiruvchi $u(x,t)$ yechimini topish masalasini ko'ramiz.

Bu masalaning $u(x,t)$ yechimini $C_{x,l}^{2,1}(D) \cap C(\overline{D})$ funksiyalar sinfidan izlaymiz.

Buning uchun (1) tenglamaning D sohada noldan farqli va bir jinsli (3) chegaraviy shartlarni qanoatlantiruvchi xususiy yechimlarini

$$u(x,t) = X(x) \cdot T(t) \neq 0 \qquad (4)$$

ko'rinishda izlaymiz.

(4) ifodani (1) tenglamaga qo'yib, uning o'zgaruvchilarini ajratsak, ushbu

$$T'(t) \cdot X(x) = t^{\beta} \cdot T(t) \cdot X''(x)$$

yoki

$$\frac{T'(t)}{t^{\beta} \cdot T(t)} = \frac{X''(x)}{X(x)} = -\lambda \qquad (5)$$

tenglikka ega bo‘lamiz. Bu tenglikning chap tomoni faqat t o‘zgaruvchiga, o‘ng tomoni esa faqat x o‘zgaruvchiga bog‘liq. Shuning uchun (5) tenglik, ikki tomoni ham bitta o‘zgarmas $-\lambda$ songa teng bo‘lgandagina o‘rinli bo‘ladi. U holda (5) ifodadan quyidagi

$$T'(t) + t^{\beta} \cdot \lambda \cdot T(t) = 0, \quad 0 < t < T, \tag{6}$$

$$X''(x) + \lambda \cdot X(x) = 0, \quad 0 < x < l, \tag{7}$$

oddiy differensial tenglamalarga ega bo‘lamiz.

Berilgan issiqlik tenglamasining noldan farqli (4) ko‘rinishdagi $u(x,t)$ yechimini topish uchun (7) oddiy differensial tenglamaning quyidagi

$$X(0) = 0, \ \ X(l) = 0 \tag{8}$$

shartlarni qanoatlantiruvchi $X(x)$ yechimini topish zarur.

Shunday qilib, noma’lum $X(x)$ funksiyani topish uchun quyidagi

$$X''(x) + \lambda \cdot X(x) = 0, \ \ X(0) = 0, \ \ X(l) = 0 \tag{9}$$

masalaga ega bo‘ldik. Bunday masala matematik fizikada spektral masala yoki Shturm-Liuvill masalasi deyiladi. Bu masala [1-5] adabiyotlarda batafsil o‘rganilgan.

Shturm-Liuvill masalasining noldan farqli yechimini ta’minlagan λ parametrning qiymatlari spektral masalaning xos qiymatlari, unga mos yechimlar esa xos funksiyalar deb ataladi. (9) masalaning xos qiymatlari to‘plami shu masalaning spektri deyiladi.

Endi qaralayotgan spektral masalaning xos qiymatlarini va ularga mos xos funksiyalarini topaylik.

Buning uchun uchta $\lambda < 0, \lambda = 0, \lambda > 0$ hollarni alohida-alohida qarab chiqamiz.

1) Faraz qilaylik, $\lambda < 0$ bo‘lsin. U holda (7) tenglamaning umumiy yechimi

$$X(x) = C_1 e^{\sqrt{-\lambda}x} + C_2 e^{-\sqrt{-\lambda}x}$$

ko‘rinishda bo‘ladi. Bu yerda C_1 va C_2 – ixtiyoriy o‘zgarmas sonlar. Shu yechimni (8) bir jinsli chegaraviy shartlarga qo‘ysak, C_1 va C_2o‘zgarmaslarni topish uchun quyidagi

$$\begin{cases} X(0) = C_1 + C_2 = 0 \\ X(l) = C_1 e^{\sqrt{-\lambda}l} + C_2 e^{-\sqrt{-\lambda}l} = 0 \end{cases}$$

tenglamalar sistemasiga ega bo‘lamiz.

Bu sistemaning asosiy determinanti noldan farqli va u yagona trivial yechimga ega, ya’ni $C_1 = 0, C_2 = 0$.

Demak, bu holda $X(x) \equiv 0$ bo‘ladi va bu yechim masala shartini qanoatlantirmaydi.

2) Endi $\lambda = 0$ bo‘lsin. U holda (7) tenglamaning umumiy yechimi

$$X(x) = C_1 + C_2 x$$

va (8) shartlarga asosan $C_1 = 0, C_2 = 0$ bo‘ladi, demak, $X(x) \equiv 0$, bu yechim ham masala shartini qanoatlantirmaydi.

3) Faraz qilaylik, $\lambda > 0$ bo‘lsin. U holda (7) tenglamaning umumiy yechimi

$$X(x) = C_1 \cos\sqrt{\lambda}\, x + C_2 \sin\sqrt{\lambda}\, x$$

ko‘rinishda bo‘ladi. Oxirgi ifodani (8) chegaraviy shartlarga qo‘ysak,

$$\begin{cases} X(0) = C_1 + C_2 \cdot 0 = 0 \\ X(l) = C_1 \cos\sqrt{\lambda}\, l + C_2 \sin\sqrt{\lambda}\, l = 0 \end{cases}$$

sistemaga ega bo‘lamiz. Bundan $C_1 = 0$, $C_2 \sin\sqrt{\lambda}\, l = 0$ ekanligi kelib chiqadi.

Endi $C_2 \neq 0$ deb olamiz, aks holda yana $X(x) \equiv 0$ bo‘ladi. Shuning uchun $\sin\sqrt{\lambda}\, l = 0$, bundan esa $\sqrt{\lambda} l = \pi k$, $k \in Z$ kelib chiqadi.

Shunday qilib, (9) masalaning noldan farqli yechimi faqatgina

$$\lambda_k = \left(\frac{\pi k}{l}\right)^2, \quad (k = 1,2,3,\dots)$$

qiymatlarda mavjud va bu qiymatlar qaralayotgan masalaning xos qiymatlari deyiladi. $C_2 = 1$ desak, bu qiymatlarga mos xos funksiyalar

$$X_k(x) = \sin\frac{\pi k}{l} x$$

ko‘rinishida bo‘ladi.

λ parametrning $\lambda = \lambda_k$ qiymatlariga mos (6) tenglamaning

$$T_k(t) = a_k \cdot e^{-\left(\frac{\pi k}{l}\right)^2 \cdot \frac{t^{\beta}}{\beta+1}} \tag{10}$$

yechimlari mos keladi, a_k – ixtiyoriy o‘zgarmas sonlar.

Shunday qilib, quyidagi barcha funksiyalar

$$u_k(x,t) = T_k(t) \cdot X_k(x) = a_k \cdot e^{-\left(\frac{\pi k}{l}\right)^2 \cdot \frac{t^{\beta}}{\beta+1}} \cdot \sin\frac{\pi k}{l} x \tag{11}$$

qaralayotgan (1) tenglamani va (2) chegaraviy shartlarni qanoatlantiradi. Bu funksiyalardan ushbu

$u(x,t)=\sum_{k=1}^{\infty}a_k\cdot e^{-\left(\frac{\pi k}{l}\right)^2\cdot\frac{t^\beta}{\beta+1}}\cdot sin\frac{\pi k}{l}x$ (12) qatorni tuzamiz.

Endi (12) qatorni (2) boshlang'ich shartni qanoatlantirishini talab qilib,

$$u(x,0)=\varphi(x)=\sum_{k=1}^{\infty}a_k\,sin\frac{\pi k}{l}x \qquad (13)$$

ifodani olamiz. Hosil qilingan bu (13) ifoda $\varphi(x)$ funksiyaning $(0,l)$ oraliqda sinuslar bo'yicha Furye qatoriga yoyilmasi bo'lib, uning a_k koeffitsiyentlari

$$a_k=\frac{2}{l}\int_0^l\varphi(x)\,sin\frac{\pi kx}{l}dx \qquad (14)$$ formula bilan aniqlanadi.

Shunday qilib, bir jinsli o'zgaruvchan koeffitsiyentli issiqlik tarqalish tenglamasining yechimi (12) qator ko'rinishida bo'lib, undagi a_k koeffitsiyenti (14) formula bilan aniqlanadi.

Teorema. *Agar $\beta>0$ bo'lib, berilgan $\varphi(x)\in C^3[0,l]$ funksiya quyidagi*

$$\varphi(0)=\varphi(l)=0,\quad \varphi''(0)=\varphi''(l)=0 \qquad (15)$$

shartlarni qanoatlantirsa, u holda (1)-(3) masalani $C^{2,1}_{x,l}(D)\cap C(\overline{D})$ sinfda aniqlangan $u(x,t)$ yechimi mavjud bo'lib va $t^\beta u_{xx}\in C(\overline{D})$o'rinli bo'ladi.

Isboti. Teoremani isbotlash uchun avval (14) formula bilan aniqlangan integralni uch marta bo'laklab integrallaymiz. (15) tengliklarga asosan

$$a_k=-\frac{2}{l}\left(\frac{l}{\pi k}\right)^3\int_0^l\varphi'''(x)\cos\frac{\pi k}{l}xdx=-\left(\frac{l}{\pi}\right)^3\frac{p_k}{k^3} \qquad (16)$$

ifodani olamiz. Bu yerda

$$p_k=\frac{2}{l}\int_0^l\varphi'''(x)\cos\frac{\pi k}{l}xdx$$

Boshlang'ich shartlarga ko'ra $\varphi'''(x)$ funksiya $[0,l]$ segmentda uzluksiz, u holda matematik analiz kursidan ma'lum bo'lgan Bessel tengsizligiga ko'ra ushbu qator

$$\sum_{k=1}^{\infty}p_k^2\le\frac{2}{l}\int_0^l[\varphi'''(x)]^2dx \qquad (17)$$

yaqinlashuvchi qator bo'ladi.

Endi (16) ifodani (12) qatorga qo'yib, quyidagi

$$u(x,t)=-\left(\frac{l}{\pi}\right)^3\sum_{k=1}^{\infty}\frac{p_k}{k^3}e^{-\left(\frac{\pi k}{l}\right)^2\cdot\frac{t^{\beta+1}}{\beta+1}}sin\frac{\pi k}{l}x \qquad (18)$$

qatorni olamiz.

Hosil bo'lgan (18) qatorning har bir hadi yopiq $\overline{D}$ sohaning $\forall(x,t)$ nuqtasida ushbu yaqinlashuvchi

$$\left(\frac{l}{\pi}\right)^3\sum_{k=1}^{\infty}\frac{1}{k^3}\cdot|p_k|$$

sonli qatorning hadlari bilan chegaralangan. U holda Veyershtrass alomatiga ko'ra (12) qator yopiq $\overline{D}$ sohada absolyut va tekis yaqinlashadi. Demak, $u(x,t)$ funksiya yopiq $\overline{D}$ sohada yaqinlashuvchi qatorning yig'indisi sifatida uzluksiz bo'ladi. Endi (12) qatorni x va t o'zgaruvchilar bo'yicha hadma-had differensiallash mumkin ekanligini ko'rsatamiz. Buning uchun (12) qatorni hadma-had differensiallashdan hosil bo'lgan qatorlarning yopiq $\overline{D}$ sohada absolyut va tekis yaqinlashishini isbotlaymiz. (18) qatorni hadma-had differensiallab, ushbu

$$u_t(x,t)=\frac{l}{\pi}\sum_{k=1}^{\infty}\frac{1}{k}p_kt^\beta e^{-\left(\frac{\pi k}{l}\right)^2\frac{t^{\beta+1}}{\beta+1}}sin\frac{\pi k}{l}x \qquad (19)$$

$$u_{xx}(x,t)=\frac{l}{\pi}\sum_{k=1}^{\infty}\frac{1}{k}p_ke^{-\left(\frac{\pi k}{l}\right)^2\frac{t^{\beta+1}}{\beta+1}}sin\frac{\pi k}{l}x \qquad (20)$$

$$t^\beta u_{xx}(x,t)=\frac{l}{\pi}\sum_{k=1}^{\infty}\frac{1}{k}p_kt^\beta e^{-\left(\frac{\pi k}{l}\right)^2\frac{t^{\beta+1}}{\beta+1}}sin\frac{\pi k}{l}x \qquad (21)$$

qatorlarga ega bo'lamiz. Bu qatorlar $\forall(x,t)\in\overline{D}$ sohada

$$\frac{l}{\pi}\sum_{k=1}^{\infty}\frac{1}{k}|p_k| \qquad (22)$$

qatorga majorant bo'ladi. Oxirgi (22) qatorning yaqinlashuvchi bo'lishi (17) qatorlarning yaqinlashishidan va quyidagi

$$\frac{1}{k}|p_k|\le\frac{1}{2}\left(\frac{1}{k^2}+p_k^2\right)$$

tengsizliklardan kelib chiqadi. U holda (20)-(22) qatorlar Veyershtass alomatiga asosan yopiq $\overline{D}$ sohada absolyut va tekis yaqinlashuvi bo'ladi. Demak, $u_t(x,t)$, $u_{xx}(x,t)$ va $t^\beta u_{xx}(x,t)$ funksiyalar yopiq $\overline{D}$ sohada uzluksiz ekan. Endi (19) va (20) qatorlarni (1) tenglamaga qo'ysak, (12) formula bilan aniqlangan $u(x,t)$ funksiya issiqlik tarqalish tenglamasini qanoatlantirishiga ishonch hosil qilish mumkin. Shunday qilib, teorema isbot bo'ldi.

APPLICATION OF METHODS FOR DETERMINING THE COEFFICIENT OF INTERNAL FRICTION OF LIQUIDS IN PHARMACEUTICAL PREPARATIONS

Annotation: *The Poiseuille formula is suitable for laminar liquid flow and is used to determine the dynamic viscosity of liquids. Various viscometers are widely used in this method, including capillary viscometers, rotational viscometers, and the VK-4 viscometer. Determining the dynamic viscosity of liquids plays an important role in the qualitative analysis of liquid pharmaceuticals. This article analyzes methods for determining the dynamic viscosity of liquids.*

Keywords: *liquid, viscosity, velocity gradient, internal friction, Reynolds number, laminar flow, turbulent flow.*

Kirish

Suuyuqliklarda ichki ishqalanish tezlik gradienti, ishqalanayotgan qatlamlarning yuzasi va dinamik qovushqoqlikka to'gri proporsional. Suyuqlikning bu xususiyati qattiq jismlardagi ishqalanishdan farq qiladi, chunki qattiq jismlarda ichki ishqalanish yuzaga bog'liq emas. Puazeyl formulasi suyuqlikning laminar oqimi uchun o'rinli bo'lib, suyuqlikning dinamik qovushoqligini aniqlashda qo'llaniladi. Bu usulda turli xil viskozimetrlardan keng foydalaniladi. Masalan: kapillayar viskozimetr, rotatsion viskozimetr, VK-4 viskozimetri. Turli xil yog'lar, eritmalarning ichki ishqalanish koeffitsientini o'rganish oziq-ovqat, neft-gaz sanoatida, tibbiyot va farmatsevtikada muhim ahamiyat kasb etadi.

Adabiyotlar tahlili

Suyuqlikning ichki ishqalanishi bo'yicha juda ko'plab ilmiy, amaliy maqolalar, ilmiy ishlar nashr etilgan. Bir necha maqola tahlilini quyida keltiramiz. Шахматов К.С., Доня Д.В., Басова Г.Г. «Способ определения вязкости жидкостей малых объемов» nomli maqolasida "Rheotest 2" rotatsion viskozimetr yordamida 0,1-0,3 ml hajmdagi suyuqliklar bilan olib borilgan ilmiy tadqiqot natijalari haqida axborot bergan. [1] Shamrov N.I., Shamrova E.A. «Определение вязкости биологической жидкости в малом объеме» nomli maqolasida biologik suyuqliklarning ichki ishqalanishini kapillyar viskozimetr - Osvald viskozimetrida aniqlash usulini yoritib bergan. [2] Мизеровский Л.Н., Смирнов П.Р. «Вязкость и внутренее трение в жидкостях» номли маколасида suyuqliklarning ichki ishqalanishi bo'yicha axborot bergan. [3]

Tadqiqot metodologiyasi

Maqolada suuyuqliklarda ichki ishqalanish hodisasi haqida umumiy ma'lumotlar berildi.

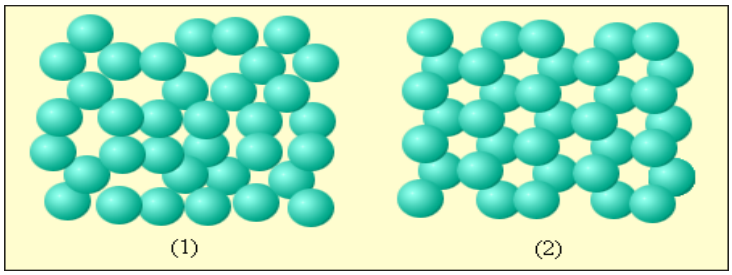
Natijalar va ularning tahlili

Biologik suyuqliklar organizmdagi jarayonlarda bevosita ishtirok etib, moddalar almashinuvi, ionlarning harakatchanligiga o'z ta'sirini ko'rsatadi.

Suyuq dori vositalarining texnologik xossalarini, fizik-mexanik ko'rsatkichlarini o'rganish, ularning tarkibini tanlashda, sifat va miqdoriy tahlil usullarini ishlab chiqishda, standartlash va sifatini nazorat qilishda muhim ahamiyatga ega.

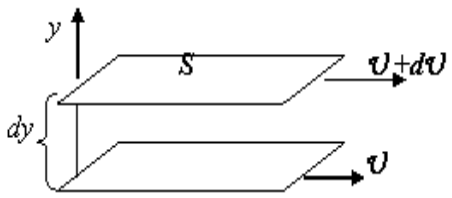
Zarrachalarning biologik membranalar orqali harakatchanligi va o'tkazuvchanligi ishqalanishga yoki boshqa zarrachalar bilan to'qnashuvga bog'liq. Ichki ishqalanish koeffitsienti qanchalik yuqori bo'lsa, ularning harakatchanligi va biologik membrana orqali o'tkazuvchanligi shunchalik yuqori bo'ladi. Suyuq dori vositalarining organizmda so'rilishini yaxshilash uchun ularning dinamikasini hisobga olish kerak.

Suyuqlik moddaning gaz va qattiq jism oralig'idagi agregat holatidir. Shuning uchun ham uning ba'zi xossalari gaznikiga, ba'zilari esa qattiq jismnikiga o'xshab ketadi. Suyuqliklar qattiq jismga o'xshab ma'lum hajmga ega bo'lsa, gazlardek o'zi quyilgan idish hajmini egallaydi. Suyuqlikning har bir molekulasi atrofida o'zi kabi molekulalar bilan o'ralgan bo'ladi va muvozanat vaziyati atrofida tebranma harakat qiladi. Vaqti vaqti bilan molekula bo'sh, ya'ni vakant o'rinni egallashi mumkin, chunki kristallardagi kabi molekulalar aniq bir markazga bog'lanmagan. Suyuqlik molekulalari yaxshi o'rin almashish xususiyatiga ega, ya'ni suyuqlik oqishi va o'zi solingan idash hajmini egallashi mumkin. Suyuqlik molekulalari orasidagi o'zaro ta'sir kuchining kattaligi natijasida suyuqlik amalda siqilmaydi. Molekulalararo ta'sir kuchi suyuqlikning molekulyar bosimi deyiladi. Masalan: suvning molekulyar bosimi 1100 MPa artofida. Suyuqliklarni rentgen nurlari yordamida o'rganish ularning molekulyar tuzilishida qattiq jismlarning molekulyar tuzilishiga o'xshash joylari borligin ko'rsatdi. Agar qattiq jismlarda molekulalarning ancha katta masofada ham batartib joylashuvi kuzatilsa, suyuqliklarda juda kichik, atomlararo masofalardagina batartib joylashuvi kuzatiladi (1-rasm).



1-rasm. 1-Suv. 2-Muz.

Frenkel nazariyasiga ko'ra, suyuqlik molekulasi ma'lum vaqt davomida o'z muvozanat holati atrofida, go'yoki kristall panjaraning tugunida turgandek tebranib turadi, so'ngra sakrab oldingisidan atomlararo masofada bo'lgan yangi holatga (yangi tugunga) o'tadi. Molekulalarning biror holatda bo'lish vaqti juda kichik, 10^{-10} s ni tashkil etadi. Suyuqlikning har bir molekulasiga uni o'rab turgan molekulalar tomonidan tortishish kuchlari ta'sir ko'rsatadi. Mutlaqo yopishmaydigan va siqilmaydigan suyuqlik ideal suyuqlik deyiladi. Real suyuqlik oqqanda uning ayrim qatlamlari bir-biriga shu qatlamlarga urinma ko'rinishda yo'nalgan kuchlar bilan o'zaro ta'sirlashadi. Bu hodisaga ichki ishqalanish yoki qovushqoqlik deyiladi. Suyuqlikni shartli ravishda qatlamlardan iborat deb tasavvur qilamiz. Qatlamlar o'zaro bir-biriga ta'sir ko'rsatadi. Qatlamlar harakatining tezligini harakatga tik bo'lgan y o'qqa nisbatan qaraylik. Bu holda harakatning y o'qi bo'yicha o'zgarish tezligi (tezlik gradiyenti) bo'ladi $\frac{d\vartheta}{dy}$ (2-rasm).

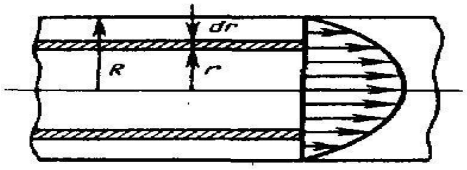


2-rasm. Suyuqlik qatlamlari.

Agar koordinata y ortishi bilan qatlamlarning tezligi bir tekisda ortsa, u holda tezlik gradiyenti suyuqlikning barcha massasi uchun bir xil bo'ladi. Bir-biridan Δy uzoqlikda turgan qatlamlarning tezliklari υ_1 va υ_2 bo'lsa, u holda tezlik gradiyenti

$\frac{\vartheta_2-\vartheta_1}{dy}$ bo‘ladi. Suyuqlik qatlamlari orasida mavjud bo‘lgan ishqalanish kuchi F uchun Nyuton quyidagi qonuniyatni aniqladi: $\vec{F}=\eta\left|\frac{d\vec{\vartheta}}{dz}\right|S$ (1)

bu formulada η -suyuqlikning qovushqoqlik koeffitsiyenti; S -qatlamlar yuzasi; dυ/dy kattalik (tezlik gradiyenti) bir qatlamdan ikkinchi qatlamga o‘tganda suyuqlik qatlamlari tezliklarining o‘zgarish jadalligini ifodalaydi. Ishqalanish kuchi (F) ikki "qo‘shni" qatlamning tezroq harakatlanayotganini to‘xtatishga, sekinroq harakatlanayotganini esa tezlatishga intiladi. (1) ga ko‘ra η ning SI dagi birligi qilib shunday suyuqlikning qovushqoqligi olinadiki, bunda tezlik gradiyenti dυ/dy=1m/s*m=1/s bo‘lganda, suyuqlikning ikki "qo‘shni" qatlamlari orasidagi S=1 m2 sirtda mavjud bo‘lgan ishqalanish kuchi 1 N ga teng bo‘ladi. Bu birlik paskal-sekund (Pa*s) deb ataladi. Ko‘pchilik suyuqliklarda qovushqoqlik tezlik gradiyentiga bog‘liq bo‘lmaydi, bunday suyuqliklar Nyuton tenglamasiga bo‘ysunadi, shuning uchun ular Nyuton suyuqliklari deyiladi. Nyuton tenglamasiga bo‘ysunmaydigan suyuqliklar nonyuton suyuqliklar deyiladi. Murakkab va yirik molekulalardan iborat suyuqliklar, masalan: polimerlar eritmasi, molekula va zarrachalarning bog‘lanishlari tufayli hosil bo‘lgan fazoviy strukturalar, qon shunday suyuqliklarga misol bo‘la oladi. Fransuz olimi Puazeyl (1841) suyuqliklarning naylarda oqish tezliklarini tajriba yo‘li bilan o‘rganib, suyuqlikning nay bo‘ylab o‘rtacha laminar oqish tezligi nay uzunlik birligiga, bosimning tushishi hamda nay radiusining kvadratiga to‘g‘ri mutanosib va qovushqoqlik koeffitsiyentiga teskari mutanosib ekanligini aniqladi: $\vartheta_{o'}=\frac{\rho_1-\rho_2}{l}\cdot\frac{R^2}{8\eta}$ (2)



3-rasm. Suyuqlikning nay bo‘ylab harakati.

Radiusi R bo‘lgan naydan radiusi r bo‘lgan suyuqlik hajmi (3-rasm) ajratib olinadi. Birlik vaqt ichida truba ko‘ndalang kesimidan oqib o‘tgan suyuqlik oqimi topiladi. Shuning uchun ham bu qonun Puazeyl qonuni deb ataladi. Nay uchun $S=\pi R^2$ va $Q=\upsilon_{o'}\cdot S$ ekanligini hisobga olib Puazeyl qonunini quyidagicha yozish mumkin:

$$Q=\frac{P_1-P_2}{l}\cdot\frac{\pi R^4}{8\eta} \quad (3)$$

Laminar suyuqliklar uchun Puazeyl formulasi quyidagicha bo‘ladi.

$$Q=\frac{P_1-P_2}{l}\cdot\frac{\pi R^4}{8\eta} \quad (4)$$

Real suyuqlik yoki gazlarda ishqalanish kuchlari mavjudligi tufayli ularda harakatlanuvchi jismlarga ta’sir etuvchi qarshilik kuchlari paydo bo‘ladi.

Bu kuchlarning miqdori asosan jismlarning harakat tezligiga bog‘liq bo‘ladi. Stoks katta bo‘lmagan ϑ tezliklar bilan harakatlanuvchi r radiusli sharsimon jismlarga muhit tomonidan ta’sir etuvchi qarshilik kuchi F jismning tezligi va o‘lchamlariga hamda muhitning qovushqoqlik koeffitsienti η ga to‘g‘ri mutanosib ekanligini ko‘rsatdi: $F=6\pi\eta r\vec{\vartheta}$ (5)

(5) ifoda Stoks formulasi deyiladi.

Sferik jism (sharcha)ning suyuqlik solingan idish ichidagi harakat tezligi quyidagi formula orqali aniqlanadi:

$\upsilon=\frac{2\ \rho_1-\rho_2)r^2}{9\eta}g$

Suyuqliklarning qatlam-qatlam bo‘lib, ya’ni suyuqlik qatlamlarining tezligi o‘zgarmasdan oqishi laminar oqim deyiladi. Turbulent oqimda zarrachalar tezligi turli joyda turlicha bo‘lib, uzluksiz va xaotik o‘zgarib turadi, harakat nostatsionar bo‘ladi. Suyuqliklarning nay bo‘ylab oqishi suyuqlikning xossalariga, uning oqish tezligiga, nayning o‘lchamlariga bog‘liq bo‘lib, Reynolds soni bilan aniqlanadi:

$$Re=\frac{\rho l\vartheta}{\eta} \quad (6)$$

(6) dagi Re o‘lchamsiz kattalik bo‘lib, Reynolds soni deb ataladi. Agar Reynolds soni biror kritik qiymatdan katta bo‘lsa ($Re>Re_{kr}$), unda suyuqlik harakati turbulent bo‘ladi. Masalan: silliq devorli silindrik naylarda $Re_{kr}\approx2300$. Muhit qovushqoqlik koeffitsiyentining zichligiga nisbati η/ρ esa kinematik qovushqoqlik deb ataladi: $\frac{\eta}{\rho}=\nu$

Amalda Reynolds soni qovushqoqlik koeffitsiyenti orqali emas, balki kinematik qovushqoqlik orqali ifodalanadi: $Re=\frac{l\vartheta}{\nu}$

Xulosa. Biologik suyuqliklar organizmdagi jarayonlarda bevosita ishtirok etib, moddalar almashinuvi, ionlarning harakatchanligiga o‘z ta’sirini ko‘rsatadi.

Zarrachalarning biologik membranalar orqali harakatchanligi va o'tkazuvchanligi ishqalanishga yoki boshqa zarrachalar bilan to‘qnashuvga bog‘liq. Ichki ishqalanish koeffitsienti qanchalik yuqori bo‘lsa, ularning harakatchanligi va biologik membrana orqali o‘tkazuvchanligi shunchalik yuqori bo‘ladi. Suyuq dori vositalarining organizmda so‘rilishini yaxshilash uchun ularning dinamikasini hisobga olish kerak.

RATES OF CONVERGENCE IN THE LAW OF LARGE NUMBERS FOR SUMS OF INDEPENDENT RANDOM VARIABLES WITH MULTIPLE-VARIABLE INDICES

Abstract: *The purpose of this article is devoted to limit theorems for the rates of convergence in the law of large numbers for sums of independent random variables with multiple-variable indices. It contains the necessary conditions for the law of multiple logarithms of the sum of random variables.*

Keywords: *multidimensional indices; tail probabilities of sums of i.i.d. random variables; stable distributions; domain of attraction; strong law; law of the iterated logarithm.*

Kirish. Hozirgi zamon matematikasining barcha yutuqlari haqida batafsil so‘zlash imkoni kichik bir ish ichida beimkon muammodir, chunki matematika fani shunchalik rivojlanib ketganki, uning yuzlab tarmoqlarida minglab ilmiy ishlar qilinmoqda, chop etilgan ishlarning bir necha foizigina o‘rganilib, kundalik hayot ehtiyojlariga tatbiq etiladi xolos. Matematika fanining ehtimollar nazariyasi va matematik statistika, differensial tenglama va matematik fizika, funksional tahlil sohasidagi yutuqlari respublikadan ancha uzoqda ham mashhur .

Ehtimollar nazariyasi va matematik statistika fanining xx asrdagi rivoji va uning xalq xo‘jaligining turli tarmoqlariga tadbiqlari o‘zining ilmiy amaliy ahamiyati bilan ajralib turadi. Buning misoli sifatida A.N.Kolmogorov, A.Xinchin, Y.V.Proxorov, B.V.Gnedenko, A.Borovkov, A.N.Shiryayev, V.Petrov, V.Korolyuk, S.X.Sirojiddinov, A.Skoroxod, Y.P.Kubilyus, V.Feller kabi olimlarning ishlari fundamentalligi bilan ajralib turadi.

Adabiyotlar tahlili vatadqiqot metodologiyasi. Ehtimollardan tuzilgan qatorlarning yaqinlashishini o‘rganish keyingi o‘n yilliklardagi muhim yo‘nalishlardan hisoblanadi. Bu yo‘nalishlarda P.Erdesh, M.Kas, I.S.Chao, T.L.Lay, N.Amosova, V.Petrov, S.X.Sirojiddinov, M.U.G‘ofurov, A.D.Slastnikov, A.Gut, O.I.Klesov, R.Smayz, Sh.Shorahmedov, I.Yo‘Ldoshev, M.K.Xolmurodov, R. Kenjayev, X.Sarimsaqova, I.M.Xamdamov, G.A.Abud, R.Kenjayev va boshqalarning qilgan ishlari va olingan natijalarini keltirish mumkin. 2000 yillardan boshlab A.Gut, O.Klesov, J.Steynbach , A.Bulinskiy , A.Dilman, A.Spataru, U.Shtadtmyuller, I.Fazekash kabilarning ishlarida indekslari ko‘p o‘lchovli tasodifiy miqdorlar uchun qator fundamental natijalar olindi. Olingan natijalar shuni ko‘rsatadiki, ehtimollardan tuzilgan qatorlarning

yaqinlashish katta sonlar qonuni, chegaraviy funksionallar taqsimoti (chegaraviy shartlar bo'yicha chegaradan chiqishlar soni, ekssess va oxirgi chiqish momenti) kabi masalalarni yechishda keng ko'lamda qo'llanilgan.

R orqali xaqiqiy sonlar to'plami, N bilan natural sonlar to'plami bo`lsin. Faraz qilaylik, quyidagi d-o'lchovli koordinatalari natural sonlardan iborat vektorlar to'plami berilgan bo'lsin: $Z_+^d = \{\vec{n} = (n_1, n_2, \dots, n_d); n_i \in N, i = \overline{1,d}\}$, bu yerda d∈N. Z_+^d to'plamda qisman tartiblanganlik tushunchasini kiritamiz: $\vec{m}, \vec{n} \in Z_+^d$ uchun $\vec{m} < \vec{n}$ munosabat $m_i \le n_i, i = \overline{1,d}$ni bildiradi.

Ushbu $\vec{n} = (n_1, n_2, \dots, n_d) \in Z_+^d$uchun $$|\overline{n}| = \prod_{i=1}^{d} n_i$$

bo'lsin ,agar $n_i \to \infty$ har bir, $i = \overline{1,d}$ uchun bo'lsa, $\bar{n} \to \infty$ ni bildiradi . Quyidagi munosabat o'rinli $\alpha\bar{n} = (\alpha n_1, \dots, \alpha n_d), \alpha \in R$. $log^+ x = max(0, log\, x)$ belgilashni kiritamiz.

Kelgusida $\{X(\bar{n}); n \in Z_+^d\}$ orqali bog'liq bo'lmagan, bir hil taqsimlangan tasodifiy miqdorlar to'plamini belgilaymiz:

$$S(\bar{0}) = 0, S(\bar{n}) = \sum_{k<n} X(\bar{k}).$$

X orqali $X(\bar{n}); n \in Z_+^d$ tasodifiy miqdor bilan bir hil taqsimotga ega bo'lgan tasodifiy miqdorni belgilaymiz.

Ushbu yo'nalishdagi birinchi natijalar Gut[11] va Klesov[1, 2] tomonidan keltirilgan. Ular $EX = 0$ va $E[X^2(\log(1+|X|))^{d-1}] < \infty$ (1) bo'lganda

$$\lim_{\varepsilon\to 0} \frac{\varepsilon^2}{(-2log\varepsilon)^{d-1}} \sum_n P(|S_n| \ge \varepsilon|n|) = \frac{EX^2}{(d-1)!}, \qquad (2)$$

bo'lishini ko'rsatishgan.

Natijalar va muhokamalar. Ushbu maqolada quyidagi teorema isbot qilingan.

Teorema. Faraz qilaylik $EX = 0$, u holda $E[|X|^r(\log(1+|X|))^{d-1}] < \infty, r \ge 2$, $EX^2 = 1$ ni olamiz va standart normal taqsimlangan tasodifiy miqdor bo`lsin. $1 \le p < 2$ uchun quyidagi o`rinli :

$$\limsup_{\varepsilon\to 0} \frac{\varepsilon^{\frac{2p}{2-p}\left(\frac{r}{p}-1\right)}}{(-\log\varepsilon)^{d-1}} \sum_{j\ge 1} d(j)\, j^{\frac{r}{p}-2} P\left(\left|S_{\pi(j)}\right| \ge \varepsilon j^{\frac{1}{p}}\right) =$$

$$\frac{1}{\sqrt{\pi}} \cdot \frac{1}{(d-1)!} \cdot \left(\frac{2p}{2-p}\right)^{d-1} \cdot \frac{p}{r-p} \cdot 2^{\frac{\alpha p}{\alpha-p}\cdot\left(\frac{2}{p}-1\right)} \Gamma\left(\frac{\alpha p}{\alpha-p} \cdot \left(\frac{2}{p}-1\right) + \frac{1}{2}\right)$$

Natija. Teorema r=2 va ∝= 2 bo`lganda yuqoridagi natijalarni umumlashtiradi.

Teoremaning isboti.

Shunday qilib, standart normal taqsimlangan tasodifiy miqdor bo`lsin. U holda uning dispersiyasi $\sigma^2 = 1$. Bundan tashqari, N standart taqsimlangan tasodifiy miqdor, bu erda F t.m. ning taqsimot funksiyasi va $\Psi(x) = 1 - F(x) + F(-x) = (|N| > x),\ x \ge 0$ .Quyidagi lemmalardan foydalanamiz.

Lemma-1. $d \ge 2\ va\ \gamma > 0$ lar uchun

$$\lim_{\varepsilon\to 0} \frac{1}{(-log\varepsilon)^{d-1}} \int_{\varepsilon C}^{\infty} \left(\log\frac{y}{\varepsilon}\right)^{d-1} y^{\gamma-1}\Psi(y)dy = \gamma^{-1}E|Z|^{\gamma}.$$

Isbot. Lemma 2.4 dan darhol $h(y) = y^{\gamma-1}\,\Psi(y)$ bilan isboti kelib chiqadi.

Lemma -2. $k \to \infty$ da $\gamma > -1$ uchun biz

$$\sum_{j=1}^{k} d(j) j^{\gamma} \sim \frac{1}{(d-1)!} \sum_{j=1}^{k} j^{\gamma}\,(logj)^{d-1} \sim \frac{1}{(d-1)!} \frac{k^{\gamma+1}(logk)^{d-1}}{\gamma+1}.$$

-ga ega bo'lamiz.

Isbot. $k > 1$ uchun biz $\sum_{j=1}^{k} d(j) j^{\gamma} = M(k)k^{\gamma} + \sum_{j=1}^{k-1} d(j)(j^{\gamma} - k^{\gamma})$ tenglikni olamiz. Keyin $\sum_{j=1}^{k} d(j) j^{\gamma}$ yig`indini $M(k)k^{\gamma} - \gamma\sum_{i=1}^{k-1} M(i) i^{\gamma-1}$ va $M(k)k^{\gamma} - \gamma\sum_{i=1}^{k-1} M(i)(i+1)^{\gamma-1}$ lar orasida yotishini kuzatamiz. Bu esa $j^{\gamma} - k^{\gamma}$ ning $-\gamma\sum_{i=j}^{k-1} i^{\gamma-1}$ va $-\gamma\sum_{i=j}^{k-1}(i+1)^{\gamma-1}$ lar orasida yotishini anglatadi. $\sum_{j=1}^{k} j^{\gamma}(\log j)^{d-1} \sim \frac{k^{\gamma+1}(\log k)^{d-1}}{\gamma+1}$ ning $k \to \infty$ ekanligini hisobga olib, biz quyidagini hosil qilamiz:

$$M(k)k^{\gamma} - \gamma\sum_{i=1}^{k-1} M(i) i^{\gamma-1} \sim \frac{k^{\gamma+1}(\log k)^{d-1}}{(d-1)!} - \frac{\gamma}{(d-1)!}\sum_{i=1}^{k-1} i^{\gamma}(\log i)^{d-1} \sim \frac{\gamma+1}{(d-1)!}\sum_{j=1}^{k} j^{\gamma}(logj)^{d-1} - \frac{\gamma}{(d-1)!}\sum_{i=1}^{k-1} i^{\gamma}(logi)^{d-1}$$

$$= \frac{1}{(d-1)!}\sum_{j=1}^{k} j^{\gamma}(logj)^{d-1} + \frac{\gamma}{(d-1)!} k^{\gamma}(logk)^{d-1} \sim \frac{1}{(d-1)!}\sum_{j=1}^{k} j^{\gamma}(logj)^{d-1} \sim \frac{1}{(d-1)!}\frac{k^{\gamma+1}(\log k)^{d-1}}{\gamma+1}.$$

Bog'langan $M(k)k^{\gamma}-\gamma\sum_{i=1}^{k-1}M(i)(i+1)^{\gamma-1}\ \ k\to\infty$ intilganda bir xil asimptotikani ta'minlaydi.

Teoremani isbotini keltiramiz. $\frac{r}{p}-2$ uchun xulosa lemmaga asosan α o`rniga 2 gani, Z esa N bilan almashtiriladi. Shuning uchun $r\geq 2p$ bo'lsin. $\gamma=\frac{r}{p}-2$ bilan Lemma -2. bo'yicha, k_0 ni $k\geq k_0$ shunday tanlaymiz ya'ni $0<\delta<1$ uchun;

$$\frac{1-\delta}{(d-1)!}\sum_{j=1}^{k}(logj)^{d-1}\,j^{\frac{r}{p}-2}\ \leq\sum_{j=1}^{k}d(j)\,j^{\frac{r}{p}-2}\leq\frac{1+\delta}{(d-1)!}\sum_{j=1}^{k}(logj)^{d-1}\ j^{\frac{r}{p}-2},$$

Bundan tashqari, $j\geq k_0$ uchun $(logj)^{d-1}j^{\frac{r}{p}-2}\leq(1+\delta)(\log(j-1))^{d-1}(j-1)^{\frac{r}{p}-2}$ deb faraz qilamiz. Lemmalarga asosan quyidagini olamiz.

$$\sum_{j\geq 1}d(j)j^{\frac{r}{p}-2}P\left(\left|S_{\pi(j)}\right|\geq\varepsilon j^{\frac{1}{p}}\right)\leq\ C+\frac{1+\delta}{(d-1)!}\sum_{j\geq k_0}(logj)^{d-1}j^{\frac{r}{p}-2}\Psi\left(\varepsilon j^{\frac{1}{p}-\frac{1}{2}}\right)$$

$$\leq C+\frac{(1+\delta)^2}{(d-1)!}\sum_{j\geq k_0}(\log(j-1))^{d-1}(j-1)^{\frac{r}{p}-2}\Psi\left(\varepsilon j^{\frac{1}{p}-\frac{1}{2}}\right)\ \leq\ C+\frac{(1+\delta)^2}{(d-1)!}\int_{k_0-1}^{\infty}(\log x)^{d-1}x^{\frac{r}{p}-2}\Psi\left(\varepsilon x^{\frac{1}{p}-\frac{1}{2}}\right)dx$$

$$\leq C+\varepsilon^{-\frac{2p}{2-p}\left(\frac{r}{p}-1\right)}\frac{(1+\delta)^2}{(d-1)!}\left(\frac{2p}{2-p}\right)^{d}\int_{\varepsilon C}^{\infty}\left(\log\frac{y}{\varepsilon}\right)^{d-1}y^{\frac{2p}{2-p}\left(\frac{r}{p}-1\right)}\Psi(y)\,dy,$$

Bu va $\gamma=\frac{2p}{2-p}\left(\frac{r}{p}-1\right)$ bilan Lemma 2 dan quyidagi natia kelb chiqadi:

$$\limsup_{\varepsilon\to 0}\frac{\varepsilon^{\frac{2p}{2-p}\left(\frac{r}{p}-1\right)}}{(-\log\varepsilon)^{d-1}}\sum_{j\geq 1}d(j)\,j^{\frac{r}{p}-2}P\left(\left|S_{\pi(j)}\right|\geq\varepsilon j^{\frac{1}{p}}\right)=$$

$$\frac{1}{\sqrt{\pi}}\cdot\frac{1}{(d-1)!}\cdot\left(\frac{2p}{2-p}\right)^{d-1}\cdot\frac{p}{r-p}\cdot 2^{\frac{\alpha p}{\alpha-p}\cdot\left(\frac{2}{p}-1\right)}\Gamma\left(\frac{\alpha p}{\alpha-p}\cdot\left(\frac{2}{p}-1\right)+\frac{1}{2}\right)$$

Yuqoridagilardan teoremani isboti kelib chiqadi. Teorema r=2 va $\propto=2$ bo`lganda yuqoridagi natijalarni umumlashtiradi.

XULOSA. Shunday qilib, tasodifiy miqdorlar yig‘indisi uchun katta sonlar qonunida yaqinlashish tezliklari olindi**:** ehtimollardan tuzilgan qatorlarni matematik kutilmalarning mavjudligi ma’nosida yaqinlashishi uchun zaruriy va yetarli shartlar keltirildi;ehtimollardan tuzilgan qatorlarning kichik parametrlari bo‘yicha asimptotikasi o‘rganildi; katta sonlarning kuchaytirilgan qonunida kichik parametrlari bo‘yicha masalalar o‘rganildi va kuchaytirilgan katta sonlar qonuni va uning yaqinlashish tezliklari.

Annotatsiya: *Ushbu maqolada simmetrik shifrlash tizimlarining asosiy chiziqli bo‘lmagan komponenti bo‘lgan S-bloklarning kriptografik xossalarini kompleks baholash nazariy va hisoblash usullari yordamida tahlil qilinadi. Tadqiqotda 15 ta asosiy kriptografik mezon (balanslashganlik, chiziqli bo‘lmaganlik, qat’iy lavina mezoni, bit mustaqillik mezoni, differensial yagona qiymat, chiziqli va differensial taxminiy ehtimollar, algebraik daraja, shaffoflik tartibi, absolyut ko‘rsatkich, bumerang yagona qiymati, kvadratlar yig‘indisi ko‘rsatkichi, qo‘zg‘almas nuqtalar, chiziqli strukturalar va tsiklik tuzilma) formal ta’riflar, matematik formulalar, talqinlar va xavfsizlik oqibatlari bilan tavsiflanadi. Uolsh-Adamar spektral tahlili, differensial va chiziqli yaqinlashtirish jadvallari (DDT/LAT) hamda bool funksiyalar nazariyasiga asoslangan hisoblash metodologiyasi taklif etilgan. AES, tasodifiy va optimallashtirilgan S-bloklarining solishtirma tahlili metrikalar o‘rtasidagi fundamental kompromisslarni ochib beradi. Maqola S-blok dizaynini ko‘p maqsadli optimallashtirish, sun’iy intellekt asosidagi avtomatlashtirilgan loyihalash va kvantga chidamli strukturalarni ishlab chiqish bo‘yicha ilmiy yo‘nalishlarni belgilab beradi.*

Kalit so‘zlar: *S-blok, Boolean funksiyalari, chiziqli bo‘lmaganlik, differensial yagona qiymat, Uolsh-Adamar transformatsiyasi, kriptotahlil, algebraik normal shakl, bumerang yagona qiymati, ko‘p maqsadli optimallashtirish.*

COMPREHENSIVE STUDY OF THE CRYPTOGRAPHIC ANALYSIS OF S-BOXES: METRICS, METHODS, AND SECURITY IMPLICATIONS

Abstract: *This article presents a comprehensive analysis of the cryptographic properties of S-boxes, which constitute the primary nonlinear components of symmetric encryption systems, using both theoretical and computational approaches. The study examines 15 key cryptographic criteria—balancedness, nonlinearity, strict avalanche criterion, bit independence criterion, differential uniformity, linear and differential approximation probabilities, algebraic degree, transparency order, absolute indicator, boomerang uniformity, sum-of-squares indicator, fixed points, linear structures, and cyclic structure. Each metric is described through formal definitions, mathematical formulations, interpretations, and corresponding security implications.*

A computational methodology based on the Walsh–Hadamard spectral analysis, differential and linear approximation tables (DDT/LAT), and Boolean function theory is proposed. A comparative analysis of AES, random, and optimized S-boxes reveals fundamental trade-offs among the considered metrics.

The paper further outlines promising research directions, including multi-objective optimization in S-box design, artificial intelligence–driven automated construction, and the development of quantum-resistant structures.

Keywords: *S-box, Boolean functions, nonlinearity, differential uniformity, Walsh–Hadamard transform, cryptanalysis, algebraic normal form, boomerang uniformity, multi-objective optimization.*

КОМПЛЕКСНОЕ ИССЛЕДОВАНИЕ КРИПТОГРАФИЧЕСКОГО АНАЛИЗА S-BOX'ОВ: МЕТРИКИ, МЕТОДЫ И АСПЕКТЫ БЕЗОПАСНОСТИ

Аннотация. *В данной статье представлен комплексный анализ криптографических свойств S-box’ов (блоков подстановки), которые составляют основные нелинейные компоненты систем симметричного шифрования, с использованием как теоретических, так и вычислительных подходов. В исследовании рассматриваются 15 ключевых*

криптографических критериев: сбалансированность, нелинейность, строгий лавинный критерий (SAC), критерий независимости битов (BIC), дифференциальная равномерность, вероятности линейной и дифференциальной аппроксимации, алгебраическая степень, порядок прозрачности, абсолютный индикатор, бумеранговая равномерность, индикатор суммы квадратов, неподвижные точки, линейные структуры и циклическая структура. Каждая метрика описывается через формальные определения, математические формулировки, интерпретации и соответствующие последствия для безопасности. Предложена вычислительная методология, основанная на спектральном анализе Уолша–Адамара, таблицах дифференциальной и линейной аппроксимации (DDT/LAT) и теории булевых функций. Сравнительный анализ AES, случайных и оптимизированных S-box'ов выявляет фундаментальные компромиссы между рассматриваемыми метриками. В работе также намечаются перспективные направления исследований, включая многокритериальную оптимизацию при проектировании S-box'ов, автоматизированное конструирование на основе искусственного интеллекта и разработку квантово-устойчивых структур.

Ключевые слова: *S-box, булевы функции, нелинейность, дифференциальная равномерность, преобразование Уолша–Адамара, криптоанализ, алгебраическая нормальная форма, бумеранговая равномерность, многокритериальная оптимизация.*

Kirish. Simmetrik shifrlash algoritmlarida kryptografik ustahkamlikning asosiy omili shannon nazariyasidagi **confusion** (chalkashtirish) va diffusion (tarqatish) tamoyillarini samarali amalga oshirish hisoblanadi. S-bloklar (almashtirish qutilari) aynan chalkashtirish funksiyasini bajaruvchi asosiy strukturaviy komponent bo‘lib, ularning sifati simmetrik shifrlarning chiziqli va differensial kriptotahlilga chidamliligini bevosita belgilaydi. Tarixan DES, GOST 28147-89, AES (Rijndael) va zamonaviy blokli shifrlar (ChaCha, SPECK, ASCON) S-bloklardan foydalanadi yoki ularning printsipial analoglarini qo‘llaydi.

S-bloklarning asosiy vazifasi kirish ma’lumotlariga nisbatan chiziqli bo‘lmagan, statistik jihatdan muvozanatli va differensial xossalar nazorat qilinadigan almashtirishni ta’minlashdir. Chiziqli bo‘lmaganlik darajasi past bo‘lsa, shifr chiziqli yaqinlashtirish orqali buzilishi mumkin; differensial yagona qiymat yuqori bo‘lsa, differensial kriptotahlil samaradorligi ortadi. Shu sababli, zamonaviy kriptografiyada S-bloklarni baholash yagona mezon emas, balki ko‘p o‘lchovli, o‘zaro bog‘liq kriptografik mezonlar tizimi asosida amalga oshiriladi.

Ushbu maqolaning maqsadi S-bloklarning kriptografik tahlilini nazariy, matematik va hisoblash jihatdan kompleks talqin qilish, 15 ta asosiy baholash mezonini formalizatsiya qilish, ularning o‘zaro bog‘liqligini tahlil qilish va zamonaviy S-blok loyihalash amaliyoti uchun ilmiy metodologik asos yaratishdir. Tadqiqot DSc darajasidagi kriptografiya va bool funksiyalari tahlili sohasidagi mutaxassislar, shuningdek, blokli shifrlar dizaynerlari va kriptografik standartlar ishlab chiquvchilari uchun nazariy va amaliy qo‘llanma sifatida xizmat qiladi.

Adabiyotlar tahlili. S-bloklarni loyihalash va baholash nazariyasi 1970-yillardan boshlab rivojlanib kelmoqda. Dastlab DES S-bloklari maxfiy tarzda ishlab chiqilgan bo‘lib, ularning differensial va chiziqli hujumlarga chidamliligi keyinchalik Biham va Shamir [1], Matsui [2] tomonidan tahlil qilingan. Nyberg [3] differensial yagona qiymat tushunchasini kiritib, APN (Almost Perfect Nonlinear) funksiyalar nazariyasini shakllantirdi. Carlet [4], [5] bool va vektorli bool funksiyalarining algebraik, spektral va kriptografik xossalarini tizimli o‘rganib, chiziqli bo‘lmaganlik, differensial xossalar va algebraik daraja o‘rtasidagi fundamental chegaralarni isbotladi.

TPACK, DigCompEdu kabi pedagogik modellar emas, balki kriptografik modellar doirasida S-bloklar baholashda Uolsh-Adamar transformatsiyasi [6], [7], Differensial Yaqinlashtirish Jadvali (DDT) [8], Chiziqli Yaqinlashtirish Jadvali (LAT) [9] asosiy vositalar sifatida qo‘llaniladi. Shaffoflik tartibi (Transparency Order) Plos va boshq. [10] tomonidan DPA (Differential Power Analysis) hujumlariga chidamlilikni baholash uchun taklif qilingan. Bumerang yagona qiymati esa Cid va boshq. [11], Wang va Lai [12] tomonidan bumerang va rektilinear kriptotahlilga qarshi himoya ko‘rsatkichi sifatida joriy etilgan.

Zamonaviy tadqiqotlarda metaevristik usullar (genetik algoritmlar, simulyatsion sovutish, mashinali o‘rganish) yordamida ko‘p maqsadli S-blok optimallashtirish [13], [14], [15] faol rivojlanmoqda. Biroq, adabiyotda metrikalar o‘rtasidagi fundamental kompromisslar, kvant hisoblash sharoitida S-blok xossalarining o‘zgarishi va AI-generatsiyalangan S-bloklarning kriptografik verifikatsiyasi bo‘yicha tizimli nazariy yechimlar yetishmayapti. Ushbu maqola aynan shu bo‘shliqni to‘ldirishga qaratilgan.

Matematik asoslar

Boolean funksiyalari va vektorli boolean funksiyalar. $f: F_2^n \to F_2$ funksiyasi n -o‘lchovli boolean funksiya deyiladi. $S: F_2^n \to F_2^m$ esa vektorli boolean funksiya (S-blok) bo‘lib, har bir chiqish biti $S_i(x)$ alohida boolean funksiya orqali ifodalanadi.

Algebraik normal shakl (ANSH). Har qanday boolean funksiya quyidagi ko‘rinishda yozilishi mumkin:

$$f(x)=\bigoplus_{u\in \mathrm{F}_2^n} a_u x^u, \quad x^u=\prod_{i=1}^{n} x_i^{u_i}, \quad a_u \in \mathrm{F}_2$$

Bu yerda algebraik daraja $deg(f) = max\{wt(u)|a_u \neq 0\}$.

Uolsh-Adamar transformatsiyasi. $f$ning spektral tasviri:

$$W_f(u)=\sum_{x\in \mathrm{F}_2^n} (-1)^{f(x)\oplus u\cdot x}, \quad u\in \mathrm{F}_2^n$$

Chiziqsizlik bilan bog‘liq holda:

$$NL(f)=2^{n-1}-\frac{1}{2}\max_{u\in \mathrm{F}_2^n} |W_f(u)|$$

Differensial yagona qiymat. S-blok uchun differensial xususiyat:

$\delta_S = \max_{a\neq 0,b} |\{x \in \mathbb{F}_2^n \mid S(x) \oplus S(x \oplus a) = b\}|$

$\delta_S = 2$ bo‘lsa, funksiya APN (mukammal differensial xavfsizlikka yaqin) hisoblanadi.

Kriteriyalar tahlili

Quyida S-bloklarni baholashning 15 ta asosiy mezoni formal ta’rif, formula, talqin va xavfsizlik oqibatlari bilan keltirilgan.

S-bloklarni baholashning asosiy mezonlari 1-jadval.

Mezon	Formal ta’rif	Formula	Talqin	Xavfsizlik oqibati
Balanslash-ganlik	Har bir chiqish qiymati teng ehtimollikda uchraydi	$\sum_{x\in\{0,1\}^n} (-1)^{f(x)} = 0$	Chiqish qiymatlarining **teng ehtimollikda taqsimlanganligini** bildiradi	Statistik hujumlarga qarshi himoya
Chiziqsizlik (Nonlinearity, NL)	Mantiqiy funksiyaning **barcha affine (chiziqli) funksiyalardan Hamming masofasi bo‘yicha eng kichik masofasi**	$NL(f) = \min_{g\in A_n} d_H(f,g)$ yoki $NL(f) = 2^{n-1} - \frac{1}{2}\max_{\omega\in F_2^n}\lvert W_f(\omega)\rvert$ bu yerda $W_f(\omega) = \sum_{x\in F_2^n} (-1)^{f(x)\oplus\omega\cdot x}$	Chiziqli yaqinlashtirishga qarshilik	Yuqori NL chiziqli kriptotahlil murakkabligi ortadi
Qat’iy lavina mezoni (Strict Avalanche Criterion, SAC)	Bitta kirish biti o‘zgarganda har bir chiqish biti 0.5 ehtimol bilan o‘zgaradi	$SAC_{i,j} = \frac{1}{2^n}\sum_{x\in F_2^n}\left(F_j(x) \oplus F_j(x\oplus e_i)\right)$ bu yerda i — kirish biti indeksi, j — chiqish biti indeksi, $F_j(x)$ — chiqishning j-biti, $x\oplus e_i$ — x ning i-biti o‘zgargan holati	Lokal diffuziya $SAC_{i,j} = 0.5$ bo‘lsa mezon bajarilgan bo‘ladi.	Past SAC differensial xossalar buziladi
Bit mustaqillik mezoni (Bit Independence Criterion, BIC)	Kirish vektorining istalgan bitta biti o‘zgartirilganda, chiqish bitlarining o‘zgarishlari **o‘zaro statistik jihatdan mustaqil**	$BIC = \max_{i\in\{1,\dots,n\}} \max_{j\neq k} \lvert Corr\left(\begin{matrix}S_j(x)\oplus S_j(x\oplus\\ S_k(x)\oplus S_k(x\oplus\end{matrix}\right.$	Bu mezon kriptografik funksiyaning statistik barqarorligini oshiradi va uni turli kriptoanalitik hujumlarga nisbatan	Differensial hujumlarga qarshi barqarorlik oshadi va statistik bog‘liqlik yo‘qoladi.

	(korrelyatsiya-siz) bo‘lishi talab qilinadi.		mustahkam qiladi. $BIC \approx 0$ bo‘lsa mezon bajarilgan bo‘ladi.	
Differensial bir xillik darajasi (Differential Uniformity)	kriptografik funksiyaning kirish farqlari uchun chiqish farqlarining maksimal takrorlanish sonini ifodalovchi ko‘rsatkich bo‘lib,	$\delta_F = \max_{a \in F_2^n \setminus \{0\}, b \in F_2^m} \lvert\{x \in F_2^n \mid F(x) \oplus F(x \oplus a) = b\}\rvert$ Bu yerda $F: F_2^n \to F_2^m$ — S-box yoki vektorli funksiya $a \neq 0$ — kirish farqi b — chiqish farqi δ_F — differensial uniformlik (maksimal chastota)	Differensial tarqalish nazorati va differensial kriptoanalizga nisbatan barqarorlikni baholaydi	Differensial uniformlik qancha kichik bo‘lsa, funksiya shuncha kuchli hisoblanadi . $\delta_F \downarrow \Rightarrow xavfsizlik \uparrow$
Chiziqli taxmin ehtimoli (Linear Approximation Probability, LAP)	kriptografik funksiya uchun kirish va chiqish bitlari orasidagi chiziqli bog‘lanishning **qanchalik ehtimollik bilan bajarilishini** o‘lchovchi ko‘rsatkich	yoki $LAP(a,b) = \frac{\lvert W_F(a,b)\rvert}{2^n}$ $W_F(a,b) = \sum_{x \in F_2^n} (-1)^{a \cdot x \oplus b \cdot F(x)}$		
Chiziqli bog‘lanishning maksimal og‘ishi				
DDT dagi maksimal nisbiy chastota (DAP — Differential Approximation Probability)	DDT (Difference Distribution Table) uchun maksimal nisbiy chastota — bu S-box yoki vektor Boolean funksiyaning kirish farqi berilganda chiqish farqining yuzaga kelish ehtimolining maksimal qiymatidir.	$DAP = \frac{\delta_S}{2^n}$	DAP differensial kriptoanalizda muhim ko‘rsatkich bo‘lib, u S-boxning differensial hujumlarga chidamliligini baholaydi.	Qiymat qanchalik kichik bo‘lsa, S-box shunchalik kuchli hisoblanadi. Maksimal qiymat esa eng “zaif” differensial o‘tishni bildiradi.
Algebraik daraja	ANF dagi eng yuqori monom darajasi	$\deg(S) = \max_i \deg(S_i)$	Algebraik murakkablik	Yuqori tartibli daraja differensial va algebraik

				hujumlarga qarshi
Shaffoflik tartibi (TO — Transparency Order)	komponent Boolean funksiyalar S i va Sj lar uchun ularning Walsh spektrlari asosida hisoblangan o‘zaro korrelyatsiya-lar yig‘indisining maksimal (yoki o‘rtacha) bahosidir.	$TO(S) = \max_{i \neq j} \frac{1}{2^n} \sum_{a \in \mathbb{F}_2^n} W_{S_i}(a) W_{S_j}(a)$ $a \in F_2^n$–barcha kirish vektorlar	Quvvat tahliliga chidamlilik	
Absolyut ko‘rsatkich	bu Boolean funksiya yoki S-boxning avtokorrelyatsiya funksiyasining maksimal moduli bo‘lib, u funksiyaning o‘ziga o‘zi nisbatan siljitilganda qanchalik bog‘liqligini o‘lchaydi.	$\Delta_S = \max_{a \neq 0} \left\| \sum_{x \in \mathbb{F}_2^n} (-1)^{S(x) \oplus S(x \oplus a)} \right\|$	kichik bo‘lsa:yaxshi **diffuziya**, yuqori **chiziqsizlik**,hujumlarga (ayniqsa linear va differensial) chidamli.	
Bumerang yagona qiymati	Boomerang Connectivity Table) dagi maksimal qiymat bo‘lib, u berilgan kirish va chiqish farqlari ostida bumerang shartini qanoatlantiruvchi kirishlar sonini o‘lchaydi	$\beta_S = \max_{a \neq 0,\, b \neq 0} \left\| \begin{Bmatrix} x \in \mathbb{F}_2^n \mid \\ S^{-1}(S(x) \oplus b) \oplus \\ S^{-1}(S(x \oplus a) \oplus b) \\ = a \end{Bmatrix} \right\|$	**Ikki tomonlama differensial barqarorlikni** o‘lchaydi.	**Differensial hujumga zaiflik ortadi.**
Kvadratlar yig‘indisi ko‘rsatkichi (SSI — Sum of Squared Indicators)	bu Boolean funksiya yoki S-boxning avtokorrelyatsiya funksiyasi qiymatlarining kvadratlari yig‘indisi bo‘lib, u **spektral energiyaning taqsimlanishini**	$\sigma_S = \sum_{a \in \mathbb{F}_2^n} \left(\Delta_S(a)\right)^2$	SSI **spektral konsentratsiyani** o‘lchaydi ya’ni energiya qanchalik “bir joyga yig‘ilgan” yoki tarqalgan.	Katta SSI avtokorrelyatsiya ba’zi nuqtalarda katta strukturaviy bog‘liqlik mavjud lokal chiziqsiz-lik past

	(konsentratsiya sini) baholaydi.			
Qo‘zg‘almas nuqtalar	S(x)=x sharni qanoatlantiriuvchi nuqtalar	FP ={x : S(x) = x}		
Chiziqli strukturalar	bu shunday nolga teng bo‘lmagan $a \in F_2^n$ vektor mavjud bo‘lib, S-box S uchun barcha x lar uchun chiqish farqi o‘zgarmas bo‘ladi:	$LS(S) = \{a \in \mathbb{F}_2^n \setminus \{0\} \mid \exists c \in \mathbb{F}_2^m : \forall x, S(x) \oplus S(x \oplus a) = c\}$	LS mavjud bo‘lsa Bu holat differensial kriptoanalizni juda osonlashtiradi	LS mavjud emas xavfsiz.
Siklik tuzilma	bu S-box S ning permutatsiya sifatida qaralganda, elementlar ustida hosil qiladigan sikllarining uzunligi va sonini tavsiflovchi xususiyatdir.	$\text{Cycle}_S(x) = \begin{pmatrix} x, S(x), S^2(x), \ldots \\ , S^k(x) = x \end{pmatrix}$	S-box iterativ qo‘llanganda (masalan, blok shifrlarda):	Qisqa sikllar (< 4) kriptotahlilni osonlashtiradi

Metodologiya. Tadqiqotda S-bloklarni baholash uchun quyidagi bosqichli metodologiya qo‘llanildi:

1. Generatsiya/ Tanlash:

— Algebraik: $GF(2^8)$ da teskari funksiya + affina transformatsiya (AES)

— Tasodifiy: Bir xil taqsimotlangan permutatsiyalar

— Optimallashtirilgan: Ko‘p maqsadli genetik algoritmlar yordamida NL va δ_S ni optimallashtirish [13,14].

2. Hisoblash jarayoni:

- Truth table → ANF → Walsh-Hadamard spektri
- DDT va LAT matritsalarini $O(2^{2n})$ murakkablikda hisoblash
- SAC/BIC matritsalari, BCT, avtokorrelyatsiya, TO hisoblash

3. Dasturiy ta’minot: SageMath 9.7 + Python 3.10 (NumPy, SymPy), C++ yordamida DDT/LAT generatsiyasi. Validatsiya NIST SP 800-22 testlariga moslashtirilgan statistik tekshiruvlar bilan amalga oshirildi. Quyida DDT hisoblashning psivdakodi

```
def compute_DDT(S):
n = len(S).bit_length()
DDT = [[0]*2n for _ in range(2n)]
for a in range(1, 2n):
for x in range(2n):
b = S[x] ^ S[x ^ a]
DDT[a][b] += 1
return max(max(row) for row in DDT)
```

Metrikalar o‘rtasidagi bog‘liqlikni tahlil qilish uchun Pearson/Spearman korrelyatsiya matritsalari, Pareto front analizi va ko‘p o‘lchovli scaling (MDS) qo‘llanildi.

Eksperimental natijalar va tahlil. Quyida 8×8 o‘lchamli uch turdagi S-blok (AES, tasodifiy, optimallashtirilgan) uchun hisoblangan asosiy metrikalar solishtirma jadvalda keltirilgan.

Eksperimental natijalar jadvali 2-jadval.

Mezon	AES S-blok	Tasodifiy S-blok	Optimallashtirilgan S-blok
Chiziqli bo‘lmaganlik (NL)	112	85–108	114
Differensial yagona qiymat (δ_S)	4	6–14	4
Algebraik daraja	7	5–6	7
Shaffoflik tartibi (TO)	7.62	6.8–7.1	7.9
Bumerang yagona qiymati (β_S)	4	5–8	4
Kvadratlangan spektral ko‘rsatkichlar (SSI)	1024	1400–2100	980
Qo‘zg‘almas nuqtalar	1	0–3	0
Chiziqli strukturalar	0	0–1	0
Eng qisqa sikl uzunligi	87	12–45	102

- AES S-bloki metrikalar o‘rtasidagi muvozanatni saqlaydi: yuqori NL, past δ_S optimal TO va β_S. Bu uning ko‘plab kriptotahlilga chidamliligini taminlaydi.

- Tasodifiy S-bloklarda metrikalar turlicha taqsimlanadi: ba’zilari yuqori NL ko‘rsatadi, lekin $\delta_S \geq 6$ yoki TO < 7.0 bo‘lib, differensial yoki quvvat tahliliga zaif bo‘ladi.

- Optimallashtirilgan S-blok NL va SSI ni yaxshilasa ham, TO va siklik uzunlikdagi o‘zgarishlar amaliy jihatdan qo‘shimcha verifikatsiyani talab qiladi. Bu esa ko‘p maqsadli optimallashtirishda Pareto chegarasining mavjudligini ko‘rsatadi.

Muhokama. S-blok dizaynida eng muhim muammo metrikalar o‘rtasidagi fundamental kompromisslardir. Masalan, chiziqli bo‘lmaganlikni maksimal darajaga oshirish algebraik darajani pasaytirishi yoki differensial yagona qiymatni oshirishi mumkin [4], [16]. TO va β_S ko‘rsatkichlari quvvat tahlili va bumerang hujumlariga qarshi himoya qilishda muhim, ammo ularni optimallashtirish S-blokning apparatdagi murakkabligini oshiradi [10], [12]. S bloklarni optimallashtirishdagi asosiy muammolar:

1. NP-qiyinlik: Ko‘p maqsadli S-blok optimallashtirish diskret, ko‘p o‘lchovli va global optimum topish qiyin bo‘lgan masala [13].

2. Metrikalar konflikti: NL va δ_S bir vaqtda minimal chegaraga erishmaydi (Carlet chegarasi [5]).

3. Amaliy cheklovlar: Kichik apparat resurslari (IoT, RFID) yuqori algebraik daraja yoki murakkab TO talab qiluvchi S-bloklarni qo‘llashni qiyinlashtiradi [25].

Kvant hisoblash sharoitida Grover algoritmi kalit izlashni $O(\sqrt{N})$ ga tushiradi, lekin S-bloklarning chiziqli bo‘lmagan xossalari post-kvant shifrlarida ham muhimligicha qoladi. Shu bilan birga, AI/ML asosidagi S-blok generatsiyasi [27], [28] avtomatlashtirishni oshirsa-da, ularning matematik verifikatsiyasi va formal isbotlangan xavfsizlik chegaralari hali yetarli emas.

Xulosa. Ushbu ishda S-bloklarning kriptografik tahlilini nazariy, matematik va hisoblash jihatdan kompleks tahlil qilindi. 15 ta asosiy mezon formalizatsiya qilindi, ularning o‘zaro bog‘liqligi va xavfsizlik oqibatlari tahlil qilindi. Tajribaviy natijalar shuni ko‘rsatdiki, AES S-bloki metrikalar muvozanati jihatidan optimal bo‘lib, tasodifiy yoki maqsadli optimallashtirilgan S-bloklardan samarali hisoblanadi.

Ushbu natijalar kriptografik standartlar ishlab chiqish, shifrlar verifikatsiyasi va zamonaviy kriptotahlil metodologiyasini takomillashtirishda ilmiy va amaliy ahamiyatga ega.

Аннотация. *В данной работе рассматривается задача прогнозирования распространения вредных аэрозольных частиц в атмосфере с учетом процессов почвенной эрозии и воздействия метеорологических факторов. Математическая модель основана на системе дифференциальных уравнений в частных производных, описывающих перенос и диффузию частиц в атмосферном пограничном слое. В связи со сложностью аналитического решения задачи разработан численный алгоритм, основанный на конечно-разностной аппроксимации дифференциальных операторов. На основе предложенного алгоритма реализован программный комплекс, с помощью которого проведены вычислительные эксперименты при различных значениях скорости ветра, коэффициента турбулентности, шероховатости поверхности и влажности почвы. Результаты моделирования показали, что распределение концентрации вредных веществ существенно зависит от вертикального профиля коэффициента турбулентности, а также от направления и скорости ветра. Установлено, что увеличение скорости ветра приводит к экспоненциальному росту переноса аэрозольных частиц, тогда как повышение влажности почвы снижает интенсивность их выброса. Полученные результаты могут быть использованы для экологического мониторинга, оценки загрязнения атмосферы и принятия управленческих решений в условиях Приаральского региона.*

Ключевые слова: *моделирование, атмосферная диффузия, аэрозольные частицы, почвенная эрозия, эксперимент, загрязнение атмосферы.*

RESEARCH AND MODELING FOR PREDICTING THE DISTRIBUTION OF HARMFUL SUBSTANCES IN THE ATMOSPHERE CONSIDERING ENVIRONMENTAL FACTORS

Abstract. *This paper addresses the problem of predicting the dispersion of harmful aerosol particles in the atmosphere, accounting for soil erosion processes and the impact of meteorological factors. The mathematical model is based on a system of partial differential equations describing the transport and diffusion of particles within the atmospheric boundary layer. Due to the complexity of the analytical solution, a numerical algorithm based on finite-difference approximation of differential operators has been developed. A software package was implemented using the proposed algorithm to conduct computational experiments under various values of wind speed, turbulence coefficient, surface roughness, and soil moisture. Simulation results demonstrate that the concentration distribution of harmful substances significantly depends on the vertical profile of the turbulence coefficient, as well as wind direction and speed. It was established that an increase in wind speed leads to an exponential growth in aerosol particle transport, while higher soil moisture reduces the intensity of their emission. The results obtained can be utilized for environmental monitoring, air pollution assessment, and management decision-making within the Aral Sea region.*

Keywords: *modeling, atmospheric diffusion, aerosol particles, soil erosion, experiment, air pollution.*

ATROF-MUHIT OMILLARINI HISOBGA OLGAN HOLDA ATMOSFERADA ZARARLI MODDALAR TAQSIMLANISHINI PROGNOZLASH UCHUN TADQIQOTLAR VA MODELLASHTIRISH

Annotatsiya. *Ushbu ishda tuproq eroziyasi jarayonlari va meteorologik omillarning ta’sirini hisobga olgan holda atmosferada zararli aerozol zarralarining tarqalishini prognozlash masalasi ko‘rib chiqiladi. Matematik model atmosfera chegara qatlamida*

zarralarning ko'chishi va diffuziyasini tavsiflovchi xususiy hosilali differensial tenglamalar tizimiga asoslangan. Masalaning analitik yechimi murakkabligi sababli, differensial operatorlarning chekli-ayirmali approksimatsiyasiga asoslangan sonli algoritm ishlab chiqilgan. Taklif etilgan algoritm asosida dasturiy majmua amalga oshirildi, uning yordamida shamol tezligi, turbulentlik koeffitsiyenti, sirt g'adir-budurligi va tuproq namligining turli qiymatlarida hisoblash tajribalari o'tkazildi. Modellashtirish natijalari zararli moddalar konsentratsiyasining taqsimlanishi turbulentlik koeffitsiyentining vertikal profiliga, shuningdek, shamol yo'nalishi va tezligiga sezilarli darajada bog'liqligini ko'rsatdi. Shamol tezligining oshishi aerozol zarralari ko'chishining eksponensial o'sishiga olib kelishi, tuproq namligining ortishi esa ularning ajralib chiqish intensivligini kamaytirishi aniqlandi. Olingan natijalardan ekologik monitoring, atmosfera ifloslanishini baholash va Orol bo'yi mintaqasi sharoitida boshqaruv qarorlarini qabul qilishda foydalanish mumkin.

Введение

В последние десятилетия проблема загрязнения атмосферы мелкодисперсными аэрозольными частицами приобретает всё большую актуальность, особенно в регионах с нарушенным экологическим равновесием. Одним из таких регионов является Приаралье, где вследствие высыхания Аральского моря сформировались обширные территории, являющиеся источниками пылевых и солевых выбросов. Под воздействием ветровой эрозии значительные массы частиц поднимаются в атмосферу и переносятся на большие расстояния, оказывая негативное влияние на окружающую среду, сельское хозяйство и здоровье населения. Процессы переноса и диффузии аэрозольных частиц в атмосфере имеют сложный многопараметрический характер и зависят от ряда факторов, включая скорость и направление ветра, турбулентность атмосферного пограничного слоя, свойства подстилающей поверхности и влажность почвы. Особую роль играет почвенная эрозия, которая определяет интенсивность поступления загрязняющих веществ в атмосферу.

Для адекватного описания данных процессов широко применяются математические модели, основанные на дифференциальных уравнениях в частных производных. Однако аналитическое решение таких задач в большинстве случаев невозможно из-за их сложности, что обусловливает необходимость использования численных методов и проведения вычислительных экспериментов. Целью данной работы является разработка и исследование математической модели распространения вредных веществ в атмосфере с учетом эрозии почвы, а также проведение вычислительных экспериментов для анализа влияния основных факторов на динамику загрязнения. Реализация предложенного подхода позволяет получить количественные оценки концентраций аэрозольных частиц и выявить закономерности их распространения, что имеет важное значение для экологического мониторинга и принятия управленческих решений.

Постановка задачи

Одной из актуальных задач современной экологии и прикладной математики является прогнозирование распространения вредных веществ в атмосфере, особенно в регионах с выраженными процессами деградации окружающей среды, таких как Приаралье. Осушенное дно Аральского моря является мощным источником пылевых и солевых аэрозолей, оказывающих негативное влияние на экологическое состояние и здоровье населения. Сложность данной задачи обусловлена многофакторным характером процесса, включающим влияние скорости и направления ветра, турбулентности атмосферы, шероховатости поверхности, а также влажности почвы. Дополнительную трудность представляет необходимость учета процессов эрозии почвы, определяющих интенсивность поступления аэрозольных частиц в атмосферу.

Аналитическое решение задач переноса и диффузии вредных веществ, описываемых многомерными дифференциальными уравнениями в частных производных с соответствующими начальными и граничными условиями, является затруднительным. В связи с этим возникает необходимость разработки эффективных численных методов и алгоритмов, позволяющих проводить вычислительные эксперименты и получать достоверные прогнозы. Таким образом, требуется создание математической модели и численного алгоритма, обеспечивающих адекватное описание процессов распространения вредных веществ в атмосфере с учетом эрозии почвы и метеорологических факторов.

Моделирование процесса распространения вредных веществ с использованием сети Петри

Для формализации и анализа процессов переноса и диффузии вредных аэрозольных частиц в атмосфере предлагается использование аппарата сетей Петри. Данный подход позволяет описать многопараметрическую динамическую систему с параллельными и взаимосвязанными процессами, учитывающими влияние метеорологических факторов и эрозии почвы.

Сеть Петри определяется как кортеж: $PN = (P, T, F, M_0)$,

где P — множество позиций, T — множество переходов, F — множество дуг, а M_0 — начальная маркировка сети.

В рамках разработанной модели введено десять позиций:

- P_1 — наличие аэрозольных частиц на поверхности почвы;
- P_2 — состояние почвенной эрозии;
- P_3 — поток частиц, поступающих в атмосферу;
- P_4 — влияние скорости ветра;
- P_5 — коэффициент турбулентности;
- P_6 — концентрация частиц в атмосфере;
- P_7 — вертикальная диффузия;
- P_8 — горизонтальный перенос;
- P_9 — процесс осаждения частиц;
- P_{10} — результаты экологического мониторинга.

Функционирование системы описывается следующими переходами:

- T_1 — инициация процесса эрозии;
- T_2 — подъём частиц в атмосферу;
- T_3 — перенос частиц под воздействием ветра;
- T_4 — турбулентная диффузия;
- T_5 — формирование концентрации загрязняющих веществ;
- T_6 — осаждение аэрозольных частиц;
- T_7 — мониторинг и оценка состояния среды.

Связи между позициями и переходами задаются следующим образом:

$$\begin{gathered} P_1 \to T_1 \to P_2, \\ P_2 \to T_2 \to P_3, \\ P_3 + P_4 \to T_3 \to P_8, \\ P_3 + P_5 \to T_4 \to P_7, \\ P_7 + P_8 \to T_5 \to P_6, \\ P_6 \to T_6 \to P_9, \\ P_6 + P_9 \to T_7 \to P_{10}. \end{gathered}$$

Начальное состояние сети определяется наличием токена в позиции источника загрязнения:

Разработанная сеть Петри отражает последовательность и параллелизм процессов, происходящих при распространении вредных веществ в атмосфере. Изначально аэрозольные частицы находятся на поверхности почвы и под воздействием эрозии переходят в атмосферу. Далее их перенос осуществляется под влиянием скорости ветра и турбулентности, что приводит к формированию пространственного распределения концентрации. В дальнейшем происходит осаждение частиц на подстилающую поверхность, а также формирование данных для экологического мониторинга.

Таким образом, для рассматриваемой задачи имеем дифференциальное уравнение в частных производных первого порядка для определения объемного расхода уносимых атмосферным фронтом частиц. Интегрирование этого уравнения дает две произвольные постоянные(C_1, C_2). С учетом константы почвы «k_p» необходимо определить три постоянные C_1, C_2, k_p. Поэтому граничные условия должны быть заданы для трех значений F_0. Чтобы использовать меньше аргументов, принимаем следующие граничные условия [1]:

$$\left.\begin{array}{ll} F_0 = F_{0_1}: & \zeta = \zeta_1, \quad u = u_1; \\ F_0 = F_{0_2}: & \zeta = \zeta_2, \quad u = u_2; \\ F_0 = F_{0_3}: & \zeta = \zeta_3, \quad u = u_3. \end{array}\right\} \tag{18}$$

Решение (17) получено в виде

$$F_0 = c_1 \zeta^{c_2/k_p} e^{c_2 u}. \tag{19}$$

Так как задача (14)-(19) описывается полным дифференциальным уравнением в частных производных с соответствующими краевыми и внутренними условиями, то выписать решение в явной аналитической форме затруднительно. Для решения задачи разработан численный алгоритм, основанный на замене дифференциальных операторов на конечно-разностные отношения [2].

Для прогнозирования концентрации вредных веществ в атмосфере в зависимости от перечисленных выше параметров, погодно-климатических факторов и эрозии почвы на основе разработанного программного комплекса проведены ВЭ (рис. 1-8).

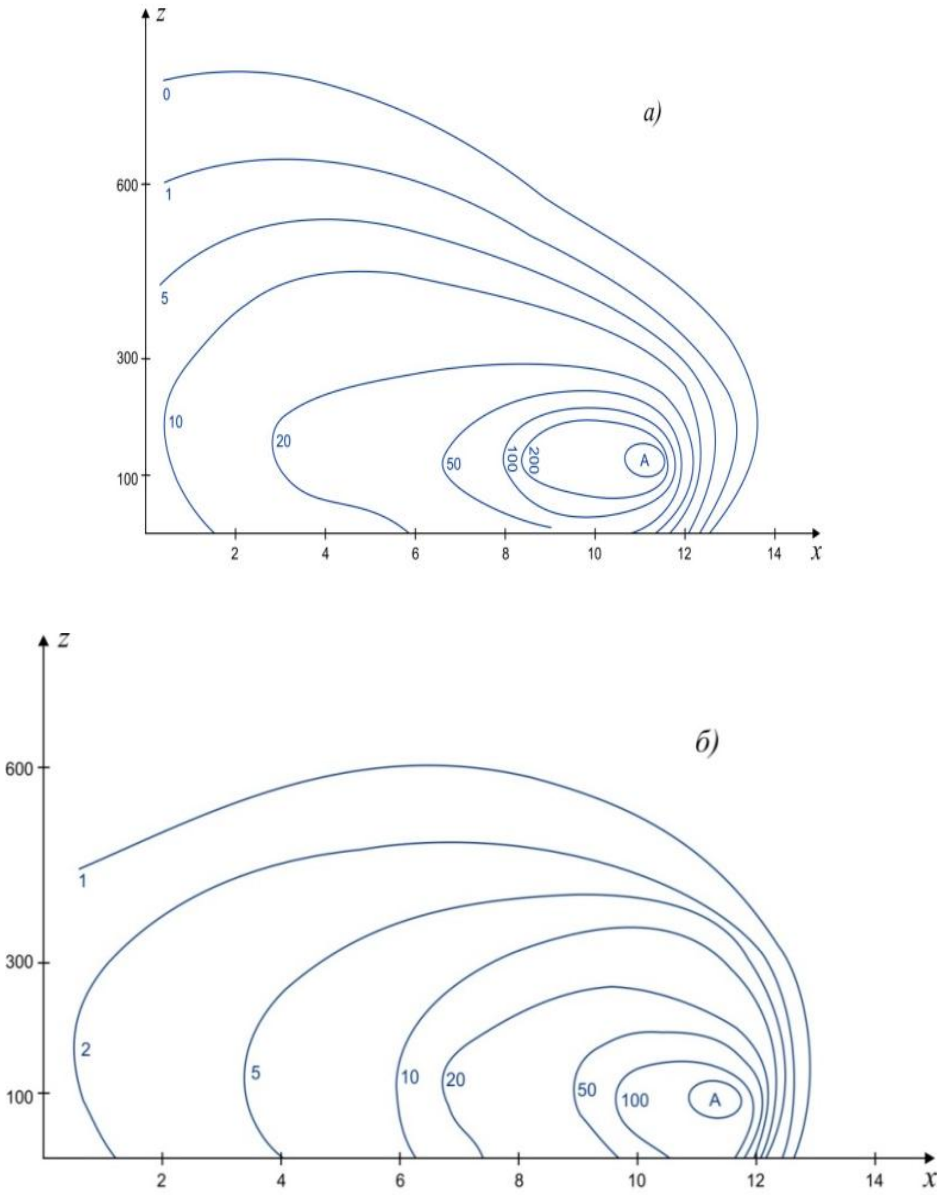

Рис. 1. Вертикальные профили$\theta(x, y_{11}, z, t_{10})$:
при а) $w_g = 0,06, k = k_2(z)$ б)$w_g = 0,2, k = k_2(z)$

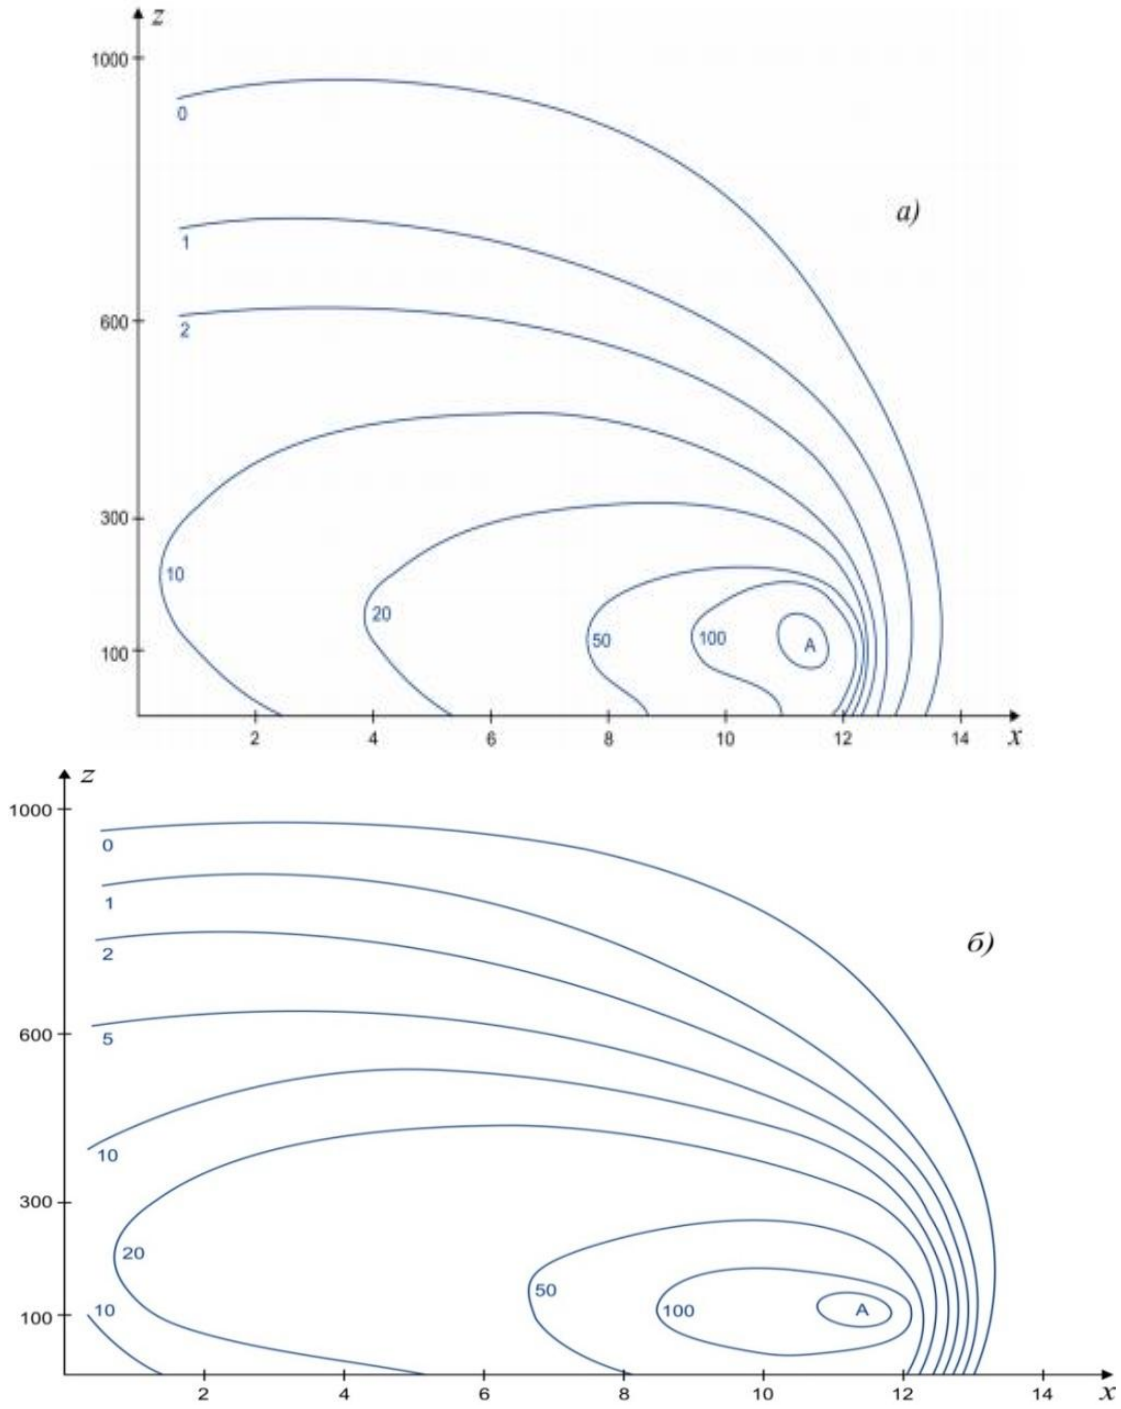

Рис. 2. Вертикальные профили$\theta(x, y_{11}, z, t_{10})$:
при а) $w_g = 0,2, k = k_2(z)$; б)$w_g = 0,003$, $k = k_2(z)$

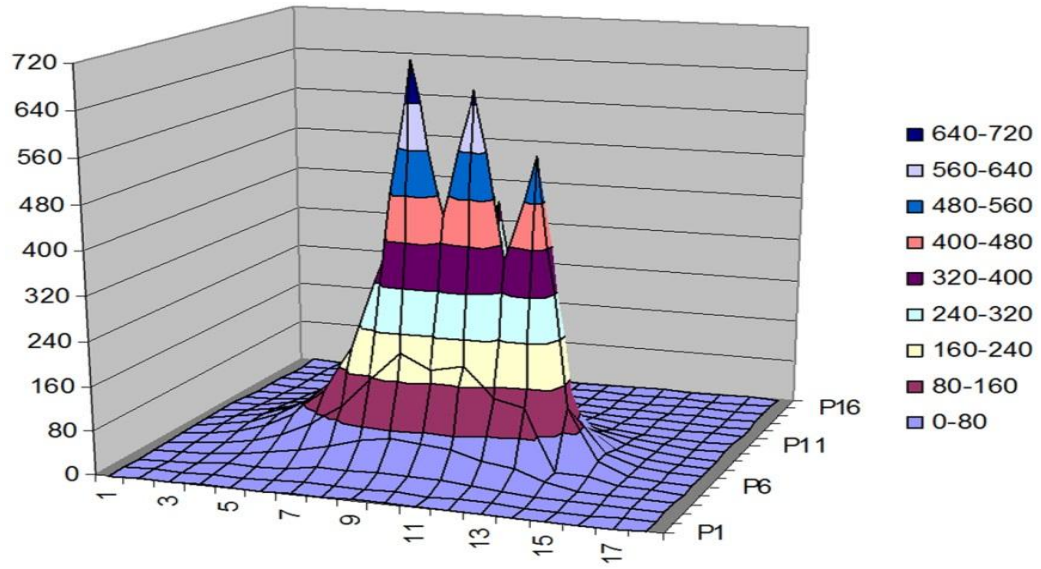

Рис. 3. Изменение концентрации вредных веществ в атмосфере при времени прогноза t = 17,5 ч, z = 300 м

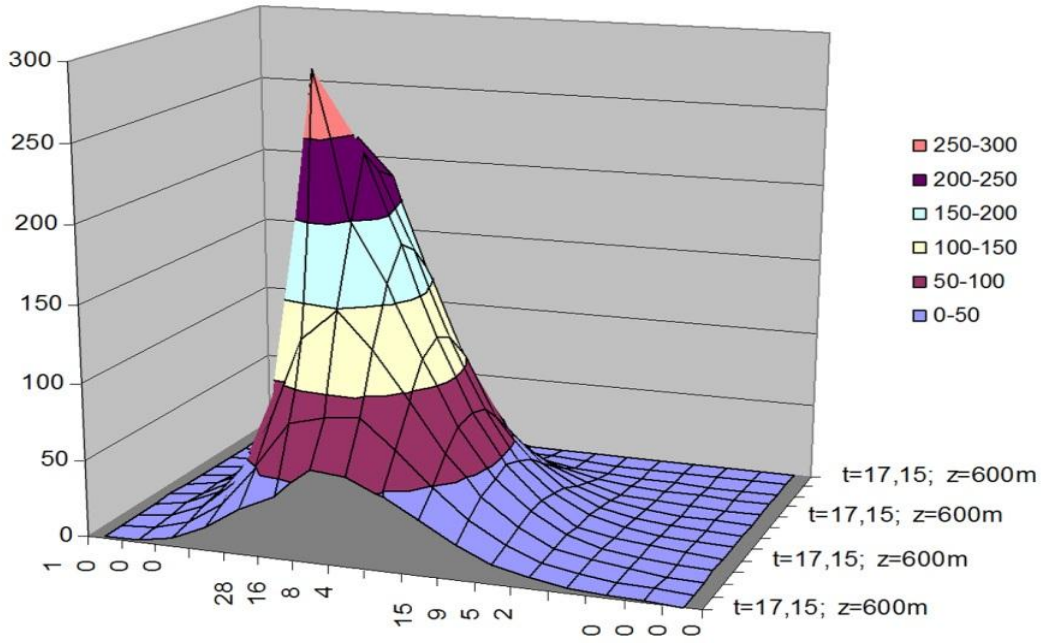

Рис. 4. Изменение концентрации вредных веществ в атмосфере при времени прогноза t = 17,5 ч, z = 600 м

Численные эксперименты проводились при различных значениях коэффициента турбулентности, шероховатости земли, горизонтальной и вертикальной скоростях ветра, различных значениях влажности почвы и т.д.

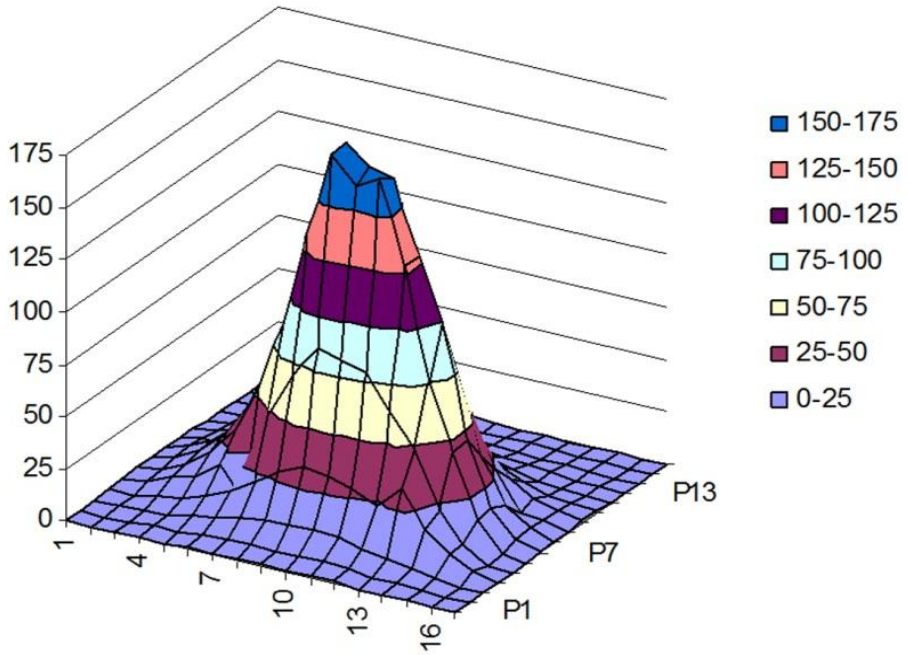

Рис. 5. Изменение концентрации вредных веществ в атмосфере при времени прогноза t = 17,5 ч, z = 1000 м

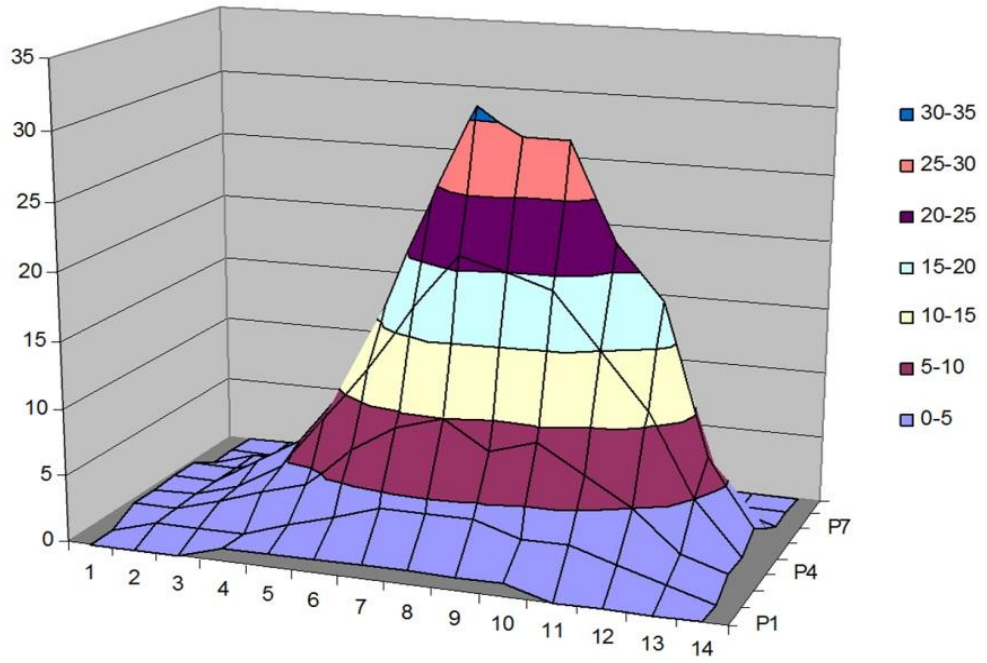

Рис. 6. Изменение концентрации вредных веществ в атмосфере при времени прогноза t = 6,30 ч, z = 1800 м

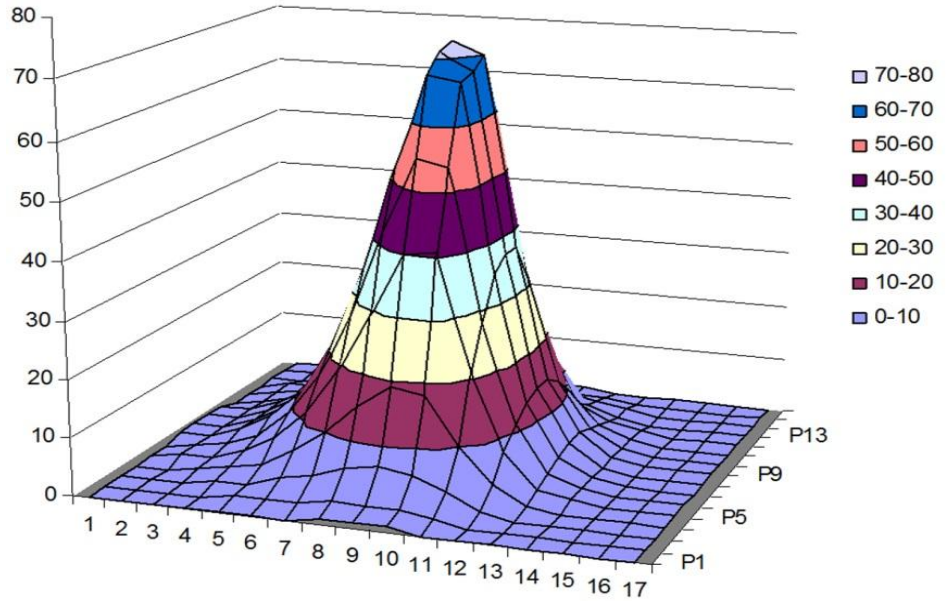

Рис. 7. Изменение концентрации вредных веществ в атмосфере при времени прогноза t = 17,5 ч, z = 1800 м

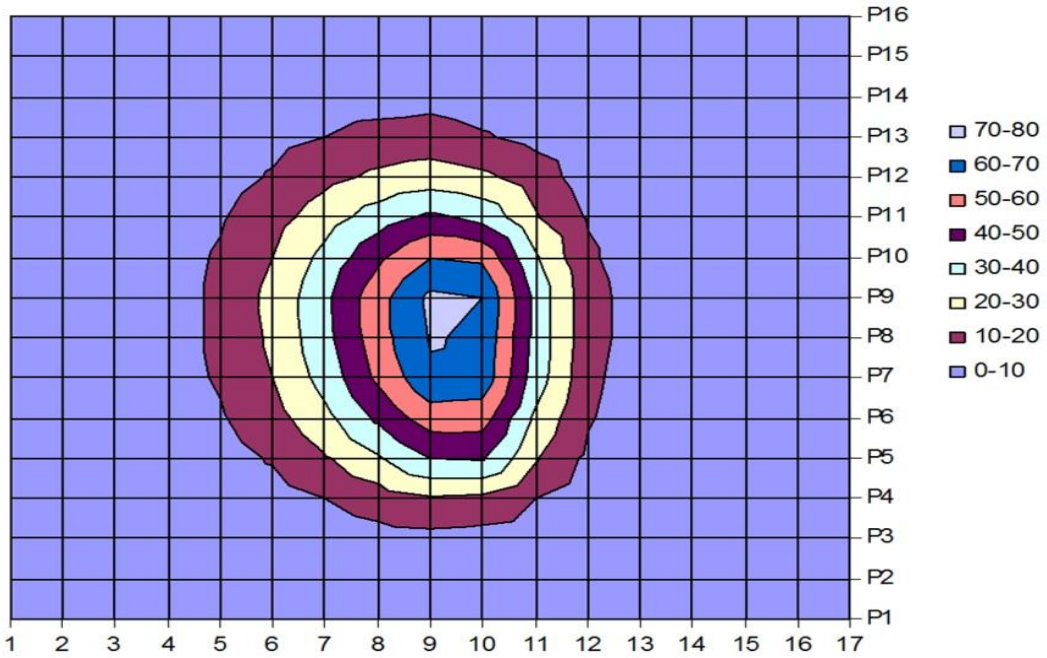

Рис. 8. Изменение концентрации вредных веществ в атмосфере при времени прогноза t = 17,5 ч, z = 1800 м

При использовании модели 1 перенос осуществлялся равномерно во всех уровнях в зависимости от направления скорости ветра. А из теории пограничного слоя известно, что при неустойчивой стратификации значение $k(z)$ растет до уровня 200-400 м и быстро падает с высотой, стремясь к нулю на верхней границе пограничного слоя (высота пограничного слоя при неустойчивой стратификации достигает 1000-1600 м), а при устойчивой стратификации $k(z)$ растет незначительно в приземном слое и падает с высотой (высота пограничного слоя – 400-600 м). Поэтому считаем целесообразным воспользоваться моделью 3.

На рис. 3 и 4 приведены концентрации $\theta(x, y_{11}, z, t_{10})$ в момент времени$t = t_0$, где источник расположен в точке $A(x, y_{11}, z_1)$. Расчеты проводились для области $D(0 < x, y > 21 * 10000$ м$, 0 < z < 2400$ м$)$ с шагом сетки $h_x = h_y = 10000$ м, L_z: 150, 300, 600, 1200, 2400 м, шаг по времени $\Delta t = 3600$ с, при различных значениях коэффициента турбулентности $k(z)$ и скорости осаждения w_g. Численные расчеты показывают, что перенос и диффузия осуществляются в зависимости от метеорологических условий, от свойств частиц и существенно зависят от распределения коэффициента турбулентности по вертикали.

Для прогноза распространения пыли и соли над осушенной частью Аральского моря воспользуемся моделью 3. *Для*$k(z)$ используется характерное значение при слабой неустойчивой стратификации, а *для* скорости ветра – степенной закон изменения. Область представляется как

$$D = \left(0 < x, y < 22 \times h_x, 0 < z < 1500 \text{ м}, h_x = h_y = 1500 \text{ м}, h_z = 100, 200, 300, 400, 500 \text{ м}\right).$$

Площадные источники расположены в северо-восточной части (рис. 2) осушенной части южного Приаралья. За период времени $[0, t_5]$ ветер направлен на юг, $[t_5, t_{10}]$- на юго-запад, шаг по времени $\Delta t = 3600$ с$(t_5 = 5 \times \Delta t, t_{10} = 10 \times \Delta t)$.

Итак, вычисляя концентрацию вредных веществ в атмосфере на сеточной области, можно определить требуемый функционал, имеющий различные физические интерпретации:

1. Полное количество аэрозоля в области D за время $[0, T]$:

$$J = \int_0^T \int_D \theta(x, y, z, t) dDdt.$$

2. Среднее значение количества аэрозоля в области D*или* $D_i \in D$ за период T:

$$J_{cp} = \frac{1}{T} \int_0^T \int_D \theta(x, y, z, t) dDdt, J_{i,cp} = \frac{1}{T} \int_0^T \int_{D_i} \theta(x, y, z, t) dD_i dt.$$

3. Количество аэрозоля, выпавшего на подстилающую поверхность:

$$J_0 = \left(w_g + \beta\right) \int_0^T \int_{\Omega_0} \theta(x, y, z_0, t) dxdydt,$$

$$J_{i,0} = \left(w_g + \beta\right) \int_0^T \int_{\Omega_{i,0}} \theta(x, y, z_0, t) dxdydt.$$

4. Количество аэрозоля, выпавшего на подстилающую поверхность в момент времени t_n в точке $r_k \in \Sigma_0$:

$$J = \left(w_g + \beta\right) \theta(x_k, y_k, z_0, t_n).$$

5. Количество аэрозоля, выпавшего на подстилающую поверхность за время $[0, T]$ в точке $r_k \in \Sigma_0$:

$$J = \left(w_g + \beta\right) \int_0^T \theta(x_k, y_k, z_0, t) dt.$$

6. Распределение количество аэрозоля, выпавшего на подстилающую поверхность:

$$J(x, y) = \left(w_g + \beta\right) \cdot \int_0^T \theta(x, y, z, t) dt,$$

$$r(x, y, z_0) \in \Omega_0.$$

В ходе ВЭ было установлено, что, когда источники находятся в северо-восточной части осушенной зоны Южного Приаралья или в средней части осушенной зоны при слабой неустойчивой стратификации, в случае с северным ветром аэрозоль не доходит до города Нукуса, а при северо-восточном ветре – достигает Нукуса.

Количество аэрозоля, выпавшего на Нукус, составило $5 \cdot 10^{-8}$(г/м^2), когда источники находятся в северо-восточной части, и $15 \cdot 10^{-8}$(г/м^2) – когда источники находятся в средней зоне.

Анализ проведенных ВЭ показал, что на объем уноса мелкодисперсных частиц с поверхности осушенной части Аральского моря существенно воздействуют:

а) составляющие скорости ветра на поверхности земли, с ростом этого параметра экспоненциально растет объем уносимых аэрозольных частиц в атмосферу;

б) влажность почвы, с ростом этого показателя резко уменьшается количество выброса вредных веществ в атмосферу;

с) коэффициент шероховатости земли.

Заключение

Предложенная модель на основе сети Петри позволяет формализовать сложный многопараметрический процесс распространения загрязняющих веществ, обеспечивая возможность его дальнейшего анализа и имитационного моделирования. Данный подход может быть использован как дополнение к численным методам решения дифференциальных уравнений, обеспечивая наглядное представление структуры процесса и взаимосвязей между его основными компонентами. В результате проведенного исследования разработана математическая модель и численный алгоритм для прогнозирования распространения вредных аэрозольных частиц в атмосфере с учетом процессов почвенной эрозии. Использование конечно-разностных методов позволило эффективно решить задачу, описываемую системой дифференциальных уравнений в частных производных. Проведенные вычислительные эксперименты показали, что ключевыми факторами, влияющими на перенос и диффузию вредных веществ, являются скорость и направление ветра, вертикальное распределение коэффициента турбулентности, шероховатость поверхности и влажность почвы. Установлено, что увеличение скорости ветра

приводит к значительному росту объема переносимых частиц, тогда как повышение влажности почвы оказывает сдерживающее воздействие на процессы эрозии.

Также выявлено, что направление ветра существенно влияет на зону распространения загрязнений, в частности, при определенных условиях аэрозольные частицы могут достигать населенных пунктов, таких как город Нукус. Полученные результаты подтверждают эффективность применения вычислительных экспериментов для анализа и прогноза экологических процессов. Разработанная модель может служить основой для создания систем экологического мониторинга и поддержки принятия решений, направленных на снижение негативного воздействия загрязнения атмосферы и обеспечение экологической безопасности региона.

Annotatsiya; *ALICE kollaboratsiyasi tomonidan o‘lchangan $\sqrt{s_{nn}} = 2.76\ va\ 5.02\ TeV$ energiyali Pb+Pb to‘qnashuvlarida markaziy jadallik sohasidagi birlamchi zaryadlangan zarrachalarning keng ko‘ndalang impuls sohasidagi ($p_T \leq 15$ GeV/c) taqsimotlari markaziylikka bog‘liq holda tahlil qilindi. Tahlil termodinamik jihatdan mos, ko‘ndalang oqimni hisobga oluvchi Tsallis funksiyasi asosida amalga oshirildi. Natijalar avvalgi tadqiqotlar bilan solishtirildi va periferik to‘qnashuvlarda ko‘ndalang oqim deyarli kuzatilmasligi, markaziylik ortishi bilan esa uning bosqichma-bosqich shakllanishi aniqlandi. Kinetik muzlash temperaturasi T_0 markaziylik oshishi bilan kamayishi kuzatildi. Shuningdek, adron fazasidan kvark-glyuon plazma (QGP) fazasiga o‘tish uchun mos keluvchi markaziylik sohalari baholanib, tegishli chegaraviy $\langle N_{part} \rangle$ qiymatlari baholandi.*

Kalit so‘zlar*: LHC (Large Hadron Collider – Katta Adron Kollayderi) dagi yuqori energiyali Pb+Pb to‘qnashuvlari; birlamchi zaryadlangan zarrachalarning ko‘ndalang impuls taqsimotlari; ko‘ndalang oqimni o‘z ichiga olgan Tsallis taqsimoti; noekstensivlik parametri q; ko‘ndalang oqim tezligi; kinetik muzlash temperaturasi.*

ЭВОЛЮЦИЯ РАСПРЕДЕЛЕНИЙ ПОПЕРЕЧНОГО ИМПУЛЬСА ПЕРВИЧНЫХ ЗАРЯЖЕННЫХ ЧАСТИЦ В ВЫСОКОЭНЕРГЕТИЧЕСКИХ PB+PB СТОЛКНОВЕНИЯХ В ЗАВИСИМОСТИ ОТ ЦЕНТРАЛЬНОСТИ

Аннотация; *Распределения поперечного импульса (p_T) первичных заряженных частиц, измеренные ALICE collaboration в Pb+Pb столкновениях при энергиях в системе центра масс $\sqrt{s_{nn}} = 2.76\ va\ 5.02$ ТэВ, были проанализированы в центральной области (псевдо)быстроты в широком диапазоне p_T ($p_T \leq 15$ GeV/c) в зависимости от центральности столкновений. Анализ выполнен с использованием термодинамически согласованной функции Цаллиса с учетом поперечного потока.*

Полученные результаты сопоставлены с предыдущими исследованиями и показано, что в периферических столкновениях поперечный поток практически отсутствует, тогда как с ростом центральности он постепенно формируется. Установлено, что температура кинетического «замерзания» T_0 уменьшается с увеличением центральности. Кроме того, оценены пороговые значения центральности, соответствующие переходу от плотного адронного состояния к фазе кварк-глюонной плазмы (КГП) или смешанному состоянию КГП–адрон, и определены соответствующие значения $\langle N_{part} \rangle$.

Ключевые слова: *высокоэнергетические Pb+Pb столкновения на LHC (Large Hadron Collider – Большой адронный коллайдер); распределения поперечного импульса первичных заряженных частиц; распределение Цаллиса с учётом поперечного потока; параметр неэкстенсивности q; скорость поперечного потока; температура*

EVOLUTION OF TRANSVERSE MOMENTUM DISTRIBUTIONS OF PRIMARY CHARGED PARTICLES IN HIGH-ENERGY PB+PB COLLISIONS AS A FUNCTION OF CENTRALITY

Abstract; *The transverse momentum p_T distributions of primary charged particles measured by the ALICE collaboration in Pb+Pb collisions at center-of-mass energies $\sqrt{s_{nn}} = 2.76\ and\ 5.02\ TeV$ were analyzed in the mid-(pseudo)rapidity region over a wide p_T range ($p_T \leq 15$ GeV/c) as a function of collision centrality. The analysis was performed using a thermodynamically consistent Tsallis function that incorporates transverse flow.*

The results were compared with previous studies, showing that transverse flow is nearly absent in peripheral collisions, while it gradually develops with increasing centrality. The kinetic freeze-out temperature T_0 was found to decrease with increasing centrality.

In addition, the centrality thresholds corresponding to the transition from a dense hadronic phase to the quark–gluon plasma (QGP) phase (or a mixed QGP–hadron phase) were estimated, and the corresponding values of $\langle N_{part} \rangle$ were estimated.

Keywords: *high-energy Pb+Pb collisions at the LHC; transverse momentum distributions of primary charged particles; Tsallis distribution with embedded transverse flow; non-extensivity parameter q; transverse flow velocity; kinetic freeze-out temperature*

Kirish

Yuqori energiyali yadrolararo to‘qnashuvlarda hosil bo‘ladigan kvark-glyuon plazma (QGP) juda qisqa vaqt davomida mavjud bo‘lib, deyarli ideal suyuqlik xususiyatlarini namoyon etadi. Ushbu tizim tez kengayish va sovish jarayonlari orqali kimyoviy va kinetik muzlash bosqichlariga o‘tadi. Ayniqsa, zarrachalarning ko‘ndalang impuls p_T taqsimotlarini tahlil qilish kinetik muzlash bosqichidagi tizimning termodinamik va gidrodinamik xossalarini aniqlashda muhim ahamiyatga ega [1–12].

An’anaviy eksponensial modellardan farqli ravishda, Tsallis statistikasi asosidagi taqsimot funksiyalari yuqori energiyali to‘qnashuvlarda zarrachalarning keng p_T sohadagi taqsimotlarini samarali tavsiflay oladi. Ushbu yondashuv tizimning effektiv temperaturasi va notermallashuv darajasini aniqlash imkonini beradi hamda ko‘ndalang oqimni hisobga olish orqali fizik tavsif yanada aniqlashtiriladi .

Mazkur ishda ALICE kollaboratsiyasi tomonidan [12] Pb+Pb to‘qnashuvlarida o‘lchangan birlamchi zaryadlangan zarrachalarning keng p_T sohadagi taqsimotlari termodinamik jihatdan mos Tsallis modeli asosida tahlil qilinadi. Tadqiqotning asosiy maqsadi kinetik muzlash parametrlarining markaziylikka bog‘liq evolyutsiyasini aniqlash va ularni avvalgi natijalar bilan qiyosiy tahlil qilishdan iborat.

2. Eksperimental ma’lumotlar va modellar.

Mazkur ishda ALICE kollaboratsiyasi tomonidan [12] $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalarda p+p, p+Pb va Pb+Pb to‘qnashuvlarida o‘lchangan birlamchi zaryadlangan zarrachalarning ko‘ndalang impuls (p_T) spektrlari $|\eta| < 0.8$ intervalida keng (p_T) sohadada tahlil qilindi. Pb+Pb to‘qnashuvlari uchun ma’lumotlar turli markaziylik sohalari bo‘yicha ajratilib, minimum-bias p+p va p+Pb natijalari taqqoslash (baseline) sifatida qo‘llanildi.

Pb+Pb to‘qnashuvlari uchun markaziylik sinflariga mos ravishda ishtirokchi nuklonlar sonining o‘rtacha qiymati ($\langle N_{part} \rangle$) va zaryadlangan zarrachalar sonining psevdojadallik bo‘yicha o‘rtacha zichligi $\langle dN_{ch}/d\eta \rangle$ qiymatlari Glauber–Monte Karlo modeli asosida aniqlanib, tahlilda foydalanildi.

Kimyoviy potensial TeV to’qnashuv energiya sohasida $\mu \approx 0$ deb olinganda, markaziy jadallik sohasida qo‘llaniladigan Tsallis funksiyasining quyidagi ko‘rinishi [8,9] bosim, temperatura, zarrachalar soni, energiya hamda entropiya zichliklari uchun termodinamik moslikni ta’minlaydi:

$$\frac{d^2N}{2\pi N_{ev} p_T dp_T dy} = C_q m_T \left(1 + (q-1)\frac{m_T}{T}\right)^{-\frac{q}{q-1}}, \quad (1)$$

Bu yerda C_q — moslashtirish konstantasi, N_{ev} noelastik to‘qnashuvlar soni, $m_T = \sqrt{p_T^2 + m_0^2}$ ko‘ndalang massa, m_0 adronning tinch holat massasi, T effektiv temperatura, q tizimning noekstensiv parametridir.

1-tenglamada keltirilgan effektiv temperatura T tizimdagi xaotik issiqlik harakati va kollektiv ko‘ndalang oqimning qo‘shma hissasini o‘z ichiga oladi.

Mazkur komponentlarni alohida ajratib o‘rganish uchun Tsallis taqsimot funksiyasiga ko‘ndalang oqim tezligini kiritish talab etiladi. Pb+Pb to‘qnashuvlarida $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalarda turli markaziyliklar uchun zaryadlangan zarrachalarning markaziy jadallik sohasidagi p_T taqsimotlarini to’g’ri tavsiflash maqsadida Tsallis taqsimotiga kollektiv ko‘ndalang oqim effekti kiritiladi. Shu maqsadda (2)-tenglamani hosil qilish uchun $m_T \to \langle \gamma_T \rangle$ $(m_T - p_T\langle \beta_T \rangle)$ almashtirish amalga oshiriladi, bu yondashuv birinchi marta [5] ishda taklif etilgan. Natijada quyidagi funksiya olinadi:

$$\frac{d^2N}{2\pi N_{ev} p_T dp_T dy} = C_q \langle \gamma_T \rangle (m_T - p_T\langle \beta_T \rangle) \left(1 + \langle \gamma_T \rangle \frac{(q-1)(m_T - p_T\langle \beta_T \rangle)}{T_0}\right)^{-\frac{q}{q-1}}, \quad (2)$$

Ushbu funksiya mazkur ish doirasida ko‘ndalang oqimni o‘z ichiga olgan termodinamik jihatdan mos Tsallis funksiyasi sifatida talqin etiladi.

2-tenglamani hosil qilishda amalga oshirilgan $m_T \to \langle \gamma_T \rangle$ $(m_T - p_T\langle \beta_T \rangle)$, almashtirish zarrachalarning ko‘ndalang tekislikdagi o‘rtacha kollektiv oqim tezligi $\langle \beta_T \rangle$ bilan birga harakatlanuvchi zarralar bilan birga harakatlanuvchi hisob tizimiga o‘tishni ifodalovchi Lorens transformatsiyasiga mos keladi, bunda ushbu oqim mavjud deb qaraladi.

Markaziy jadallik sohasida eksperimental o‘lchangan ko’ndalang impuls p_T taqsimotlari uchun $d^2N/(N_{ev}dp_Tdy)$ ko‘ndalang oqimni o‘z ichiga olgan termodinamik jihatdan mos Tsallis funksiyasi quyidagi ifodaga ega bo‘ladi:

$$\frac{d^2N}{N_{ev}dp_Tdy} = 2\pi\, C_q p_T\langle\gamma_T\rangle(m_T - p_T\langle\beta_T\rangle)\left(1 + \langle\gamma_T\rangle\frac{(q-1)(m_T - p_T\langle\beta_T\rangle)}{T_0}\right)^{-\frac{q}{q-1}} \quad (3)$$

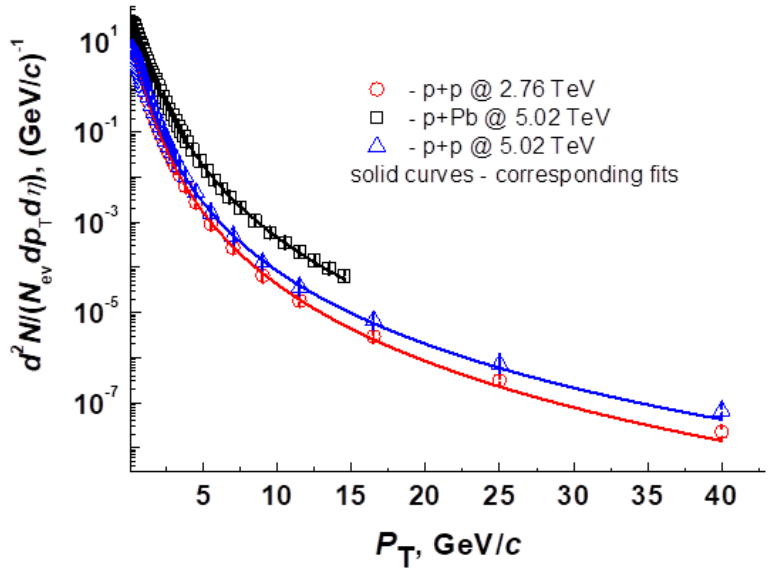
3. Tahlil va natijalar

Termodinamik jihatdan mos Tsallis funksiyasi (3-tenglama) asosida, ko‘ndalang oqimni hisobga olgan holda, minimum χ^2 usuli bilan olingan fitlash natijalari minimum-bias p+p $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV hamda p+Pb $\sqrt{s_{nn}}$=5.02 TeV to‘qnashuvlarida hosil bo‘lgan birlamchi zaryadlangan zarrachalarning markaziy (psevdo)jadallik sohasidagi p_T spektrlari uchun 1-jadvalda taqdim etilgan.

1-jadval. (3)-tenglamada keltirilgan funksiya asosida minimum χ^2 fitlash amalga oshirilgan moslash natijalari minimum-bias p+p $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV hamda p+Pb $\sqrt{s_{nn}}$ = 5.02 TeV.. to‘qnashuvlarida hosil bo‘lgan zaryadlangan zarrachalarning eksperimental markaziy (psevdo)jadallik sohasidagi ko‘ndalang impuls spektrlari uchun keltirilgan. Bu yerda *n.d.f.* (number of degrees of freedom) — erkinlik darajalari sonini bildiradi.

Collision type / **Parameters**	**p+p @ 2.76 TeV**	**p+p @ 5.02 TeV**	**p+Pb @ 5.02 TeV**
$\chi 2/n.d.f.$	3.2/35	16.9/35	20.1/35
C_q, (GeV/c)$^{-3}$	173±16	168±20	302±57
$\langle\beta_T\rangle$ (in units of c)	~ 10^{-7}	~ 10^{-7}	~ 10^{-7}
q	1.142±0.001	1.148±0.002	1.136±0.002
T_0 (MeV)	103±8	106±11	139±25

$\sqrt{s_{nn}}$ = 2.76 TeV and 5.02 TeV energiyalardagi minimum bias p+p hamda $\sqrt{s_{nn}}$ = 5.02 TeV dagi minimum bias p+Pb to‘qnashuvlarida ko‘ndalang oqim tezligi deyarli nolga tengligi aniqlandi (1-jadval). Bu holat shuni bilan izohlanadiki, minimum-bias p+p va p+Pb to‘qnashuvlarining aksariyati zarrachalar ko‘payishi past bo‘lgan periferik to‘qnashuvlardan iborat bo‘lib, ularda ko‘ndalang oqim kuzatilmaydi [4, 6, 7]. So‘nggi paytlarda ALICE ma’lumotlari tahlili asosida aniqlanishicha [4, 6, 11], sezilarli ko‘ndalang oqim faqat zarrachalar ko‘payishi yetarlicha yuqori bo‘lgan yuqori energiyali p+p [4, 6] va p+Pb [11] to‘qnashuv hodisalarida rivojlanadi, bunday hodisalar esa umumiy statistikaning juda kichik qismini tashkil etadi. $\sqrt{s_{nn}}$ = 2.76 TeV and 5.02 TeV energiyalardagi minimum bias p+p hamda $\sqrt{s_{nn}}$ = 5.02 TeV dagi minimum bias p+Pb to‘qnashuvlarida hosil bo‘lgan zaryadlangan zarrachalarning markaziy (pseudo)jadallik sohasidagi ko‘ndalang impuls (p_T) spektrlari (belgilar bilan ifodalangan) va (3)-tenglama asosida olingan fitlash egri chiziqlari (uzluksiz chiziqlar) 1-rasmda keltirilgan.



1-rasm. $\sqrt{s_{nn}}$ = 2.76 TeV and 5.02 TeV energiyalardagi minimum bias p+p hamda $\sqrt{s_{nn}}$ = 5.02 TeVdagi minimum bias p+Pb to‘qnashuvlarida hosil bo‘lgan zaryadlangan zarrachalarning o‘rta jadallik sohasidagi ko‘ndalang impuls (p_T) spektrlari (belgilar bilan ifodalangan) va (3)-tenglama asosida olingan fitlash egri chiziqlari (uzluksiz chiziqlar) keltirilgan.

$(s_{nn})^{1/2}$ = 5.02 TeV energiyadagi Pb+Pb to'qnashuvlarida zaryadlangan zarrachalarning o'rta jadallik sohasidagi p_T spektrlari uchun ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasi (3-tenglama) asosida minimum χ^2 fitlash orqali aniqlangan model parametrlarining natijalari 2-jadvalda keltirilgan. Ko'ndalang oqimni o'z ichiga olgan termodinamik jihatdan mos Tsallis funksiyasi (3-tenglama) periferik Pb+Pb to'qnashuvlaridagi zarralar ko'ndalang impuls taqsimotlarini yaxshi tavsiflaydi, biroq markaziyroq to'qnashuvlarda ((40–50)% dan (0–5)% gacha), mazkur model funksiyasi $p_T \lesssim$ 8–9 GeV/c sohada spektrlarni qoniqarli darajada tavsiflaydi, ammo p_T > 9 GeV/c sohada eksperimental natijalarni sezilarli darajada kam baholaydi.

2-jadval. $(s_{nn})^{1/2}$ = 5.02 TeV energiyadagi Pb+Pb to'qnashuvlarida zaryadlangan zarrachalarning o'rta jadallik sohasidagi p_T spektrlari uchun ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasi (3-tenglama) asosida minimum χ^2 fitlash orqali aniqlangan model parametrlarining natijalari.

Centrality	C_q	q	T_0 **(MeV)**	$\langle\beta_T\rangle$	$\chi^2/n.d.f.$

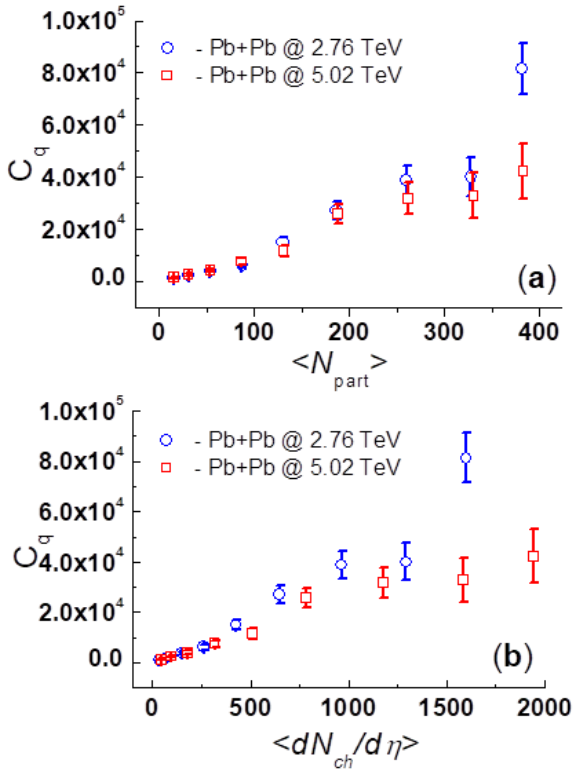
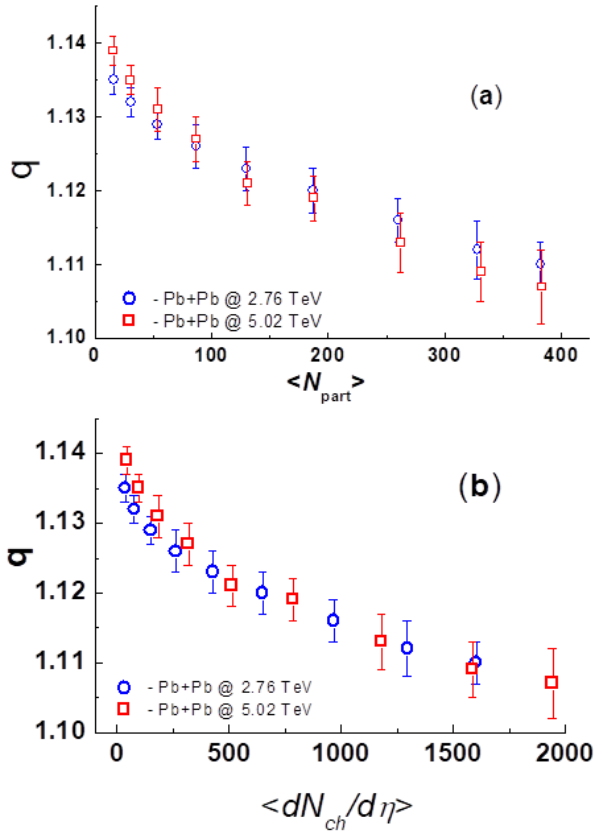
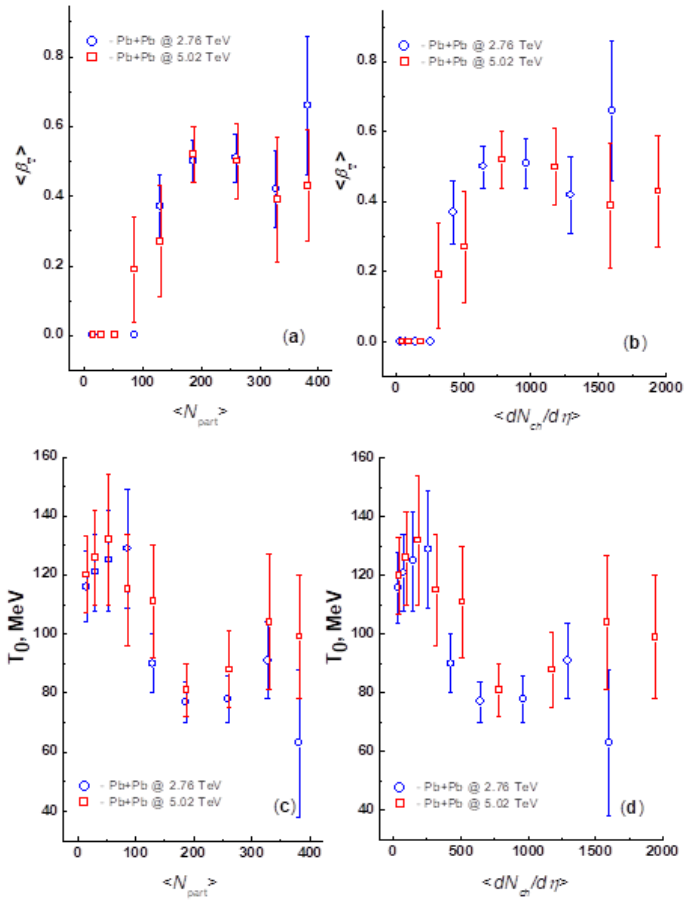
2-rasm. $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalardagi Pb+Pb to'qnashuvlarida ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasining (3-tenglama) C_q parametrining $\langle N_{part}\rangle$ (a) hamda $dN_{ch}/d\eta\rangle$ (b) ga bog'liqliklari.



3-rasm. $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalardagi Pb+Pb to'qnashuvlarida ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasining (3-tenglama) noekstensivlik parametri q ning $\langle N_{part}\rangle$ (a) hamda $\langle dN_{ch}/d\eta\rangle$ (b) ga bog'liqliklari.



4-rasm. $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalardagi Pb+Pb to‘qnashuvlarida ko‘ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasining (3-tenglama) ko‘ndalang oqim tezligi ⟨β_T⟩ hamda kinetik muzlash temperaturasi T_0 parametrlari uchun ⟨N_{part}⟩ (a, c) va ⟨$dN_{ch}/d\eta$⟩(b, d) ga bog‘liqliklari.



$\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalardagi Pb+Pb to'qnashuvlarida ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasining (3-tenglama) C_q parametrining $\langle N_{part}\rangle$ hamda $dN_{ch}/d\eta\rangle$ ga bog'liqliklari 2-rasmda ko'rsatilgan. $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalardagi Pb+Pb to'qnashuvlarida ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasining (3-tenglama) noekstensivlik parametri q ning $\langle N_{part}\rangle$ hamda $\langle dN_{ch}/d\eta\rangle$ ga bog'liqliklari 3-rasmda berilgan. $\sqrt{s_{nn}}$ = 2.76 TeV va 5.02 TeV energiyalardagi Pb+Pb to'qnashuvlarida ko'ndalang oqimni hisobga oluvchi termodinamik jihatdan mos Tsallis funksiyasining (3-tenglama) ko'ndalang oqim tezligi $\langle\beta_T\rangle$ hamda kinetik muzlash temperaturasi T_0 parametrlari uchun $\langle N_{part}\rangle$ va $\langle dN_{ch}/d\eta\rangle$ ga bog'liqliklari 4-rasmda keltirilgan.

2-Rasmda C_q parametrining $\langle N_{part}\rangle$ (Pb+Pb to'qnashuv markaziyligi) ortishi bilan ortishi ko'rsatilgan, bu esa to'qnashuv markaziyligi ortishi bilan Pb+Pb tizimi hajmining oshishini ko'rsatadi. 3-Rasmda noekstensivlik q parametrining $\langle N_{part}\rangle$ (Pb+Pb to'qnashuv markaziyligi) ortishi bilan muntazam kamayishi ko'rsatilgan, bu esa to'qnashuv markaziyligi ortishi bilan Pb+Pb to'qnashuv tizimining termallashuv (termalizatsiya) darajasini o'sishini ko'rsatadi. 4-Rasmdagi $\sqrt{s_{nn}}$=2.76 hamda 5.02 TeV energiyadagi Pb+Pb to'qnashuvlarida $\langle\beta_T\rangle$ hamda kinetik muzlash temperaturasi T_0 parametrlarining $\langle N_{part}\rangle$ hamda $\langle dN_{ch}/d\eta\rangle$ ga bog'liqliklari tahlil qilinganda, zich adron materiyasining kvark-glyuon plazma holatiga crossover fazaviy o'tish uchun to'qnashuv markaziyligining ($\langle N_{part}\rangle$) chegara qiymatlari mos ravishda $\langle N_{part}\rangle$ = 109 ± 8 hamda $\langle N_{part}\rangle$ = 71 ± 7 bo'lishi baholandi.

Xulosa. Mazkur ishda $\sqrt{s_{nn}}$=5.02 TeV energiyadagi Pb+Pb to'qnashuvlarida birlamchi zaryadlangan zarrachalarning eksperimental p_T spektrlari asosida baholangan zich materiyaning kvark-glyuon plazma holatiga crossover fazaviy o'tish uchun to'qnashuv markaziyligining chegara qiymati $\langle N_{part}\rangle$ = 71 ± 7 bo'lib, u shu energiyadagi Pb+Pb to'qnashuvlarida zaryadlangan pionlar, kaonlar, protonlar va antiprotonlarning p_T spektrlari birgalikda tahlili asosida ilgari aniqlangan mos qiymat bilan to'liq mos keladi. Shu bilan birga, mazkur ishda $\sqrt{s_{nn}}$=2.76 energiyadagi Pb+Pb to'qnashuvlarida birlamchi zaryadlangan zarrachalarning eksperimental p_T spektrlari asosida baholangan $\langle N_{part}\rangle$ = 109 ± 8 chegara qiymati, ushbu energiyada zaryadlangan pionlar, kaonlar, protonlar va antiprotonlarning p_T spektrlari birgalikda tahlili asosida ilgari aniqlangan mos qiymat $\langle N_{part}\rangle$ = 71 ± 7 ga nisbatan sezilarli darajada katta ekanligi aniqlandi.

Noekstensivlik parametri q $\sqrt{s_{nn}}$=2.76 va 5.02 TeV energiyadagi Pb+Pb to'qnashuvlarida $\langle N_{part}\rangle$ hamda $\langle dN_{ch}/d\eta\rangle$ortishi bilan izchil o'zgarish xususiyatini ko'rsatadi. Bu holat markaziylik ortishi bilan tizimning termallashuv darajasining tizimli ravishda oshib borishini ko'rsatadi va avvalgi ishlar natijalari bilan mos keladi.

PLAZMA SHAROITIDA PO'LAT SIRTINI TOZALASH VA FAZAVIY HOLATINI BAHOLASH

Kaxramonov Boburjon Ro'ziboyevich
Ion plazma va lazer texnologiyalari instituti katta ilmiy xodimi, PhD.
e-mail: boburjon2285@gmail.com.

Annotatsiya: *Annotatsiya. Ushbu tadqiqotda Po'lat 45 sirtini vakuum-yoy va miltillama razryad yordamida tozalash jarayonining fazaviy hamda mikrostrukturaviy xususiyatlari qiyosiy ravishda o'rganildi. Namunalar dastlab mexanik va kimyoviy tayyorlash bosqichidan o'tkazilib, so'ng past bosimli vakuum muhitida ishlov berildi. Natijalar vakuum-yoy razryadi sharoitida katod dog'larining yuqori lokal harorati va yuqori energiyali ion bombardimoni ta'sirida sirt qatlamidagi oksid plyonkalar to'liq bartaraf etilishini, miltillama razryadda esa faqat qisman tozalanish yuz berishini ko'rsatdi.*

DIGI-MICROSCOPE (×1000) va XRD fazaviy tahlil natijalari ishlov berilmagan sirtda FeO, FeO_2, Fe_2O_3, Fe_3O_4 hamda α-Fe fazalari mavjudligini aniqladi. Miltillama razryaddan keyin oksid fazalar kamaygan bo'lsa-da, ularning qoldiq cho'qqilari saqlanib qoldi. Vakuum-yoy razryadidan so'ng esa faqat α-Fe fazasi cho'qqilari kuzatildi, bu sirtning 100% tozalanganligini tasdiqladi. Olingan natijalar Po'lat 45 sirtini oksid qatlamlardan chuqur tozalash va keyingi qoplama yotqizish bosqichiga tayyorlashda vakuum-yoy razryadi usuli eng yuqori samaradorlikka ega ekanligini ko'rsatdi.

Kalit so'zlar: *Po'lat 45, vakuum-yoy razryadi, miltillama razryad, katod dog'i, ion bombardimoni, XRD fazaviy tahlil, α-Fe fazasi, temir oksidlari.*

ОЧИСТКА ПОВЕРХНОСТИ СТАЛИ В ПЛАЗМЕННЫХ УСЛОВИЯХ И ОЦЕНКА ФАЗОВОГО СОСТОЯНИЯ

Аннотация: *В данном исследовании сравнительно изучены фазовые и микроструктурные особенности процесса очистки поверхности стали 45 с использованием вакуумно-дугового и тлеющего разрядов. Образцы предварительно подвергались механической и химической подготовке, после чего обрабатывались в условиях низкого давления вакуума. Полученные результаты показали, что в условиях вакуумно-дугового разряда под воздействием высокой локальной температуры катодных пятен и высокоэнергетической ионной бомбардировки оксидные плёнки на поверхности полностью удаляются, тогда как при тлеющем разряде наблюдается лишь частичная очистка.*

Результаты, полученные с использованием DIGI-MICROSCOPE (×1000) и фазового анализа методом XRD, выявили наличие на необработанной поверхности фаз FeO, FeO_2, Fe_2O_3, Fe_3O_4 и α-Fe. После обработки тлеющим разрядом количество оксидных фаз уменьшилось, однако их остаточные пики сохранились. После вакуумно-дугового разряда наблюдались только пики фазы α-Fe, что подтвердило 100% очистку поверхности. Полученные результаты показали, что метод вакуумно-дугового разряда обладает наивысшей эффективностью при глубокой очистке поверхности стали 45 от оксидных слоёв и её подготовке к последующему нанесению покрытия.

Ключевые слова: *сталь 45, вакуумно-дуговой разряд, тлеющий разряд, катодное пятно, ионная бомбардировка, фазовый анализ XRD, фаза α-Fe, оксиды железа.*

PLASMA-ASSISTED STEEL SURFACE CLEANING AND PHASE STATE EVALUATION

Abstract: *In this study, the phase and microstructural characteristics of the cleaning process of Steel 45 surface using vacuum arc and glow discharges were comparatively investigated. The samples were initially subjected to mechanical and chemical pretreatment, followed by processing under low-pressure vacuum conditions. The results showed that under vacuum arc discharge conditions, the oxide films on the surface were completely removed due to the high local temperature of cathode spots and high-energy ion bombardment, whereas only partial cleaning was observed in the glow discharge process.*

The results obtained using DIGI-MICROSCOPE (×1000) and XRD phase analysis revealed the presence of FeO, FeO_2, Fe_2O_3, Fe_3O_4 and α-Fe phases on the untreated surface. After glow discharge treatment, the oxide phases decreased, although their residual peaks remained. After vacuum arc discharge treatment, only the peaks of the α-Fe phase were observed, confirming 100% surface

cleaning. The obtained results demonstrated that the vacuum arc discharge method provides the highest efficiency for deep removal of oxide layers from the Steel 45 surface and its preparation for subsequent coating deposition.

Keywords: *Steel 45, vacuum arc discharge, glow discharge, cathode spot, ion bombardment, XRD phase analysis, α-Fe phase, iron oxides.*

Kirish

Metall sirtlarini tozalash qoplama yotqizish, korroziyadan himoyalash va mexanik xususiyatlarni yaxshilashda muhim texnologik bosqich хисобланади. Ayniqsa, Po‘lat 45 kabi konstruksion materiallarda sirt qatlamining holati uning ekspluatatsion xossalari, qoplama adgeziyasi va keyingi ishlov samaradorligini belgilaydi. Shu bois sirtni oksid qatlamlar, adsorbsiyalangan gazlar hamda boshqa yot moddalardan samarali tozalash dolzarb ilmiy-amaliy masalalardan biridir.

Hozirgi vaqtda vakuum-yoy razryadi va miltillama razryad metall sirtlarini ion-plazmali tozalashning keng qo‘llaniladigan usullari sifatida qaraladi. Biroq vakuum-yoy jarayonlarida ishlov berish samaradorligi vakuum darajasi, tok zichligi, katod materiali, ishlov berish vaqti hamda sirtni oldindan tayyorlash bosqichiga kuchli bog‘liq. Ayniqsa, gaz ishlatilmagan vakuum sharoitida vakuum-yoy razryadi orqali sirtni faollashtirish va tozalashning fizik mexanizmlari yetarli darajada tizimli o‘rganilmagan. Shu sababli ushbu ishning maqsadi gazziz vakuum-yoy razryadi va miltillama razryad yordamida oldindan tayyorlangan Po‘lat 45 namunalari sirtida yuz beradigan fazaviy hamda mikrostrukturaviy o‘zgarishlarni aniqlash, shuningdek texnologik parametrlarning tozalash samaradorligiga ta’sirini baholashdan iborat.

So‘nggi yillarda vakuum-yoy razryadi asosidagi ion-plazmali ishlov berish jarayonlari metall sirtini modifikatsiyalashning samarali usullaridan biri sifatida keng tadqiq etilmoqda. Tadqiqotlarda katod dog‘lari dinamikasi va ionlar energiyasi sirt qatlamining morfologiyasi hamda mexanik xossalariga sezilarli ta’sir ko‘rsatishi aniqlangan [1]. Yuqori energiyali ion oqimi sirt qatlamida lokal qizish va tez sovish jarayonlarini yuzaga keltirib, qayta kristallanish hodisalariga sabab bo‘ladi [2]. Gaz muhiti sharoitida vakuum-yoy razryadi orqali ishlov berishda katod dog‘lari hosil qiladigan yuqori haroratli mikrozonalar oksid qatlamlarni intensiv bug‘lanish va purkash mexanizmlari orqali yo‘q qiladi [3]. Shuningdek, gaz bosimi va tok zichligi parametrlarining o‘zgarishi sirtning faollashuv darajasini oshirib, vakuum-yoy razryadini qoplama yotqizishdan oldingi samarali aktivatsiya usuliga aylantiradi [4].

Miltillama razryad yordamida metall sirtini oldindan tozalash masalasi ham keng yoritilgan. Tadqiqotlar past bosimli razryad sharoitida ionlar va aktiv radikallar oksid hamda organik iflosliklarni samarali parchalab, sirtning adgeziya qobiliyatini oshirishini ko‘rsatadi [5]. Mazkur ishda Po‘lat 45 sirtini vakuum-yoy va miltillama razryad yordamida tozalash samaradorligi DIGI-MICROSCOPE (×1000) hamda XRD fazaviy tahlil asosida qiyosiy ravishda baholandi.

Tadqiqot metodologiyasi

Metall sirtini miltillama razryad ionlari yordamida tozalash va baholash jarayoni. Metall sirtini miltillama razryad plazmasi ionlari bilan tozalash namuna sirtini manfiy potensial ostida ion bombardimoni qilish orqali amalga oshirildi. Ushbu usul sirtdagi yot moddalar, adsorbsiyalangan gazlar va oksid qatlamlarni samarali bartaraf etib, sirt faolligini va qoplama adgeziyasini oshiradi.

Jarayon vakuum muhitida bajarilib, ishchi gaz sifatida argon (Ar) qo‘llanildi. Kameradagi ishchi bosim (1×10^{-1} – 5×10^{-1} Pa) diapazonida saqlandi. Namuna katod sifatida ulanib, unga manfiy potensial berildi. Razryad kuchlanishi 250–1000 V, tok esa 0,2–1,5 A oralig‘ida tanlandi, tok zichligi 1–5 mA/sm² ni tashkil etdi. Ushbu parametrlar ionlar energiyasi va bombardimon intensivligini belgiladi. Elektr maydoni ta’sirida ionlashgan argon ionlari namuna yuzasiga yo‘naltirilib, oksidlar va yot qatlamlar fizik purkash mexanizmi orqali bartaraf etildi. Tadqiqotlarda miltillama razryadda kuchlanish va tok parametrlariga bog‘liq holda sirt tozalanishi 60–80% gacha yetishi ko‘rsatilgan [6]. Past ion energiyasida esa oksid qatlam faqat qisman yo‘qoladi. Shu sababli ushbu usul qoplama yotqizishdan oldingi faollashtirish bosqichi sifatida samarali hisoblanadi [7]. Tozalash davomiyligi 10–12 daqiqa etib tanlandi. Jarayon yakunida namuna vakuum muhitida sovitilib, keyingi fazaviy va mikrostrukturaviy tahlillar uchun tayyorlandi.

Yoy razryadi tokining tozalash parametrlariga ta’siri. Vakuum-yoy razryadida sirtni tozalash katod dog‘lari hosil qiladigan yuqori energiyali ion bombardimoni orqali amalga oshirildi. Tok ortishi bilan katod dog‘lari soni va ularning harakat intensivligi oshib, sirtning purkash tezligi sezilarli kuchayadi [8], [9]. Ayniqsa, 150–220 A tok diapazonida sirt aktivlashuvi maksimal qiymatga yetib, oksid qatlam keskin kamayadi.

Katod dog‘lari ta’sir maydoni quyidagi ifoda bilan baholandi [10]:

$$S = nvd \tag{1}$$

bu yerda n — katod dog‘lari soni, v — ularning harakat tezligi, d — katod dog‘i diametri. Hisoblashlarga ko‘ra, 0,5–1,0 mm diametrli dog‘lar 10^2–10^3 sm/s tezlik bilan harakatlanib, sirtni tozalash maydoni 100–200 sm²/s ga yetadi, bu esa usulning yuqori samaradorligini ko‘rsatadi.

Ion bombardimoni natijasida sirtning mikroqatlami tozalanib, strukturasi zichlashadi va keyingi qoplama yotqizish uchun optimal energetik holat shakllanadi. Vakuum-yoy plazmasida ion energiyasini 1–3 keV diapazonda boshqarish purkash samaradorligi va sirt zichligini sezilarli oshiradi [11]. Shu bois razryad toki, kuchlanish va vakuum parametrlarini optimal tanlash sirtni samarali tozalashning asosiy omillaridan biri hisoblanadi.

Vakuum-yoy razryadida katod dog‘lari harakat trayektoriyasi va tok parametrlarini boshqarish orqali sirt notekisligini nazorat qilish mumkinligi eksperimental jihatdan tasdiqlangan [12]. Ushbu tadqiqotda katod dog‘lari lokal mikrokraterlar hosil qilishi, biroq sirtning umumiy mikrostrukturaviy yaxlitligini buzmasligi ko‘rsatilgan. Shuningdek, katod dog‘lari ta’sirida organik va oksidli ifloslanishlar intensiv destruksiyaga uchraydi, plazma parametrlari yetarli bo‘lmagan holatlarda esa sirtning ayrim sohalarida qoldiq qatlamlar saqlanib qolishi mumkinligi aniqlangan [13].

Natijalar va tahlillar

Vakuum-yoy razryadi usulida tozalangan namuna sirtining ko‘rinishi 1b-rasmda, miltillama razryad bilan ishlov berilgan sirt esa 1v-rasmda keltirilgan. Tasvirlarni ishlov berilmagan sirt holati bilan birgalikda (1a, 1b va 1v) qiyosiy tahlil qilish natijasida sirt morfologiyasidagi sezilarli farqlar aniq kuzatildi.

a) b) v)

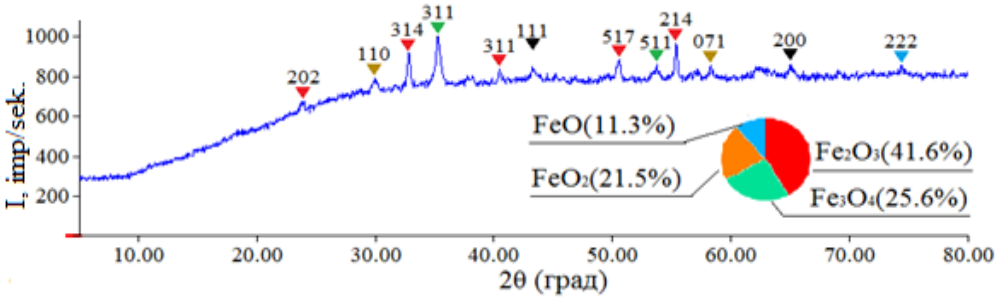
1-rasm. Po‘lat-45 namunasi sirtining ko‘rinishi: a) ishlov berishdan oldin, b) vakuum-yoy razryadi usulida tozalangan, v) miltillama razryad usulida tozalangan.

Xususan, vakuum-yoy razryadi bilan ishlov berilgan sirt (1b-rasm) ancha bir jinsli, faol va yot qatlamlardan holi holatga kelgani ko‘rindi. Katod dog‘lari hosil qiladigan yuqori lokal harorat hamda intensiv ion bombardimoni ta’sirida sirt qatlamidagi oksid va organik iflosliklar samarali ravishda bartaraf etilgan. Natijada sirtning mikrorelyefi silliqlashib, keyingi qoplama yotqizish uchun qulay aktiv holat shakllangan.

Miltillama razryad bilan tozalangan sirt (1v-rasm) ham dastlabki holatga nisbatan sezilarli yaxshilangan bo‘lsa-da, ayrim sohalarda qoldiq yot moddalar va oksid izlari saqlanib qolganligi kuzatildi. Bu esa vakuum-yoy razryadining katod dog‘lari bilan ishlov berish usuli miltillama razryad ionlari bilan ishlov berishga nisbatan samaraliroq ekanligini va sirtni chuqurroq tozalashini ko‘rsatadi.

XRD fazaviy tahlili. XRD fazaviy tahlilini ko‘rib chiqamiz .

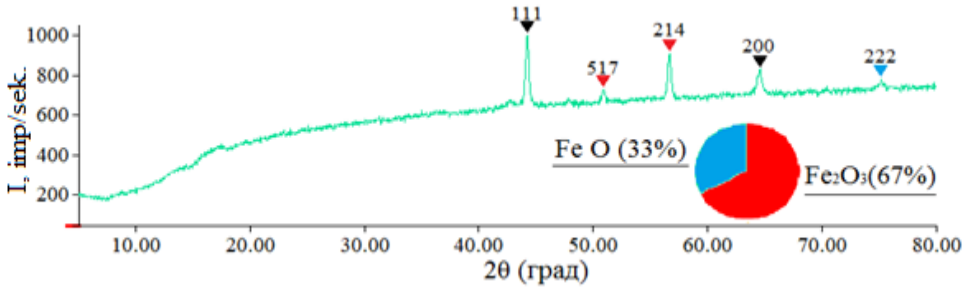
2-rasmda ishlov berilmagan Po‘lat 45 namunasining XRD fazaviy tahlili keltirilgan bo‘lib, unda jami 12 ta asosiy difraksion cho‘qqi kuzatildi. Tahlil natijalariga ko‘ra, 74.44° (2θ) da FeO (222), 29.97° va 58.3° da FeO_2 (110, 071), 23.85°, 32.86°, 40.53°, 50.51° va 55.30° da Fe_2O_3 (202, 314, 311, 517, 214) hamda 35.31° va 53.71° da Fe_3O_4 (311, 511) oksid fazalariga mos cho‘qqilar qayd etildi.



2-rasm. Ishlov berilmagan Po‘lat 45 sirtining XRD fazaviy tahlili.

Shuningdek, 43.31° va 65.00° burchaklarda α-Fe fazasining (111, 200) Miller indekslariga mos asosiy metall cho‘qqilar kuzatildi. Ushbu natijalar dastlabki sirt qatlamida temir oksidlarining ko‘p qatlamli murakkab fazaviy tarkibi mavjudligini ko‘rsatadi.

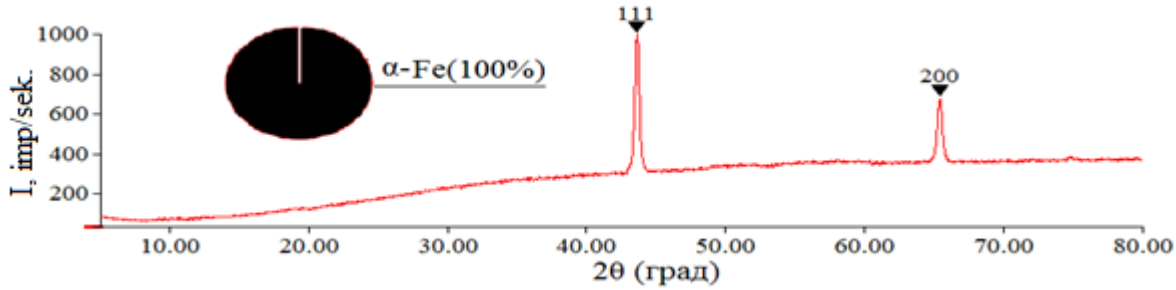
3-rasmda miltillama razryad yordamida tozalangan Po‘lat 45 sirtining XRD spektri keltirilgan. Ushbu holatda difraksion cho‘qqilar soni 12 tadan 5 tagacha kamaygani kuzatildi. Xususan, 75.12° da FeO (222), 50.93° va 56.66° da Fe_2O_3 (517, 214) qoldiq oksid fazalari saqlanib qolgan.



3-rasm. Miltillama razryad bilan tozalangan sirtning XRD fazaviy tahlili

Bundan tashqari, 44.24° va 64.53° da α-Fe (111, 200) fazasining cho‘qqilari aniq namoyon bo‘ldi. Bu holat miltillama razryad ta’sirida sirt qatlamidagi oksid fazalar sezilarli kamayganini, biroq ular to‘liq yo‘qolmaganini ko‘rsatadi. Shu bilan birga α-Fe cho‘qqilarining intensivligi oshishi sirtning qisman metall holatga yaqinlashganini tasdiqlaydi.

4-rasmda vakuum-yoy razryadi bilan ishlov berilgan Po‘lat 45 sirtining XRD natijalari keltirilgan. Spektrda atigi 2 ta asosiy difraksion cho‘qqi kuzatilib, ular 44.7° va 65.1° burchaklarda joylashgan bo‘lib, α-Fe fazasining (111, 200) Miller indekslariga to‘g‘ri keladi.

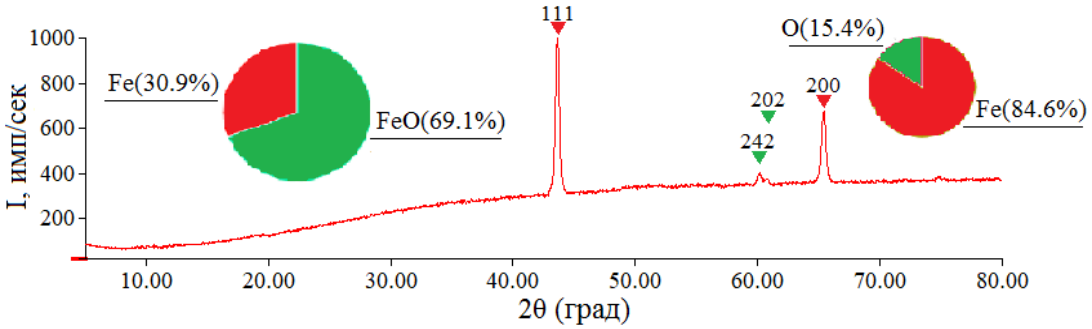


4-rasm. Vakuum-yoy razryadi bilan tozalangan sirtning XRD fazaviy tahlili.

Muhimi, ushbu holatda FeO, Fe_2O_3 va Fe_3O_4 kabi temir oksidlari cho‘qqilari to‘liq yo‘qolgan, bu esa vakuum-yoy razryadi sirtni oksid qatlamlardan chuqur va samarali tozalaganini ko‘rsatadi. Katod dog‘lari hosil qiladigan yuqori lokal harorat hamda intensiv ion bombardimoni ta’sirida sirt qatlamining fazaviy tarkibi to‘liq metall α-Fe holatiga o‘tgan.

Shunga o‘xshash natijalar ikki bosqichli ion-plazmali vakuum-yoy ishlov berilgan po‘latlarda ham kuzatilgan bo‘lib, mualliflar oksid fazalar intensivligi kamayib, metall fazalar ustunligi ortishini qayd etganlar [14]. Umuman olganda, ushbu natijalar vakuum-yoy razryadi Po‘lat 45 sirtini 100% tozalash va keyingi qoplama yotqizish uchun optimal metall asos yaratishda eng samarali usul ekanligini tasdiqlaydi.

5-rasmda vakuum-yoy razryadi yordamida tozalangan Po‘lat 45 sirtining XRD fazaviy tahlili, namunani vakuum kameradan to‘liq sovimasdan chiqarib olish holati uchun keltirilgan. Tahlil natijalari shuni ko‘rsatdiki, vakuum-yoy razryadi davomida sirt oksid qatlamlardan samarali tozalangan bo‘lsa-da, namuna yuqori harorat holatida kamera tashqarisiga chiqarilganda yuzada ikkilamchi oksidlanish jarayoni sodir bo‘ladi.



5-rasm. Vakuum-yoy razryadidan keyin sovitish sharoitining XRD fazaviy tahlilga ta’siri

Buning natijasida sirt atmosfera kislorodi bilan tez o‘zaro ta’sirlashib, yupqa oksid qatlam hosil qiladi va bu holat XRD spektrida qoldiq oksid fazalar paydo bo‘lishi bilan namoyon bo‘ladi. Mazkur holat vakuum-yoy razryadi bilan erishilgan to‘liq metall holatni saqlab qolish uchun namunani vakuum muhitida sovitish muhim texnologik bosqich ekanligini ko‘rsatadi.

Taqqoslash natijalari miltillama razryaddan keyin oksid fazalar soni kamaygan bo‘lsa-da, ularning ayrim qoldiq cho‘qqilari saqlanib qolishini, vakuum-yoy razryadida esa to‘liq sovitish sharoitida faqat α-Fe fazasi ustunligi kuzatilishini ko‘rsatdi. Aksincha, sovitish jarayoni buzilganda sirtning qayta oksidlanishi ehtimoli ortadi. Shunday qilib, vakuum-yoy

razryadidan keyingi sovitish rejimi sirtning yakuniy fazaviy holatini belgilovchi asosiy texnologik omillardan biri ekanligi aniqlandi. Bu natija keyingi qoplama yotqizish jarayonlarida yuqori adgeziya va barqaror metall asos hosil qilish uchun muhim ahamiyatga ega.

Xulosa va takliflar

Ushbu tadqiqotda Po‘lat 45 sirtini vakuum-yoy va miltillama razryad yordamida tozalash jarayonlarining fazaviy hamda mikrostrukturaviy o‘zgarishlari kompleks tahlil qilindi. Olingan natijalar vakuum-yoy razryadi usuli sirtni chuqur tozalashda miltillama razryadga nisbatan samaraliroq ekanligini ko‘rsatdi.

Mikrostrukturaviy tahlillar vakuum-yoy razryadidan so‘ng sirtning bir jinsli, silliqlashgan va yot qatlamlardan holi aktiv holatga kelganini tasdiqladi. XRD natijalariga ko‘ra, ishlov berilmagan sirt tarkibida FeO, FeO_2, Fe_2O_3, Fe_3O_4 va α-Fe fazalari aniqlangan bo‘lsa, miltillama razryaddan so‘ng oksid fazalar kamayib, qoldiq cho‘qqilar saqlanib qolgan. Vakuum-yoy razryadidan keyin esa faqat α-Fe fazasi cho‘qqilari kuzatilib, sirtning to‘liq metall holatga o‘tgani va 100% tozalangani isbotlandi.

Shuningdek, vakuum-yoy razryadidan keyingi sovitish rejimi muhim texnologik omil ekanligi aniqlandi. Namuna vakuumdan sovimasdan chiqarilganda yuzada ikkilamchi oksidlanish kuzatildi. Shu sababli namunalarni vakuum muhitida to‘liq sovitish tavsiya etiladi. Natijalar asosida vakuum-yoy razryadi Po‘lat 45 sirtini qoplama yotqizishdan oldin aktivlashtirish va yuqori adgezion metall asos yaratishda eng samarali usul ekanligi ilmiy jihatdan asoslandi. Miltillama razryad esa dastlabki yumshoq tozalash bosqichi sifatida qo‘llanishi mumkin.

Annotation: *In this study, the activity of natural radionuclides and radiological hazard indices were assessed in soils around a technogenic radioactive waste storage area in Navoi region. During the study, 16 surface-layer soil samples were collected from the soils of the enclosing wall surrounding the area. The specific activities of the radionuclides ^{226}Ra, ^{232}Th, and ^{40}K in the soil samples were determined by gamma-spectrometric method, while the ambient dose equivalent rate H*(10) was measured directly under field conditions. In addition, several radiological hazard indices for the external environment were calculated. The obtained results showed that although natural radionuclides are present in the soils around the technogenic waste storage area, the level of radiological hazard associated with external gamma radiation is low.*

Keywords: *technogenic radioactive waste, soil, natural radionuclides, radiological hazard, radium equivalent activity, absorbed dose rate, ambient dose equivalent rate, external hazard index*

ЕСТЕСТВЕННЫЕ РАДИОНУКЛИДЫ И ПОКАЗАТЕЛИ РАДИОЛОГИЧЕСКОЙ ОПАСНОСТИ В ПОЧВАХ ТЕРРИТОРИИ ХРАНЕНИЯ ТЕХНОГЕННЫХ РАДИОАКТИВНЫХ ОТХОДОВ

Аннотация*: В данном исследовании были оценены активность природных радионуклидов и показатели радиологической опасности в почвах вокруг территории хранения техногенных радиоактивных отходов в Навоийской области. В ходе исследования было отобрано 16 образцов почвы поверхностного слоя из почв ограждающего вала, окружающего территорию. Удельная активность радионуклидов ^{226}Ra, ^{232}Th и ^{40}K в образцах почвы была определена гамма-спектрометрическим методом, а мощность эквивалентной дозы окружающей среды H*(10) была непосредственно измерена в полевых условиях. Кроме того, был рассчитан ряд показателей радиологической опасности для внешней среды. Полученные результаты показали, что, несмотря на наличие природных радионуклидов в почвах вокруг территории хранения техногенных отходов, уровень радиологической опасности, связанной с внешним гамма-излучением, является низким.*

TEXNOGEN RADIOAKTIV CHIQINDILAR SAQLASH HUDUDI TUPROQLARDA TABIIY RADIONUKLIDLAR VA RADIOLOGIK XAVF KO‘RSATKICHLARI

Annotatsiya: Ushbu tadqiqotda Navoiy viloyatidagi texnogen radioaktiv chiqindilar saqlash hududi atrofidagi tuproqlarda tabiiy radionuklidlar faolligi va radiologik xavf ko'rsatkichlari baholandi. Tadqiqot davomida hudud o'ralgan devor tuproqlaridan 16 ta sirt qatlam bo'yicha tuproq namunalari olindi. Tuproq namunalari tarkibidagi ^{226}Ra, ^{232}Th va ^{40}K radionuklidlarining solishtirma faolligi gamma-spektrometrik usulda aniqlandi, atrof-muhit ekvivalent doza quvvati H(10) esa maydon sharoitida bevosita o'lchandi. Bundan tashqari bir qancha tashqi muhit uchun radiologik xavf ko'rsatkichlari hisoblab topildi. Olingan natijalar texnogen chiqindilar saqlash hududi atrofidagi tuproqlarda tabiiy radionuklidlar mavjud bo'lsa-da, tashqi gamma-nurlanish bilan bog'liq radiologik xavf darajasi past ekanini ko'rsatdi.*

Kalit so'zlar: *texnogen radioaktiv chiqindilar, tuproq, tabiiy radionuklidlar, radiologik xavf, radiy ekvivalent faolligi, yutilgan doza quvvati, atrof-muhit ekvivalent doza quvvati, tashqi xavf indeksi.*

Introduction

The activity of radionuclides contained in rocks and soils occurring in nature is usually low. However, technogenic radioactive waste generated in areas where uranium production enterprises are operating exerts its influence as an additional source of radionuclides in the environment [1]. Uranium-containing radioactive industrial wastes have high concentrations of uranium, radium, thorium, radon, and other radionuclides, and as a result of their decay, alpha and beta particles, gamma radiation, radioactive aerosols, and radon gas are released [2–4]. In such technogenic areas, the migration processes of radionuclides in soil, water, air, and plant environments intensify, and over time, their redistribution among environmental components is observed [5].

The amount of natural radionuclides in the environment is often regarded as negligible. However, anthropogenic activities such as mining may cause an increase in their amount. An increase in natural radionuclide levels poses serious health risks to mine workers, as they are exposed during ore extraction, transportation, and processing [6]. The population may also be exposed to these natural radionuclides, and this may potentially lead to serious diseases such as leukemia and chronic lung cancer [7].

Soil samples have been used in many studies devoted to measuring radioactivity levels, because they provide important information for monitoring and assessing radiological hazards [8]. Therefore, such studies are of important significance from the point of view of radiation protection. Many studies on soil radioactivity have been carried out in various mining areas associated with the uranium industry located in the territory of Central Asia [9–12]. However, information on radioactivity levels in areas associated with mining activities in Navoi region is insufficient. Therefore, the aim of this study was to assess the radiological hazards of the soils and atmospheric air around the technogenic waste storage area in Navoi region. During the research, the specific activities of the radionuclides ^{226}Ra, ^{232}Th, and ^{40}K in soil samples were determined, and the correlation relationships among them were analyzed. The obtained results may serve as a radioecological database and may be an important source of information in areas where technogenic radioactive waste is stored.

Materials and Methods

Study Area. The natural landscape of the area has been altered as a result of anthropogenic impact, namely, radioactive soil waste brought from industrial enterprises has been dumped there. The study area mainly consists of a mixture of crushed rocks of granitic origin, clayey hydrometallurgical residues, and local sandy alluvial materials. A conceptual model of the uranium waste storage area is presented in Figure 1. The technogenic waste storage site is enclosed by a wall formed from natural soil with a thickness of 10 m. Soil samples for the study were also taken from the soils of the wall enclosing the area. The soil sampling points and the points for measuring ambient dose equivalent quantities are shown by red dots in Figure 1.

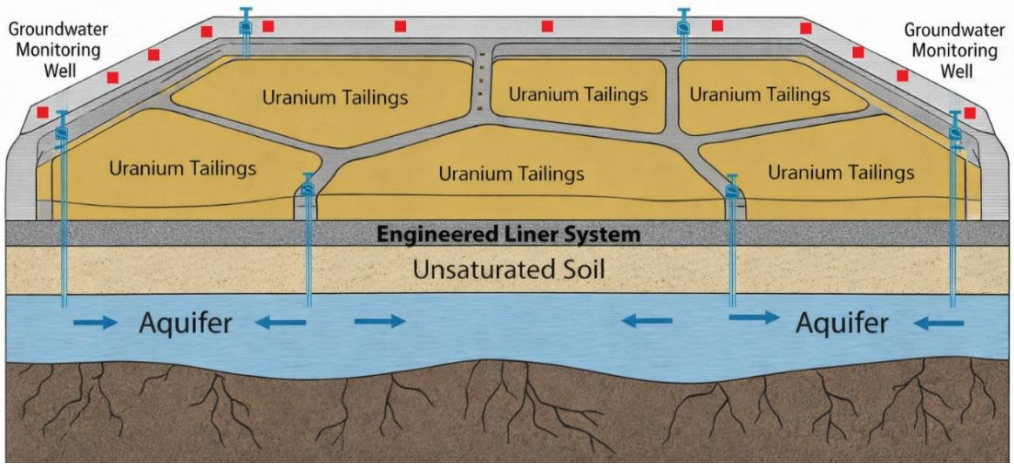

Figure 1. Conceptual model of the uranium waste storage area.

Sample Collection and Analysis Determination of Natural Radionuclides in the Soils of the Study Area

In the study area, soil samples were collected from a total of 16 special control points only from the surface layer, in an amount of approximately 2 kg. Under laboratory conditions, the samples were subjected to a preliminary treatment process before analysis. The existing organic matter and small stones were removed. The samples were dried to constant dry weight, placed into standard Marinelli plastic containers, hermetically sealed, and stored for 30 days in order to establish secular equilibrium between the progenies of the ^{238}U and ^{232}Th decay series, based on the guidelines of the International Atomic Energy Agency (IAEA) for the measurement of radionuclides in food and the environment [13].

The specific activity of natural radionuclides (^{226}Ra, ^{232}Th, and ^{40}K) in the soil samples was determined using an MKS-AT1315 gamma-beta spectrometer manufactured by ATOMTEX (Minsk, Belarus) [14]. The spectrometer, equipped with a 63×63 mm NaI(Tl) detector, operates in the gamma-radiation energy range from 50 keV to 3 MeV. The permissible limits of relative error of the spectrometer are ±20%, the energy resolution is 8% at the 661 keV gamma line of the ^{137}Cs radionuclide, and the spectrometer is connected to a 1024-channel pulse analyzer. Special ATWin software was used for data analysis and processing.

Measurement of Ambient Dose Equivalent Rate

Around the technogenic radioactive waste storage area, the ambient dose equivalent rate of gamma radiation, H*(10), was measured using a DKS-96 dosimeter (“Doza” SPZ, Russian Federation). This universal dosimeter-radiometer is designed for high-precision monitoring of ionizing radiation fields. The DKS-96 device is equipped with a scintillation detector and makes it possible to measure the radiation dose rate within a specified time interval (1–60 s) in the range from 0.1 μSv/h to 10 Sv/h. The measurement error of the device does not exceed ±12%.

The gamma-radiation dose rate was determined at 16 measurement points, and the measurements were carried out on top of the wall enclosing the study area at a height of 1 m above ground level. At each station, measurements were performed at three different points, and the average value of these measurements was accepted as the final result [15]. Conducting measurements at a height of 1 m above ground level is an international standard (ICRP) and makes it possible to assess the radiation dose at the level of vital organs of the human body that have high radiosensitivity [16].

Statistical Analysis

Statistical analysis of the data and graphical visualization were carried out using the Google Colab Python environment. Because the relationships under analysis had a linear character, the Pearson correlation coefficient was used to assess the relationships among radionuclides [17].

Assessment of radiation hazard indices

Radium equivalent activity (Ra_{eq})

The assessment of radiation hazard indices includes the determination of hazards caused by naturally occurring radioactive materials (NORM) present in soil. One of the important indicators in this assessment is radium equivalent activity (Ra_{eq}), which combines the activities of the main radionuclides such as ^{226}Ra, ^{232}Th, and ^{40}K [18,19]. This quantity makes it possible to compare the radiation effects of different radionuclides and serves to ensure safety in calculation activities.

$$\mathrm{Ra_{eq}(Bqk}g^{-1}) = \mathrm{A_{Ra}} + 1.43\mathrm{A_{Th}} + 0.077\mathrm{A_K} \quad (1)$$

Absorbed dose rate (D)

The absorbed dose rate in the outdoor environment (D_{outdor}, nGy h^{-1}) was calculated using standard conversion coefficients based on the specific activities of the radionuclides ^{226}Ra, ^{232}Th, and ^{40}K in soil. This indicator represents the calculated assessment of the gamma dose rate generated by natural terrestrial radionuclides in open air at a height of 1 m above the ground surface [20–22]. The observed absorbed dose rate values are presented in Table 2.

$$D_{out}\ (\mathrm{nGy\ h^{-1}}) = 0.462\mathrm{A_{Ra}} + 0.604\mathrm{A_{Th}} + 0.0417\mathrm{A_K} \quad (2)$$

Annual Effective Dose Equivalent (E)

In accordance with the recommendations of UNSCEAR (2000) [21], the annual effective dose for the outdoor environment (E_{outdor}) was calculated using Equation (3). By adopting occupancy factors of 20% for the outdoor environment and 80% for the indoor environment, respectively, E_{outdor} was determined as follows using a conversion coefficient of 0.7 Sv/Gy to convert the absorbed dose in air to the annual effective dose.

$$\mathrm{E_{out}(mSv \cdot y^{-1})} = D_{out}(\mathrm{nGy \cdot h^{-1}}) \times 8760\ \mathrm{h} \times 0.2 \times 0.7\ \mathrm{Sv \cdot Gy^{-1}} \times 10^{-6} \quad (3)$$

External Hazard Index (H_{ex})

The external hazard index (H_{ex}) serves as a complex indicator for assessing radiation damage that may occur as a result of external exposure of the human body. Hex represents the total dose received externally due to gamma-radiation sources from natural radionuclides present in environmental objects such as soil, rocks, and plants. The H_{ex} value was calculated using Equation (4), and the results are presented in Table 2 [23].

$$H_{ex}(Bqkg^{-1}) = \frac{A_{Ra}}{370} + \frac{A_{Th}}{259} + \frac{A_K}{4810} \quad (4)$$

Results and Discussion

Radioactivity Concentrations and Ambient Equivalent Dose Rate

Among the natural radionuclides identified in the soil samples of the study area, ^{40}K was observed to have the highest specific activity values. Its values varied from 157 ± 18 to 756 ± 72 Bq/kg, with an average of 463.6 ± 44 Bq/kg. The specific activity of ^{226}Ra ranged from 25 ± 2.9 to 45 ± 6.8 Bq/kg, with an average of 34.9 ± 5.4 Bq/kg, while the values of ^{232}Th were in the range of 15 ± 1.8 to 27 ± 2.5 Bq/kg, with an average of 22.6 ± 2.3 Bq/kg. These results indicate that the main contribution to natural radioactivity in the soils of the study area corresponds to ^{40}K, whereas ^{226}Ra and ^{232}Th contribute at relatively lower levels.

Table 1

Measured activity concentrations of K-40, Ra-226, and Th-232 in soil samples, together with the in situ measured ambient equivalent dose rate, H*(10)

SAMPLE NO.	ACTIVITY CONCENTRATION (Bqkg^{-1})			DOSE EQUIVALENT RATE (μSvh^{-1})

S14	325±28	28±5.4	21±2	0.10
S15	478±46	37±4.6	25±2.6	0.10
S16	569±52	45±6	26±2.8	0.12
Minimum	157±18	25±2.9	15±1.8	0.07
Maximum	756±72	45±6.8	27±2.5	0.15
Average	463.6±44	34.9±5.4	22.6±2.3	0.1

The distribution of radionuclide activities is also clearly demonstrated in the boxplot diagram (Figure 2). The figure shows that ^{40}K not only has the highest central value, but also that its range of variation is considerably wider than that of the other radionuclides. This may be explained by the stronger dependence of ^{40}K on the mineralogical composition and lithological characteristics of the soil. The interquartile range for ^{226}Ra is moderate, indicating that its distribution across the area is relatively more stable compared to ^{40}K. ^{232}Th has the narrowest distribution range, which indicates that this radionuclide is distributed relatively uniformly in the investigated samples. In general, with respect to the composition of

natural radionuclides in the soils of the study area, ^{40}K was dominant, ^{226}Ra was at an intermediate level, and ^{232}Th was present at a relatively low and more stable level.

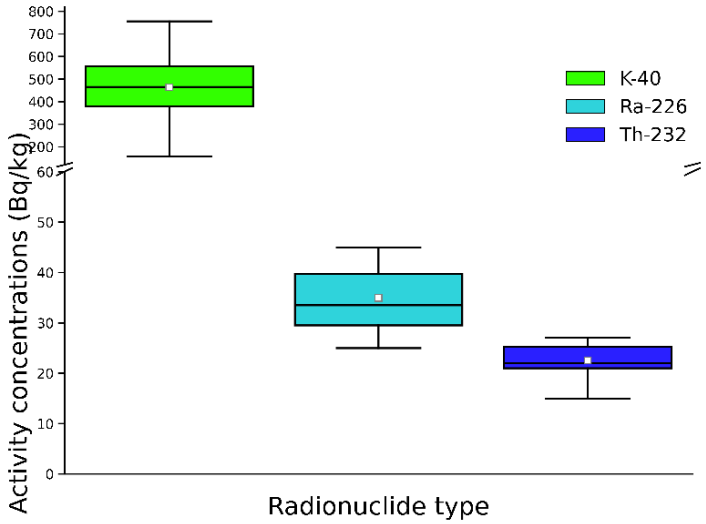

Figure 2. Boxplot distribution of K-40, Ra-226 and Th-232 activity concentrations in the investigated soil samples.

The ambient equivalent dose rate (EDR) values measured at the study points ranged from 0.07 to 0.15 μSv/h, with an average value of 0.10 μSv/h. The lowest value was recorded at point S1 (0.07 μSv/h), while the highest value was recorded at point S10 (0.15 μSv/h). The values at the remaining points were mainly within the range of 0.08–0.14 μSv/h, indicating that the external gamma-radiation field across the area was relatively stable. According to the results presented in Table 1, although relatively higher EDR values were observed at some points, the overall distribution did not show sharply distinct or highly anomalous conditions. This indicates that the gamma-background level in the study area was generally maintained within the same order, while the differences may be related to local geochemical and lithological characteristics.

Figure 3, presented in the form of a bar chart, clearly illustrates the variation of EDR across the sample points. The graph clearly shows that the EDR values were relatively high at points S9 and especially S10, whereas the lowest value was recorded at point S1. At the same time, the fact that the values at most points are located around the average line indicates that the level of external radiation across the area changes moderately rather than sharply.

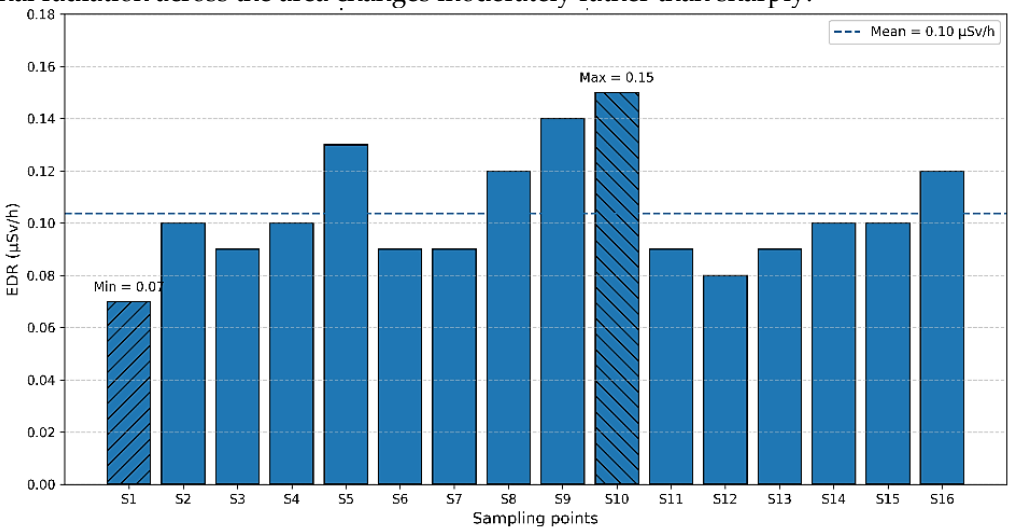

Figure 3. Spatial variation of the measured ambient equivalent dose rate (EDR) across the sampling points. The dashed line indicates the mean EDR value.

Radiological Hazards

The radiological indicators calculated on the basis of the activity of natural radionuclides in the soil samples are presented in Table 2, and they made it possible to provide an overall assessment of the external gamma-radiation hazard across the area. According to the calculation results, the values of radium equivalent activity (Ra_{eq}) varied within the range of 69.3–133.6 Bq/kg, with an average of 102.9 Bq/kg. The highest Ra_{eq} value was recorded at sample point S7, while the lowest value was recorded at point S13. In general, the Ra_{eq} values determined for all samples were considerably lower

than the recommended limit value of 370 Bq/kg, indicating that the overall radiological burden associated with gamma radiation in the investigated soils is not high.

Table 2

Radiological Parameters obtained from the measured activity concentrations in soil samples.

Sample ID	Ra_{eq} ($Bqkg^{-1}$)	D ($nGy \cdot h^{-1}$)	E_{out} ($mSv \cdot y^{-1}$)	H_{ex}($Bqkg^{-1}$)
S1	118.0	56.45	0.07	0.32
S2	127.1	60.62	0.07	0.34
S3	101.1	48.13	0.06	0.27
S4	104.2	50.12	0.06	0.28
S5	113.1	53.59	0.07	0.31
S6	113	53.70	0.07	0.31
S7	133.3	65.00	0.08	0.36
S8	87.8	42.00	0.05	0.24
S9	96.3	45.23	0.06	0.26
S10	110	53.45	0.07	0.30
S11	73.9	35.16	0.04	0.20
S12	81.1	38.97	0.05	0.22
S13	69.1	31.71	0.04	0.19
S14	83.1	39.17	0.05	0.22
S15	109.6	52.13	0.06	0.29
S16	125.9	60.22	0.07	0.34
Minimum	69.3	31.70	0.04	0.19
Maximum	133.6	65.00	0.08	0.36
Average	102.9	49.10	0.06	0.28

The absorbed dose rate in air (D) ranged from 31.70 to 65.00 $nGy \cdot h^{-1}$, with an average value of 49.10 $nGy \cdot h^{-1}$. The highest D value was observed in sample S7, while the lowest value was observed in sample S13. These results indicate that the external gamma dose rate also increases at points where radionuclide activity is relatively higher. At the same time, the variation of D across the sample points is not sharp, but rather moderate in character, reflecting a relatively stable background of natural radioactivity in the area.

The outdoor annual effective dose (E_{out}) values ranged from 0.04 to 0.08 $mSv \cdot y^{-1}$, with an average of 0.06 $mSv \cdot y^{-1}$. This indicator showed the same tendency as the D values, that is, E_{out} was also relatively higher at points where the absorbed dose rate was higher. The fact that the E_{out} values are located within a low range indicates that the annual effective dose formed as a result of external radiation in the study area is not significant.

The external hazard index (H_{ex}) values ranged from 0.19 to 0.36, with an average value of 0.28. Since the H_{ex} value was less than 1 in all samples, this indicates that the soils in the study area do not pose a high risk from the point of view of external gamma radiation. The highest H_{ex} value was recorded at point S7, while the lowest value was recorded at point S13, which is consistent with the Ra_{eq} and D results.

Conclusion

The results of the study showed that the main contribution to natural radioactivity in the soils around the technogenic radioactive waste storage area in Navoi region is formed by ^{40}K, whereas ^{226}Ra and ^{232}Th were distributed within relatively lower and narrower ranges. The measured H*(10) values ranged from 0.07 to 0.15 μSv/h, confirming that the external gamma field across the area generally has a moderate character and is not sharply anomalous. The calculated radiological indicators also supported this condition: all Ra_{eq} values were considerably lower than the recommended limit level of 370 Bq/kg, and H_{ex} was less than 1 in all samples, indicating that the investigated soils do not create a high radiological burden from the point of view of external gamma hazard.

In addition, the average absorbed dose rate was 49.10 $nGy \cdot h^{-1}$, which is lower than the world average value of 59 $nGy \cdot h^{-1}$ for the outdoor environment reported by UNSCEAR. The average value of the outdoor annual effective dose was 0.06 $mSv \cdot y^{-1}$, which is significantly lower than the recommended annual dose limit of 1 mSv for the public. Therefore, the levels of radionuclides identified in the soils around the study area and the resulting external radiation indicators were assessed as satisfactory from the viewpoint of radiation protection.

In general, the soils around the investigated area do not pose a high radiological hazard; however, it is advisable to continue such monitoring activities periodically in order to assess long-term changes associated with the influence of the technogenic object.

Kirish

Ma’lumki, yuqori tartibli singulyar koeffitsiyentli tenglamalar uchun chegaraviy masalalar nazariyasi zamonaviy differensial tenglamalar nazariyasining tez rivojlanayotgan bo‘limlaridan biri hisoblanadi. Uchinchi tartibli singulyar koeffitsiyentli tenglamalar uchun qo‘yilgan masalalar asosan simmetrik va maxsus xususiyatga ega bo‘lgan (singulyar) o‘tkazuvchan muhitlarda to‘lqinlarning tarqalishi va muvozanat holatini o‘rganish uchun xizmat qiladi**.** Dispersiv muhitda kichik, ammo chekli amplitudali to‘lqinlarni o‘rganish uchun ko‘pincha model sifatida Kortevega-de Vries tenglamasidan foydalaniladi:

$$u_y + uu_x + \beta u_{xxx} = 0, \beta = const \neq 0.$$

Chiziqli holatda bunday tenglamalar nazariyasini L.Cattabriga [1], T.D.Djurayev [2] va uning shogirdlari tomonidan o‘rganilgan va rivojlantirilgan. Bu karrali xarakteristikali tenglamalarning boshqa sinflari bo‘yicha tadqiqotlar boshlanishiga turtki bo‘ldi. Natijada vaqt bo‘yicha ikkinchi tartibli hosilani o‘z ichiga olgan karrali xarakteristikali tenglamalar ustida tadqiqotlar boshlandi va davom etmoqda. Karrali xarakteristikali uchinchi tartibli tenglama bo‘yicha birinchi natijalar H.Blok, E.Del Vecchio ishlarida olingan. L.Catabriga ikki karrali xosmas integral ko‘rinishida $D_x^{2n+1}u - D_y^2u = 0$ tenglama uchun fundamental yechimini qurgan, potentsial xossalarini o‘rgangan va tegishli chegaraviy masalalarni yechish bilan shug‘ullangan.

I. Masalaning qo‘yilishi

Mazkur ishda $D = \{(x, y):\ 0 < x < p, 0 < y < q\}$ sohada ushbu

$$u_{xxx} - u_{yy} - \frac{2\beta}{y}u_y + \mu u = 0 \quad (1)$$

tenglamani qaraylik, bu yerda $p > 0$, $q > 0$, $0 < \beta < 1/2$, μ – doimiy haqiqiy son.

Ushbu (1) tenglama D sohada uchinchi tartibli xususiy hosilali, singulyar koeffitsiyentli, chiziqli, karrali xarakteristikaga ega tenglama hisoblanadi.

(1) tenglama uchun D sohada quyidagi masalani qo‘yamiz va tadqiq qilamiz:

A_1-masala. D sohada (1) tenglamaning

$$u(x,y) \in C^{3,2}_{x,y}(D),\ u_{xx}, y^{2\beta}u_y \in C(\overline{D})$$

sinfga tegishli bo‘lgan hamda quyidagi

$$u(x,0) = u(x,q) = 0,\ 0 \le x \le p \tag{2}$$

$$u(0,y) = \psi_1(y), u(p,y) = \psi_2(y), u_x(p,y) = \psi_3(y), 0 \le y \le q \tag{3}$$

chegaraviy shartlarni qanoatlantiruvchi yechimini topilsin, bu yerda $\psi_i(y)$, $(i = 1,3)$ – berilgan funksiyalar.

Agar A_1-masalada $\beta = 0$ bo‘lsa, [3] ishda o‘rganilgan masala kelib chiqadi. Bu masalaga o‘xshash masalar esa [4], [5] ishlarda o‘rganilgan.

II. Masala yechimining yagonaligi

1-teorema. Agar A_1 masalaning yechimi mavjud bo‘lib, $0 \le \beta \le 1/2$, $\mu \ge 0$ bo‘lsa, u holda u yagonadir.

Isbot. Faraz qilaylik, A_1 masala ikkita $u_1(x,y)$ va $u_2(x,y)$ yechimlarga ega bo‘lsin. U holda $u(x,y) = u_1(x,y) - u_2(x,y)$ funksiya bir jinsli A_1-masalaning yechimi bo‘ladi. $\overline{D}$ sohada $u(x,y) \equiv 0$ ekanligini isbotlaymiz.

(1) tenglamaning har ikkala tomonini $y^{2\beta}u(x,y)$ ga ko‘paytiramiz. Natijada quyidagi tenglikka ega bo‘lamiz:

$$y^{2\beta}uu_{xxx} - y^{2\beta}uu_{yy} - 2\beta y^{2\beta-1}uu_y + y^{2\beta}u^2 = 0.$$

Oxirgi ifodani quyidagi ko‘rinishda ham yozish mumkin:

$$\frac{\partial}{\partial x}y^{2\beta}\left(uu_{xx} - \frac{1}{2}{u_x}^2\right) - \frac{\partial}{\partial y}\left(y^{2\beta}uu_y\right) + y^{2\beta}{u_y}^2 + y^{2\beta}\mu u^2 = 0. \tag{4}$$

(4) ifodani D soha bo‘yicha integrallaymiz va Grin formulasini [6] qo‘llab, quyidagi ifodaga ega bo‘lamiz:

$$\int_0^q y^{2\beta}\left(u(p,y)u_{xx}(p,y) - \frac{1}{2}u_x^2(p,y) - u(0,y)u_{xx}(0,y) + \frac{1}{2}u_x^2(0,y)\right)dy -$$
$$- \int_0^p y^{2\beta}u(x,y)u_y(x,y)\Big|_{y=0}^{y=q}dx + \iint_D y^{2\beta}u_y^2 dxdy + \iint_D y^{2\beta}\mu u^2 dxdy = 0.$$

Bir jinsli chegaraviy shartlarni inobatga oladigan bo‘lsak, quyidagi

$$\frac{1}{2}\int_0^q y^{2\beta}u_x^2(0,y)dy + \iint_D y^{2\beta}u_y^2(x,y)dxdy + \mu\iint_D y^{2\beta}u^2(x,y)dxdy = 0 \tag{5}$$

tenglikka ega bo‘lamiz. (5) tenglikda agar

• $\mu = 0$ bo‘lsa, $u_y(x,y) = 0$ bo‘ladi. Bundan esa $u(x,y) = f(x)$hosil bo‘ladi. Bu yerdan $y = 0$ deb olsak, $u(x,0) = 0$ chegaraviy shartga asosan $f(x) = 0$ bo‘ladi. Demak, $u(x,y) \equiv 0$, $(x,y) \in \overline{D}$.

• $\mu > 0$ bo‘lsa (5) ning uchinchi hadidan $u(x,y) \equiv 0$, $(x,y) \in \overline{D}$ kelib chiqadi.

Teorema isbotlandi.

III. Masala yechimining mavjudligi

2-teorema. Agar quyidagi $\psi_i(y) \in C^3[0,q]$, $i = \overline{1,3}$, $\psi_i(q) = \psi_i(0) = 0$, $|\psi_i'''(0)| < \infty$ shartlar bajarilsa A_1 masala yechimga ega.

Isbot. A_1 masala yechimini quyidagi

$$u(x,y) = X(x)\cdot Y(y) \tag{6}$$

ko‘rinishda qidiramiz.

(6) ni (1) tenglamaga qo‘yamiz va $X(x)$, $Y(y)$ funksiyalarga nisbatan quyidagi $Y'' + \frac{2\beta}{y}Y' + \lambda^3 Y = 0$, $X''' + (\mu + \lambda^3)X = 0$ oddiy differensial tenglamalarni hosil qilamiz.

(2) shartni inobatga oladigan bo‘lsak, quyidagi

$$Y''(y) + \frac{2\beta}{y}Y'(y) + \lambda^3 Y(y) = 0, \tag{7}$$

$$Y(0) = 0,\ Y(q) = 0 \tag{8}$$

spektral masalani hosil qilamiz, bu yerda λ^3– ajratish koeffitsiyenti.

Endi {(7), (8)} masalaning noldan farqli yechimi mavjud bo‘ladigan λ parametrning qiymatlarini topish bilan shug‘ullanamiz. Buning uchun λ parametrning uchta holini ko‘rib chiqamiz.

Faraz qilaylik, $\lambda < 0$ bo‘lsin. U holda (7) tenglamada $Y(y) = \left(\frac{t}{\sqrt{-\lambda^3}}\right)^{\frac{1}{2}-\beta} p(t), t = \sqrt{-\lambda^3}y$ almashtirish bajaramiz va natijada quyidagi

$$t^2 p''(t) + tp'(t) - (t^2 + \nu^2)p(t) = 0 \tag{9}$$

tenglamaga ega bo‘lamiz, bu yerda $\nu = 1/2 - \beta$.

(9) tenglamaning umumiy yechimi $p(t) = c_1 I_\nu(t) + c_2 K_\nu(t)$ ko‘rinishida ekanligi [7], [8] adabiyotlarda ko‘rsatib o‘tilgan, bu yerda $c_1$va c_2 – ixtiyoriy o‘zgarmaslar. $I_\nu(t)$ va $K_\nu(t)$ lar esa mos holda ν – tartibli Infeld va Makdonald funksiyalaridir.

Qilingan almashtirishdan foydalanib, y o‘zgaruvchiga qaytadigan bo‘lsak (7) tenglamaning umumiy yechimi quyidagi ko‘rinishda yoziladi:

$$Y(y) = c_1 y^{1/2-\beta} I_{1/2-\beta}\left(\sqrt{-\lambda^3}y\right) + c_2 y^{1/2-\beta} K_{1/2-\beta}\left(\sqrt{-\lambda^3}y\right) \quad (10)$$

(10) yechimni (8) chegaraviy shartlarga bo‘ysindiramiz va c_1 hamda c_2 ga nisbatan quyidagi

$$\begin{cases} c_1 0^{1/2-\beta} I_{1/2-\beta}\left(\sqrt{-\lambda^3}0\right) + c_2 y^{1/2-\beta} K_{1/2-\beta}\left(\sqrt{-\lambda^3}y\right) = 0, \\ c_1 q^{1/2-\beta} I_{1/2-\beta}\left(\sqrt{-\lambda^3}q\right) + c_2 y^{1/2-\beta} K_{1/2-\beta}\left(\sqrt{-\lambda^3}q\right) = 0, \end{cases}$$

tenglamalar sistemasini hosil qilamiz. Bu sistemani yechib $Y(y) \equiv 0$ ekanligiga ishonch hosil qilish mumkin. Demak, $\lambda < 0$ da {(7), (8)} masalaning noldan farqli yechimi mavjud emas.

$\lambda = 0$ da {(7), (8)} masala quyidagi ko‘rinishga ega:

$$\begin{cases} Y''(y) + \dfrac{2\beta}{y} Y'(y) = 0, \\ Y(0) = 0, Y(q) = 0. \end{cases}$$

Oxirgi tenglamaning umumiy yechimi $Y(y) = c_3 y^{1-2\beta} + c_4, c_3, c_4 = const$, ko‘rinishida aniqlanadi. Bu funksiyani (8) shartlarga bo‘ysundiramiz va $\lambda = 0$ da {(7), (8)} masalaning noldan farqli yechimi mavjud emasligiga ishonch hosil qilish mumkin.

Faraz qilaylik $\lambda > 0$ bo‘lsin. U holda $Y(y) = \left(t/\sqrt{\lambda^3}\right)^{1/2-\beta} p(t)$, $t = \sqrt{\lambda^3}y$ almashtirish bajarish natijasida quyidagiga ega bo‘lamiz:

$$t^2 p''(t) + t p'(t) + (t^2 - \nu^2) p(t) = 0, \quad (11)$$

bu yerda, $\nu = 1/2 - \beta$. (11) tenglamaning umumiy yechimidan va kiritilgan almashtirishlardan foydalanib (7) tenglamaning umumiy yechimi

$$Y(y) = c_5 y^{1/2-\beta} J_{1/2-\beta}\left(\sqrt{\lambda^3}y\right) + c_6 y^{1/2-\beta} J_{\beta-1/2}\left(\sqrt{\lambda^3}y\right), c_5, c_6 = const$$

ko‘rinishda bo‘ladi, bu yerda $J_\nu(x)$ – νindeksli birinchi tur Bessel funksiyasi.

Bu umumiy yechimni (8) shartlarga bo‘ysundiramiz:

$$\begin{cases} c_5 y^{1/2-\beta} J_{1/2-\beta}\left(\sqrt{\lambda^3}y\right)\Big|_{y=0} + c_6 y^{1/2-\beta} J_{\beta-1/2}\left(\sqrt{\lambda^3}y\right)\Big|_{y=0} = 0, \\ c_5 q^{1/2-\beta} J_{1/2-\beta}\left(\sqrt{\lambda^3}q\right) + c_6 q^{1/2-\beta} J_{\beta-1/2}\left(\sqrt{\lambda^3}q\right) = 0. \end{cases}$$

Birinchi tenglikdan $c_6 = 0$ ekanligi kelib chiqadi. Ikkinchi tenglikdan esa $J_{1/2-\beta}\left(\sqrt{\lambda^3}q\right) = 0$ tenglamani hosil qilamiz. Bu tenglamaning musbat ildizlarini $\sqrt{\lambda^3}q = \sigma_n$ deb belgilab, λ -parametrning qiymatlarini, ya’ni masalaning xos qiymatlarini $\lambda_n = (\sigma_n/q)^{2/3}$, $n \in N$ ko‘rinishida topamiz.

Bu xos qiymatlarga mos keluvchi {(7), (8)}masalaning xos funksiyalari $Y_n(y) = c_5 y^{1/2-\beta} J_{1/2-\beta}\left(\sqrt{\lambda^3}y\right)$ ko‘rinishda aniqlanadi. Bu funksiyalar sistemasini normallashtirib quyidagiga ega bo‘lamiz:

$$Y_n(y) = \frac{\sqrt{2}}{q J_{3/2-\beta}(\sigma_n)} y^{1/2-\beta} J_{1/2-\beta}\left(\frac{\sigma_n y}{q}\right). \quad (12)$$

[8] adabiyotdagi ma’lumotlarga muvofiq (12) funksiyalar sistemasi $L_2[0,q]$ fazosida $y^{2\beta}$ vazn bilan to‘la ortonormal sistemani tashkil qiladi.

Qo‘yilgan masalaning x o‘zgaruvchiga mos keladigan qismi [4] ishda o‘rganilgan. 2-teoremaning va bu tadqiqotning natijasi hamda (12) formulaga asosan A_1-masalaning yechimi

$$u(x,y) = \sum_{n=1}^{\infty} \left[C_{1n} e^{-k_n x} + e^{\frac{1}{2}k_n x}\left(C_{2n} \cos\frac{\sqrt{3}}{2}k_n x + C_{3n} \sin\frac{\sqrt{3}}{2}k_n x \right) \right] \frac{\sqrt{2} y^{1/2-\beta} J_{1/2-\beta}\left(\frac{\sigma_n y}{q}\right)}{q J_{3/2-\beta}(\sigma_n)},$$

ko‘rinishda bo‘ladi, bu yerda $C_{1n} = \frac{1}{\Delta}\left[A_{1n}\frac{\sqrt{3}}{2}k_n e^{k_n p} - A_{2n}\delta k_n e^{\frac{1}{2}k_n p} + A_{3n}\beta e^{\frac{1}{2}k_n p} \right]$,

$$C_{2n} = \frac{1}{\Delta}\left[-A_{1n}k_n e^{-\frac{1}{2}k_n p}(\delta + \beta) + A_{2n}\delta k_n e^{\frac{1}{2}k_n p} - A_{3n}\beta e^{\frac{1}{2}k_n p} \right],$$

$$C_{3n} = \frac{1}{\Delta}\left[A_{1n}k_n(\alpha + \gamma) e^{-\frac{1}{2}k_n p} + A_{2n}k_n\left(e^{-k_n p} + \gamma e^{\frac{1}{2}k_n p} \right) + A_{3n}\left(\alpha e^{\frac{1}{2}k_n p} - e^{-k_n p} \right) \right],$$

$$A_{in} = \sqrt{\frac{2}{q}} \int_0^q \psi_i(\eta) \sin\frac{\pi(2n-1)}{2q}\eta d\eta, \quad i = 1,2,3, \quad k_n = \sqrt[3]{{\lambda_n}^3 + \mu}, \Delta = \sqrt{3}k_n e^{k_n p}\left(\frac{1}{2} - e^{-\frac{3}{2}k_n p} \sin\left(\frac{\sqrt{3}}{2}k_n p + \frac{\pi}{6} \right) \right), \alpha =$$

$$\cos\frac{\sqrt{3}}{2}k_n p, \ \beta = \sin\frac{\sqrt{3}}{2}k_n p, \ \gamma = \cos\left(\frac{\sqrt{3}}{2}k_n p + \frac{\pi}{3} \right), \ \delta = \sin\left(\frac{\sqrt{3}}{2}k_n p + \frac{\pi}{3} \right).$$

STATISTICAL ANALYSIS OF FLUORESCENCE SPECTRA FOR CONSTRUCTING A PLANT CLASSIFIER

Abstract: *Based on an analysis of the correspondence between the spectral structure of fluorescence and photochemical reactions occurring in the photosynthetic apparatus of plant leaves, it is concluded that plant diagnostics using laser-induced fluorescence spectra is possible. To achieve sufficiently accurate identification of plant species and plant condition, the use of a multivariate classifier constructed using discriminant analysis is proposed.*

Keywords: *fluorescence, laser, plant, spectrum, discriminant analysis*

FLUORESSENT SPEKTRLARINI STATISTIK TAHLIL QILISH ASOSIDA O‘SIMLIKLAR KLASSIFIKATORINI TUZISH

Annotatsiya: *Fluoressent nurlanish spektrining tuzilishi va o‘simlik barglaridagi fotosintetik apparatda sodir bo‘ladigan fotokimyoviy reaksiyalar o‘rtasidagi moslikni tahlil qilish asosida lazer bilan induktsiyalangan fluoressent spektrlar orqali o‘simliklarni diagnostika qilish mumkin ekanligi to‘g‘risida xulosaga kelingan. O‘simlik turlari va ularning holatini yetarlicha aniq tasniflash uchun diskriminant tahlil usuli yordamida tuzilgan ko‘p o‘lchamli klassifikatordan foydalanish taklif etilagan.*

Kalit so‘zlar: *fluoressensiya, lazer, o‘simlik, spektr, diskriminant tahlil*

Введение

В настоящее время наиболее перспективным направлением изучения, прогнозирования и повышения устойчивости организмов к экстремальным воздействиям считается оценка исходного физиологического состояния организма растений.

Для определения состояния растительного покрова по данным дистанционного зондирования наиболее точным методом является измерение флуоресцентного излучения, возбуждённого лазерными лучами [1]. Флуоресцентное излучение молекул хлорофилла, содержащихся в листьях растений несёт наиболее полную информацию о состоянии фотосинтетического аппарата, в котором происходят фотохимические реакции на фоне влияния факторов окружающей среды [2,3].

Информативность изучения закономерности флуоресценции состоит в том, что синглетно возбуждённые молекулы хлорофилла являются основным участником в фотохимических реакциях фотосинтеза. Часть энергии возбуждённого хлорофилла растачивается в виде флуоресценции и без иррадиационной диссипации, а также в

результате миграции энергии к другим молекулам хлорофилла. Хотя флуоресценция обусловлена испусканием квантов света молекулами хлорофилла, не участвующими в фотопереносе электрона, она может отражать протекание первичных фотопроцессов. Основной базис информативности фотолюминесцентных показателей состоит в том, что уменьшение эффективности запасания света в фотосинтезе приводит к увеличению интенсивности флуоресценции. В свою очередь, деструкция или функциональное разобщение компонентов электрон-транспортной цепи, вызванное стрессовым воздействием внешних факторов неизбежно отразится на интенсивности свечения. Это позволяет использовать фотолюминесцентные показатели в качестве оперативной оценки состояния эффективности фотосинтетического аппарата [4].

Несмотря на универсальность протекания фотохимических превращений в фотосинтетическом аппарате высших растений, имеется определённые особенности их проявления в спектрах флуоресценции в зависимости *in situ* состояний в клетках. На формирование спектральной структуры флуоресценции влияют процессы трансмембранного электрохимического градиента протонов с участием фотосистем ФС 1 и ФС II при синтезе АТФ и в результате утечек ионов *H*, *K* и *Cl*. При фосфорилировании светособирающего комплекса уменьшение выхода флуоресценции обусловлено перераспределения поглощённой энергии в пользу ФС1, необходимой для достижения оптимального соотношения двух фотосистем. В целом, соотношением функционирования этих двух фотосистем, в основном, определяется вклад характерные участки флуоресцентного спектра в области максимумов 680 и 730 *нм* [5,6].

Большинство авторов рекомендуют проводит оценку состояния растений именно по соотношению F680 и F730 [7-8]. Однако более тщательные исследования показали, что это соотношение F680/F730 не всегда имеет однозначную закономерность, что ограничивает его использование при оценке реального состояния растений [9]. Более точную информацию можно извлечь, включив в рассмотрение конфигурацию спектра во всём диапазоне длин волн от 670 до 740 *нм*.

Результаты измерений

Измерения, проведённые над большой выборкой опытных растений (более 100 экземпляров), показали значительный разброс в спектральном облике флуоресцентной эмиссии как между видами растений так и внутри одного и того же вида (рис.1). Это обстоятельство существенно усложняет однозначную идентификацию фенотипа растений, что приводит к трудностям точной оценки по спектральным данным дистанционного зондирования.

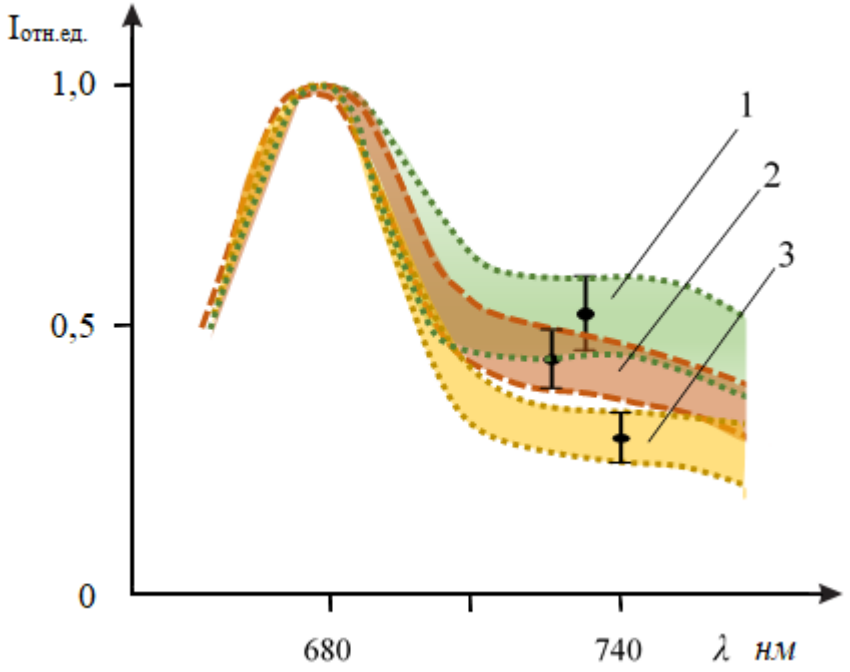

Рис.1. Статистический разброс спектральных кривых, нормированных по длине волны $I_{фл}$ (680 м), для различных классов растений: 1 - хлопок, 2 - кукуруза, 3 - пшеница (доверительный интервал при доверительной вероятности 0,95)

Для выбора эталонных сигнатур, присущих каждому классу, необходимо провести статистический анализ спектральных данных в широкой выборке обучающих образов полученных в ходе множественных экспериментов в лабораторных условиях. Анализ и обработку такой информации удобно выполнять, пользуясь методами распознавания образов (РО). Следует отметить, что при обработке массива многоспектральных данных для его анализа и хранения удобно обращаться с ограниченным набором цифровых величин, образованных, например из

интенсивностей спектральных откликов на определённых длинах волн. В этом случае данные будут образовывать точку (или совокупность точек), соответствующих к тому или иному классу в n -мерном пространстве признаков (где n - число выбранных каналов спектра). Таким образом, задача интерпретации дистанционных измерений будет сводиться к определению принадлежности n мерного вектора спектрального отклика отдельным классам. Качество и достоверность идентификации этих измерений будет, в конечном счёте, определяться тем, несколько хорошо образованные классы будут разделены в пространстве признаков, т.е. спектрально различимы.

Как показали измерения, плотность вероятности значений интенсивности люминесценции (ПВИЛ) в каждом выбранном канале регистрации подчиняется нормальному закону (рис.2). К тому же, спектральные отклики, измеренные на двух длинах волн оказались зависимыми. Эти факты дали основание для выбора дискриминантной функции в виде нормального распределения.

Различие усреднённых спектральных кривых разных сортов хлопчатника в абсолютных единицах значительно больше, чем тех же спектров в относительных единицах. Однако, спектральные признаки в абсолютных единицах, не "привязанные" к выбранной собственной интенсивности, могут приводить к неверной классификации. Поэтому наблюдаемое большое различие между классами по отмеченным выше спектральным признакам не является достаточно надёжным. Сопоставление двух способов представления данных демонстрирует, что во всех рассмотренных здесь случаях, наиболее эффективным являются спектральные признаки в абсолютных единицах в области 680-690 *нм*, а для нормализованных спектров в области 720-730 *нм*.

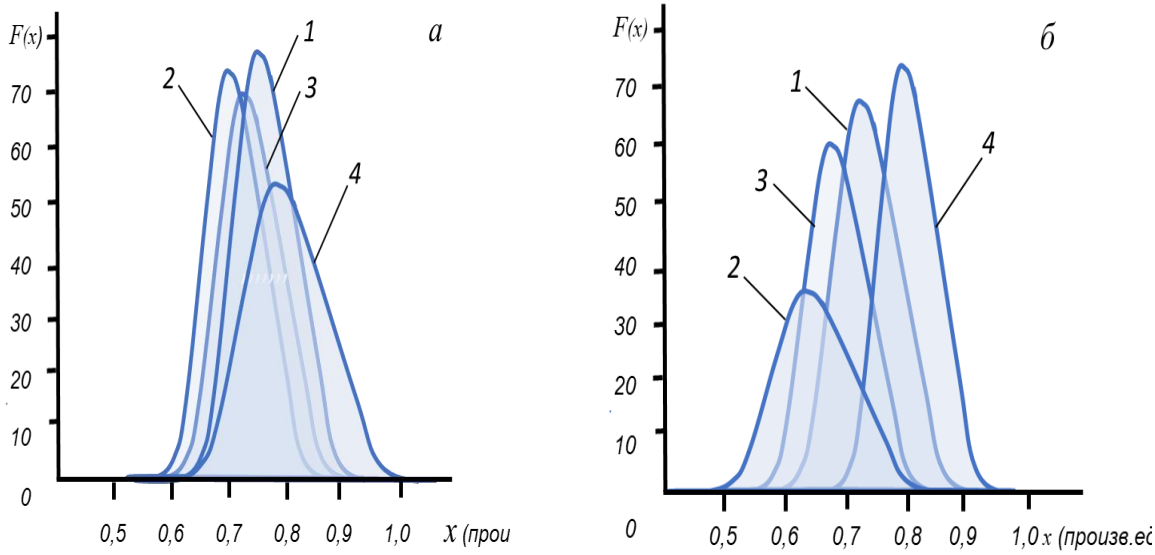

Рис.1. Кривые ПВИЛ - $F(x)$ *(произвольные единицы)* (x - значения интенсивности в участках спектра, соответствующих двум характерным максимумам - 680 (а) и 730 *нм* (б). 1 - здоровые; 2, 3 и 4 - подверженные водному, азотному и водно-азотному стрессу растения хлопчатника соответственно.

Таблица 1. Математическое ожидание и дисперсия значений интенсивности (*в произвольных величинах*) для здоровых (кл.1), подверженных водному (кл.2), азотному (кл.3) и водно-азотному (кл.4) растений хлопчатника. Индексы *1* и *2* относятся к спектральным каналам 680 и 730 *нм*

Класс	μ_1	μ_2	σ_{11}	σ_{22}	σ_{12}
1	7,71 E-01	7,46 E-01	3.31 E-03	3.31 E-03	1.59 E-03
2	7,30 E-01	6.48 E-01	3.40 E-03	1.48 E-03	5.48 E-03
3	7,54 E-01	6.97 E-01	3.89 E-03	4.56 E-03	3.97 E-03
4	8,03 E-01	8.19 E-01	7.02 E-03	2.24 E-03	2.70 E-03

Методика обработки измерений

Для решения задачи классификации наиболее удобным оказалось применение метода статистического распознавания образов (рис.3), основанный на дискриминантный анализе многоспектральных данных [10].

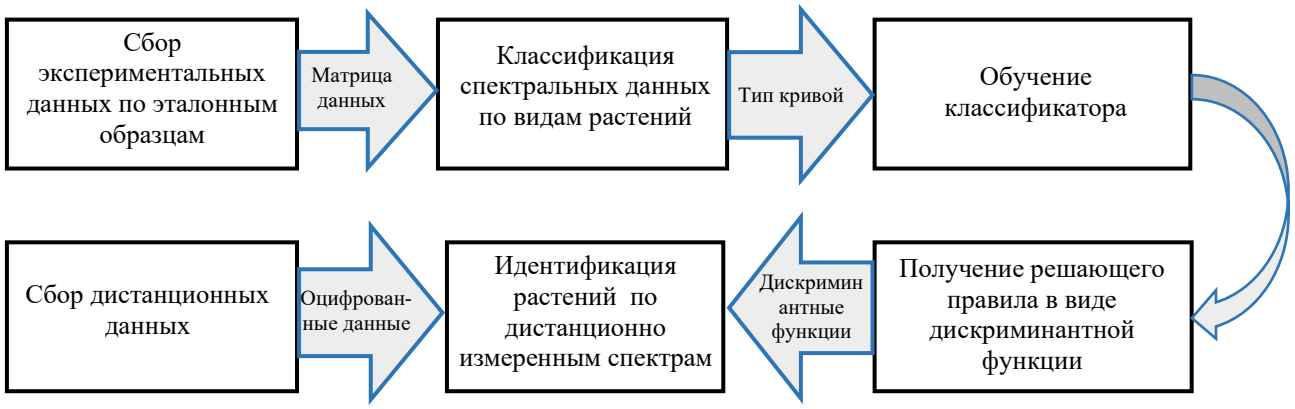

Рис.3. Алгоритм классификации методом дискриминантного анализа.

Данный метод основан на вычислении дискриминантных функций g_i для различных классов и оценке по правилу максимума правдоподобия

$$g_i = lnP(W_i) - \frac{1}{2} ln\,|S_i| - \frac{1}{2}(\vec{x} - \vec{\mu}_i)^T S_i^{-1}(\vec{x} - \vec{\mu}_i) \quad (1)$$

где $P(W_i)$ - априорная вероятность, неизвестная в лабораторных условиях, принимается равной для всех классов ; $|S_i|$ - определитель ковариационной матрицы, составленный из элементов

$$\sigma_{nm}^i = \frac{1}{q_i - 1}\sum_{l=1}^{n}(x_l^n - \mu_i^n)(x_l^m - \mu_i^m) \quad (2)$$

x_l^n - значение переменной x в n,m спектральном канале ; S_i^{-1} - матрица обратная к S_i ; $(\vec{x} - \vec{\mu}_i)^T$ - транспонированный вектор - столбец $\vec{x} - \vec{\mu}_i$; μ_i^n - математическое ожидание переменной класса i в n - спектральном канале.

При этом классифицируемый объект принадлежит классу i если: $g_i(x) \geq g_j(x)$ для всех $i \neq j$, противном случае объект x принадлежит к другим классам. Таким образом, для классификации необходимо было построить соответствующие дискриминантные функции интересующих нас классов по обучающим образам, в качестве которых служили образцы растений соответствующих групп. Учитывая, что не существует прямой зависимости между количеством признаков и качеством классификации, отдельный интерес представлял выбор оптимального набора признаков, содержащих максимум полезной информации, позволяющих разделить классы. Выбор наиболее информативных, с точки зрения классификации признаков, в данном случае спектральных каналов осуществляется с помощью меры статистической разделимости классов i и j в каждом канале λ ,в качестве которой использовались нормализованное расстояние

$$Dij = \frac{|\mu_i - \mu_j|}{\sigma_i + \sigma_j} \quad (3)$$

и критерий Фишера [11]

$$F_{ij} = \frac{(\mu_i - \mu_j)^2}{\sigma_i^2 + \sigma_j^2} \quad (4)$$

Проведённые оценки информативности спектральных признаков в абсолютных и относительных единицах, выполненные с помощью нормализованного расстояния Dij и критерия Фишера Fij показали, что наибольшее различие классов наблюдается в области второго максимума (λ = 710 - 730 nm) для данных, представленных в относительных единицах (табл.2).

Таблица 2. Нормализованное расстояние Dij и критерий Фишера F_{ij} между классами (*индексы 1 - кукуруза, 2- пшеница и 3 - хлопчатник*)

λ (nm)	D_{12}	F_{12}	D_{13}	F_{13}	D_{23}	F_{23}
670	0.12	0.03	0.14	0.04	0.88	0.09
680	0.26	0.11	0.48	0.38	0.08	0.01
690	0.04	0.00	0.11	0.02	0.08	0.01
700	0.49	0.45	1.35	3.42	0.76	1.14
710	0.63	0.78	1.53	4.19	1.11	2.21

720	0.20	0.08	1.29	3.09	1.13	2.37
730	0.20	0.08	0.99	1.77	0.87	1.35
740	0.29	0.17	0.98	1.81	0.73	1.03

Анализ результатов показал, что в случае одномерного классификатора (что соответствует оценку только по соотношению I_{730}/I_{680}) величина ошибки составляла от 17 до 42%, тогда как для многомерного (n ~ 10 - 12) классификатора ошибка оказалось практически равной нулю.

Выводы

Таким образом результат проведённых исследований показал реальную возможность распознавания состояний растений по спектрам лазерно-индуцированной флуоресценции. При этом в случае использования многомерного дискриминантного анализа обеспечивается высокая степень точности распознавания, которая определяется размерностью используемого классификатора. Эффективность предлагаемой методики состоит в том, что она позволяет по спектральной структуре флуоресценции определять отклонения от нормы в состоянии растений задолго до появления каких-либо визуальных признаков заболевания.

Аннотация: *В данной работе тонкие пленки ZnO, CuO и Cu_2O, а также гетероструктуры на их основе были комплексно исследованы с точки зрения структурных, морфологических, оптических и электрических свойств. Пленки были получены методом DC-магнетронного распыления при различных долях кислорода. Их морфология поверхности — SEM, элементный состав — EDS, а оптические и электрические свойства — соответствующими спектроскопическими и электрическими методами.*

Результаты показали, что пленки ZnO обладают высоким кристаллическим качеством и гладкой поверхностью, тогда как для Cu_2O и особенно CuO с увеличением парциального давления кислорода наблюдаются укрупнение зерен и рост пористости. Анализ электрических свойств выявил доминирование зонного транспорта в ZnO, смешанного механизма в Cu_2O и поляронного -транспорта в CuO, тогда как кварц проявляет изолирующие свойства. Оптические результаты показали уменьшение ширины запрещенной зоны от ZnO (≈3.3 эВ) к Cu_2O (≈1.43 эВ) и CuO (≈2.05 эВ), что сопровождается смещением спектра поглощения из ультрафиолетовой области в видимую и ближнюю инфракрасную области.

Научная новизна работы заключается в экспериментальном установлении эволюции механизмов переноса заряда — от свободного к частично локализованному — при одинаковых технологических условиях, а также в выявлении их связи с дефектной химией и парциальным давлением кислорода. Полученные результаты подтверждают перспективность данных материалов для применения в фотоэлектрических, оптоэлектронных и сенсорных устройствах.

Ключевые слова: *ZnO; Cu_2O; CuO; кварцевая подложка; тонкие пленки; магнетронное распыление; гетероструктура; электрическая проводимость; носители заряда.*

Cu_2O/CuO/ZnO/kvars GETEROSTRUKTURALARIDA ELEKTROFIZIK XOSSALARNING EVOLYUTSIYASI VA ZARYAD TASHUVCHILAR TRANSPORT MEXANIZMLARI

Annotatsiya: *Ushbu ishda* Zinc oxide, Copper(II) oxide *va* Copper(I) oxide *yupqa plyonkalar hamda ular asosidagi geterostrukturalarning strukturaviy, morfologik, optik va elektr xossalari kompleks tarzda o'rganildi. Plyonkalar DC magnetron*

sputtering usulida turli kislorod fraksiyalarida hosil qilinib, sirt morfologiyasi (SEM), elementar tarkibi (EDS) hamda optik va elektr xossalari mos usullar bilan baholandi.

Natijalar ZnO plyonkalari yuqori kristall sifati va silliq sirtga ega ekanligini, Cu_2O va ayniqsa CuO da esa kislorod bosimi ortishi bilan donalar yiriklashuvi va g'ovaklik kuchayishini ko'rsatdi. Elektr tahlillar ZnO da band transport, Cu_2O da aralash (band–hopping), CuO da esa kichik polaronli hopping mexanizmlar ustunligini aniqladi, Silicon dioxide *esa izolyator sifatida namoyon bo'ldi.*

Optik natijalar taqiqlangan zona kengligining ZnO (≈3.3 eV) dan Cu_2O (≈1.43 eV) va CuO (≈2.05 eV) ga kamayishini hamda yutilish spektrining UV → visible → NIR diapazonlarga siljishini tasdiqladi.

Ishning ilmiy yangiligi — bir xil texnologik sharoitlarda transport mexanizmlarining **erkin va qisman lokalizatsiyalangan** *tarzida evolyutsiyasi eksperimental asosda ko'rsatilib, uning defekt kimyosi va kislorod bosimi bilan bog'liqligi aniqlanganidadir. Olingan natijalar mazkur materiallarning fotovoltaik, optoelektron va sensor qurilmalarda qo'llanish istiqbolini asoslaydi.*

Kalit so'zlar: *ZnO; Cu_2O; CuO; kvars taglik; yupqa plyonka magnetron sputtering; geterostruktura; elektr o'tkazuvchanlik; zaryad tashuvchilar.*

EVOLUTION OF ELECTROPHYSICAL PROPERTIES AND CHARGE TRANSPORT MECHANISMS IN Cu_2O/CuO/ZnO/Quartz HETEROSTRUCTURES

Abstract: *In this work, thin films of* Zinc oxide, Copper(II) oxide, *and* Copper(I) oxide, *as well as their heterostructures, were comprehensively investigated in terms of structural, morphological, optical, and electrical properties. The films were deposited by DC magnetron sputtering under different oxygen fractions. Their surface morphology by SEM, elemental composition by EDS, and optical and electrical properties by corresponding spectroscopic and electrical techniques.*

The results showed that ZnO films exhibit high crystalline quality and smooth surfaces, whereas Cu_2O and especially CuO films demonstrate grain growth and increased porosity with increasing oxygen partial pressure. Electrical analysis revealed band transport in ZnO, mixed (band–hopping) transport in Cu_2O, and polaronic hopping transport in CuO, while Silicon dioxide *behaves as an insulator.*

Optical results indicated a decrease in the band gap from ZnO (≈3.3 eV) to Cu_2O (≈1.43 eV) and CuO (≈2.05 eV), accompanied by a shift of the absorption edge from the ultraviolet to the visible and near-infrared regions.

The scientific novelty lies in the experimental demonstration of the evolution of charge transport mechanisms—from free to partially localized—under identical technological conditions, as well as in revealing their relationship with defect chemistry and oxygen partial pressure. The obtained results confirm the potential of these materials for applications in photovoltaic, optoelectronic, and sensor devices.

Keywords: *ZnO; Cu_2O; CuO; quartz substrate; thin films; magnetron sputtering; heterostructure; electrical conductivity; charge carriers.*

Введение

Производство, накопление и эффективное распределение энергии являются одними из наиболее актуальных направлений современной науки, при этом особое внимание уделяется разработке недорогих, высокоэффективных и экологически устойчивых материалов.

В последние годы медь (Cu) широко используется в полупроводниковых технологиях в качестве контактного материала и характеризуется способностью формировать высококачественные тонкие пленки благодаря высокой диффузионной подвижности [1]. В частности, тонкие пленки Cu_2O рассматриваются как перспективный материал для солнечных элементов, фотоэлектрохимических систем, газовых сенсоров, биосенсоров и устройств накопления энергии [2–4]. Cu_2O представляет собой p-тип полупроводника с кубической кристаллической структурой и прямой запрещённой зоной в диапазоне 2.1–2.7 эВ [5]. Данный материал может быть получен различными методами, включая DC/RF-магнетронное распыление, электроосаждение, химическое осаждение из паровой фазы (CVD), импульсное лазерное осаждение (PLD), а также термическое и плазменное испарение, что позволяет целенаправленно управлять его структурными и оптическими свойствами [6–9]. Окисление Cu_2O до CuO при низких температурах протекает поэтапно и обусловлено миграцией ионов меди через катионные вакансии [10–11]. Оптимизация параметров магнетронного распыления является ключевым фактором, определяющим электрическую проводимость и механизмы переноса заряда в тонких пленках [12]. В данной работе планируется получение гетероструктур на основе ZnO, Cu_2O и CuO на кварцевых подложках методом магнетронного распыления, а также комплексное исследование их морфологии поверхности, элементного состава и оптических свойств с использованием методов SEM, EDS и спектроскопии HR-4000.

Методика исследования

В экспериментах в качестве подложек использовались монокристаллические кремниевые (Si) пластины p-типа с ориентацией (111) и толщиной 450 ± 2 мкм. Для обеспечения высокого качества интерфейса и адгезии подложки подвергались многоступенчатой очистке: ультразвуковая обработка в ацетоне, этаноле и деионизированной воде, после чего проводилась обработка по методу RCA-1 ($NH_4OH:H_2O_2:H_2O$ = 1:1:5) при температуре 75 °C в течение 10 минут. Для удаления естественного слоя SiO_2 подложки обрабатывались в 2% растворе HF в течение 1–2 минут с последующим промыванием в деионизированной воде. В ряде случаев перед осаждением дополнительно применялась очистка Ar^+-плазмой (10 W, 5 минут) для повышения активности поверхности.

Тонкие пленки ZnO осаждались методом DC-магнетронного распыления с использованием мишени ZnO чистотой 99.99%. Базовое давление в камере составляло ~5×10^{-6} Torr, рабочее давление — ($2–5$) × 10^{-3} Torr, мощность — 90 W, расстояние мишень–подложка — 60 мм. В качестве рабочего газа использовался Ar с добавлением O_2 в диапазоне 1–5%. В данных условиях формировались пленки ZnO в фазе вюрцита с высокой стехиометрией и толщиной порядка ~500 нм.

Пленки Cu_2O и CuO получали методом реактивного DC-магнетронного распыления с использованием медной (Cu) мишени чистотой 99.99% при базовом давлении ~4×10^{-6} Torr. Рабочее давление составляло 3×10^{-3} Torr, мощность — 70–90 W, расстояние мишень–подложка — 55–60 мм. При доле кислорода 5–10% формировалась фаза Cu_2O (Cu^+, кубическая структура), тогда как при 20–30% — фаза CuO (моноклинная структура). В обоих случаях толщина пленок контролировалась на уровне ~500 нм.

Перед формированием гетероструктур на кварцевых подложках были предварительно получены системы ZnO/Si, CuO/Si и Cu_2O/Si методом магнетронного распыления. Влияние температуры подложки и условий ионной очистки на структуру, морфологию и оптические свойства пленок оценивалось систематически. Морфология поверхности и элементный состав гетероструктур детально исследовались методами SEM, EDS и спектроскопии HR-4000.

Предложенный подход позволяет глубже понять механизмы формирования пленок CuO и Cu_2O на подложках ZnO/Si и служит научной основой для разработки высококачественных материалов, перспективных для применения в фотогальванических и сенсорных устройствах.

Анализ и результаты

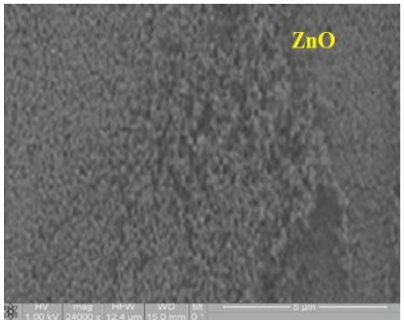
В данной работе морфология поверхности и микроструктурные характеристики тонких пленок были исследованы методом сканирующей электронной микроскопии (SEM). Изображения получены при ускоряющем напряжении 5–15 кВ и различных увеличениях при одинаковых условиях для всех образцов, что обеспечило их корректное и достоверное сравнение.

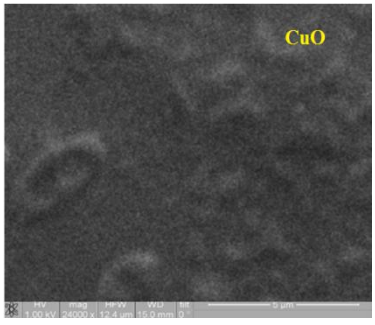
Для образцов ZnO/Si характерна плотная, однородная и относительно гладкая поверхность. Зерна имеют четко выраженные границы и равномерно распределены по поверхности. Узкий диапазон размеров зерен свидетельствует о низкой шероховатости, хорошей адгезии и высокой структурной стабильности (рис. 1a).

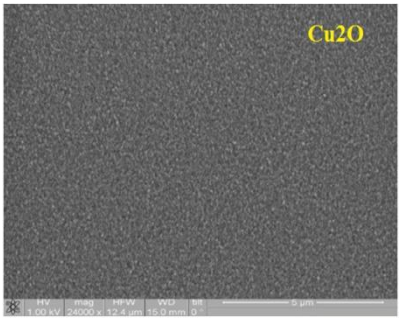
В образцах Cu_2O/Si наблюдаются более крупные зерна, преимущественно близкие к кубической форме, с четко выраженными границами. Поверхность остается однородной, без трещин и значительных структурных дефектов. Такая морфология характерна для фазы Cu_2O, формирующейся при пониженном парциальном давлении кислорода, и отражает механизм частичного окисления (рис. 1b).

Образцы CuO/Si демонстрируют существенно более шероховатую и неоднородную поверхность. При повышенном парциальном давлении кислорода наблюдаются укрупнение зерен, их неправильная форма и агломерация. Увеличение пористости связано с процессами межзеренного роста, рекристаллизации и структурной перестройки (рис. 1c).

Сравнительный анализ показывает, что увеличение парциального давления кислорода приводит к переходу от плотной и гладкой поверхности к грубой, пористой и агломерированной структуре. Эти изменения обусловлены ростом размеров зерен и усилением процессов агломерации, что оказывает существенное влияние на структурные и функциональные свойства тонких пленок.







a **b** **c**

Рис. 1. SEM-изображения тонких пленок a) ZnO/Si, b) CuO/Si и c) Cu_2O/Si.

Для определения элементного состава и стехиометрии тонких пленок ZnO/Si, Cu_2O/Si и CuO/Si был проведён анализ методом энергодисперсионной рентгеновской спектроскопии (EDS). Измерения выполнялись с использованием Si(Li)-детектора, интегрированного в систему сканирующего электронного микроскопа (SEM), при ускоряющем напряжении 10 кВ и рабочем расстоянии ~10 мм, что обеспечило получение достоверного сигнала от приповерхностных слоёв. (Рис. 2.)

EDS-спектры регистрировались в различных точках и областях поверхности образцов, что позволило оценить равномерность распределения элементов. Наблюдаемый сигнал Si (Kα ≈ 1.74 кэВ) обусловлен вкладом кремниевой подложки и учитывался при полуколичественном анализе.

В образцах ZnO/Si чётко фиксируются пики Zn (Lα ≈ 1.01 кэВ, Kα ≈ 8.63 кэВ) и O (Kα ≈ 0.53 кэВ), что подтверждает формирование слоя ZnO, а соотношение интенсивностей указывает на близость к стехиометрическому составу. Для пленок Cu_2O/Si и CuO/Si зарегистрированы пики Cu (Lα ≈ 0.93 кэВ, Kα ≈ 8.04 кэВ) и O; увеличение интенсивности кислорода свидетельствует о росте степени окисления и переходе фазы Cu_2O → CuO.

Согласно результатам полуколичественного анализа, для Cu_2O/Si отношение Cu:O составляет приблизительно 2:1, тогда как для CuO/Si — около 1:1. Полученные данные хорошо согласуются с результатами XRD и рамановской спектроскопии, подтверждая достоверность проведённого синтеза и анализа. Элементное картирование EDS показало равномерное распределение Zn, Cu и O по поверхности, что свидетельствует о стабильности процесса DC-магнетронного распыления.

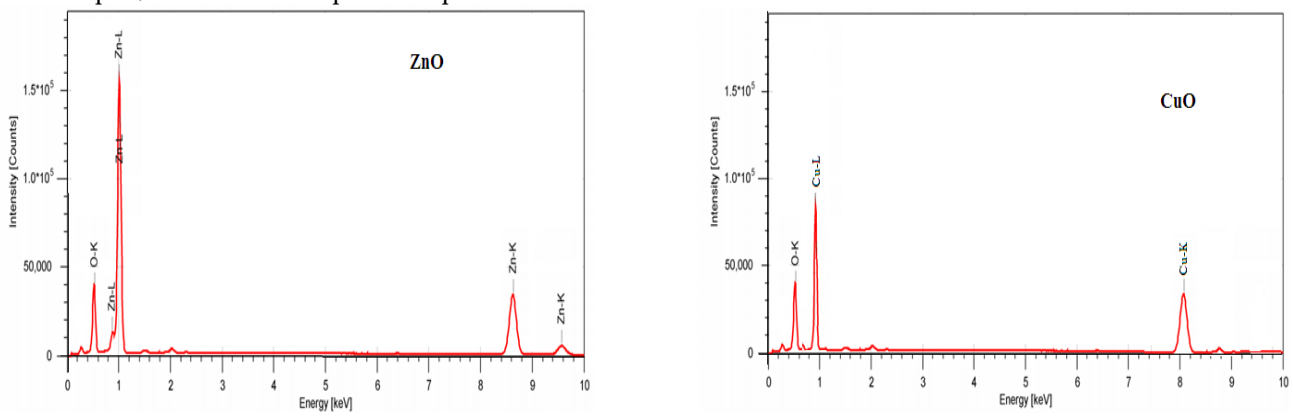


Рис. 2. EDS-изображения образцов ZnO/Si, Cu_2O/Si и CuO/Si.

Логарифмический анализ удельного сопротивления позволяет наглядно и количественно выявить принципиальные различия в механизмах электрического транспорта в различных материалах. Для кварца удельное сопротивление находится в диапазоне 10^{16}–10^{18} Ω·см, что подтверждает его природу как широкозонного диэлектрика с запрещённой зоной Eg ≈ 9 эВ.

Для ZnO наблюдается резкое снижение сопротивления (10^3–10^2 Ω·см), что обусловлено высокой концентрацией электронов, возникающей вследствие наличия донорных дефектов (кислородных вакансий и межузельных атомов Zn). Это приводит к усилению проводимости n-типа. В CuO и Cu_2O значения сопротивления находятся в промежуточном диапазоне (10^{13}–10^{16} Ω·см). Это связано с дырочным (p-тип) механизмом проводимости, наличием дефектных уровней и ловушечных центров. В частности, более высокое сопротивление CuO обусловлено сильной локализацией носителей заряда, повышенной вероятностью рекомбинации и низкой подвижностью. Полученные результаты свидетельствуют о наличии различий на несколько порядков величины между исследуемыми материалами и подтверждают фундаментальное различие их механизмов переноса заряда — от диэлектрической изоляции до n-типа электронной и p-типа дырочной проводимости (рис. 3). Логарифмический анализ концентрации носителей заряда позволяет выявить фундаментальные факторы, определяющие электрические свойства полупроводников.

В ZnO концентрация электронов находится в диапазоне 10^{16}–10^{20} $см^{-3}$, что обусловлено высокой плотностью донорных дефектов — кислородных вакансий (V_O) и межузельных атомов Zn (Zn_i) — а также их мелкими энергетическими уровнями. В результате данные донорные центры при комнатной температуре практически полностью ионизированы, обеспечивая устойчивую проводимость n-типа. В CuO и Cu_2O концентрация дырок составляет соответственно 10^{14}–10^{16} $см^{-3}$ и 10^{13}–10^{15} $см^{-3}$. Эти значения связаны с более глубоким расположением акцепторных уровней, а также эффектами донорно-акцепторной компенсации, что ограничивает эффективность p-типа проводимости.

В кварце концентрация носителей заряда крайне мала (<10^6 $см^{-3}$), что подтверждает его свойства как широкозонного диэлектрика (изолятора). В целом логарифмический анализ наглядно демонстрирует различия концентрации носителей заряда на несколько порядков между исследуемыми материалами и подтверждает, что эти различия напрямую обусловлены их дефектной химией и структурой энергетических уровней (рис. 4).

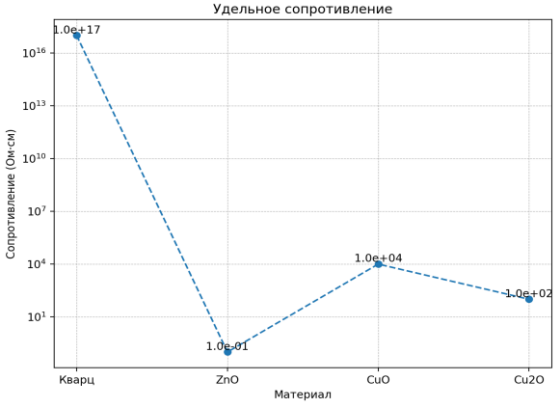

Рис. 3. Сравнение удельного сопротивления слоев гетероструктуры.

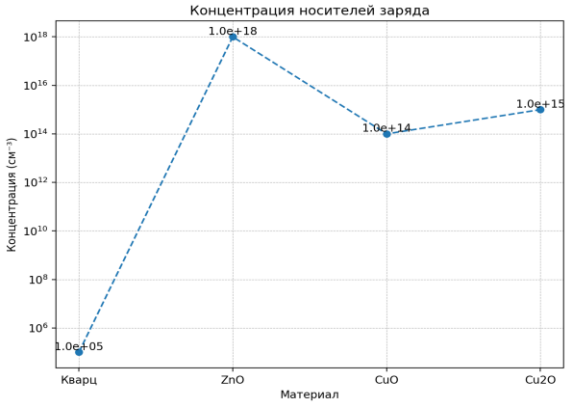

Рис. 4. Логарифмический анализ концентрации носителей заряда.

Резкое снижение подвижности носителей заряда отражает фундаментальное изменение механизмов транспорта и определяется зонной структурой материала, механизмами рассеяния и электрон-фононным взаимодействием. В ZnO наблюдаются значения μ ≈ 10–100 $см^2/В·с$, что обусловлено малой эффективной массой (m*), высоким кристаллическим качеством и низкой степенью локализации. В этих условиях электроны находятся в делокализованном состоянии в зоне проводимости, а транспорт описывается зонной (модель Друде), где подвижность определяется выражением μ = eτ/m* (τ — время релаксации). Основными ограничивающими факторами являются рассеяние на ионизированных дефектах и фононах. В CuO подвижность снижается до μ ≈ 1–10 $см^2/В·с$. Валентная зона данного материала формируется гибридизированными орбиталями Cu 3d–O 2p, что приводит к увеличению эффективной массы носителей и слабой дисперсии зон. В результате носители заряда частично локализуются, а транспорт осуществляется в смешанном режиме (band–hopping crossover). Существенную роль играют ионизированные акцепторы, границы зерен и дефектные центры, выступающие в качестве источников рассеяния. В Cu_2O подвижность резко уменьшается до μ ≈ 0.01–1 $см^2/В·с$. Этот материал характеризуется более узкой запрещённой зоной и сильным электрон-фононным взаимодействием, что приводит к локализации носителей заряда в виде малых поляронов. В этом случае перенос осуществляется за счёт термически активируемого hopping-механизма. В кварце вследствие широкой запрещённой зоны (≈9 эВ) свободные носители заряда практически отсутствуют, поэтому μ ≈ 0, а перенос возможен лишь за счёт туннелирования или при высоких электрических полях (диэлектрический пробой) (рис. 5).

В CuO проводимость имеет промежуточные значения и определяется главным образом дырочным (p-тип) механизмом. Снижение σ связано с ограниченной подвижностью носителей, более глубоким расположением акцепторных уровней, а также рассеянием на границах зерен и дефектных центрах. В Cu_2O проводимость еще ниже, что обусловлено сильной локализацией носителей заряда, высокой плотностью ловушечных состояний и преобладанием поляронного hopping-механизма переноса. В этом режиме проводимость носит термически активированный характер и существенно зависит от температуры.

В кварце проводимость практически равна нулю, что подтверждает его свойства как идеального диэлектрика с широкой запрещённой зоной.

В целом полученные результаты полностью согласуются с классическим соотношением **σ = q·n·μ,** что подтверждает прямую зависимость проводимости от концентрации носителей заряда и их подвижности. Изменение этих параметров определяет переход механизма переноса от зонного к локализованному (hopping) режиму (рис. 6). Сравнительный анализ ширины запрещённой зоны (Eg) является одним из ключевых факторов, определяющих оптическое поглощение, генерацию носителей заряда и механизмы электронного транспорта в материалах. В кварце Eg ≈ 9 эВ, что характеризует его как широкозонный диэлектрик. Такая большая энергетическая щель практически исключает переход электронов из валентной зоны в зону проводимости, вследствие чего концентрация свободных носителей заряда крайне мала, а оптическое поглощение наблюдается лишь в глубокой ультрафиолетовой области.

В ZnO Eg ≈ 3.3 эВ, что соответствует широкозонному полупроводнику, эффективно работающему в ультрафиолетовом (UV) диапазоне. Наличие высокой энергии связи экситонов (~60 мэВ) обеспечивает их

стабильность даже при комнатной температуре, что способствует высокой эффективности оптоэлектронных устройств на основе ZnO.

В CuO и Cu_2O значения составляют соответственно Eg ≈2.05 эВ и ≈1.43 эВ, что обеспечивает эффективное оптическое поглощение в видимой и ближней инфракрасной (NIR) областях спектра. Валентная зона этих материалов формируется преимущественно за счёт гибридизации орбиталей Cu 3d и O 2p, что приводит к усилению электронных корреляций и сужению зон. В результате увеличивается эффективная масса носителей заряда и возрастает вероятность их локализации.

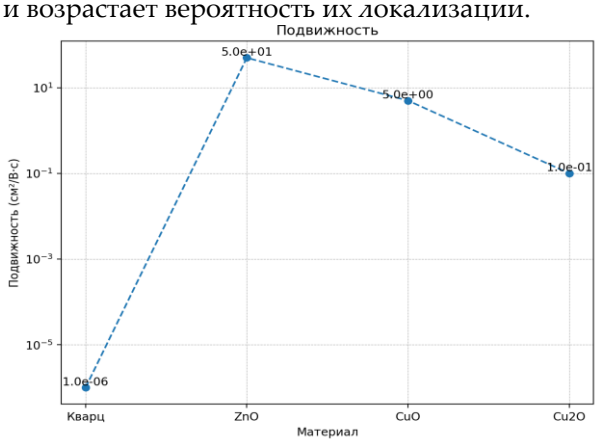

Рис. 5. Сравнение подвижности носителей заряда в слоях гетероструктуры.

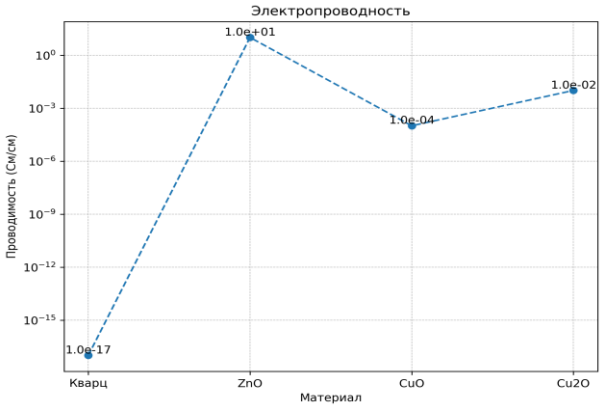

Рис. 6. Сравнение электрической проводимости слоев гетероструктуры.

Постепенное уменьшение ширины запрещённой зоны повышает вероятность возбуждения носителей заряда фотонами (смещение спектра поглощения в длинноволновую область). Однако одновременно возрастает роль дефектных уровней, ловушечных центров и подзонных состояний, что усиливает процессы рекомбинации и способствует переходу от зонного к локализованному (hopping/поляронному) механизму транспорта.

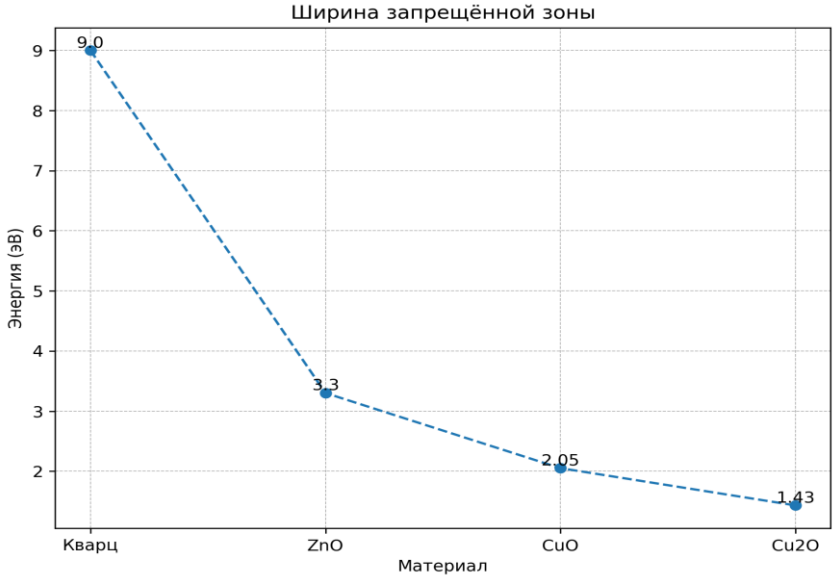

Рис. 7. Сравнение ширины запрещённой зоны слоёв гетероструктуры.

Таким образом, уменьшение Eg приводит не только к изменению оптического отклика (UV → Visible → NIR), но и к фундаментальной трансформации механизмов переноса заряда: от широкозонного диэлектрика (SiO_2) к широкозонному n-типу полупроводника (ZnO), а затем к более узкозонным p-типу материалам (Cu_2O, CuO). Данная эволюция является ключевой физической основой, определяющей функциональные свойства материалов в оптоэлектронных и сенсорных устройствах (рис. 7). В данной работе тонкие пленки ZnO/Si, Cu_2O/Si и CuO/Si, а также гетероструктуры на их основе были комплексно исследованы с точки зрения структурных, морфологических, оптических и электрических свойств.

Заключение:Результаты SEM и EDS подтвердили высокую фазовую чистоту пленок, однородную морфологию и близость к стехиометрическому составу. Пленки ZnO характеризуются гладкой и плотной структурой, тогда как для Cu_2O и особенно CuO при увеличении парциального давления кислорода наблюдаются укрупнение зерен, агломерация и рост пористости. Логарифмический анализ электрических свойств выявил

различия на несколько порядков между материалами: для ZnO доминирует зонный механизм переноса, для Cu_2O характерен смешанный режим, а для CuO — поляронный -механизм. В то же время SiO_2 проявляет свойства изолятора. Оптические исследования показали уменьшение ширины запрещённой зоны от ZnO (≈3.3 эВ) к Cu_2O (≈1.43 эВ) и CuO (≈2.05 эВ), что сопровождается смещением спектра поглощения из ультрафиолетовой области в видимую и ближнюю инфракрасную области. При этом уменьшение Eg усиливает влияние дефектных и ловушечных уровней, что приводит к усложнению механизмов переноса заряда. Научная новизна работы заключается в том, что в системах ZnO/Si, Cu_2O/Si и CuO/Si, полученных при одинаковых технологических условиях, впервые системно показана последовательная эволюция механизмов переноса заряда по схеме смешанный → поляронный, а также установлена их прямая связь с зонной структурой, дефектной химией и парциальным давлением кислорода. Таким образом, исследованные материалы и гетероструктуры обладают управляемыми электрическими и оптическими свойствами и могут рассматриваться как перспективная функциональная платформа для применения в фотогальванических, оптоэлектронных и сенсорных устройствах.

Annotatsiya. *Ushbu maqolada tor zonali kvant o'ralarda ta'qiqlangan zona kengligining harorat va magnit maydonga bog'liqligi nazariy jihatdan o'rganilgan. Tadqiqotda InAs/GaP tipidagi tor zonali kvant o'lchamli geterostrukturalar asosida elektron va kovaklarning energiyasi, ularning to'lqin funksiyalari hamda energetik holatlar zichligining o'zgarishi tahlil qilingan. Shuningdek, harorat oshishi bilan kvant o'raning ta'qiqlangan zonasi torayishi, energiya holatlar zichligidagi ossillyatsiyalar pasayishi aniqlangan. Taklif etilgan model yordamida past haroratlarda va kuchli kvantlovchi magnit maydon sharoitida kvant o'raning ta'qiqlangan zona kengligini nazorat qilish imkoniyati asoslab berilgan.*

Kalit so'zlar: *Tor zonali kvant o'ra, geterostruktura, magnit maydon, harorat, ta'qiqlangan zona, energetik holatlar zichligi, Landau sathlari, effektiv massa.*

ЗАВИСИМОСТЬ ШИРИНЫ ЗАПРЕЩЁННОЙ ЗОНЫ УЗКОЗОННЫХ КВАНТОВЫХ ЯМ ОТ ТЕМПЕРАТУРЫ И МАГНИТНОГО ПОЛЯ

Аннотация. *В данной статье теоретически исследована зависимость ширины запрещённой зоны узкозонных квантовых ям от температуры и магнитного поля. В исследовании на основе узкозонных квантово-размерных гетероструктур типа InAs/GaP проанализированы энергия электронов и дырок, их волновые функции, а также изменение плотности энергетических состояний. Установлено, что с повышением температуры ширина запрещённой зоны квантовой ямы уменьшается, а амплитуда осцилляций плотности энергетических состояний снижается. С помощью предложенной модели обоснована возможность управления шириной запрещённой зоны квантовой ямы при низких температурах и в условиях сильного квантующего магнитного поля.*

Ключевые слова: *узкозонная квантовая яма, гетероструктура, магнитное поле, температура, запрещённая зона, плотность энергетических состояний, уровни Ландау, эффективная масса.*

DEPENDENCE OF THE BAND GAP WIDTH OF NARROW-BAND QUANTUM WELLS ON TEMPERATURE AND MAGNETIC FIELD

Annotation. *In this paper, the dependence of the band gap width of narrow-band quantum wells on temperature and magnetic field is theoretically investigated. Based on narrow-band quantum-sized heterostructures of the InAs/GaP type, the energies of electrons and holes, their wave functions, and the variation of the density of energy states are analyzed. It is established that, with increasing temperature, the band gap width of the quantum well decreases, while the amplitude of oscillations in the density of energy states diminishes. Using the proposed model, the possibility of controlling the band gap width of a quantum well at low temperatures and under strong quantizing magnetic fields is substantiated.*

Keywords: *narrow-band quantum well, heterostructure, magnetic field, temperature, band gap, density of energy states, Landau levels, effective mass.*

Kirish. Hajmiy va kichik o'lchamli yarimo'tkazgichli strukturalarning asosiy fundamental fizik kattaligi ta'qiqlangan zona kengligi bo'lib (E_g^{3d}, E_g^{2d}), uning energetik kengligi yarimo'tkazgich asosidagi qurilmaning eksplutasion

parametrlarini oldindan bashorat qilish imkonini beradi. Shuning uchun, E_g^{3d} va E_g^{2d}larni aniqlash (agar yangi yaratilgan materiallarning ta'qiqlangan zona kengligi ma'lum bo'lmasa) yarimo'tkazgichli geterostrukturalar texnologiyasini asosiy vazifalaridan biri hisoblanadi. Bundan tashqari, E_g ni yana muhim xususiyatlaridan biri, uning tashqi ta'sirlarga moyilligi kuchli bo'lib, xattoki, ushbu ta'sir natijasida E_g ni o'zgarishi, yarimo'tkazgichli asbobning fizik va kimyoviy xossalarini tubdan o'zgartirib yuboradi.

Adabiyotlar tahlili. [1-4] ishlarda tor zonali kvant o'rali yarimo'tkazgichlarning (InAs/GaP va GaSb/InSb) ruxsat etilgan zonalarning elektrik va optik xususiyatlari o'rganilgan. Jumladan, 1-rasmda InAs/GaP (kvant o'ra InAs) materialning zonaviy strukturasi keltirilgan. Bu zonalar strukturasidan ko'rinib turibdiki, $\frac{\pi^2\hbar^2}{2d^2}\left(\frac{1}{m_c}+\frac{1}{m_n}\right)$ xadni hisobiga InAs kvant o'raning ta'qiqlangan zona kengligi E_g^{3d}dan E_g^{2d}ga (ortishi) o'zgarishi kuzatilmoqda. Lekin, ushbu ishlarda kvantlovchi magnit maydonni ta'siri umuman tadbiq etilmagan.

Tor zonali kvant o'raning o'tkazuvchanlik va valent zonasidagi erkin elektronlar va kovaklarning E_n^e, E_n^p energetik spektri hamda ushbu zaryad tashuvchilarning $\chi_n^e, \chi_n^h$to'lqin funksiyalari B=0 (magnit maydon ta'sir etmaganda) quyidagi Shredenger (bir elektronli xolat uchun) tenglamalari topiladi.

$$\begin{cases}\left(-\frac{\hbar^2}{2m_e}\frac{\partial^2}{\partial z^2}+E_c(z)\right)\chi_n^e(z)=E_n^e\chi_n^e(z)\\ \left(\frac{\hbar^2}{2m_p}\frac{\partial^2}{\partial z^2}+E_V(z)\right)\chi_n^p(z)=E_n^p\chi_n^p(z)\end{cases} \quad (1)$$

Bunda, m_e, m_h- elektronlar va kovaklarning effektiv massalari. E_c, E_v tor zonali kvant o'raning o'tkazuvchanlik va valentlik zonalarining chekka sohalari, $E_c(z)$, $E_v(z)$ esa tor zonali kvant o'raning ifodalovchi energiyaga bog'liq funksiyalardir. Tor zonali yarimo'tkazgichlarning o'tkazuvchanlik zonasidagi erkin elektronlarning harakati va kvant o'raning valentlik zonasi XY tekisligi bo'ylab cheksiz bo'lib qoladi yoki bunday tekislikdagi elektronlat va kovaklarning energetik spektri uzluksiz bo'ladi. Bu holda elektronlar va kovaklarning harakat energiyasi Z o'qi bo'ylab kvantlanadi, ya'ni harati cheklangan bo'ladi. Shunday qilib, kvant o'raning o'tkazuvchanlik zonasidagi elektronlar va valentlik zonasidagi kovaklarning umumiy energiyasi dispersiyaning nokvadratik qonuniga muvofiq quyidagicha ifodalanadi [5]:

$$\begin{cases}E_c^{2d,nonparab}(k,d)=-\frac{E_g}{2}\left\{1-\left[1+\frac{4P^2}{E_g^2}*\frac{2m_n}{\hbar^2}\left(\frac{\hbar^2k_x^2}{2m_{nx}}+\frac{\hbar^2k_y^2}{2m_{ny}}+\frac{\pi^2\hbar^2}{2m_{nt}}n_z^2\right)\right]^{1/2}\right\}\\ E_v^{2d,nonparab}(k,d)=-\frac{E_g}{2}\left\{1+\left[1+4\frac{\frac{\hbar^2\vec{k}_x^2}{2m_x}+\frac{\hbar^2\vec{k}_y^2}{2m_y}+\frac{\pi^2\hbar^2}{2md^2}n_z^2}{E_g^2}\right]\right\}\end{cases} \quad (2)$$

Tahlil va natijalar. Kvadratik dispersiya qonuni uchun [6] ishlarda kvant o'raning energetik holatlar zichligini magnit maydon va haroratga bog'liqligi mukammal o'rganilgan. Natijada, $N_s^{k,2d}(E,B,T,d)$ bo'yicha yangil model taklif qilingan [7]:

$$N_{S,Z}^{2d}(E,B,T,d)=\sum_{N_L,N_Z}^{\infty}\frac{eB}{\pi\hbar}\cdot\frac{1}{kT}\cdot exp\left(-\frac{\left(E-\left(\left(N_L+\frac{1}{2}\right)\hbar\omega_c+\frac{\pi^2\hbar^2}{2m^*d^2}n_Z^2\right)\right)^2}{(kT)^2}\right) \quad (3)$$

Bu modelni yaratishda, energrtik holatlar zichligini delta funksiyalar δ(x) ni energiya bo'yicha qatorga yoyish usulidan foydalanilgan [8].

Shunday qilib, kvant o'raning o'tkazuvchanlik va velentlik zonalaridagi elektronlar va kovaklarning diskret Landau sathlarining haroratga bog'liqligini tahlil qilaylik. Tor zonali to'g'ri burchakli kvant o'raning ruxsat etilgan chegara zonalariga ko'ndalang va kvantlovchi magnit maydon kuchli ta'sir qiladi. Bu ta'sir tor zonali kvant o'raning o'tkazuvchanlik zonasi tubi va valentlik zonasi shipining "siljishi" ga sabab bo'ladi. Bu energetik holatlar zichligidagi ossillyatsiyalarda ham o'z aksini topadi. Bu holda tor zonali kvant o'raning o'tkazuvchanlik va valentlik zonalaridagi zaryad tashuvchilarning energiyasi XY tekisligi bo'ylab kvantlanadi, ya'ni bu yo'nalishda harakat cheklanadi. Shunday qilib, (2) formula asosida, spinni inobatga olmagan holda, ko'ndalang kvantlovchi magnit maydon ta'sirida tor zonali kvant o'raning o'tkazuvchanlik zonasidagi elektronlar va valentlik zonasidagi kovaklarning energiyasini quyidagicha ifodalash mumkin [9]:

$$\begin{cases}E_n^{2d,nonparab}(E_g(B,d),B,d,n_z,N_L^e)=-\frac{E_g(B,d)}{2}+\frac{1}{2}\sqrt{(E_g(B,d))^2+4E_g(B,d)[(N_L^e+\frac{1}{2})\hbar\omega_c^e+\frac{\pi^2\hbar^2}{2md^2}n_z^2]}\\ E_v^{2d,nonparab}\left(E_g(B,d),B,d,n_z,N_L^p\right)=-\frac{\left(E_g(0)+\frac{1}{2}\hbar\omega_c^p+\frac{1}{2}\frac{\pi^2\hbar^2}{2md^2}n_z\right)}{2}*\left\{1+\left[1+4\frac{\left(N_L^p+\frac{1}{2}\right)\hbar\omega_c^p+\frac{\pi^2\hbar^2}{2md^2}n_z^2}{\left(E_g(0)+\frac{1}{2}\hbar\omega_c^p+\frac{1}{2}\frac{\pi^2\hbar^2}{2md^2}n_z^2\right)^2}\right]^{1/2}\right\}\end{cases} \quad (4)$$

Bu yerda N_L^e va N_L^p - kvant o'raning o'tkazuvchanlik va valentlik zonasidga Landau sathlari soni. Kichik o'lchamli materiallarning muhim xususiyatlaridan biri kvant o'raning o'tkazuvchanlik va valentlik zonalaridagi energetik holatlar zichligi ossillyatsiyalari hisoblanadi. Ayniqsa, kichik o'lchamli materiallarga kvantlovchi magnit maydonining ta'siri

zaryad tashuvchilar energetik spektrining o‘zgarishiga va shu bilan birga ruxsat etilgan zonaning holatlar zichligi ossillyatsiyalarining o‘zgarishiga olib keladi. Endi, ko‘ndalang kvantlovchi magnit maydon ta’sirida tor zonali kvant o‘rali to‘g‘ri burchakli geterostrukturalarning o‘tkazuvchanlik va valentlik zonalaridagi holatlar zichligi ossillyatsiyalarining haroratga bog‘liqligini ko‘rib chiqamiz.

Ko‘ndalang kvantlovchi magnit maydon ta’sirida tor zonali kvant o‘raning o‘tkazuchanlik va valentlik zonalaridagi energetik holatlar zichligi ossilliyatsiyalariga harorat ta’sirini o‘rganish orqali kvant o‘ra ta’qiqlangan zonasining haroratga bog‘liqligini hisoblash mumkin. (3) formulani qatorga yoyish orqali tor zonali kvant o‘raning o‘tkazuvcanlik va valentlik zonasidagi energetik holatlar zichligi ossillyatsiyalarini aniqlanadi. Jumladan,

tor zonali kvant o‘raning o‘tkazuvchanlik zonasi uchun:

$$N_{s,z}^{c,2d}(E,B,T,d)=\sum_{N_L,n_e}^{\infty}\frac{eB}{\pi\hbar}\cdot\frac{1}{kT}\cdot exp\left(-\frac{\left(E+\frac{E_g(B,d)}{2}-\frac{1}{2}\sqrt{(E_g(B,d))^2+4E_g(B,d)\left(\left(N_L^e+\frac{1}{2}\right)\hbar\omega_c^e+\frac{\pi^2\hbar^2}{2m^*d^2}n_e^2\right)}\right)^2}{(kT)^2}\right) \quad (5)$$

tor zonali kvant o‘raning valentlik zonasi uchun:

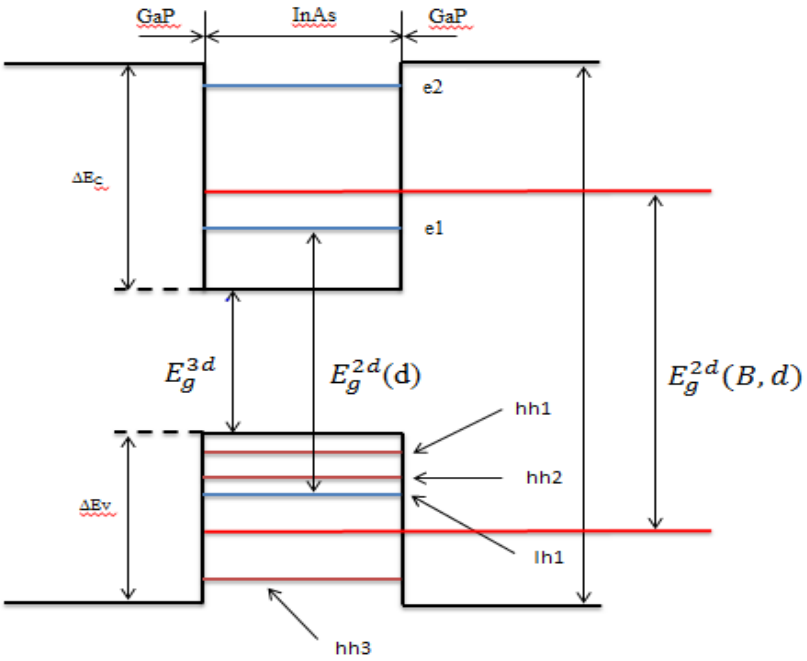
$$N_{s,z}^{v,2d}(E,B,T,d)=\sum_{N_L,n_h}^{\infty}\frac{eB}{\pi\hbar}\cdot\frac{1}{kT}\cdot exp\left(-\frac{\left(E+\frac{\left(E_g(0)+\frac{1}{2}\hbar\omega_c^p+\frac{1}{2}\frac{\pi^2\hbar^2}{2md^2}n_h\right)}{2}*\left\{1+\left[1+4\frac{\left(N_L^p+\frac{1}{2}\right)\hbar\omega_c^p+\frac{\pi^2\hbar^2}{2md^2}n_p^2}{\left(E_g(0)+\frac{1}{2}\hbar\omega_c^p+\frac{1}{2}\frac{\pi^2\hbar^2}{2md^2}n_p^2\right)^2}\right]^{1/2}\right\}\right)^2}{(kT)^2}\right) \quad (6)$$

$E>E_c$ shart bajarilsa, ko‘ndalang kvantlovchi magnit maydon ta’sirida tor zonali kvant o‘raning o‘tkazuvchanlik zonasidagi energetik holatlar zichligi ossillyatsiyalining haroratga bog‘liqligi (5) formula orqali aniqlanadi, agar $E<E_V$ bo‘lsa, valentlik zonasidagi energetik holatlar zichligi ossillyatsiyalining haroratga bog‘liqligi (6) formula orqali hisoblanadi, boshqa hollarda bu ta’qiqlangan zona bo‘lganligi sababli, uni hisoblash bu sharoitda mos kelmaydi. Demak, tor zonali kvant o‘raning o‘tkazuvchanlik va valentlik zonasidagi energetik holatlar zichligi ossillyatsiyalariga kuchli ko‘ndalang magnit maydon va haroratning ta’sirini (5) va (6) ifodalar orqali nokvadratik dispersiya qonuniga ko‘ra aniqlash mumkin.

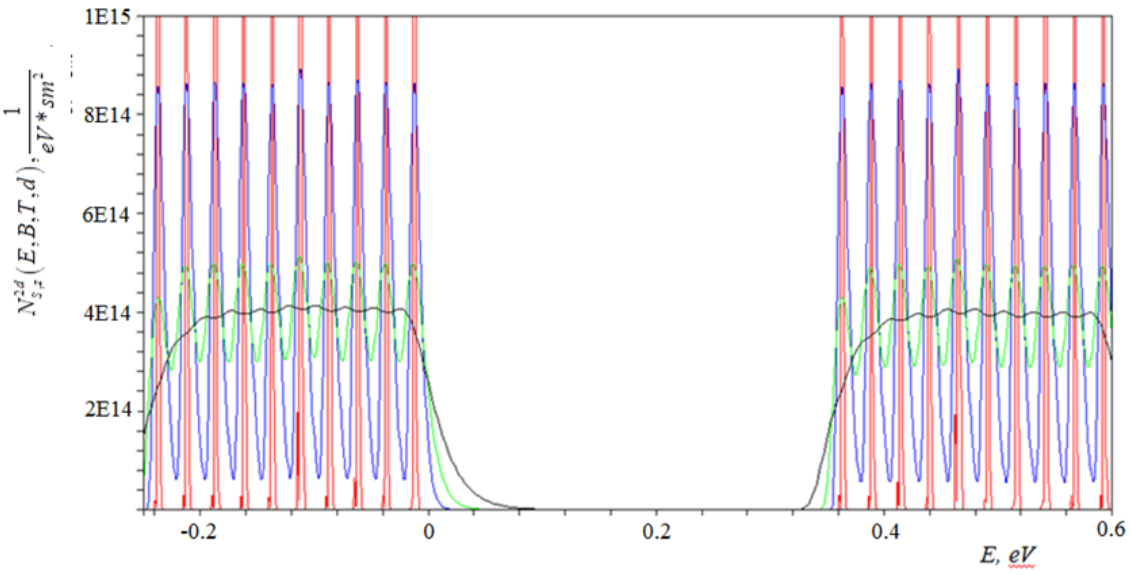
Tor zonali kvant o‘lchamli geterostrukturali materiallarning ko‘ndalang kvantlovchi magnit maydon ta’siridagi energetik holatlar zichligini haroratga bog‘liq ossillyatsiyalarini taxlil qilaylik. 1-rasmda InAs/GaP kvant o‘lchamli geterostrukturaning ko‘ndalang kvantlovchi magnit maydon ta’siridagi bitta kvant o‘ra diagrammasi keltirilgan. InAs tor zonali kvant o‘ra qalinligi d=1÷10 nm gacha bo‘lib, bu GaP qatlamining qalinligidan ancha kichik [10]. Bu geterobirikmadagi InAs ning ta’qiqlangan zona kengligi (Eg_0=0.35 eV), GaP ning ta’qiqlangan zona kengligi (Eg_0=2.26 eV). Bundan ko‘rinib turibdiki GaP ning ta’qiqlangan zona kengligi InAs ning ta’qiqlangan zona kengligidan ancha kattaroqdir 1-rasm. O‘tkazuvchanlik zonasidagi elektronlar va valentlik zonasidagi kovaklar Z o‘qi bo‘ylab harakati kvantlangan. Ko‘ndalang kvantlovchi magnit maydon Z o‘qiga parallel, XY tekisligiga perpendikulyar bo‘lganda o‘tkazuvchanlik zonasidagi elektronlar va valentlik zonasidagi kovaklarning harakati cheklanadi. Shunday qilib, zaryad tashuvchilarning harakati barcha yo‘nalishlarda to‘liq kvantlanadi, bu holat kvant nuqta analogiyasini beradi. Bu fizik jarayonlarda energetik holatlar zichligidagi ossillyatsiyalarni qanday aniqlanadi va haroratning ta’siri qanday bo‘ladi degan savol tug‘iladi. Yangi taklif etilgan model asosida InAs kvant o‘raning o‘tkazuvchanlik va valentlik zonalaridagi energetik holatlar zichligi ossillyatsiyalarini haroratga bog‘liq holda hisoblash mumkin. 1-rasmda doimiy past haroratda va ko‘ndalang kvantlovchi magnit maydon ta’sirida InAs tor zonali kvant o‘raning ruxsat etilgan zonalaridagi energetik holatlar zichligi ossillyatsiyalari tasvirlangan. Bu yerda B=10 Tl, d=6nm, T=5 K va E_{g0}=0.35 eV. Tor zonali kvant o‘raning qalinligi d zaryad tashuvhchilarning de-Broyl to‘lqin uzinligiga teng yoki undan kichik bo‘lsa (xona haroratida InAs material uchun (λ_d=41 nm), erkin elektronlarning harakati harorat o‘qi bo‘yicha kvantlanadi. InAs tor zonali kvant o‘raning o‘tkazuvchanlik va valentlik zonalaridagi elektronlar va kovaklarni zich joylashgan diskret Landau sathlarini hosil qiladi (2-rasm). T=5 K va B=0 bo‘lganda InAs tor zonali kvant o‘raning ta’qiqlangan zona kengligi $E_g^{2d}(0)=0{,}35\ eV$, sirt holatlar zichligi $Nss=4\cdot10^{15}eV^{-1}sm^{-1}$.

Ko‘ndalang kvantlovchi magnit maydon (B=10 Tl) ta’siri natijasida, o‘tkazuvchanlik zonasining tubi va valentlik zonasining shipi siljishi kuzatiladi. Bu hodisa Landau sathlarining paydo bo‘lishi bilan bog‘liq. Natijada, InAs tor zonali kvant o‘raning ta’qiqlangan zonasi kengayishi kuzatiladi. Ko‘plab ilmiy ishlarda kvant o‘lchamli geterostrukturali materiallarda kvant o‘radagi ta’qiqlangan zona kengligining kvant o‘ra kengligiga bog‘liqligi nazariy va tajribaviy jihatdan keng o‘rganilgan. Taklif etilayotgan matematik model past haroratlarda va kvantlovchi magnit maydon ta’sirida kvant o‘raning ta’qiqlangan zona kengligini boshqarish imkonini beradi. 2-rasmda GaP/InAs (InAs kvant o‘ra) geterostrukturaning ta’qiqlangan zona kengligi B va T ga bog‘liqligi keltirilgan. Ushbu grafik taklif etilgan model asosida

qurilgan. T=5 K da 1-rasmdagidek $E_g^{2d} = 0.361\ eV$ ga tengligi hisoblangan. Lekin, 2-rasmdan ko‘rinib turibdiki, T=50 K, 100 K va 200 K larda $E_g^{2d}(B,T)$ kamayib borishini kuzatish mumkin. Buning asosiy sababi, N.F.Mott nazariyasiga muvofiq, holatlar zichligini “dum” lari paydo bo‘lmoqda. Ushbu “dum” larning paydo bo‘lishi kvant o‘raning ta’qiqlangan zona kengligini kamayishiga olib kelmoqda. Umuman olganda, model yordamida tor zonali kvant o‘raning $E_g(B,T)$ ni boshqarish imkoniyati paydo bo‘lmoqda.



1-rasm. Tor zonali kvant o‘lchamli geterostrukturalarning energetik spektriga past haroratlarda ko‘ndalang magnit maydonning ta’siri [2].



—— T=5 K, B=10 Tl, d=4 nm, ——T=50 K, B=10 Tl, d=4 nm,
—— T=100 K, B=10 Tl, d=4 nm, ——T=200 K, B=10 Tl, d=4 nm

2-rasm. GaP/InAs (InAs kvant o‘ra) geterostrukturaning ta’qiqlangan zona kengligi B va T ga bog‘liqligi

Xulosa. Ushbu ishda tor zonali InAs/GaP kvant o‘lchamli geterostrukturalarda ta’qiqlangan zona kengligining harorat va magnit maydon ta’sirida o‘zgarishi nazariy jihatdan tahlil qilindi. Tadqiqot natijalariga ko‘ra, harorat oshishi bilan kvant o‘raning ta’qiqlangan zona kengligi kamayadi, shuningdek, energetik holatlar zichligidagi ossillyatsiyalar amplitudasi pasayadi. Kuchli kvantlovchi magnit maydon esa o‘tkazuvchanlik zonasi tubi va valentlik zonasining shipi siljishiga sabab bo‘lib, ta’qiqlangan zonaning kengayishiga olib keladi.

Annotatsiya:. *Ushbu ishda NiV yupqa plyonkalari soda-ohak shisha tagliklarga bir xil o'stirish sharoitida doimiy va impulsli RF magnetron changlatish yordamida o'stirildi. O'stirish rejimi va qizdirishdan keyingi ishlov berishning plyonkalarning strukturaviy va sirt xususiyatlariga ta'siri tizimli ravishda o'rganildi. Plyonkalarning sirt morfologiyasi esa skanerlash elektron mikroskopiyasi (SEM) yordamida o'rganildi. Element tarkibi energiya-dispers spektroskopiyasi (EDS) va to'lqin uzunligi-dispers rentgen lyuminestsensiyasi (WDXRF) yordamida aniqlandi. Olingan natijalar NiV yupqa plyonkalarining o'sish mexanizmlari haqida tushuncha beradi va o'stirish rejimi va termik ishlov berish ularning strukturaviy va sirt xususiyatlarini boshqarishda muhim rol o'ynashini ko'rsatadi.*

Kalit so'zlar: *NiV yupqa plyonka, magnetron changlatish, sirt morfologiyasi, AFM, nanokristall tuzilma*

INFLUENCE OF MAGNETRON SPUTTERING MODE ON THE MICROSTRUCTURE AND SURFACE TOPOGRAPHY OF NiV THIN FILMS

Abstract*: In this work, NiV thin films were grown on soda-lime glass substrates under identical growth conditions using continuous and pulsed RF magnetron sputtering. The influence of the growth regime and post-deposition heat treatment on the structural and surface properties of the films was systematically studied. The surface morphology of the films was examined using scanning electron microscopy (SEM). The elemental composition was determined using energy-dispersive spectroscopy (EDS) and wavelength-dispersive X-ray fluorescence (WDXRF). The results obtained provide insight into the growth mechanisms of NiV thin films and demonstrate that the growth regime and thermal treatment play a significant role in controlling their structural and surface properties.*

Keywords*: NiV thin film, magnetron sputtering, surface morphology, AFM, nanocrystalline structure.*

ВЛИЯНИЕ РЕЖИМА МАГНЕТРОННОГО НАПЫЛЕНИЯ НА МИКРОСТРУКТУРУ И ТОПОГРАФИЮ ПОВЕРХНОСТИ ТОНКИХ ПЛЕНОК NiV

Аннотация: *В данной работе тонкие пленки NiV были выращены на подложках из натриево-известкового стекла при идентичных условиях роста с использованием постоянного и импульсного ВЧ (RF) магнетронного напыления. Систематически изучено влияние режима роста и последующей термической обработки на структурные и поверхностные свойства пленок. Морфология поверхности пленок была исследована с помощью сканирующей электронной микроскопии (СЭМ). Элементный состав был определен с использованием энергодисперсионной спектроскопии (ЭДС) и волновой дисперсионной рентгеновской флуоресценции (WDXRF). Полученные результаты дают представление о механизмах роста тонких пленок NiV и показывают, что режим роста и термическая обработка играют важную роль в управлении их структурными и поверхностными характеристиками.*

Ключевые слова: *тонкая пленка NiV, магнетронное напыление, морфология поверхности, АСМ (AFM), нанокристаллическая структура.*

Kirish.

Nikel asosidagi yupqa plyonkalar mikroelektronika, kontakt metallizatsiyasi, diffuziya to'siqlari va himoya qoplamalarida keng qo'llaniladi [1-4]. Xususan, Ni–V qotishmalari (NiV) o'zining mexanik va kimyoviy barqarorligi

hamda termal ishlovga bog‘liq o‘zgarishlarga nisbatan sezgir emasligi bilan ajralib turadi. Shu sababli NiV plyonkalarining struktura va sirt xossalarini chuqur o‘rganish - nafaqat fundamental materialshunoslik, balki amaliy elektronika va fotovoltaika texnologiyalarini optimallashtirish nuqtai nazaridan ham yuqori ahamiyatga ega. Adabiyotlarda Ni va NiMe qotishma plyonkalarining o‘sish mexanizmi, kristallarni o’sishi va shakllanishiga oid ishlar mavjud bo‘lsa-da, aynan NiV qotishmasining changlatish rejimi (DC vs impulsli RF) va qalinlik–issiq ishlov kombinatsiyasining sinovli va integratsiyalangan tahliliga oid tizimli tadqiqotlar cheklangan [5-8]. Magnetron changlatish orqali tayyorlangan Ni-V qotishma yupqa plyonkalari katalitik faolligi va strukturaviy barqarorligi tufayli katta e'tiborni tortdi. Resnik va boshqalar [8,9] tomonidan olib borilgan tadqiqotlarda DC magnetron sputtering yordamida olingan Ti/NiV/Ag ko‘p qatlamli strukturalarning yaxshi adgeziya va diffuziya to‘siq xossalariga ega ekanligi ko‘rsatilgan. Shuningdek, Akkus va boshqalar [12] NiV yupqa plyonkalarining katalitik xossalarini o‘rganib, magnetron changlatish orqali tayyorlangan NiV plyonkalar natriy borogidrid gidrolizida sof Ni va NiCr plyonkalarga nisbatan yuqori vodorod hosil qilish samaradorligini namoyon etishini aniqlagan. Boshqa tadqiqotlarda Ni–V asosidagi plyonkalar optik elementlar va multilayer oynalar uchun ham istiqbolli material sifatida ko‘rib chiqilgan. NiV/Ti ko‘p qatlamli strukturalar yumshoq rentgen diapazonida ishlovchi optik qoplamalarda qo‘llanilishi mumkinligi ko‘rsatilgan. Biroq, AFM orqali sirt topografiyasining nozik o‘lchovlari, SEM orqali morfologik kuzatuvlar, WDXRF orqali kompozitsion aniqlik va elektr xossalar bilan bog‘lash borasida yetarlicha keng qamrovli ma’lumotlar kam uchraydi. Shuning uchun NiV plyonkalarida qalinlikka bog‘liq mikrostrukturaviy o‘zgarishlar va ularning sirt hamda elektrofizik xossalarga ta’sirini eksperimental jihatdan aniqlash zarurati mavjud.

Ushbu ishda shisha tagliklarga birinchi marta DC va impulsli RF magnetron changlatish yordamida olingan NiV plyonkalarining qalinlikka bog‘liq shakllanishi va sirt morfologiyasini (AFM, SEM orqali) aniqlash, shuningdek, element tarkibini (WDXRF/EDS) hisobga olib, changlatish rejimi va qizdirilgan taglik 600 °C/1 soat vakuum annealining plyonka fazaviy tarkibi, ichki kuchlanish va sirt qo‘polligiga ta’sirini baholashdir. Unga ko‘ra, tadqiqot quyidagi ilmiy vazifalarni bajaradi:

(i) AFM orqali sirt topografiyasi, qalinlik va annealingga (qizdirish) bog‘liqligini tekshirish;

(ii) SEM/EDS natijalari yordamida tarkib va taglik–plyonka signalining interpretatsiyasini aniqlash;

(iii) olingan plyonklarning changlatish parametrlari va sirt xossalarini elektr xossalarga bog‘lash uchun keyingi bosqichda Hall o‘lchovlarini qo‘llash rejasi. Ushbu tadqiqotlar natijasida magnetron changlatish qurilmasining turli rejimlari bilan hosil qilingan NiV yupqa plyonkalarini mikroelektronika texnologiyalarida metall kontaktlar, diffuziya to‘siqlari va getero qatlamlari sifatida va sensorlar ishlab chiqarishda keng qo‘llaniladi, chunki ular kremniy bilan yaxshi moslashuvchanlikka va yuqori termal barqarorlikka egadir.

Tadqiqot metodologiyasi

NiV yupqa plyonkalar shisha (soda-lime glass) tagliklarda magnetron changlatish (PVD) usuli yordamida hosil qilindi. Changlatish jarayonida diametri 76,2 mm bo‘lgan, 99,99% tozalikdagi NiV (93 at.% Ni – 7 at.% V) qotishma nishoni ishlatildi. Tagliklar depozitsiyadan avval ko‘p bosqichli ultratovushli tozalash jarayonidan o‘tkazildi (organik erituvchilar va distillangan suvda), so‘ng quritildi. Changlatish kamerasi dastlab 2×10^{-6} Torr darajadagi boshlang‘ich vakuumgacha so‘rildi. Ishchi muhit sifatida yuqori tozalikdagi argon gazi qo‘llanilib, jarayon davomida bosim $1,5 \times 10^{-3}$ Torr darajada ushlab turildi. Nishon va taglik orasidagi masofa 12 sm ga teng. Depozitsiya jarayonida taglik harorati 200 °C da barqarorlashtirildi. Plyonkalar ikki xil rejimda hosil qilindi: DC magnetron rejimi (150 W quvvat), impulsli RF rejimi (100 kHz chastota, 180 W quvvat). Changlatish davomiyligi 3, 5 va 10 minut etib tanlandi. Tajriba davomida depozitsiya tezligi DC rejimda 0,95 nm/s, impulsli RF rejimda esa 0,84 nm/s ni tashkil etdi. Ushbu qiymatlar asosida dastlabki to’liq qoplamali plyonka qalinligi 150–570 nm oralig‘ida shakllandi. Post-depozitsiya issiqlik ishlovi 800 K haroratda 1 soat davomida vakuum muhitida amalga oshirildi. Issiqlik ishlovining maqsadi strukturaviy barqarorlik, kristall o‘sishi va ichki kuchlanishning kamayishini o‘rganishdan iborat bo‘ldi.

1-jadval. NiV yupqa plyonkasining o’tkazish parametrlari

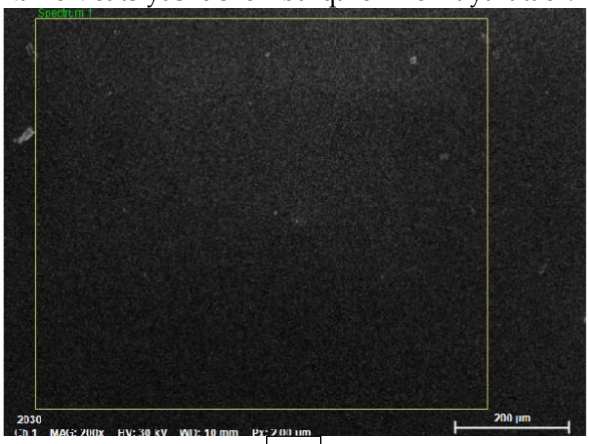
Parametr	Qiymat	Boshqa ishda	Izoh
Quvvat	120–250 W	100-200 W [9, 11]	O’stirish tezligi va zarrachalar energiyasiga ta’sir qiladi
Bosim	1–4 mTorr	5–8 mTorr [9]	Past bosim – zich plyonka; yuqori bosim – yaxshi bir jinslilik
Jarayon gazi	Argon (Ar)	Argon (Ar) [9-11]	Inert gaz
Taglik harorati	200°C	27°C [9, 10]	Plyonka xossalariga ta’sir qiladi
Cho‘ktirish tezligi	8,0-9,5 Å/s	0.833 Å/s [10]	157 W, 5 mTorr, 10 W RF bias da

Sirt topografiyasi atom-kuch mikroskopi (ASM) yordamida kontakt va tapping rejimida o‘lchandi. Skanlash maydoni 5 × 5 μm va 25 × 25 μm oralig‘ida tanlandi. Olingan 3D va 2D tasvirlar asosida sirt qo‘polligi parametrlari - o‘rtacha arifmetik qo‘pollik (Ra) va kvadratik o‘rtacha qo‘pollik (Rq) aniqlanib, annealing va depozitsiya rejimiga bog‘liq ravishda taqqoslandi. Plyonkalarning morfologik tuzilishi skanerlovchi elektron mikroskop (SNE ALPHA, SEC) yordamida o‘rganildi. O‘lchovlar 20–30 kV tezlanish kuchlanishida amalga oshirildi. SEM tasvirlar sirtning bir jinsliligi, kristall shakli va defektlarning mavjudligini baholash imkonini berdi. Element tarkibi energiya-dispersiv rentgen spektroskopiya (EDS, Bruker XFlash® 6/30 Silicon Drift Detector (SDD)) yordamida aniqlanib, Ni va V elementlarining mavjudligi tasdiqlandi. Detektor 30 mm² aktiv maydonga ega bo‘lib, Mn Kα chizig‘ida 123 eV energiya aniqligini ta’minlaydi. Qurilma yuqori hisoblash tezligiga ega bo‘lib (>1500 kcps), past energiyali elementlarni aniqlash imkonini beradi. Shisha taglikdan keluvchi Si va O signallari interpretatsiya jarayonida inobatga olindi. Shuningdek, plyonkaning element tarkibi va atom foizlari WDXRF usuli yordamida yuqori aniqlik bilan aniqlanib, Ni/V nisbatining nishon tarkibiga mosligi baholandi. Ushbu usul EDS natijalarini aniqlashtirish va kompozitsion barqarorlikni tekshirish uchun qo‘llanildi.

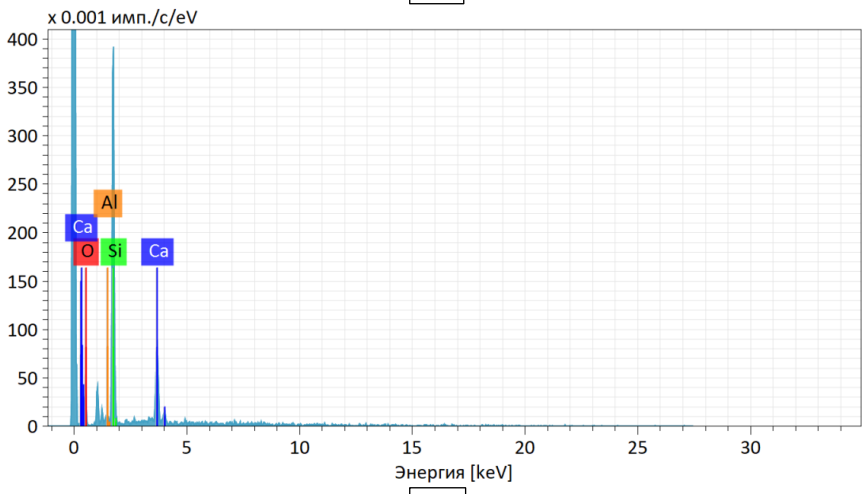
Natijalar va ularning tahlili

Dastlab NiV yupqa plyonkalarini hosil qilishdan avval shisha taglikning morfologik va element tarkibi o‘rganildi. Taglikning EDS spektri 1-rasm(a) da, SEM tasviri esa 1-rasm(b) da keltirilgan.

SEM tasviridan ko‘rinadiki, shisha yuzasi amorf va bir jinsli tuzilishga ega bo‘lib, kristallarga xos chegaralar kuzatilmaydi. Sirt bo‘ylab yirik yoriqlar yoki strukturaviy defektlar aniqlanmadi. Bu esa taglikning yupqa plyonka hosil qilish uchun mos ekanini ko‘rsatadi. EDS tahlili natijasida asosiy elementlar sifatida O, Si va Ca aniqlanib, mos ravishda 61,95 at.%, 31,98 at.% va 5,72 at.% ni tashkil etdi. Kichik miqdorda Al elementi (0,35 at.%) ham qayd etildi. Odatda soda-lime glass tarkibi: SiO_2 ≈ 70–75%, Na_2O ≈ 12–15%, CaO ≈ 8–12% va Al_2O_3 kichik miqdorda bo’ladi. EDS da Na chiqmasligining sababi Na past energiyali element bo’lib, EDS past energiyada sezgirlik pasayishi bilan tushuntirish mumkin. Olingan natijalar soda-lime turidagi silikat shishaning tipik tarkibiga mos keladi. Na elementi aniqlanmagan bo‘lsa-da, bu EDS usulining past energiyali elementlarga nisbatan sezgirligi cheklanganligi bilan izohlanadi. Olingan natijalar shuni ko‘rsatadiki, taglikning kimyoviy tarkibi va morfologiyasi NiV plyonkalari o‘sish jarayoniga sezilarli xalaqit bermaydi. Amorf va bir jinsli sirt plyonka nukleatsiyasi uchun barqaror muhit yaratadi.



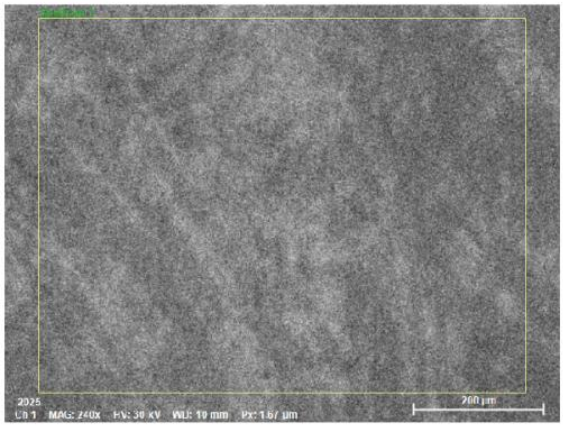
a



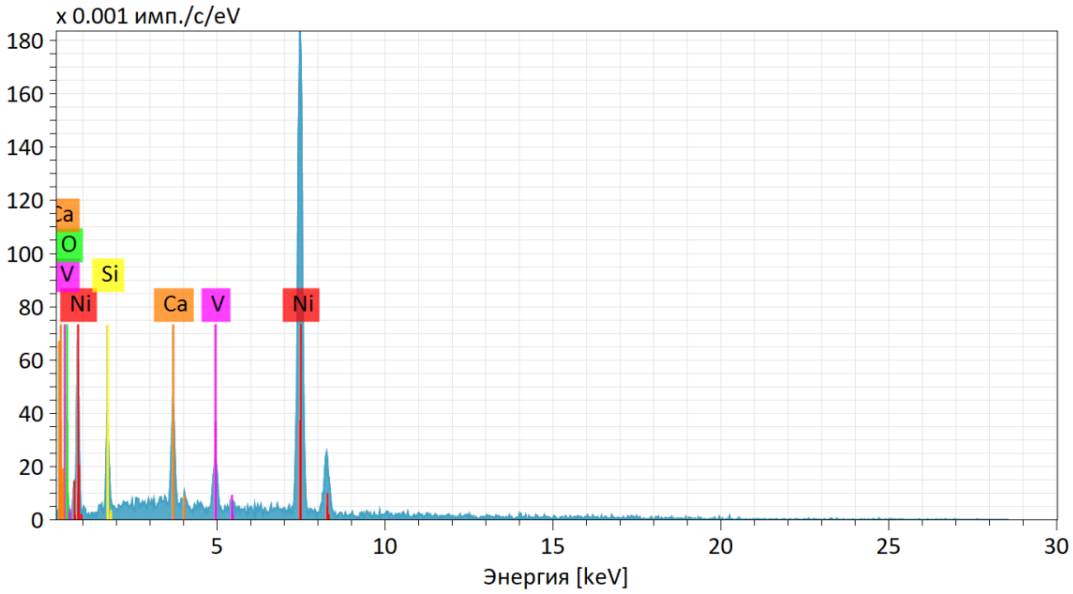
b

Rasm 1. Soda-lime glass taglikning SEM tasviri (a) va EDS spektri (b)

Magnetron changlatish qurilmasi yordamida soda-lime glass yuzasida DC rejimi bilan hosil qilingan NiV yupqa plyonkasining element tarkibi EDS spektri orqali aniqlandi (2a-rasm) va SEM tasviri olindi (2b-rasm).



a



b

Rasm 2. Soda-lime glass yuzasida hosil qilingan NiV yupqa plyonkasining SEM tasviri (a) va EDS spektri (b)

Shisha taglik va NiV bilan qoplangan namunaning EDS spektrlari taqqoslanganda tagliklarga xos bo‘lgan Si signali indikator sifatida qabul qilindi. Plyonka+taglik namunasidagi Si atom foizi taglikdagi qiymatga nisbatan masshtablanib, taglik hissasi aniqlanib ayirildi. Ushbu farq-usuli orqali plyonkaga tegishli metall komponentlar qayta normallashtirildi. Hisob-kitob natijasida Ni va V elementlarining o‘zaro nisbati taxminan 94:6 atrofida bo‘lib, bu ishlatilgan 93:7 tarkibli nishon bilan yaxshi mos keladi. Bu natija DC rejimida hosil qilingan plyonkaning NiV qotishmasi sifatida muvaffaqiyatli shakllanganini tasdiqlaydi. Taglik elementlarining mavjudligi plyonkaning nisbatan kichik qalinligi va yuqori tezlanish kuchlanishi bilan izohlanadi.

2-jadval. Shisha taglik, NiV/shisha namunasi va substrat hissasi ayirilgandan keyingi NiV plyonkaning hisoblangan atom foiz tarkibi (EDS asosida)

Element	taglik (at.%)	plyonka+taglik (at.%)
Ni	0	47,06
V	0	3,2
Si	31,98	13,6
O	61,95	29,14
Ca	5,72	7,01

NiV plyonkaning haqiqiy element nisbatini aniqlash maqsadida EDS natijalari tagliklar hissasini hisobga olgan holda qayta ishlandi. Yupqa plyonkaning qalinligi elektron penetratsiya chuqurligidan kichik bo‘lgani sababli, o‘lchov natijasida plyonka va shisha taglik signallari aralash holda qayd etildi (2-rasm). Shu sababli kompozitsiyani ajratish uchun farq (difference) usuli qo‘llanildi.

Taglik hissasini aniqlash uchun Si elementi indikator sifatida tanlandi, chunki Si faqat shisha tarkibiga kiradi va NiV plyonkada mavjud emas. Plyonka+taglik namunasida aniqlangan Si atom foizi shishadagi Si atom foiziga nisbatan masshtablanib, taglik hissasi koeffitsienti (α) aniqlanadi: $\alpha = \frac{C_{Si}^{(film+sub)}}{C_{Si}^{(sub)}}$

So‘ngra taglikga tegishli boshqa elementlarning (O va Ca) hissasi ham shu koeffitsient yordamida baholanib, umumiy natijadan ayirildi:

$$C_{element}^{(film)} = C_{element}^{(film+sub)} - \alpha \cdot C_{element}^{(sub)}$$

Ni va V elementlari shisha tarkibiga kirmagani sababli ular to‘g‘ridan-to‘g‘ri plyonkaga tegishli deb qabul qilindi. Taglik hissasi ayirilgandan so‘ng Ni va V qiymatlari qayta normallashtirilib, qotishmaning haqiqiy atom nisbatlari hisoblandi. Natijada Ni va V ning o‘zaro nisbati nishon tarkibiga (93:7) juda yaqin ekanligi aniqlandi (3-jadval). Bu esa DC rejimida hosil qilingan plyonkaning NiV qotishmasi sifatida muvaffaqiyatli shakllanganini tasdiqlaydi.

3-jadval. NiV yupqa plyonkasining element tarkibi

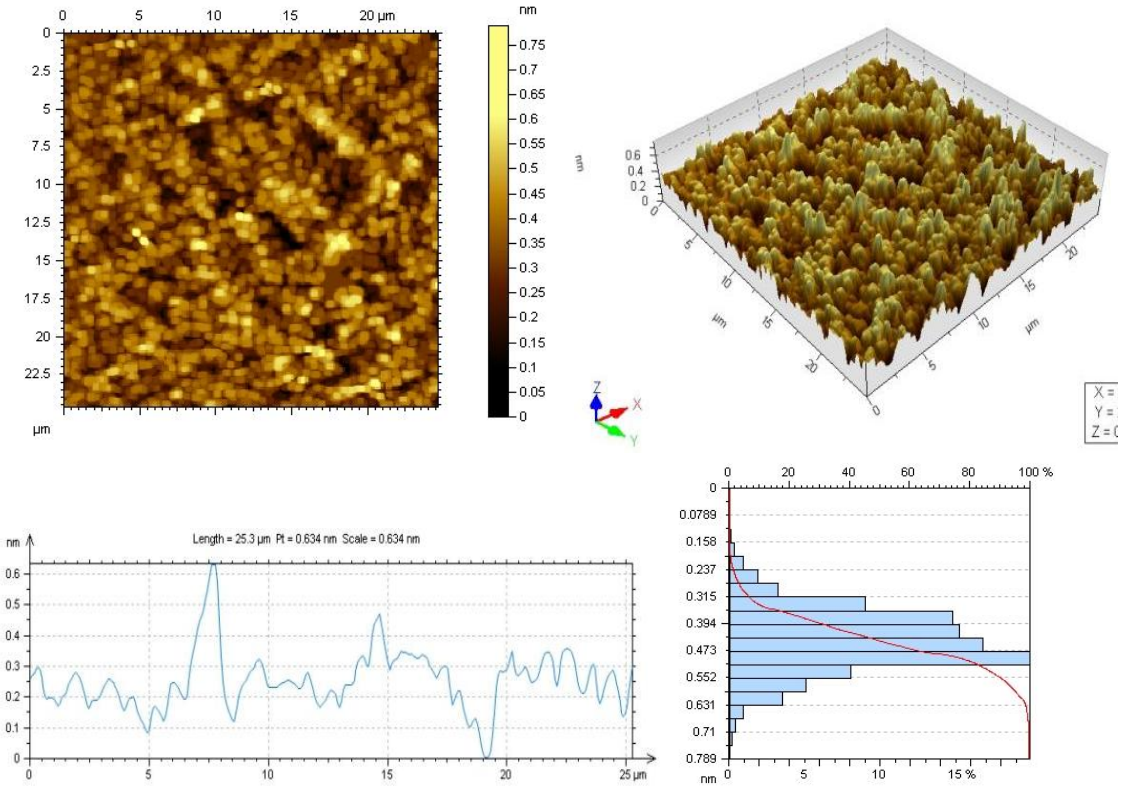
Element	Element natijalari (at.%)
Ni	93,63310784
V	6,366892161

DC magnetron rejimida shisha taglik yuzasida hosil qilingan NiV yupqa plyonkaning sirt morfologiyasi va kimyoviy tarkibi kompleks ravishda SEM va EDS usullari yordamida o‘rganildi. Olingan SEM tasvirlari plyonkaning substrat yuzasini to‘liq va uzluksiz qoplaganini ko‘rsatadi. Sirt bir jinsli va zich tuzilishga ega bo‘lib, yirik yoriqlar, ajralishlar yoki delaminatsiya belgilarisiz shakllangan. Morfologik kuzatuvlarda mayda granulali tuzilma namoyon bo‘ladi, bu esa metall qotishma plyonkalarga xos bo‘lgan nukleatsiya va keyingi kristall birikishi jarayonlari bilan mos keladi. Depozitsiya davomiyligi nisbatan qisqa bo‘lishiga qaramay, plyonkaning kompakt va zich hosil bo‘lgani DC rejimida ion bombardman energiyasining yetarli darajada bo‘lganini ko‘rsatadi. Energetik zarrachalar oqimi sirt bo‘ylab atomlarning qayta taqsimlanishini kuchaytirib, strukturaning zichlashishiga va yopiq plyonka shakllanishiga olib keladi. EDS spektri Ni va V elementlarining mavjudligini tasdiqlaydi, bu esa nishon tarkibiga mos ravishda qotishma plyonkaning muvaffaqiyatli hosil bo‘lganini ko‘rsatadi. Shu bilan birga, spektrda Si, O va Ca elementlarining aniqlanishi shisha taglikdan kelib chiqqan signal bilan izohlanadi. Yupqa metall plyonkalarda tezlanish kuchlanishining yuqoriligi elektron nurlarining plyonka orqali taglikgacha yetib borishiga sabab bo‘ladi, natijada taglik elementlari ham qayd etiladi. Bu holat element tarkibini interpretatsiya qilishda hisobga olinishi zarur. Mass-normalizatsiya qilingan natijalar plyonkaning asosiy qismini nikel tashkil etishini ko‘rsatadi, vanadiy esa qotishma element sifatida barqaror ravishda aniqlanadi. Olingan ma’lumotlar NiV qotishmasining shakllanishi va elementlarning plyonka bo‘ylab bir tekis taqsimlanganini tasdiqlaydi.

SEM va EDS natijalarining o‘zaro mosligi plyonkaning taglik bilan yaxshi adgeziyaga ega ekanini va depozitsiya jarayonida fazaviy ajralish sodir bo‘lmaganini ko‘rsatadi. Morfologik bir jinslilik va element tarkibining tasdiqlanishi plyonka shakllanish mexanizmining dastlabki bosqichlarida nukleatsiya markazlarining ko‘p sonli va bir tekis taqsimlanganini anglatadi. Bu esa keyingi strukturaviy evolyutsiya jarayonlari - kristallit o‘sishi, kristall chegaralarining shakllanishi va ichki kuchlanishning rivojlanishi - uchun asos yaratadi. Shunday qilib, DC rejimida qisqa vaqtli depozitsiya sharoitida ham NiV qotishmasi zich va uzluksiz yupqa plyonka hosil qilish qobiliyatiga ega ekanligi aniqlanadi, bu esa keyingi AFM tahlillar bilan birgalikda sirt xossalarini kompleks baholash imkonini beradi.

Impulsli RF rejimida 10 minut davomida hosil qilingan as-depozitsiyalangan NiV yupqa plyonkaning sirt topografiyasi atom-kuch mikroskopiyasi (AFM) yordamida o‘rganildi. Olingan natijalar 3-rasm(a–d) da keltirilgan.

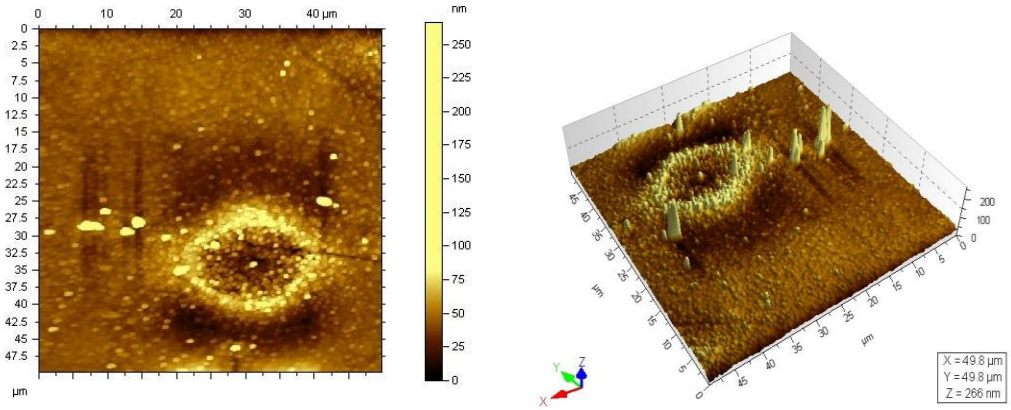
AFM natijalari plyonkaning sirtida yuqori darajada bir jinsli va kompakt tuzilma shakllanganini ko‘rsatadi. 2D tasvirdan ko‘rinishicha, sirt bo‘ylab kristallar mayda va bir tekis taqsimlangan bo‘lib, yirik agregatsiya yoki klasterlanish kuzatilmaydi. 3D rekonstruksiya esa balandlik o‘zgarishlarining juda kichik amplitudada ekanini tasdiqlaydi, bu esa sirtning yuqori darajada tekis va zich shakllanganini bildiradi. Balandlik taqsimoti histogrammasi tor intervalda joylashgan bo‘lib, sirt qo‘polligining past ekanini ko‘rsatadi. Profil chizig‘i bo‘yicha tebranishlar kichik amplitudali bo‘lib, sirt bo‘ylab keskin piklar yoki chuqur defektlar aniqlanmadi. Bu holat impulsli RF rejimida atomlarning nisbatan barqaror energiyada kondensatsiyalanishi va sirt bo‘ylab qayta taqsimlanishi bilan izohlanadi. Impulsli RF rejimida plazma barqarorligi yuqori bo‘lgani sababli, adatomlarning sirt diffuziyasi muvozanatli tarzda kechadi. Natijada nukleatsiya markazlari bir tekis shakllanadi va plyonka zich, mayda kristalli morfologiyaga ega bo‘ldi. Bu o‘sish mexanizmi Volmer–Weber tipidagi orolchali nukleatsiya bosqichidan tezda uzluksiz qatlam hosil bo‘lishiga o‘tish bilan tavsiflanadi.

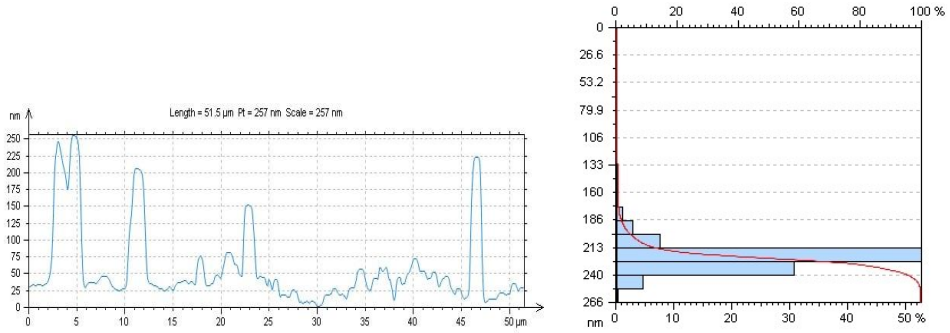


3-rasm. (a) – 2D sirt topografiyasi, b) – 3D sirt rekonstruksiyasi, c) – sirt balandliklari taqsimoti (histogramma), (d) – sirt bo‘ylab profil chizig‘i

AFM natijalari XRD orqali aniqlangan nanokristall tuzilma bilan mos keladi va plyonkaning strukturaviy yaxlitligini tasdiqlaydi. Sirt qo‘polligining pastligi keyingi elektr o‘lchovlar uchun muhim ahamiyatga ega bo‘lib, kristall chegaralari va sirt tarqalishining kamayishiga xizmat qiladi. Shunday qilib, impulsli RF rejimida 10 minut davomida olingan NiV yupqa plyonka yuqori tekislikka ega, zich va nanokristall tuzilishga ega ekanligi aniqlandi, bu esa depozitsiya jarayonining optimalligini ko‘rsatadi. AFM natijalari sirtning juda tekis ekanligini ko‘rsatdi. Balandlik o‘zgarishi 1 nm dan kichik bo‘lib, maksimal Z qiymati taxminan 0,8 nm ni tashkil etdi. Bu impulsli RF rejimda atomlarning nisbatan past energiyada va barqaror tarzda kondensatsiyalanishi natijasida zich va bir xil plyonka hosil bo‘lganini ko‘rsatadi. Profil chizig‘i sirt bo‘ylab kichik amplitudali tebranishlarni ko‘rsatadi, bu esa nanokristall tuzilmaning mavjudligini tasdiqlaydi.

Impulsli RF rejimida hosil qilingan NiV yupqa plyonkalarning termal barqarorligini baholash maqsadida namunalar 600 °C haroratda 1 soat davomida vakuum muhitida issiqlik ishloviga duchor qilindi. Tavlangan namunaning sirt topografiyasi AFM yordamida o‘rganildi va natijalar 4-rasm(a–d) da keltirilgan.





4-rasm. 600 C haroratda 1 soat davomida qizdirilgan NiV yupqa plyonkasining ASM tasviri. (a) – 2D sirt topografiyasi, (b) – 3D rekonstruksiya, (c) – balandlik taqsimoti (histogramma), (d) – sirt bo‘ylab profil chizig‘i

AFM tasvirlaridan ko‘rinadiki, issiqlik ishlovidan so‘ng sirt morfologiyasi sezilarli darajada o‘zgargan. Kristallar ancha yiriklashgan va sirt relyefi aniqroq shakllangan. 3D tasvirda balandlik amplitudasi as-depozitsiyalangan namunaga nisbatan sezilarli ortgani kuzatiladi. Bu hodisa yuqori haroratda atomlarning sirt bo‘ylab diffuziyasi kuchayishi bilan izohlanadi. Balandlik taqsimoti grafigi kengroq intervalni qamrab olgan bo‘lib, sirt qo‘polligining oshganini ko‘rsatadi. Profil chizig‘i bo‘yicha keskin piklarning paydo bo‘lishi kristallarning koalesans jarayoni sodir bo‘lganini bildiradi. Kichik kristallarning energetik jihatdan barqarorroq yirik kristallarga qo‘shilishi qayta krisstallanish mexanizmi bilan tushuntiriladi. Natijada kristall chegaralari soni kamayadi va kristallit o‘lchami ortadi. Issiqlik ishlovi jarayonida ichki kuchlanishning relaksatsiyasi ham yuz beradi. Yuqori harorat atomlarning qayta tartiblanishini ta’minlab, strukturaning energetik jihatdan barqaror holatga o‘tishiga olib keladi. As-depozitsiyalangan va tavlangan namunalarning AFM natijalarini taqqoslash shuni ko‘rsatadiki, termal ishlov sirt morfologiyasiga bevosita ta’sir ko‘rsatadi va strukturaviy evolyutsiyani tezlashtiradi. Bunday o‘zgarishlar keyingi elektr xossalarga, xususan tashuvchilar harakatchanligi va qarshilikka sezilarli ta’sir ko‘rsatishi mumkin. Shunday qilib, 600 °C da 1 soat davomida tavlash NiV yupqa plyonkalarda kristall o‘sishi, sirt qo‘polligining ortishi va strukturaviy qayta tashkil topish jarayonlarini faollashtirishi aniqlandi. Bu natijalar plyonkaning termal barqarorligini va yuqori harorat sharoitida mikrostrukturaviy evolyutsiyasini tasdiqlaydi.

Xulosa

NiV qotishmasining yupqa plyonkalari soda-ohak shisha tagliklariga DC va impulsli RF magnetron purkash texnikasidan foydalangan holda muvaffaqiyatli o‘stirildi. Morfologik va kompozitsion tahlillar nanokristalli tuzilishga ega bir xil NiV qotishma plyonkalarining hosil bo'lishini tasdiqladi. Qiyosiy tahlil shuni ko'rsatdiki, o‘stirish rejimi plyonkalarning morfologik xususiyatlariga sezilarli darajada ta'sir qiladi. AFM tadqiqotlari shuni ko'rsatdiki, cho'ktirilgan plyonkalar past g’adur-budurlikka ega silliq va ixcham sirtlarga ega. 600 °C da tavlangandan so'ng, atom diffuziyasi va qayta krisstallanish jarayonlarining kuchayishi tufayli kristallarning birlashishi va sirt g’adur-budurligi ortadi. SEM, AFM va kompozitsion o'lchovlarning birgalikdagi tahlili shuni ko'rsatadiki, cho'ktirish sharoitlari va termik ishlov berish NiV yupqa plyonkalarining mikrotuzilmasi va sirt morfologiyasiga kuchli ta'sir qiladi. Ushbu topilmalar mikroelektronika, diffuziya to'siqlari va himoya qoplamalarida qo'llanilishi uchun NiV yupqa plyonkalarini optimallashtirish bo'yicha qimmatli tushunchalar beradi.

Annotatsiya. *Dimetilformamid (DMF) muhitida C_{70} fullerenining turli konsentratsiyalarda (0.03 dan 0.09 mg/mL gacha) agregatsiyalanish qonuniyatlari va ularning tizimning optik xossalariga ta'siri UV-Vis, fluoresensiya hamda refraktometriya usullari yordamida kompleks tadqiq etildi. UV-Vis spektrlarining tahlili shuni ko'rsatdiki, fulleren konsentratsiyasi ortishi bilan molekulalararo $\pi-\pi$ stacking (ustma-ust joylashish) effektlari kuchayadi va bu yutilish spektrining 1100 nm gacha kengayishiga (absorption tail) olib keladi. Fluoresensiya spektrlarida emissiya intensivligi 0.06 mg/mL konsentratsiyada o'zining maksimal qiymatiga erishishi aniqlandi; tizimda ekscimerlar (qo'zg'algan dimerlar) hosil bo'lishi va konsentratsion so'nish (concentration quenching) hodisalari tufayli klassik oyna qonuniyati (mirror rule) buzilishi kuzatildi. Lorents-Lorenz (Lorentz-Lorenz) tenglamasiga asoslangan refraktometrik tahlillar konsentratsiya ortishi bilan eritmaning nur sindirish ko'rsatkichi va tizimning umumiy elektron polarizatsiyalanuvchanligi chiziqli bo'lmagan ravishda o'sishini isbotladi. Olingan natijalar fulleren asosidagi nanomateriallarning optoelektronik xossalarini boshqarishda muhim fundamental ahamiyatga ega.*

Kalit so'zlar. *C_{70} fulleren, DMF (dimetilformamid), agregatsiya, $\pi-\pi$ stacking, UV-Vis spektr, fluoresensiya, konsentratsion so'nish, ekscimer, Lorents-Lorenz tenglamasi, refraktometriya.*

КОНЦЕНТРАЦИОННО-ЗАВИСИМАЯ ОПТИЧЕСКИЕ СВОЙСТВА ФУЛЛЕРЕНА C_{70} В СРЕДЕ ДМФА

Аннотация. *Методами UV-Vis, флуоресцентной спектроскопии и рефрактометрии проведено комплексное исследование закономерностей концентрационно-зависимой агрегации и оптических свойств фуллерена C_{70} (в диапазоне от 0.03 до 0.09 мг/мл) в среде диметилформамида (ДМФА). Анализ спектров поглощения UV-Vis показал, что с ростом концентрации фуллерена усиливаются межмолекулярные эффекты $\pi-\pi$ стекинга, что приводит к значительному уширению спектра (полосы поглощения) вплоть до 1100 нм. Установлено, что интенсивность флуоресценции достигает своего максимума при концентрации 0.06 мг/мл; при более высоких концентрациях наблюдается нарушение классического правила зеркальной симметрии, обусловленное образованием эксимеров и процессами концентрационного тушения. Рефрактометрический анализ с использованием уравнения Лоренца-Лоренца показал нелинейный рост показателя преломления и общей электронной поляризуемости системы с увеличением концентрации, что подтверждает начало*

процесса локальной агрегации. Полученные результаты имеют важное фундаментальное значение для направленного регулирования оптоэлектронных свойств наноматериалов на основе фуллеренов.

Ключевые слова: *фуллерен C_{70}, ДМФА (диметилформамид), агрегация, $\pi-\pi$ стекинг, UV-Vis спектроскопия, флуоресценция, концентрационное тушение, эксимер, уравнение Лоренца-Лоренца, рефрактометрия.*

CONCENTRATION-DEPENDENT OPTICAL PROPERTIES OF C_{70} FULLERENE IN DMF MEDIUM

Abstract. *The concentration-dependent aggregation behavior and optical properties of C_{70} fullerene (ranging from 0.03 to 0.09 mg/mL) in a dimethylformamide (DMF) medium were comprehensively investigated using UV-Vis, fluorescence, and refractometry techniques. UV-Vis absorption spectra revealed that increasing the fullerene concentration enhances intermolecular $\pi-\pi$ stacking interactions, resulting in a pronounced spectral broadening (absorption tail) extending up to 1100 nm. Fluorescence spectroscopy showed that the emission intensity reaches its maximum at 0.06 mg/mL; beyond this threshold, a significant deviation from the classic mirror rule was observed, which is attributed to excimer formation and concentration quenching processes. Furthermore, refractometric measurements analyzed via the Lorentz-Lorenz equation confirmed a nolinear increase in both the refractive index and the total electronic polarizability of the system with rising concentration. These findings provide crucial fundamental insights for tuning the optoelectronic properties of fullerene-based nanomaterials.*

Keywords *C_{70} fullerene, DMF (dimethylformamide), aggregation, $\pi-\pi$ stacking, UV-Vis spectroscopy, fluorescence, concentration quenching, excimer, Lorentz-Lorenz equation, refractometry.*

Kirish

So‘nggi o‘n yilliklarda uglerod sferik nanostrukturalari bo‘lgan fullerenlar va ularning hosilalari o‘zlarining noyob elektron, optik va magnit xossalari tufayli nanotexnologiya, molekulyar optoelektronika va biomeditsina sohalarida jadal tadqiq etilmoqda. Fullerenlar oilasining eng istiqbolli vakillaridan biri bo‘lgan C_{70} fulleren molekulasi o‘zining pasaygan sferoid simmetriyasi (D_{5h}) bilan klassik C_{60} (I_h) gomosferasidan keskin farq qiladi [1,2]. Simmetriyaning bunday pasayishi elektron energetik sathlar degeneratsiyasining qisman buzilishiga olib keladi, bu esa o‘z navbatida ko‘rinadigan va yaqin IQ spektral sohalarda yuqori intensivlikka ega bo‘lgan murakkab optik yutilish polosalarini yuzaga keltiradi. Ushbu o‘ziga xos fotofizik xarakteristikalar tufayli C_{70} juda samarali organik fotovoltak qurilmalari, ilg‘or fotodetektorlar, singlet kislorod generatorlari va targeted dori vositalarini tashish tizimlarida (drug delivery) asosiy nanomaterial sifatida qo‘llanilmoqda.

Biroq, C_{70} fullerenining amaliy va fundamental qo‘llanilishidagi eng asosiy muammo uning qutbli va qutbsiz organik erituvchilarda kuchli $\pi-\pi$ stacking (aromatik halqalarning o‘zaro tortishishi) o‘zaro ta’sirlari tufayli oson agregatsiyalanishidir [3]. Fulleren tizimlarida agregatsiya jarayoni oddiy gomogen erish mexanizmi bo‘lmaydigan, balki monomer molekulalardan boshlanib, termodinamik barqaror nanoklasterlar va supramolekulyar tuzilmalar hosil bo‘lishigacha boradigan murakkab o‘z-o‘zini tashkil etish (*self-assembly*) hodisasidir. Tizimning makroskopik, optik va gidrodinamik xossalari bevosita hosil bo‘lgan agregatlarning o‘lchami va strukturaviy tuzilishiga bog‘liq bo‘ladi [4].

Hozirgi vaqtda fullerenlarning turli erituvchilardagi klasterlanish mexanizmlarini boshqarish va bashorat qilish dolzarb muammo bo‘lib qolmoqda. Ushbu tadqiqotda dimetilformamid (DMF) qutbli muhitida C_{70} fullerenining konsentratsiyaga bog‘liq agregatsiya dinamikasi va uning optik xususiyatlariga ta’siri zamonaviy fizik-kimyoviy usullar (UV-Vis absorption, Fluoresensiya hamda yuqori aniqlikdagi refraktometriya) yordamida kompleks ravishda o‘rganildi.

Tadqiqot metodologiyasi

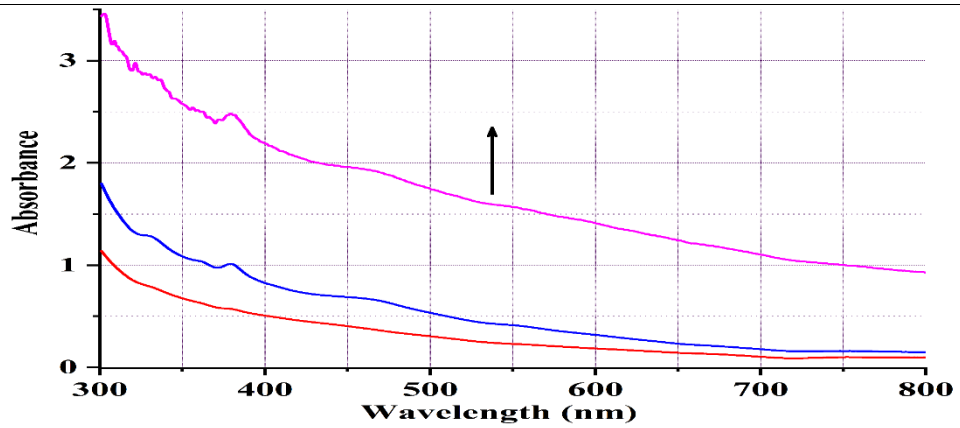
Tajribalarda C_{70} fullerene (Sigma-Aldrich,tozaligi ≥99%) va N,N-Dimethylformamid (analitik darajadagi) asosiy reagentlar sifatida qo‘llanildi. Barcha reagentlar qo‘shimcha tozalashsiz ishlatildi.

C_{70} fullerenining turli konsentratsiyalardagi eritmalari laboratoriya sharoitida tayyorlandi. Dastlab 0.3 mg, 0.6 mg va 0.9 mg miqdordagi C_{70} yuqori aniqlikdagi analitik tarozi yordamida o‘lchab olindi. Har bir o‘lchangan namuna alohida-alohida 10 ml hajmdagi N,N-Dimethylformamid solingan shisha idishlarga qo‘shildi. Natijada quyidagi konsentratsiyalardagi eritmalar hosil qilindi. 1-eritma: 0.03 mg/mL (35.7×10^{-6}M), 2-eritma: 0.06 mg/mL (71.3×10^{-6}M), 3-eritma: 0.09 mg/mL (107×10^{-6}M). Har bir eritma xona haroratida magnitli aralashtirgich yordamida 45 minut davomida aralashtirildi va bir jinsli holatga keltirildi. Eritmalar tayyorlangandan so‘ng optik va fizik o‘lchovlar uchun foydalanildi.

Eritmalarning sindirish ko‘rsatkichi refraktometr yordamida o‘lchanib, uning konsentratsiyaga bog’liqligi tahlil qilindi. Eritmalarning yutilish spektrlari 190–1100 nm diapazonda U Cary 60 Uv-vis spektrofotometr yordamida o‘lchandi. O‘lchovlar 1 sm optik yo‘l uzunligiga ega kvars kyuvetalarda amalga oshirildi. Fluoresensiya spektrlari RF-6000 spektrofluorometr yordamida o‘lchandi. Eritmalar 470 nm uyg’otuvchi to‘lqin uzunligida qo‘zg’atilib, emissiya intensivligining konsentratsiyaga bog’liqligi o‘rganildi.

Natijalar va ularning tahlili

UV–Vis yutilish spektrlari. C_{70} fullerenning N,N-dimetilformamidda (DMF) eritilgan UV–Vis yutilish spektrlari uch xil konsentratsiyada (0.03, 0.06 va 0.09 mg/mL) qayd etildi. Olingan spektrlar (1-rasm) to‘lqin uzunliklari (300–800 nm) konsentratsiyaga bog’liq aniq o‘zgarishlarni ko‘rsatadi.



1-rasm. C_{70}/DMF eritmalarning yutilish spektrlari. Konsentratsiya strelka yo‘nalishida oshib boradi (0.03 mg/mL, 0.06 mg/mL, 0.09 mg/mL).

Keltirilgan 1-rasmda C_{70} fullereni DMF (dimetilformamid) erituvchisidagi uch xil konsentratsiyasining (0.03 mg/ml, 0.06 mg/ml va 0.09 mg/ml) UV-Vis yutilish spektrlari ifodalangan. Grafikda yuqoriga yo‘nalgan strelka ko‘rsatganidek, eritmada fulleren konsentratsiyasi ortishi bilan yutilish intensivligi (Absorbance) Lambert-Beer qonuniga (eritmada yutilish intensivligi konsentratsiyaga to‘g’ri proporsional ekanligini ko‘rsatuvchi qonun) muvofiq ravishda tizimli ravishda ortib borgan. Spektirda C_{70} molekulasining o‘ziga xos elektron o‘tishlarini xarakterlovchi 330 nm, 380 nm va 471 nm to‘lqin uzunliklarida yutilish piklari (spektrdagi maksimal nuqtalar) kuzatiladi. Ushbu piklarning tabiati va hosil bo‘lish mexanizmlari quyidagicha talqin qilinadi:

330 nm dagi (Ultrabinafsha soha) pik fulleren sferasidagi uglerod atomlarining kuchli π-π^* elektron o‘tishlariga (molekuladagi bog’lovchi π orbitallardan bo‘sh bo‘lgan va yuqori energiyali bo‘shashtiruvchi π^* orbitallarga elektron o‘tishi) tegishlidir. Konsentratsiya 0.09 mg/ml ga yetganda, bu sohadagi yutilish yuqori qiymatga yetadi.

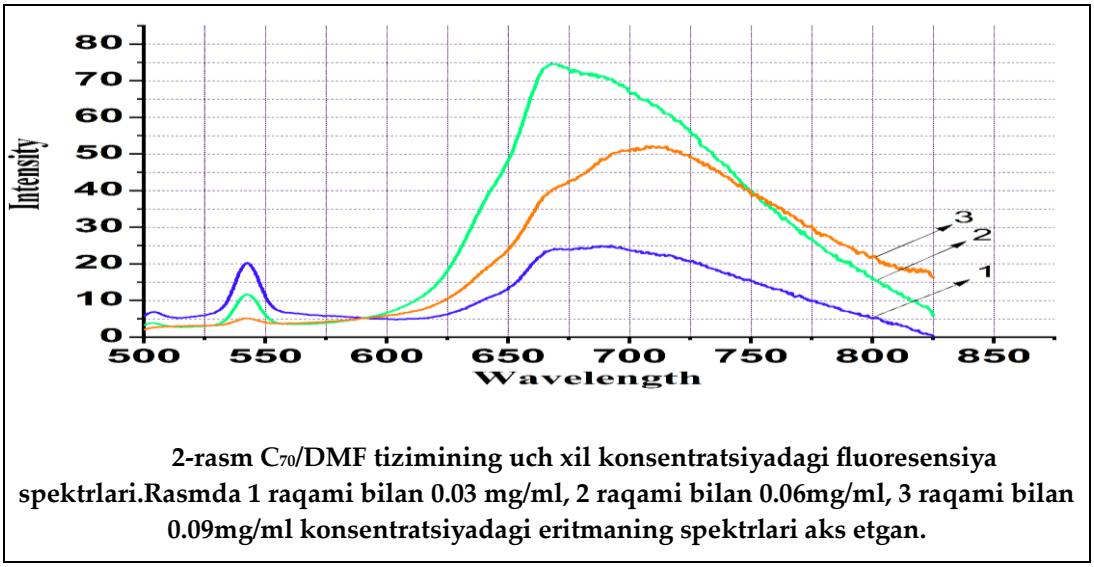
380 dagi pik (Yaqin ultrabinafsha soha) C_{70} uchun xarakterli bo‘lib, molekuladagi ruxsat etilgan dipol o‘tishlari (molekula ichida yorug’lik kvanti ta’sirida elektron bulutining qutblanishi natijasida sodir bo‘ladigan o‘tishlar) bilan bog’liq. Grafikdan ko‘rinib turibdiki, konsentratsiya ortishi bilan (ayniqsa 0.06 va 0.09 mg/ml eritmalarida) 380 nm dagi pik yanada yaqqolroq va o‘tkirroq shaklga ega bo‘ladi. Bu esa DMF muhitida C_{70} monomerlarining (yagona, mustaqil molekulalar) mavjudligini va ma’lum darajada barqarorligini ko‘rsatadi.

471 Dagi (ko‘rinadigan soha) bu yoyilgan pik C_{70} molekulalarining HOMO-LUMO (eng yuqori band bo‘lgan molekulyar orbitaldan eng past bo‘sh turgan molekulyar orbitalga) o‘rtasidagi elektron o‘tishlariga mos keladi [5]. Konsentratsiya past bo‘lganda elektron o‘tish ehtimolligi kam bo‘ladi. Ammo klaster hosil bo‘lganda 471 nm da bu o‘tishning ehtimoli ortadi. Natijada pik ko‘rina boshlaydi. Klasterlanish boshlanganda yangi energetik holatlar paydo bo‘lishi mumkin. Demak, eski o‘tishlar o‘zgaradi, yangi o‘tishlar paydo bo‘ladi, ba’zi o‘tishlar esa kuchayadi. Shuning uchun yangi pik yoki zaif pik kuzatilishi mumkin. 471 da pik C_{70} ning klasterlanishi natijasida xosil bo‘ladi. 0.03 mg/ml konsentratsiyada C_{70} fulleren solvatlangan bo‘ladi. Konsentratsiya 0.03 mg/ml dan 0.09 mg/ml gacha oshganda, 471 nm atrofidagi pik biroz tekislanadi (kengayadi) va spektrning yuqori to‘lqin uzunligi tomon qizil sohaga cho‘zilishi kuzatiladi. Bu holat eritmada molekulalararo π-π stacking (yassi aromatik yoki karkasli tuzilmalarning bir-birining ustiga parallel joylashishi va o‘zaro ta’sirlashishi) hisobiga solvofobik effektdan (erituvchining fulleren molekulalarini o‘zidan itarishi natijasida molekulalarning bir-biriga intilishi) dalolat beradi. Ya’ni, konsentratsiya ortishi bilan C_{70} molekulalari DMF ichida o‘zaro uyushib, nano-o‘lchamli klasterlar (molekulalarning tartibli guruhlari/agregatlari) hosil qila boshlaganini ko‘rsatadi. "UV-Vis spektrlarining tahlili shuni ko‘rsatadiki, C_{70}/DMF tizimida konsentratsiya ortishi nafaqat yutilish intensivligining chiziqli o‘sishiga, balki 471 nm sohasidagi spektral chiziqlarning kengayishiga olib keladi. Bu esa o‘z navbatida, eritma konsentratsiyasining ortishi tizimda kinetik barqaror nanoklasterlarning shakllanish jarayonini (nukleatsiya) stimullashini tasdiqlaydi.

Fluoresensiya spektri. Turli konsentratsiyalardagi (0,03 mg/mL, 0,06 mg/mL va 0,09 mg/mL) eritmalarimizni fluoresensiya spektrlari o‘rganildi. Barcha o‘lchovlar davomida qo‘zg’atuvchi to‘lqin uzunligi 470 nm ga teng qilib tanlandi, chunki ushbu to‘lqin uzunligi C_{70} molekulasining ko‘rinadigan sohada joylashgan yutilish sohalari bilan yaxshi mos keladi va π–π^* elektron o‘tishlarini samarali qo‘zg’atish imkonini beradi. Qolaversa Kasha qonuniga ko‘ra qo‘zg’atish to‘lqin

uzunligidan qat'iy nazar bir xil fluoresensiya emissiya spektri kuzatiladi [6]. C_{70} molekulasi 470 nm nur yutganda Jablonskiy diagrammasiga ko'ra elektron $S_0 \rightarrow S_1$ yoki S_2 ga o'tadi. Energiyaning bir qismi issiqlikka ketadi, bir qismi esa fluoresensiya sifatida chiqadi, qolgan qismi esa T_1 holatga o'tib ketadi. T_1 holat triplet qo'zg'algan holat bo'lib, bunda qo'zg'algan orbitaldagi elektron spini asosiy xolatdagi elektron spiniga bir xil yo'nalishda bo'ladi [6]. Bunday holatda asosiy holatga o'tish taqiqlangan o'tish deyiladi va fluresensiya emas endi fosforesensiya kuzatiladi. Shuning uchun xam C_{70} ning fluresensiya spektrlari kuchsiz ko'rinishga ega. 2-rasm da ko'rsatilganidek, barcha eritmalarda ikkita asosiy emissiya hududi kuzatildi. Birinchisi, taxminan 520–550 nm oralig'ida zaif va tor emissiya polosi bo'lib, uning intensivligi past bo'ldi. Ikkinchi, asosiy emissiya polosi esa 620–820 nm oralig'ida joylashgan bo'lib, maksimal intensivlik taxminan 680–695 nm da qayd etildi.

Konsentratsiya oshishi bilan fluresentsiya intensivligi sezilarli o'zgarishlarni ko'rsatdi. Eng yuqori emissiya intensivligi 0,06 mg/ml konsentratsiyadagi eritmada kuzatildi (maksimal qiymat taxminan 74 a.u.). 0,03 mg/ml konsentratsiyada intensivlik ancha past bo'lsa, 0,09 mg/ml konsentratsiyaga o'tganda asosiy polosaning intensivligi pasayishi va polosaning biroz kengayishi aniqlandi.



2-rasm C_{70}/DMF tizimining uch xil konsentratsiyadagi fluoresensiya spektrlari.Rasmda 1 raqami bilan 0.03 mg/ml, 2 raqami bilan 0.06mg/ml, 3 raqami bilan 0.09mg/ml konsentratsiyadagi eritmaning spektrlari aks etgan.

0.03 mg/ml dan 0.09 mg/ml gacha intensivlikning keskin ortishi fluresensiya kvant unumdorligi (quantum yield) (chiqarilgan fotonlar sonining yutilgan fotonlar soniga nisbati) bilan aniqlanadi va nisbatan yuqori bo'lgan monomer C_{70} molekulalarining ko'payishini ko'rsatadi.

Biz yuqorida yutilish va fluoresensiya spektrlarini ko'rib chiqdik va grafiklardan ko'rdiki ko'zgu (mirror rule) qoidasi bu yerda buzilgan. Odatda emissiya spektri yutilish spektrining ko'zgudagi aksidek bo'lishi kerak edi. Lekin bizning natijalarimizda bu bajarilmadi. Ko'zgu (Mirror rule) qoidasi quyidagi 3 xil xolatda buziladi [7]. 1.Yorug'lik tushgandan so'ng molekula tez o'zgarib qolsa (proton tashlashi, ionlashishi) 2.Qo'zg'algan molekula boshqa molekula bilan yangi kompleks xosil qilsa (expilex) 3.Bir xil molekulalar bir biri bilan kompleks xosil qilsa(exsimer)

Bizni ishimizda mirror rule buzilishiga asosiy sabab Excimer xosil bo'lishidir. Fullerenlar konsentratsiya oshib borishi bilan π-π stacking orqali xosil qilgan komplekslar soni ortadi. Bu esa emissiya spektrini qizil tomonga siljitadi [8]. Bundan tashqari DMF da C_{70} molekulalari 30-100 mkM atrofida agregatsiyalanishi kuzatilgan. Biz kuzatgan konsentratsiyalar xam deyarli shu oraliqda (35.7mkM, 107mkM) bo'lgani uchun bu tasirlar xam fluoressensiya spektrlari yutilish spektrlari bilan ustma ust tushmasligiga olib keldi [9]. Olingan natijalar shuni ko'rsatdiki, 0.06 mg/ml konsentratsiya eng yuqori fluoresensiya intensivligini beruvchi optimal konsentratsiya bo'lib, undan yuqori konsentratsiyalarda (0.09 mg/ml) agregatsiya va konsentratsion so'nish (quenching) tufayli emissiya susayishi aniqlandi.

C_{70}/DMF eritmalarining sindirish ko'rsatkichlari. C_{70}/DMF eritmalarining optik xossalarini o'rganish maqsadida turli konsentratsiyalarda tayyorlangan namunalar uchun sindirish ko'rsatkichlari (ATAGO Pocket) Refractometer yordamida eksperimental ravishda aniqlandi. O'lchash natijalari 1-jadvalda keltirilgan.

1-jadval Turli konsentratsiyadagi C_{70}/DMF eritmalarining sindirish ko'rsatkichlari

Eritma turi	Konsentratsiya	Harorat	Sindirish ko'rsatkichi
1-eritma	0.03mg/ml	22.8^{0}C	1.4252
2-eritma	0.06mg/ml	22.8^{0}C	1.4276
3-eritma	0.09mg/ml	22.9^{0}C	1.4281

Natijalar fulleren–DMF tizimida konsentratsiya ortishi bilan eritmaning sindirish koʻrsatkichi oshishini koʻrsatdi. Oʻlchashlar 22.8–22.9°C temperatura oralig'ida amalga oshirilgan boʻlib, temperatura deyarli oʻzgarmagani sababli sindirish koʻrsatkichidagi oʻzgarish asosan konsentratsiya ta'siri bilan bog'liq deb qaraladi.Tajriba natijalariga koʻra, C_{70} fulleren konsentratsiyasi 0.03 mg/ml dan 0.09 mg/ml gacha oshirilganda sindirish koʻrsatkichi 1.4252 dan 1.4281 gacha ortgan. Bu holat eritmada fulleren molekulalari sonining ortishi natijasida molekulalararo oʻzaro ta'sirlarning kuchayishi bilan tushuntiriladi[10]. Fulleren molekulalari sp^2-gibridlangan uglerod atomlaridan tashkil topgan boʻlib, kuchli delokalizatsiyalangan π-elektron tizimiga ega. C_{70} molekulasidagi har bir uglerod atomi uchta σ bog' hosil qiladi hamda bitta π-elektron umumiy elektron bulutda qatnashadi [11].

DMF molekulasida karbonil guruhi mavjudligi sababli qutbli erituvchi hisoblanadi. Eritmada fulleren molekulalari bilan DMF orasida dipol–induktsiyalangan dipol, van-der-Vaals hamda π–π tipdagi molekulalararo oʻzaro ta'sirlar yuzaga keladi. (π–π oʻzaro ta'sir fulleren molekulasidagi delokalizatsiyalangan π-elektron bulut bilan DMF molekulasidagi karbonil guruhining π-elektron tizimi orasidagi elektron bulutlarning oʻzaro ta'siri natijasida hosil boʻladi.) Bunda yangi kovalent bog' hosil boʻlmaydi, balki elektron zichliklarning fazoviy yaqinlashuvi sababli molekulalar orasida zaif energetik barqarorlashuv yuzaga keladi [12]**.**

C_{70} molekulasi katta delokalizatsiyalangan π-elektron sirtiga ega boʻlgani sababli tashqi elektromagnit maydonga juda sezgir hisoblanadi. DMF molekulasining karbonil guruhi esa qutblangan π-bog'ga ega boʻlib, fulleren sirtiga yaqinlashganda elektron bulutlarning qisman qayta taqsimlanishi sodir boʻladi. Natijada molekulaning umumiy qutblanishi ortadi. Shu sababli yorug'lik ta'sirida elektron bulutning deformatsiyalanish darajasi kuchayadi va eritmaning sindirish koʻrsatkichi oshadi**.**

Bu jarayonni orbitalar oʻzaro ta'siri sifatida ham qarash mumkin:

$$\pi(C_{70}) \leftrightarrow \pi(C = O)$$

Bu yerda:

-Fulleren delokalizatsiyalangan π-elektron donor/akseptor tizimi sifatida,

-DMF karbonil guruhi esa qutblangan π-orbital manbai sifatida qatnashadi.

Natijada eritmada elektron bulutlarning kollektiv tebranishi kuchayadi va optik zichlik ortadi.

Konsentratsiya ortishi bilan fulleren molekulalari orasidagi oʻrtacha masofa kamayadi va elektron bulutlarning oʻzaro ta'siri kuchayadi. Bu esa elektronlarning tashqi elektromagnit maydon ta'sirida deformatsiyalanish qobiliyatini oshiradi.

Sindirish koʻrsatkichining ortishi Lorentz–Lorenz tenglamasi asosida tushuntiriladi:

$$\frac{n^2-1}{n^2+2} = \frac{4\pi N\alpha}{3}$$

bu yerda:

n-sindirish koʻrsatkichi, N- molekulalar soni ,

α— elektron bulut qutblanuvchanligi.

Konsentratsiya oshishi bilan eritmadagi fulleren molekulalari soni koʻpayadi va agregatsiyalanish ehtimoli ortadi. Hosil boʻlgan nanoklasterlar kattaroq elektron bulutga ega boʻlib, yorug'lik ta'sirida kuchliroq qutblanadi. Shu sababli eritmaning sindirish koʻrsatkichi ortadi [13].

Tajriba natijalarida 0.06 mg/ml dan 0.09 mg/ml ga oʻtishda sindirish koʻrsatkichining oʻsish sur'ati kamaygani kuzatiladi. Bu holat eritmada fulleren molekulalarining qisman agregatsiyalanishi yoki lokal strukturaviy tartiblanish boshlanishi bilan bog'liq boʻlishi mumkin [14]. Bunday holatda eritmadagi erkin molekulalar sonining nisbatan kamayishi sababli sindirish koʻrsatkichining oʻsishi sekinlashadi.

Olingan natijalar fulleren–DMF tizimida optik parametrlarning konsentratsiyaga bog'liqligini koʻrsatadi hamda fulleren molekulalari orasidagi molekulalararo oʻzaro ta'sirlar eritmaning optik xossalarini belgilovchi asosiy omillardan biri ekanligini tasdiqlaydi.

Xulosa. Ushbu ishda 0.03 mg/mL dan 0.09 mg/mL gacha boʻlgan konsentratsiya diapazonida C_{70} fullerenining DMF erituvchisidagi kolloid tizimlari muvaffaqiyatli tayyorlandi va ularning strukturaviy-optik xususiyatlari kompleks tahlil qilindi. Tadqiqot natijasida quyidagi muhim ilmiy xulosalarga erishildi:

UV-Vis yutilish spektrlarida konsentratsiya ortishi bilan Beer-Lambert qonuniga mos ravishda intensivlik ortishi va 1100 nm gacha choʻzilgan yutilish sohasi (absorption tail) kuzatildi, bu π–π stacking ta'sirida klasterlanish kuchayganini tasdiqlaydi. Fluoresensiya spektrlarida eng yuqori kvant unumdorligi va intensivlik 0.06 mg/mL optimal konsentratsiyada qayd etildi, undan yuqori qiymatlarda esa excimer hosil boʻlishi va konsentratsion soʻnish (concentration quenching) hodisalari tufayli emissiyaning susayishi hamda mirror rule qonuniyatining buzilishi aniqlandi.

Refraktometrik tahlillar C_{70} konsentratsiyasi ortishi bilan sindirish koʻrsatkichining 1.4252 dan 1.4281 gacha chiziqli boʻlmagan tarzda ortishini koʻrsatdi. Lorentz-Lorenz tenglamasiga muvofiq, bu effekt C_{70} ning delokalizatsiyalangan π -

elektron tizimi va DMF ning karbonil (C=O) guruhi o‘rtasidagi dipol-induksiyalangan dipol va van-der-Vaals o‘zaro ta’sirlari natijasida tizimning umumiy elektron polarizatsiyalanuvchanligi (a) ortishi bilan izohlandi.

Olingan natijalar qutbli organik muhitlarda fulleren asosidagi nano-dispers tizimlarning barqarorligi va optik funksionalligini boshqarishda konsentratsiya faktorining fundamental rolini ko‘rsatadi va ushbu materiallardan gibrid optoelektronik qurilmalar hamda biomeditsina dasturlarida samarali foydalanish imkonini beradi.

Ushbu ish O‘zbekiston Respublikasi Oliy ta’lim, fan va innovatsiyalar vazirligining FL-8323102108 “Uglerod asosidagi funksional nanomateriallarni sintezi va modifikatsiyasi, ularning atom zarralari bilan o‘zaro ta’sirini tadqiq etish” loyihasi moliyaviy ko‘magida amalga oshirildi.

Annotatsiya: *Ushbu maqolada termovakuumli bug'latish usuli yordamida shisha tagliklarda o'stirilgan toza rux oksidi (ZnO) va Al bilan legirlangan ZnO (AZO) yupqa plyonkalarining elektr xossalari tadqiq qilindi. Plyonkalar 0.002–0.006% oralig'idagi Al kirishma miqdorlarida tayyorlanib, 300 °C haroratda 2 soat davomida termik ishlov berildi. Xoll o'lchovlari natijalari Al miqdori ortishi bilan zaryad tashuvchilar konsentratsiyasi va elektr o'tkazuvchanlik ortishini, Xoll koeffitsiyenti hamda Xoll harakatchanligi esa kamayishini ko'rsatdi. Bunday o'zgarishlar Al^{3+} ionlarining Zn^{2+} panjara tugunlarini egallashi natijasida qo'shimcha erkin elektronlar hosil bo'lishi bilan izohlanadi. Barcha namunalar n-tip o'tkazuvchanlikni namoyon etdi. Volt-amper xarakteristikalari (VAX) esa plyonkalarda nisbatan omik xususiyatlar mavjudligini ko'rsatib, Al bilan legirlash ZnO yupqa plyonkalarining elektr o'tkazuvchanligini yaxshilashda samarali usul ekanligini tasdiqladi.*

Kalit so'zlar: *ZnO, ZnO:Al, yupqa plyonkalar, legirlash, Xoll effekti.*

ЭЛЕКТРИЧЕСКИЕ СВОЙСТВА ТОНКИХ ПЛЕНОК ZnO:Al, ПОЛУЧЕННЫХ МЕТОДОМ ТЕРМОВАКУУМНОГО ИСПАРЕНИЯ

Аннотация: *В данной работе исследованы электрические свойства тонких пленок чистого оксида цинка (ZnO) и легированного алюминием оксида цинка (AZO), полученных методом термовакуумного испарения на стеклянных подложках. Пленки были синтезированы при содержании алюминия в диапазоне 0.002–0.006% и подвергнуты термической обработке при температуре 300 °C в течение 2 часов. Результаты измерений по эффекту Холла показали, что с увеличением концентрации Al возрастает концентрация носителей заряда и электрическая проводимость, тогда как коэффициент Холла и подвижность носителей уменьшаются. Эти изменения объясняются замещением ионов Zn^{2+} ионами Al^{3+} в кристаллической решетке, что приводит к образованию дополнительных свободных электронов. Все образцы продемонстрировали n-тип проводимости. Вольт-амперные характеристики (ВАХ) показали наличие преимущественно омического поведения, подтверждая, что легирование алюминием является эффективным методом повышения электрической проводимости тонких пленок ZnO.*

Ключевые слова: *ZnO, ZnO:Al, тонкие пленки, легирование, эффект Холла.*

ELECTRICAL PROPERTIES OF ZnO:Al THIN FILMS PREPARED BY THERMAL VACUUM EVAPORATION

Abstract: *In this study, the electrical properties of pure zinc oxide (ZnO) and aluminum-doped zinc oxide (AZO) thin films deposited on glass substrates by thermal vacuum evaporation were investigated. The films were prepared with Al doping concentrations in the range of 0.002–0.006% and thermally annealed at 300 °C for 2 hours. Hall measurements revealed that with increasing Al content, the charge carrier concentration and electrical conductivity increase, while the Hall coefficient and carrier mobility decrease. These changes are attributed to the substitution of Zn^{2+} ions by Al^{3+} ions in the crystal lattice, resulting in the generation of additional free electrons. All samples exhibited n-type conductivity. The current–voltage (I–V) characteristics indicated predominantly ohmic behavior, confirming that Al doping is an effective approach to enhance the electrical conductivity of ZnO thin films.*

Keywords: *ZnO, ZnO:Al, thin films, doping, Hall effect.*

Kirish

So'nggi yillarda metall oksidli yarimo'tkazgich yupqa plyonkalar optoelektronika, shaffof elektronika, sensorlar tayyorlash sohasi va quyosh energetikasi sohalarida keng qo'llanilishi tufayli katta ilmiy va amaliy qiziqish uyg'otmoqda.

Bunday materiallar orasida ZnO o‘zining to‘g‘ri o‘tishli keng taqiqlangan energetik zonasi, yuqori shaffofligi, kimyoviy barqarorligi va nisbatan arzonligi bilan ajralib turadi. ZnO xona haroratida taxminan 3.37 eV taqiqlangan zona kengligiga hamda katta eksiton bog‘lanish energiyasiga ega bo‘lib, uni ultrabinafsha fotodetektorlar, gaz sensorlari, shaffof o‘tkazuvchi elektrodlar va boshqa funksional qurilmalar uchun istiqbolli material hisoblanadi.

ZnO yupqa plyonkalarining elektr va optik xossalarini boshqarishning samarali usullaridan biri ularni donor tabiatli elementlar bilan legirlash hisoblanadi. Xususan, Al bilan legirlash ZnO panjarasida Zn^{2+} ionlari o‘rnini Al^{3+} ionlari egallashi orqali qo‘shimcha erkin elektronlar hosil qiladi. Natijada zaryad tashuvchilar konsentratsiyasi ortadi va plyonkaning elektr o‘tkazuvchanligi yaxshilanadi. Shu sababli AZO plyonkalari indiy qalay oksidi kabi an’anaviy shaffof o‘tkazuvchi materiallarga muqobil sifatida keng tadqiq qilinmoqda.

ZnO va ZnO:Al yupqa plyonkalarini olish uchun impulsli lazer cho‘ktirish, magnetron purkash, kimyoviy bug‘ fazasida cho‘ktirish, sol-gel, gidrotermal sintez va termik bug‘latish kabi turli texnologiyalar qo‘llaniladi. Ushbu usullar orasida termovakuumli bug‘latish usuli texnologik jihatdan nisbatan sodda, iqtisodiy jihatdan qulay va katta yuzali plyonkalar olish imkonini berishi bilan ajralib turadi. Biroq bu usulda ZnO va Al komponentlarining bug‘lanish kinetikasi turlicha bo‘lgani sababli plyonka tarkibi, stoixiometriyasi va legirlash darajasini boshqarish muhim ahamiyat kasb etadi.

Mazkur ishda termovakuumli bug‘latish usuli yordamida shisha tagliklarda o‘stirilgan toza ZnO va Al bilan legirlangan ZnO yupqa plyonkalarining elektr xossalari tadqiq qilindi. Al kirishma miqdorining Xoll koeffitsiyenti, zaryad tashuvchilar konsentratsiyasi, elektr o‘tkazuvchanlik, Xoll harakatchanligi hamda volt-amper xarakteristikalariga ta’siri tahlil qilindi. Olingan natijalar AZO yupqa plyonkalarida Al legirlash elektr o‘tkazuvchanlik va fototok hosil bo‘lish jarayonlariga sezilarli ta’sir ko‘rsatishini aniqlashga xizmat qiladi.

Eksperimental qism

ZnO va AZO plyonkalari Al kirishmaning turli nisbiy massa miqdorlarida ~$(2\div6)\cdot10^{-3}$ termik bug‘latish usuli orqali shisha tagliklar sirtiga cho‘ktirildi. Termovakuumli bug‘latishda ВУП-5 qurilmasidan foydalanildi. Bu jarayon uchun manba materiali sifatida tozaliklari 99.99% bo‘lgan ZnO va AZO tabletkalaridan foydalanildi.

Al va ZnO materiallarining bug‘lanish xossalari sezilarli darajada farqlanadi. Al nisbatan past haroratlarda bug‘lanib, vakuum sharoitida taxminan 1000–1500 °C da samarali bug‘lanadi. Aksincha, ZnO yuqori termik barqarorlikka ega bo‘lib, oddiy bug‘lanish o‘rniga 1500–1800 °C atrofida dissotsiatsiyalanib, Zn bug‘i va kislorodga ajraladi. Shu sababli, termik bug‘latish jarayonida ZnO plyonkalarda stoixometriya buzilishi va kislorod vakansiyalari hosil bo‘lishi ehtimoli yuqori, Al esa ZnO materialga kirishma sifatida oson kira oladi.

Termovakuumli bug‘latish usulida Al va ZnO ning turli bug‘lanish kinetikasi va ZnO ning dissotsiatsiyalanish xususiyati sababli, tayyor va ishonchli ZnO va AZO tabletkalaridan foydalanildi bunda volfram tigeldan qo‘llanildi. Kameraning bosimi esa 10^{-1}-10^{-2} Pa. Manba va taglik orasidagi masofa taxminan 12 sm ni tashkil etdi.

AZO plyonkalariga odatda 200–600 °C temperaturalar oralig‘ida termik ishlov beriladi. Optimal struktura va elektr-optik xossalar 400–500 °C diapazonda, inert yoki vakuum muhitida termik ishlov berish orqali erishiladi, yuqori temperaturalarda esa ruxning bug‘lanishi va stexiometrik buzilishlarga olib kelishi mumkin. Ushbu tadqiqot ishida plyonkalarga 300 °C haroratda 2 soat davomida termik ishlov berildi. Elektr xossalari xona haroratida Xoll o‘lchov tizimi yordamida o‘lchandi. ZnO va AZO yupqa plyonkalari odatda 50–500 nm oralig‘ida tayyorlanadi, eng ko‘p qo‘llaniladigan qalinlik esa optoelektronika va o‘tkazuvchan shaffof qatlamlar uchun 100–300 nm atrofida bo‘ladi. ZnO:Al yupqa plyonkalarning qalinligi interferension o‘lchov usuli asosida 150 nm atrofida ekanligi aniqlandi.

Tadqiqot natijalari

ZnO va AZO yupqa plyonkalarining Xoll parametrlarini aniqlash uchun Van der Pau usuli asosida elektr o‘lchovlar bajarildi. 1-jadvalda olingan yupqa plyonkalarning ba’zi elektrik parametrlari qiymatlari keltirildi. Ko‘rishimiz mumkinki Al kirishma miqdori ortishi bilan Xoll koeffitsiyentining kamayishi, zaryad tashuvchilar konsentratsiyasining ortishini ko‘rsatdi. Bunda Al^{3+} ionlarining Zn^{2+} panjara tugunlarini egallashi natijasida qo‘shimcha erkin elektronlar generatsiyalanadi. Shuning uchun tadqiq qilingan namunalar n-tip o‘tkazuvchanlik xususiyatini namoyon etdi.

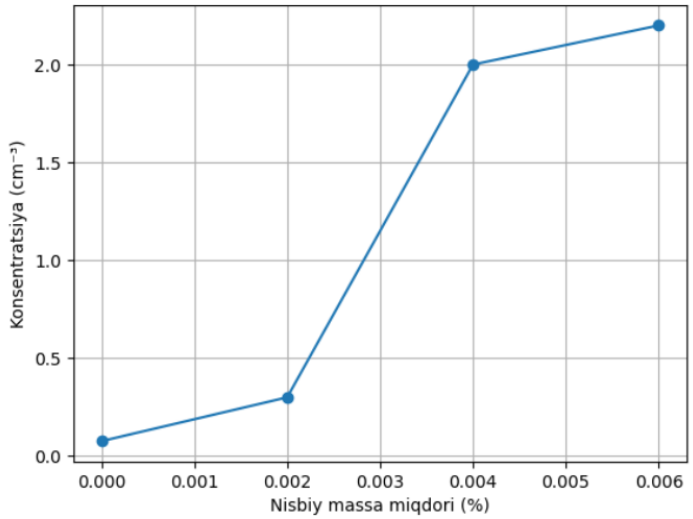
1-jadval

Olingan ZnO va AZO yupqa plyonkalarining uchun Xoll o‘lchov natijalari

№	Plyonka	Nisbiy massa miqdori (%)	Zaryad tashuvchilar turi	n (cm^{-3})	R_h (cm^3/C)	σ $(Om\cdot cm)^{-1}$	μ_h ($cm^2/V\cdot s$)
1	ZnO	0.000	n	7.6×10^{10}	-8.3×10^{7}	1.2×10^{-5}	12.9×10^{3}
2	AZO	0.002		3.0×10^{11}	-2.1×10^{7}	1.6×10^{-5}	6.3×10^{3}

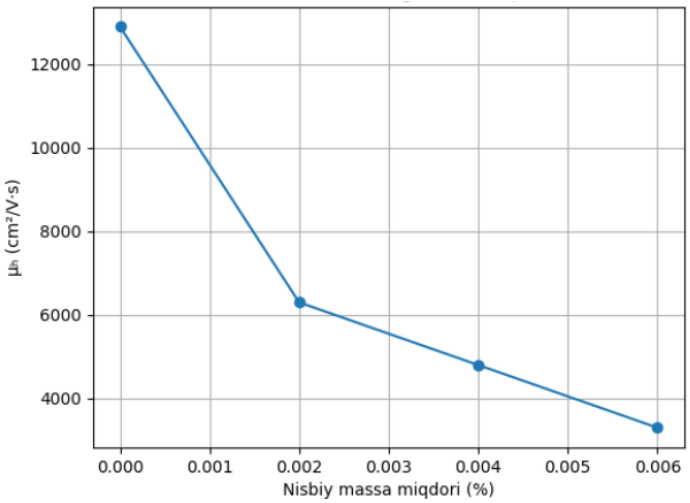
3		0.004		2.0×10^{12}	-3.13×10^{6}	1.6×10^{-4}	4.8×10^{3}
4		0.006		2.2×10^{12}	-2.9×10^{6}	1.2×10^{-3}	3.3×10^{3}

Tahlil natijalari Al kirishma miqdorining ortishi ZnO asosidagi yupqa plyonkalarning elektr o‘tkazuvchanligini oshirishini ko‘rsatdi. Bu, asosan, donor tabiatli Al atomlari hisobiga erkin zaryad tashuvchilar konsentratsiyasining ortishi bilan bog‘liq. Al kirishma konsentratsiyasi ortishi bilan Xoll harakatchanligining kamayishi 1-rasmdagi grafikdan o‘z aksini topgan.



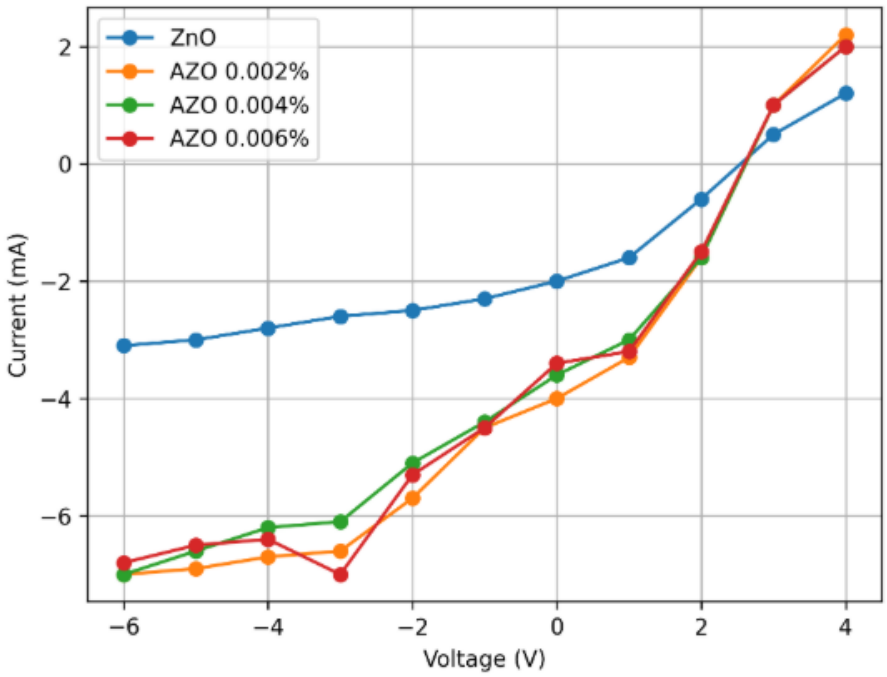
1-rasm. ZnO va AZO plyonkalarda zaryad tashuvchilar konsentratsiyasining Al kirishma nisbiy massa miqdoriga bog‘liqligi.

2-rasmdan ko‘rinadiki, Al miqdori ortishi bilan Xoll harakatchanligi izchil kamayadi, bu esa ionlashgan kirishmalar tomonidan zaryad tashuvchilarning sochilishi kuchayishi hamda zaryad tashuvchilar konsentratsiyasining ortishi natijasida ularning erkin harakatlanish sharoiti cheklanishi bilan bog‘liq. Demak, Al bilan legirlash elektr o‘tkazuvchanlikni oshiruvchi muhim omil bo‘lsa-da, u Xoll harakatchanligining kamayishi bilan birga kechadi.



2-rasm. Al kirishma miqdoriga bog‘liq holda ZnO va AZO plyonkalarda Xoll harakatchanligining μ_h o‘zgarishi.

3-rasmda 0.1 Vt/cm² yorug‘lik intensivligi ostida shisha tagliklarda o‘stirilgan ZnO va AZO yupqa plyonkalarning −6 dan 4 V gacha bo‘lgan diapazondagi VAX chiziqlari keltirilgan. Grafikdan ko‘rinadiki, qo‘llanilgan kuchlanish ortishi bilan tok kuchi ham ortib boradi. Al kirishma miqdorining ortishi esa zaryad tashuvchilar konsentratsiyasining ortishi hisobiga tok qiymatlarining yuqorilashishiga olib keladi. V=0 da tokning manfiy qiymatlari kuzatilishi yorug‘lik ta’sirida fototok hosil bo‘lishini ko‘rsatadi. Shu bilan birga, VAX chiziqlarining nisbatan chiziqli ko‘rinishi plyonkalarda omik kontakt xususiyati ustun ekanligini bildiradi.



3-rasm. Shisha taglikda o‘stirilgan ZnO va AZO plyonkalarning VAX lari.

Xulosa. Ushbu ishda termovakuumli bug‘latish usuli yordamida shisha tagliklarda ZnO va AZO yupqa plyonkalari olindi hamda Al kirishma miqdorining ularning elektr xossalariga ta’siri o‘rganildi. Xoll o‘lchovlari Al miqdori ortishi bilan zaryad tashuvchilar konsentratsiyasi 7.6 $\times 10^{10}$ dan 2.2 $\times 10^{12}$ cm^{-3} gacha oshishini ko‘rsatdi. Shu bilan birga, elektr o‘tkazuvchanlik 1.2×10^{-5} dan 1.2×10^{-3} $(\Omega\cdot cm)^{-1}$ gacha ortdi.

Barcha namunalar n-tip o‘tkazuvchanlikni namoyon etishi Al^{3+} ionlarining Zn^{2+} panjara tugunlarini egallashi hisobiga qo‘shimcha erkin elektronlar hosil bo‘lishi bilan izohlanadi. Biroq Al miqdori ortishi bilan Xoll harakatchanligi 12.9×10^{3} dan 3.3×10^{3} $cm^2/V\cdot s$ gacha kamaydi. Bu holat ionlashgan kirishmalar bilan bog‘liq sochilish jarayonlarining kuchayganligini ko‘rsatadi.

VAX tahlili Al bilan legirlash tok qiymatlarini oshirishini va yorug‘lik ta’sirida fototok hosil bo‘lish jarayonini kuchaytirishini tasdiqladi. Olingan natijalar AZO yupqa plyonkalari shaffof o‘tkazuvchi qatlamlar hamda optoelektron qurilmalar uchun istiqbolli material ekanligini ko‘rsatadi.

G_3^2-ПЕРИОДИЧЕСКИЕ P -АДИЧЕСКИЕ ОБОБЩЁННЫЕ МЕРЫ ГИББСА ДЛЯ МОДЕЛИ ИЗИНГА С ДВУХПЕРИОДИЧЕСКИМ ВНЕШНИМ ПОЛЕМ НА ДЕРЕВЕ КЭЛИ ТРЕТЬЕГО ПОРЯДКА

Аннотация. *В данной работе выводится функциональное уравнение, соответствующее p -адической модели Изинга с внешним полем на дереве Кэли. Рассматривается случай двухпериодического внешнего поля на дереве Кэли порядка три и описываются соответствующие G_3^2-периодические p -адические обобщённые меры Гиббса. Доказано, что число таких мер зависит от простого числа p: при $p \equiv 1 \ (mod \ \ 6)$ существует десять таких периодических p -адических обобщённых мер Гиббса, тогда как при $p > 3$ и $p \not\equiv 1 \ (mod \ \ 6)$ существует ровно две такие меры. Кроме того, исследуется ограниченность этих мер.*

Ключевые слова: *p -адическое число, мера Гиббса, дерево Кэли, p -адическая модель Изинга с двухпериодическим внешним полем, G_3^2-периодические p -адические обобщённые меры Гиббса.*

G_3^2-PERIODIC P -ADIC GENERALIZED GIBBS MEASURES FOR THE ISING MODEL WITH A TWO-PERIODIC EXTERNAL FIELD ON THE CAYLEY TREE OF ORDER THREE

Abstract: In this paper, we derive the functional equation associated with the p -adic Ising model with an external field on a Cayley tree. We study the case of a two-periodic external field on the Cayley tree of order three and describe the corresponding G_3^2-periodic p -adic generalized Gibbs measures. It is proved that the number of such measures depends of the prime p: when $p \equiv 1 \ \ (mod\ 6)$, there exist ten G_3^2-periodic p -adic generalized Gibbs measures, whereas for $p > 3$ with $p \not\equiv 1 \ \ (mod\ 6)$, there exist exactly two such measures. Moreover, the boundedness of these measures is investigated.

Keywords*: p-adic number, Gibbs measure, Cayley tree, p-adic Ising model with a two-periodic external field, G_3^2--periodic p-adic generalized Gibbs measure*.

1. Introduction

In recent years, many physical models within the framework of p -adic analysis have been actively studied (see, for example, [3, 4, 8, 13, 29]). These studies have contributed to the development of p -adic stochastic processes [7, 9] and have also supported further research in p -adic statistical mechanics (see [19] for a review). In addition, several works 5, 12, 14, 16] have focused on detecting phase transitions in p -adic models.

The uniqueness of the p -adic Gibbs measure for the Ising model has been established, and the notion of p -adic generalized Gibbs measures was introduced in [6]. Translation-invariant and $G_k^{(2)}$-periodic p -adic generalized Gibbs

measures on Cayley trees were studied in [6, 2]. Non-periodic p -adic generalized Gibbs measures for the Ising model were investigated in [24].

In [26], $G_k^{(2)}$-periodic p -adic quasi-Gibbs measures for the Potts model on a Cayley tree of order two were obtained. In [1, 28], weakly periodic p -adic generalized Gibbs measures were introduced as a more general class than periodic ones, and their existence was proved in the p -adic setting. In [2, 21], the author considered p -adic generalized Gibbs measures for the Ising model with homogenous external field on the Cayley tree of order two and three, respectively.

In this work, we derive the functional equation for the Ising model with a non-homogeneous external field on the Cayley tree of order k. We establish conditions on prime numbers p under which there exist G_3^2-periodic p -adic generalized Gibbs measures for the Ising model with a 2-periodic external field. Moreover, the boundedness of these measures and phase transition for the model are investigated.

2. Preliminaries

2.1. p -adic numbers and p -adic measure. Let $\mathbb{Q}$ be the field of rational numbers. For a fixed prime number p, any nonzero rational number x can be represented in the form $x = p^r \frac{n}{m}$ where, $r, n \in \mathbb{Z}$, $m \in \mathbb{N}$, and n and m are numbers not divisible by p. The p -adic norm of x is defined by

$$|x|_p = p^{-r}.$$

Also define p -adic norm

$$|0|_p = 0.$$

This norm is non-Archimedean, i.e., it satisfies the strong triangle inequality

$$|x + y|_p \le max\{|x|_p, |y|_p\}$$

for all $x, y \in \mathbb{Q}$. The completion of $\mathbb{Q}$ with respect to the p -adic norm is called the p -adic field, which is denoted by $\mathbb{Q}_p$. Any nonzero p -adic number x can be uniquely represented in the canonical form $x = p^{\gamma(x)}(x_0 + x_1 p + x_2 p^2 + \dots)$, where $\gamma(x) \in \mathbb{Z}$ and the integers x_j satisfy: $x_0 \in \{1,2, \dots, p-1\}, x_j \in \{0, \dots, p-1\}$, $j \ge 1$. In this case $|x|_p = p^{-\gamma(x)}$.

Let $B(a, r)$ be the ball defined by

$$B(a, r) = \{x \in \mathbb{Q}_p : |x - a|_p \le r\},$$

where $a \in \mathbb{Q}_p, r > 0$. The p -adic exponential is defined by

$$exp_p(x) = \sum_{n=1}^{\infty} \frac{x^n}{n!},$$

which converges for $x \in B\left(0, p^{-1/(p-1)}\right)$.

Set

$$\mathcal{E}_p = \left\{x \in \mathbb{Q}_p : |x - 1|_p < p^{-1/(p-1)}\right\}.$$

We recall that

$$\mathbb{Z}_p = \{x \in \mathbb{Q}_p : |x|_p \le 1\}, \ \mathbb{Z}_p^x = \{x \in \mathbb{Q}_p : |x|_p = 1\}$$

denote the sets of all p -adic integers and units of $\mathbb{Q}_p$, respectively.

Lemma 1. ([11,26]) Let $x \in B\left(0, p^{-1/(p-1)}\right)$. Then we have

$$\left|\exp_p(x)\right|_p = 1, \quad \left|\exp_p(x) - 1\right|_p = |x|_p < 1.$$

We recall that an integer $a \in \mathbb{Z}$ is called a *quadratic residue modulo p* if the congruence $x^2 \equiv a (mod\ p)$ has a solution $x \in \mathbb{Z}$.

Lemma 2[26]. *The equation* $x^2 = a$, where $0 \ne a = p^{\gamma(a)}(a_0 + a_1 p + a_2 p^2 + \dots)$, $0 \le a_j \le p-1$, $a_0 > 0$, *has a solution in* $x \in \mathbb{Q}_p$ if and only if the following conditions hold:

i) $\gamma(a)$ *is even;*

ii) $x^2 \equiv a_0 (mod\ p)$ *is solvable for* $p \ne 2$; *the equality* $a_1 = a_2 = 0$ *hold if* $p = 2$.

In [20], the authors introduced a new symbol "o " which makes our work easier when computing the p -adic norm. This notation replaces the congruence notation $(mod\ p^k)$ without explicitly tracking the power k. Let us recall such notions. For a given p -adic number x, by o[x] we mean a p -adic number with a norm strictly less than $p^{-\gamma(x)}$, i.e. $|o(x)|_p < |x|_p$. For example, if $x = 1 - p + p^2$, then we may write $o[1] = x - 1$ or $o[p] = x - 1 + p$. Therefore, the symbol $o[\cdot]$allows us to simplify our calculations.

The following result is known as Hensel's lemma:

Lemma 3. (Hensel's lemma [26]*). Let* $f(x) = c_0 + c_1 x + \dots + c_n x^n$ *be a polynomial whose coefficients are* p *-adic integers. Let* $f'(x) = c_1 + 2c_2 x + 3c_3 x^2 + \dots + nc_n x^{n-1}$ *be the derivative of* $f(x)$. *Let* a_0 *be a* p *-adic integer such that for some* $t \ge 0$ *we have*

$$f(a_0) \equiv 0 (mod\ p_{2t+1})$$

and

$$f'(a_0) \equiv 0 (mod\ p^t), f'(a_0) \not\equiv 0 (mod\ p^{t+1}).$$

Then $f(x)$ has a unique p -adic integer root x_0 such that $x_0 \equiv a_0 (mod\ p^{t+1})$.

A more detailed description of p -adic calculus and p -adic mathematical physics can be found in [28, 29].

Let $(X, \mathcal{B})$ be a measurable space, where $\mathcal{B}$ is an algebra of subsets X. A function $\mu: \mathcal{B} \to \mathbb{Q}_p$ is said to be a p -adic measure if for any $A_1, A_2, \dots, A_n \in \mathcal{B}$ such that $A_i \cap A_j = \emptyset$ for $i \neq j$, the following holds:

$$\mu\left(\bigcup_{j=1}^{n} A_j\right) = \sum_{j=1}^{n} \mu(A_j).$$

A p -adic measure is called a *probability measure* if $\mu(X) = 1$. An important property is boundedness: a p -adic measure μ is called bounded if $sup\{|\mu(A)|_p : A \in \mathcal{B}\} < \infty$. It is known that, in general, a p-adic probability measure is not bounded. For more detailed information about p -adic measures we refer to [10, 25].

2.2. Cayley tree. The Cayley tree Γ^k of order $k \geq 1$ is an infinite tree. A more detailed description of the Cayley tree Γ^k can be found in [25].

We introduce the following notation:

$$W_n = \{x \in V:\ d(x, x^0) = n\}, \quad V_n = \bigcup_{m=0}^{n} W_m, \quad L_n = \{\langle x, y\rangle \in L:\ x, y \in V_n\},$$

$$S(x) = \{y \in W_{n+1} : d(x, y) = 1\}, x \in V_n, \quad S_1(x) = \{y \in V : d(x, y) = 1\}.$$

Construction of p -adic Gibbs measures for the Ising model with an external field

We consider the p -adic Ising model with an external field on the Cayley tree. Let $\Gamma^k = (V, L)$ be the Cayley tree (see [25]) and $\Phi = \{-1, 1\}$ be the set of spin values. A configuration σ on $A \subset V$ is defined by the function $x \in A \to \sigma(x) \in \Phi$. The set of all configurations on A is denoted by $\Omega_A = \Phi^A$, and $\Omega_V := \Omega$.

A p -adic Hamiltonian on Ω_{V_n}, i.e., a function $H_n: \Omega_{V_n} \to \mathbb{Q}_p$, for the p -adic Ising model with a non-homogeneous external field is given by

$$H_n(\sigma_n) = J \sum_{\langle x,y\rangle \in L_n} \sigma(x)\sigma(y) + \sum_{x \in V_n} \alpha_x \sigma(x), \qquad (1)$$

where $J, \alpha_x \in B(0, p^{-1/(p-1)}) \backslash \{0\}$.

We define a function $\hat{h}: V \backslash \{x_0\} \to \mathbb{Q}_p, x \to \hat{h}_x$, and consider a p -adic probability measures $\mu_{\hat{h}}^{(n)}$ on Ω_{V_n} defined by

$$\mu_{\hat{h}}^{(n)}(\sigma_n) = \frac{1}{Z_n^{(\hat{h})}} exp_{\ p}\{H_n(\sigma_n)\} \prod_{x \in W_n} \hat{h}_x^{\varphi(x)}, \quad n = 1, 2, \dots \qquad (2)$$

where $Z_n^{(\hat{h})}$ is the normalizing constant

$$Z_n^{(\hat{h})} = \sum_{\sigma_n(x) \in \Omega_{V_n}} \exp_p\{H_n(\sigma_n)\} \prod_{x \in W_n} \hat{h}_x^{\varphi(x)}. \qquad (3)$$

A p -adic probability measure $\mu_{\hat{h}}^{(n)}$ is said to be compatable if for all $n \in \mathbb{N}$ and $\sigma_{n-1} \in \Omega_{V_{n-1}}$, we have

$$\sum_{\varphi^{(n)} \in \Omega_{W_n}} \mu_{\hat{h}}^{(n)}(\sigma_{n-1} \vee \varphi^{(n)}) = \mu_{\hat{h}}^{(n-1)}(\sigma_{n-1}). \qquad (4)$$

In this case, by the p -adic analogue of the Kolmogorov theorem [19], there exists a unique measure $\mu_{\hat{h}}$ on Ω such that $\mu_h\left(\{\sigma|_{V_n} \equiv \sigma_n\}\right) = \mu_h^{(n)}(\sigma_n)$ for all $n \in \mathbb{N}$ and $\sigma_n \in \Omega_{V_n}$.

Such a limiting p -adic measure generated by (2) is called *p -adic generalized Gibbs measure*. We note that if $\hat{h}_x \in \mathcal{E}_p$ for all $x \in V$ then the corresponding measure is called p -adic Gibbs measure (see [6, 16]). Notice that all p -adic Gibbs measures are p -adic generalized Gibbs measures but there exist p -adic generalized Gibbs measures which are not p -adic Gibbs measures. If there are at least two distinct p -adic Gibbs measures one of which is bounded and the other is unbounded, then *a phase transition occurs*. Moreover, it is said *a quasi- phase transition* occurs if there are two different functions $\boldsymbol{s}$ and $\boldsymbol{h}$ such that there exist the corresponding measures $\mu_{\boldsymbol{s}}, \mu_{\boldsymbol{h}}$, and they are either bounded or unbounded (see [15]).

Theorem 1. *The sequence of p -adic probability meosures (2) satisfy (4) if and only if, for any $x \in V$, the set of quantities $\hat{h} = \{\hat{h}_x, x \in G_k\}$ satisfies:*

$$\hat{h}_x = \prod_{y \in S(x)} \frac{\theta \eta_y \hat{h}_y + 1}{\eta_y \hat{h}_y + \theta}, \qquad (5)$$

where $\theta = exp_{\ p}(2J)$, $\eta_y = exp_p(2\alpha_y)$, $\hat{h}_x = exp_p(2h_x)$

For the proof we refer to [7, 17, 21,22].

Remark 1.

1.1. In [21], the authors derived a functional equation for the Ising model with a homogeneous external field. In Theorem 1, we derived a functional equation for the Ising model with a non-homogeneous external field.

1.2 By virtue of Theorem 1, every solution of the functional equation (5) generates a p -adic generalized Gibbs measure. Furthermore, distinct solutions of (5) induce distinct measures [18].

Note that, based on this theorem, the task of characterizing p-adic Gibbs measures is simplified to finding the solutions of the functional equation (5).

$G_3^{(2)}$-periodic p -adic generalized Gibbs measures for the Ising model with a two-periodic external field

In this section, we study the $G_3^{(2)}$-periodic p -adic generalized Gibbs measures for the considered model with a two-periodic external field.

Let us define

$$\eta_x = \begin{cases} \eta, & if \quad |x| \equiv 0(mod\ 2), \\ 1, & if \quad |x| \equiv 1(mod\ 2) \end{cases}$$

and

$$\hat{h}_x = \begin{cases} \hat{h}_0, & if \quad |x| \equiv 0(mod\ 2), \\ \hat{h}_1, & if \quad |x| \equiv 1(mod\ 2), \end{cases}$$

where $\eta \neq 1$ and $\hat{h}_0 \neq \hat{h}_1$. Then, we can rewrite equation (5) in the following form:

$$\begin{cases} \hat{h}_0 = \left(\frac{\theta\hat{h}_1+1}{\hat{h}_1+\theta}\right)^3, \\ \hat{h}_1 = \left(\frac{\theta\eta\hat{h}_0+1}{\eta\hat{h}_0+\theta}\right)^3. \end{cases} \tag{6}$$

Setting $\hat{h}_0 = y^3$ and $\hat{h}_1 = x^3$ as in (6), we arrive at the following system:

$$\begin{cases} y = \frac{\theta x^3+1}{\theta+x^3}, \\ x = \frac{\theta\eta y^3+1}{\theta+\eta y^3}. \end{cases} \tag{7}$$

Substituting the first equation of (7) into the second, we obtain

$$\sum_{i=0}^{10} A_i x^i = 0, \tag{8}$$

$A_{10} = \theta^3\eta + \theta, A_9 = -\theta^4\eta - 1, A_8 = 0, A_7 = 3\theta^2\eta + 3\theta^2, A_6 = -3\theta^3\eta - 3\theta, A_5 = 0, \quad A_4 = 3\theta^3 + 3\theta\eta, A_3 = -3\theta^2\eta - 3\theta^2, A_2 = 0, A_1 = \theta^4 + \eta$ and $A_0 = -\theta^3 - \theta\eta$.

Let $\theta = 1 + \theta_1 p + o[p]$, $\eta = 1 + \eta_2 p^2 + o[p^2]$ and

$$f(x) = \sum_{i=0}^{10} A_i\, x^i. \tag{9}$$

We now focus on finding the solutions of the equation (9). The following lemma gives a description of the solutions of this equation.

Lemma 4. Let $\mathcal{N}$ denote the number of p -adic solutions of Eq. (9). Then

$$\mathcal{N} = \begin{cases} 10, & if \quad p \equiv 1 \pmod 6, \\ 2, & if\ p > 3, p \not\equiv 1 \pmod 6. \end{cases}$$

Proof. Let $f(x)$ be the polynomial defined in Eq. (9). Since $\theta, \eta \in \mathcal{E}_p \subset \mathbb{Z}_p^{\times}$, all coefficients of $f(x)$ belong to $\mathbb{Z}_p^x$. Hence, every p -adic solution of $f(x) = 0$ lies in $\mathbb{Z}_p$.

First, we note that $x \equiv 1 \pmod p$ is a solution of Eq. (9). Since $f'(1) \not\equiv 0 \pmod p$, this solution lifts uniquely to a p -adic solution by Hensel's lemma.

Next, we determine the remaining solutions $(mod\ p^3)$. By direct computation, we obtain the following solutions:

$$x^{(2)} \equiv -1(mod\ p^3),$$
$$x^{(3)} \equiv -1 + \frac{a}{3}\theta_1 p + \frac{a}{18}(3\theta_1^2 - 6\theta_2 - a\theta_1^2)p^2(mod\ p^3),$$
$$x^{(4)} \equiv -1 - \frac{a}{3}\theta_1 p + \frac{a}{18}(-3\theta_1^2 + 6\theta_2 - a\theta_1^2)p^2(mod\ p^3),$$
$$x^{(5)} \equiv \frac{1+a}{2} + \frac{(3-a)\theta_1^2}{36}p^2(mod\ p^3),$$
$$x^{(6)} \equiv \frac{1+a}{2} + \frac{3-a}{6}\theta_1 p + \left(-\frac{a\theta_1^2}{9} + \frac{\theta_2}{2} - \frac{a\theta_2}{6}\right)p^2(mod\ p^3),$$
$$x^{(7)} \equiv \frac{1+a}{2} - \frac{3-a}{6}\theta_1 p + \left(-\frac{5a\theta_1^2}{18} + \frac{\theta_1^2}{2} - \frac{\theta_2}{2} + \frac{a\theta_2}{6}\right)p^2(mod\ p^3),$$
$$x^{(8)} \equiv \frac{1-a}{2} + \frac{(3-a)\theta_1^2}{36}p^2(mod\ p^3),$$
$$x^{(9)} \equiv \frac{1-a}{2} + \frac{3+a}{6}\theta_1 p + \left(\frac{a\theta_1^2}{9} + \frac{\theta_2}{2} + \frac{a\theta_2}{6}\right)p^2(mod\ p^3),$$
$$x^{(10)} \equiv \frac{1-a}{2} - \frac{3+a}{6}\theta_1 p + \left(\frac{5a\theta_1^2}{18} + \frac{\theta_1^2}{2} - \frac{\theta_2}{2} - \frac{a\theta_2}{6}\right)p^2(mod\ p^3),$$

where $a = \sqrt{-3}\ (mod \quad p)$.

We now verify that these solutions satisfy the conditions of Lemma 3 (Hensel's lemma). We consider several representative cases.

First, consider $x^{(2)} \equiv -1 \pmod{p^3}$. A direct computation shows that

$f(x^{(2)}) \equiv 0 \pmod{p^5}$,

and

$f'(x^{(2)}) \equiv 0 \pmod{p^2}, \quad f'(x^{(2)}) \not\equiv 0 \pmod{p^3}$.

Therefore, by Lemma 3 (Hensel's lemma), there exists a unique p -adic solution x such that

$f(x) = 0, \quad x \equiv x^{(2)} \pmod{p^3}$.

Next, consider $x^{(4)}$. By substituting $x^{(4)}$ into $f(x)$ and $f'(x)$, we obtain

$f(x^{(4)}) \equiv 0 \pmod{p^5}$,

and

$f'(x^{(4)}) \equiv 0 \pmod{p^2}, \quad f'(x^{(4)}) \not\equiv 0 \pmod{p^3}$.

Hence, $x^{(4)}$ also yields a unique$p$ -adic solution.

Finally, consider $x^{(7)}$. Similarly, we have

$f(x^{(7)}) \equiv 0 \pmod{p^5}$,

and

$f'(x^{(7)}) \equiv 0 \pmod{p^2}, \quad f'(x^{(7)}) \not\equiv 0 \pmod{p^3}$.

Thus, $x^{(7)}$ satisfies the conditions of Lemma 3 (Hensel's lemma).

The verification for the remaining cases $x^{(i)}$ $(for \quad i \in \{1,3,5,6,8,9,10\})$is analogous. Therefore, all the above $x^{(i)}$ are p -adic solutions of Eq. (21). Moreover, these solutions are pairwise distinct modulo p^3, hence they correspond to distinct p -adic roots. Since the solutions are distinct modulo p^3, their lifts via Hensel's lemma remain distinct in $\mathbb{Z}_p$.

Now we determine when all these solutions exist. The values $x^{(3)}, \dots, x^{(10)}$ depend on the parameter a, where

$a^2 \equiv -3 \pmod{p}$.

Thus, these solutions exist if and only if -3 is a quadratic residue modulo p.

Since $p > 3$, it is known that

$\left(\frac{-3}{p}\right) = 1 \quad \Rightarrow \quad p \equiv 1 \pmod{6}$.

Therefore, if $p \equiv 1 \pmod{6}$, all ten solutions exist in $\mathbb{Q}_p$ (see, [27]). Since $f(x)$ has degree 10, these are all possible p -adic solutions, and hence $\mathcal{N} = 10$.

If $p \not\equiv 1 \pmod{6}$, then $\sqrt{-3}$ does not exist in $\mathbb{Q}_p$, and thus the solutions $x^{(3)}, \dots, x^{(10)}$ do not exist. In this case, only two solutions remain, so $\mathcal{N} = 2$.

This completes the proof.

Having determined the solutions $x^{(i)}$ of (9), we now substitute them into system (7) to compute the corresponding values of y. In this way, we obtain the following solutions:

$$y^{(1)} \equiv 1 (mod\, p), y^{(2)} \equiv -1 (mod\, p), y^{(3)} \equiv \frac{a+1}{2} (mod\, p), y^{(4)} \equiv \frac{1-a}{2} (mod\, p),$$

$$y^{(5)} \equiv -1 (mod\, p), y^{(6)} \equiv \frac{1+a}{2} (mod\, p), y^{(7)} \equiv \frac{1-a}{2} (mod\, p),$$

$$y^{(8)} \equiv -1 (mod\, p), y^{(9)} \equiv \frac{1-a}{2} (mod\, p), y^{(10)} \equiv \frac{1+a}{2} (mod\, p).$$

We note that some of these values coincide modulo p, but they correspond to distinct p -adic solutions due to higher-order terms.

Although we have $x \equiv y \pmod{p}$, this does not imply that $x = y$ in $\mathbb{Q}_p$. Indeed, suppose that $x = y$. Then, from system (7), we obtain

$$x = \frac{\theta x^3 + 1}{\theta + x^3}, \quad x = \frac{\theta \eta x^3 + 1}{\theta + \eta x^3}.$$

This implies

$$\frac{\theta x^3 + 1}{\theta + x^3} = \frac{\theta \eta x^3 + 1}{\theta + \eta x^3}.$$

A direct comparison shows that this equality holds only if $\eta = 1$. However, in our setting $\eta \neq 1$. Therefore, we conclude that $x \neq y$. Thus, although x and y have the same residue modulo p, they are distinct p -adic numbers.

Using the notation $h_0 = x^3$ and $h_1 = y^3$, we obtain the following ten distinct solutions:

$h_j^{(1)} \equiv 1 \pmod{p}, \quad h_j^{(i)} \equiv -1 \pmod{p}, \quad i = 2,3,\dots,10, \quad j \in \{0,1\}$.

The solutions $h_j^{(1)}$ and $h_j^{(2)}$ exist in $\mathbb{Q}_p$ for all primes $p > 3$. The remaining solutions $h_j^{(i)}$, $i = 3, \dots, 10$, exist in $\mathbb{Q}_p$ if and only if $p \equiv 1 \pmod{6}$. Using these results and according to Theorem 1 we get the following main theorem:

Theorem 2. Let $p > 3$, $\eta = 1 + \eta_2 p^2 + o[p^2]$ and $\eta \neq 1$. For the Ising model with a 2-periodic external field on the Cayley tree of order three, the following statements hold:

1. if $p \equiv 1 \pmod 6$, then there exist ten $G_3^{(2)}$-periodic p -adic generalized Gibbs measures, among which exactly one is bounded and the remaining ones are unbounded;

2. if $p \not\equiv 1 \pmod 6$, then there exist two $G_3^{(2)}$-periodic p -adic generalized Gibbs measures, among which exactly one is bounded.

Proof. By Lemma 4, the number of solutions of equation (6) associated with $G_3^{(2)}$-periodic p -adic generalized Gibbs measures is equal to 10 when $p \equiv 1 \pmod 6$, and equals 2 otherwise. According to Remark 1, each such solution corresponds to a $G_3^{(2)}$-periodic p -adic generalized Gibbs measure. This establishes the stated number of such measures.

To determine the boundedness, we analyze the p -adic norms of $\hat{h}_1$ and $\hat{h}_0$. Using arguments analogous to those in Theorem 4.1, 6.3 in [21], one concludes that measures corresponding to solutions satisfying $\hat{h}_x \equiv 1 \pmod p$ are bounded, while those satisfying $\hat{h}_x \equiv -1 \pmod p$ are unbounded.

Remark 2.

2.1. Let $k = 3$, $p > 3$. For the Ising model with a homogeneous external field on the Cayley tree, it is known (see [2]) that if $p \equiv 1 \pmod 6$, then there exist four translation-invariant p -adic generalized Gibbs measures, while if $p \not\equiv 1 \pmod 6$, there exist two such measures. Thus, in the homogeneous case, the number of Gibbs measures is smaller compared to the non-homogeneous (2-periodic) case considered in this paper.

2.2. It is known that for the p -adic Ising model with a homogeneous external field on the Cayley tree, a phase transition occurs when $p \equiv 1 \pmod 6$ (see [2]). Our results show that the same phenomenon persists in the case of a non-homogeneous (2-periodic) external field. In particular, a phase transition also occurs when $p \equiv 1 \pmod 6$. This indicates that the occurrence of phase transition is stable with respect to the introduction of periodic external fields.

Conclusion

In this paper, we investigated $G_3^{(2)}$-periodic p -adic generalized Gibbs measures for the Ising model with a 2-periodic external field on the Cayley tree of order three. By reducing the problem to a nonlinear functional equation, we obtained a complete description of the corresponding p -adic solutions.

We established that the number of such measures depends on the prime p. In particular, if $p \equiv 1 \pmod 6$, then there exist ten distinct $G_3^{(2)}$-periodic p -adic generalized Gibbs measures, whereas for $p \not\equiv 1 \pmod 6$ there exist exactly two such measures.

We also analyzed the boundedness of these measures and showed that, in each case, exactly one measure is bounded while the others are unbounded. This leads to the occurrence of a phase transition when $p \equiv 1 \pmod 6$.

Finally, we note that the condition for the existence of phase transition coincides with the known results for the homogeneous external field. This indicates that the occurrence of phase transition is stable under the introduction of a 2-periodic external field.

The methods developed in this work can be applied to more general periodic structures and other models in p -adic statistical mechanics, which remain subjects for future research.

Abstract; *Dye-sensitized solar cells (DSSCs) have emerged as a promising alternative to conventional silicon-based photovoltaics due to their low cost, ease of fabrication, and excellent performance under low-light conditions [1,2]. This study presents a comprehensive analysis of single-layer TiO_2 photoanodes, focusing on charge transport dynamics, recombination suppression, and device optimization [3]. Compared to conventional multilayer architectures, the single-layer configuration reduces interfacial recombination, simplifies fabrication, and enhances electron diffusion pathways [4]. Furthermore, the role of polymer gel electrolytes based on PEO/PMMA blends in improving ionic conductivity is discussed [5]. The results demonstrate that optimized single-layer TiO_2-based DSSCs exhibit improved photovoltaic performance and stability, making them strong candidates for scalable solar energy applications [6].*

Keywords; *Dye-sensitized solar cells (DSSCs), Titanium dioxide (TiO_2) photoanode, Single-layer architecture, Electron transport mechanism, Charge recombination, Electron diffusion length, Polymer gel electrolyte, PEO/PMMA blend, Ionic conductivity, Photovoltaic efficiency.*

РАЗРАБОТКА ОДНОСЛОЙНЫХ ФОТОАНОДОВ НА ОСНОВЕ TiO_2 ДЛЯ УЛУЧШЕНИЯ ТРАНСПОРТА ЗАРЯДА И СНИЖЕНИЯ РЕКОМБИНАЦИИ В СОЛНЕЧНЫХ ЭЛЕМЕНТАХ, СЕНСИБИЛИЗИРОВАННЫХ КРАСИТЕЛЕМ

Аннотация: *Солнечные элементы, сенсибилизированные красителем (DSSC), стали перспективной альтернативой традиционным кремниевым фотоэлектрическим устройствам благодаря низкой стоимости, простоте изготовления и высокой эффективности в условиях низкой освещенности [1,2]. В данной работе представлен всесторонний анализ однослойных фотоанодов на основе TiO_2 с упором на динамику переноса заряда, подавление рекомбинации и оптимизацию характеристик устройства [3]. По сравнению с традиционными многослойными архитектурами, однослойная конфигурация снижает рекомбинацию на границах раздела фаз, упрощает процесс изготовления и улучшает пути диффузии электронов [4]. Кроме того, рассматривается роль полимерных гель-электролитов на основе смесей PEO/PMMA в повышении ионной проводимости [5]. Результаты показывают, что оптимизированные однослойные элементы DSSC на основе TiO_2 демонстрируют улучшенные фотоэлектрические характеристики и стабильность, что делает их перспективными кандидатами для масштабируемого применения в солнечной энергетике [6].*

Ключевые слова: *Солнечные элементы, сенсибилизированные красителем (DSSC), фотоанод из диоксида титана (TiO_2), однослойная архитектура, механизм переноса электронов, рекомбинация заряда, диффузионная длина электронов, полимерный гель-электролит, смесь PEO/PMMA, ионная проводимость, фотоэлектрическая эффективность.*

BO'YOQ BILAN SENSIBILIZATSIYALANGAN QUYOSH ELEMENTLARIDA ZARYAD TASHILISHINI KUCHAYTIRISH VA REKOMBINATSIYANI KAMAYTIRISH UCHUN BIR QATLAMLI TiO_2 FOTOANODLARINI LOYIHALASH

Annotatsizya: *Bo'yoqqa sezgir quyosh batareyalari (DSSC) arzonligi, ishlab chiqarish qulayligi va kam yorug'lik sharoitida ajoyib ishlashi tufayli an'anaviy kremniy asosidagi fotovoltaiklarga istiqbolli alternativa sifatida paydo bo'ldi [1,2]. Ushbu tadqiqotda zaryad tashish dinamikasi, rekombinatsiyani bostirish va qurilmalarni optimallashtirishga e'tibor qaratgan holda bir qavatli TiO_2 fotoanodlarining keng qamrovli tahlili keltirilgan [3]. An'anaviy ko'p qavatli arxitekturalar bilan taqqoslaganda, bir qavatli*

konfiguratsiya interfeys rekombinatsiyasini kamaytiradi, ishlab chiqarishni soddalashtiradi va elektron diffuziya yo'llarini kuchaytiradi [4]. Bundan tashqari, PEO/PMMA aralashmalariga asoslangan polimer gel elektrolitlarining ion o'tkazuvchanligini yaxshilashdagi roli muhokama qilinadi [5]. Natijalar shuni ko'rsatadiki, optimallashtirilgan bir qavatli TiO_2 asosidagi DSSClar yaxshilangan fotovoltaik ishlash va barqarorlikni namoyish etadi, bu ularni kengaytiriladigan quyosh energiyasi qo'llanmalari uchun kuchli nomzodlarga aylantiradi [6].

Kalit so'zlar; *Bo'yoqqa sezgir quyosh batareyalari (DSSC), Titan dioksidi (TiO_2) fotoanodi, Bir qavatli arxitektura, Elektron tashish mexanizmi, Zaryad rekombinatsiyasi, Elektron diffuziya uzunligi, Polimer gel elektrolit, PEO/PMMA aralashmasi, Ion o'tkazuvchanligi, Fotovoltaik samaradorlik.*

Introduction

Dye-sensitized solar cells (DSSCs), first introduced by Brian O'Regan and Michael Grätzel in 1991, represent a third-generation photovoltaic technology [1]. Unlike conventional p–n junction solar cells, DSSCs operate based on a photoelectrochemical mechanism involving dye excitation, electron injection, and redox regeneration [2]. The performance of DSSCs is strongly governed by the properties of the photoanode, typically composed of mesoporous titanium dioxide (TiO_2) [3]. TiO_2 is widely used due to its: Wide bandgap (~3.2 eV for anatase phase), High chemical stability, Non-toxicity, Large surface area for dye adsorption [4,7].

Traditional DSSC architectures involve multilayer TiO_2 films (blocking + mesoporous + scattering layers). However, these structures introduce multiple interfaces, increasing recombination losses [8]. To address these limitations, single-layer TiO_2 photoanodes have been proposed as a simplified and efficient alternative (Figure 1) [9].

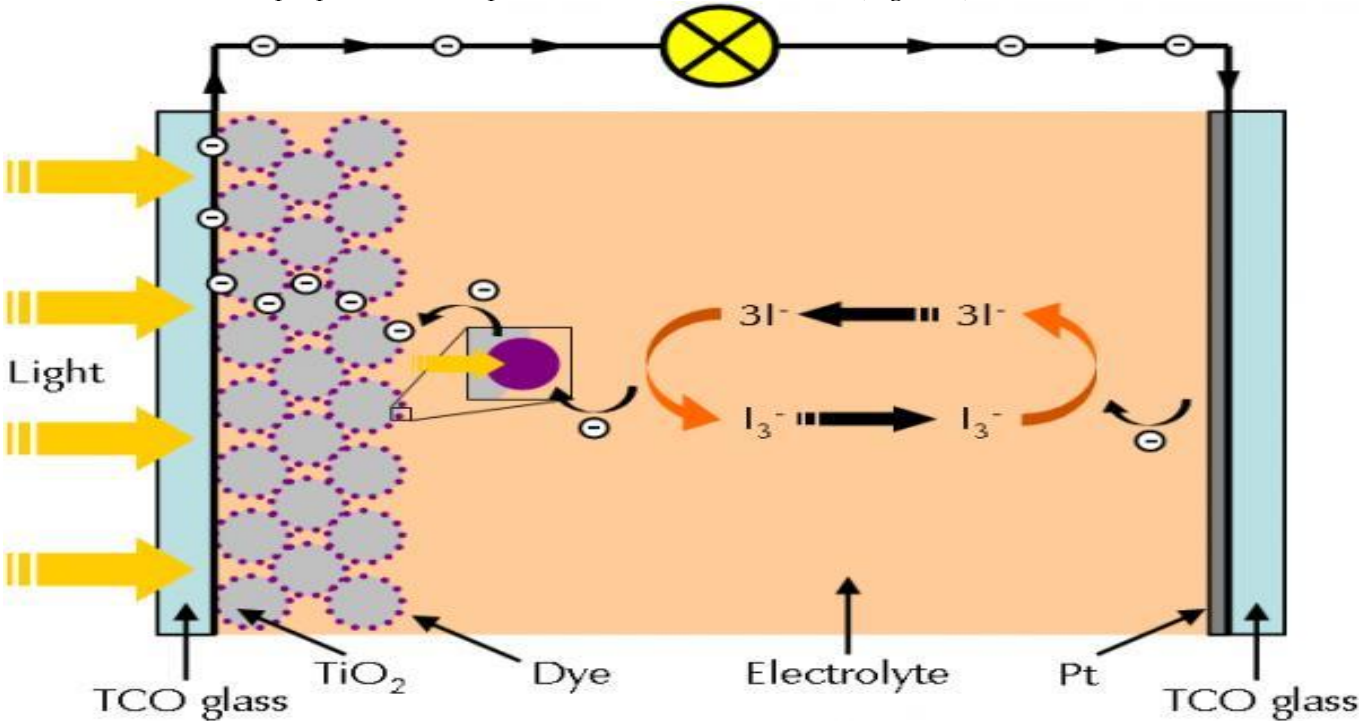

Figure 1. Electron injection and transport mechanism in a one-layer TiO_2 DSSC

Theoretical Background

Electron Transport Mechanism

Electron transport in mesoporous TiO_2 photoanodes is fundamentally governed by a diffusion-controlled process, arising from the disordered network of interconnected TiO_2 nanoparticles [3,10]. Unlike crystalline semiconductors where electrons move via band transport, charge carriers in TiO_2 propagate through a trap-limited diffusion mechanism, involving repeated trapping and detrapping events within localized energy states [11].

$$L_n = \sqrt{D_n \tau_n}$$

where: Dn - is the electron diffusion coefficient, representing the effective mobility of electrons within the TiO_2 network ; τn is the electron lifetime, determined by recombination kinetics[12]. The diffusion length Ln defines the **average distance an electron can travel before recombination occurs**. For efficient charge collection, it is essential that:

$$L_n \gg d$$

where d is the thickness of the TiO_2 photoanode.

Trap States and Transport Limitations

In mesoporous TiO_2 films, a high density of **trap states** exists due to surface defects, grain boundaries, and structural disorder. These trap states: Temporarily localize electrons, Reduce effective electron mobility, Increase transport time, As a result, electron transport is significantly slower compared to crystalline semiconductors, making DSSCs particularly sensitive to recombination processes.

Recombination Mechanism

The dominant recombination pathway in DSSCs occurs at the TiO_2/electrolyte interface, where injected electrons recombine with oxidized species (typically I_3^-) in the electrolyte [2,13]:

$$e^-(TiO_2) + I_3^- \rightarrow I^-$$

This interfacial recombination reduces both: Open-circuit voltage (Voc), Electron lifetime (τn)

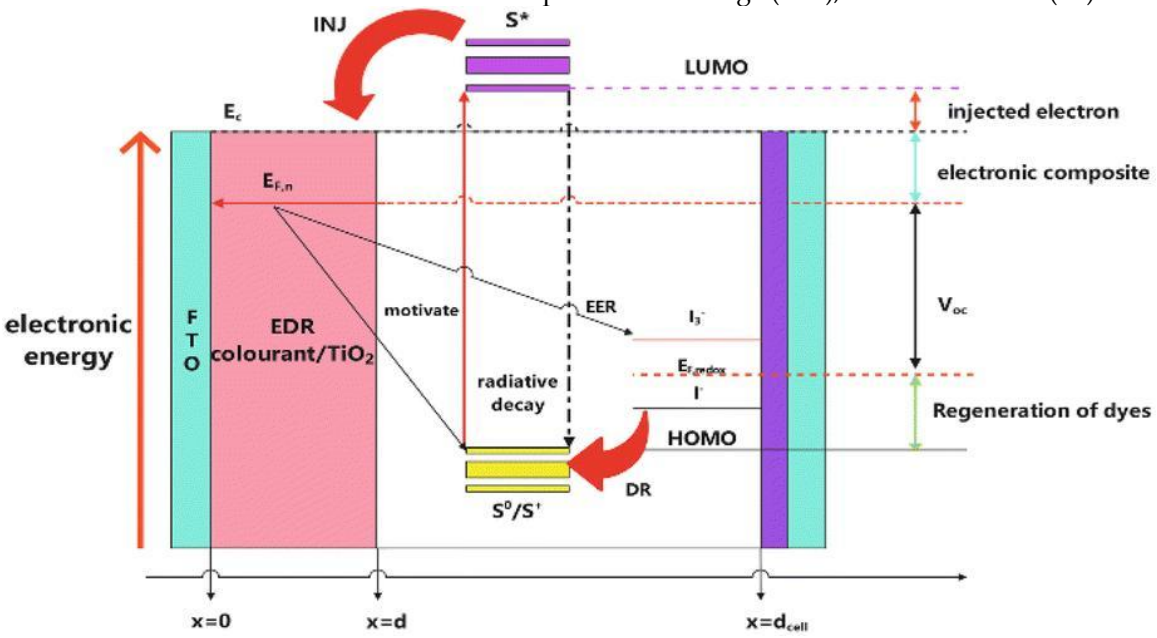

Figure 2. Interfacial charge recombination pathways at the TiO_2/electrolyte interface in a dye-sensitized solar cell

Impact of Single-Layer TiO_2 Architecture

In conventional multilayer structures, additional interfaces (blocking/scattering layers) introduce: Energy barriers, Increased trap density, Additional recombination sites [8,14].

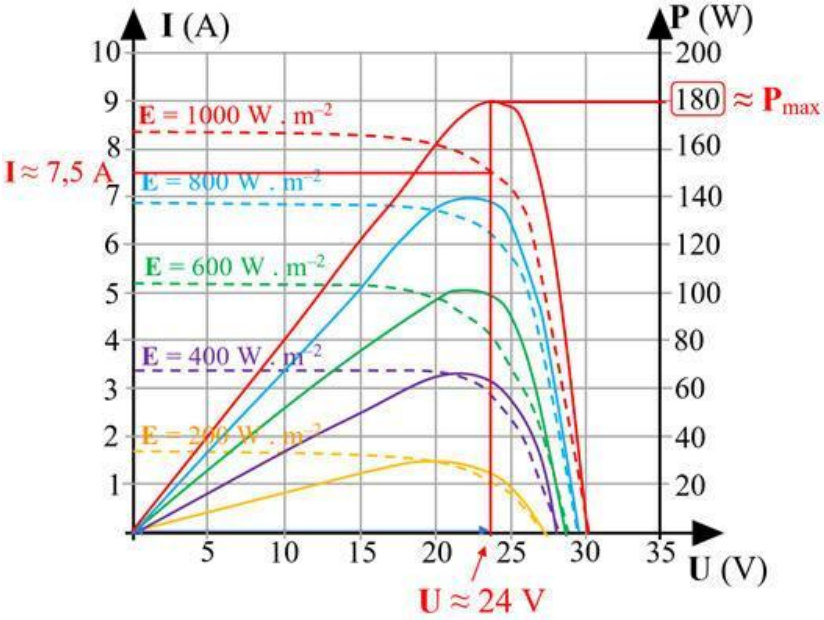

Figure 3. Current-Voltage curve of a solar cell

In contrast, **single-layer TiO_2 photoanodes** provide: Continuous electron pathways, Reduced trap-assisted recombination, Improved electron diffusion coefficient (Dn), Extended electron lifetime (τn), Consequently, the diffusion length Ln increases, leading to:

✓ Enhanced charge collection efficiency
✓ Improved photocurrent density (Jsc)
✓ Better overall device performance

Conclusion

The present study systematically demonstrates that the implementation of **single-layer TiO_2 photoanodes** offers a highly effective strategy for enhancing the performance of dye-sensitized solar cells (DSSCs). By eliminating multiple internal interfaces inherent in conventional multilayer architectures, the single-layer design significantly suppresses interfacial recombination losses and facilitates more efficient electron transport within the photoanode.

Furthermore, the incorporation of PMMA into the PEO-based polymer electrolyte plays a crucial role in modifying the microstructural properties of the system [5,15]. The reduction in PEO crystallinity leads to an increased amorphous phase, thereby enhancing segmental chain mobility and promoting ion transport. As a result, a substantial improvement in ionic conductivity is achieved, which directly contributes to more efficient dye regeneration and charge transfer processes [15]. The combined effect of optimized electrolyte composition and simplified photoanode architecture results in: A significant increase in ionic conductivity (reaching ~7 $mS \cdot cm^{-1}$), Suppression of electron recombination at the TiO_2/electrolyte interface, Enhanced electron lifetime and diffusion length. Improved photovoltaic parameters, including short-circuit current density and fill factor. An overall power conversion efficiency approaching ~7%. Importantly, the simplified fabrication process associated with single-layer TiO_2 photoanodes reduces material consumption and processing complexity, making this approach highly attractive for **low-cost, scalable, and flexible photovoltaic applications**.

Kirish. Kristall kremniy ($c-Si$) asosida quyosh elementlarini samaradorligini oshirish bo'yicha texnologiyalar o'z takamoliga deyarli erishdi. Shuning uchun so'nggi yillarda c-Si asosidagi quyosh elementlarini sirtiy va orqa qatlamini yuzasiga turli ishlov berish yoki turli qo'shimcha qatlamlar o'stirish orqali samaradorlikni ortishirishga oid ilmiy-nazariy tadqiqotlar olib borilmoqda [1,2]. Shunday tadqiqotlar qatoriga $c-n-Si/c-p-Si$ strukturali quyosh elementini sirtiy qatlam yuzasiga g'ovakli kremniy ($por-Si$) yupqa qatlamini o'stirishni misol sifatida keltirishi mumkin. $c-Si$ yuza qatlamiga $por-Si$ qatlimini o'stirish bilan ikkata muammo hal qilinadi, ya'ni $por-Si$ qatlamini yuza sirti o'ta notekisligi hisobiga nur qaytarish koeffitsienti kamaytiriladi va shuningdek $por-Si$ dagi kristallitlar o'lchamini kichikligi hisobiga $por-Si/c-Si$ qatlamlararo potensial to'siq hosil bo'lib rekombinatsion tokni kamaytiradi. Ammo ko'p qatlamli $por-Si/c-Si$ strukturali quyosh elementlarini yuqori samaradorlikka ega texnologiyalar yaratish o'z nihoyasiga yetmagan. Shuning uchun ushbu yo'nalishida eksperimental va nazariy ilmiy tadqiqotlar jadal olib borilmoqda [3,4].

Ko'pgina tadqiqotlarda $por-Si/c-Si$ strukturani kontakt sohasida ro'y beradigan jarayonlarni Volt-Amper va Volt-Farad harakteristikalar yordamida o'rganishgan va $por-Si$ qatlamining taqiq sohasini va elektr o'tkazuvchanlik xususiyatini o'zgarishi hisobiga $por-Si/c-S$i ning kontakt soxasi to'g'rilovchi xusiyatga ega bo'lishi ko'rsatilgan. Ushbu ishda $por-Si/c-Si$ qatlamlar o'rtasidagi sohadagi o'zgarishlarni haroratga bog'liqligi va ularning VFX ga ta'siri nazariy jihatdan o'rganilgan.

Biz avvalgi ishlarimizda $por-Si$ qatlamdagi mikrokristallit o'lchamini tok tashuvchilarni yashash vaqtiga va kontaktdagi potensial to'siq balandligiga ta'sirini o'rganib ushbu $por-Si$ qatlam dielektrik xossalarni namoyon qilishini asoslab bergandik. Ushbu hulosamiz [3] ishda o'zining eksperimental tasdig'ini topganini ko'rishimiz mumkin. Avvalgi ishdagi olingan natijalarga tayanib ushbu ishimizda $por-Si/n-c-Si/p-c-Si$ strukturani VFX si xaroratga bog'liqligi sababini tahlil qilamiz.

$por-Si/n^{+}-c-Si$ STRUKTURANING DIFFERENSIAL SIG'IMI VA UNI HARORATGA BOG'LIQLIGI

$por-Si/n^{+}-c-Si/p-c-S$i struktura uchun olingan VFX grafigi 1-rasmda keltirilgan va [3] da ta'kidlanganidek ushbu grafik n tip asosidagi MDY struktura uchun xos bo'lib, manfiy kuchlanishda $por-Si/n^{+}-c-Si$ sohani kuchli kambag'allashuvni kuzatish mumkin.

Ma'lumki ko'p qatlamli strukturada qatlamlararo xar bir o'tish soxasi o'zining sig'imiga ega, shuning uchun $por-Si/n^{+}-c-Si/p-c-Si$ strukturaning umumiy sig'imini quyidagicha yozishimiz mumkin.

$$\frac{1}{C_u}=\frac{1}{C_1}+\frac{1}{C_2} \tag{1}$$

Bu yerda C_1-$por-Si/n^{+}-c-Si$ soha sig'imi C_2-$n^{+}-c-Si/p-c-Si$ soha sig'imi.

$por-Si/n^{+}-c-Si$ sohani MDY struktura deb qaraganimiz uchun $C_1 \ll C_2$ munosabat o'rinli bo'ladi, u holda (1) dan quyidagiga ega bo'lamiz

$$C_u \approx C_1$$

Demak VFX grafigi asosan $por-Si/n^{+}-c-Si$ xossalariga bog'liq bo'ladi. Shuning uchun MDY strukturadagi maydon taqsimotini aniqlashda j ≈ 0 munosabat o'rinli deb qarab Puasson va uzluksizlik tenglamasini birgalikda yozamiz

$$divE=-\frac{1}{\varepsilon\varepsilon_0}\rho(x) \tag{2}$$

$$\frac{\partial\rho}{\partial t}+div\, j=0 \tag{3}$$

$j \approx 0$ ekanini hisobga olsak (3) dan $\rho(x)=const$ munosabatga ega bo'lamiz, u xolda $\rho(x)$ ni xajmiy zaryadlar sohasidagi zaryadlar zichligi deb hisoblashimiz mumkin. U holda [5] ga ko'ra

$$\rho(x)=e[\rho(x)+N_D^{+}-n(x)-N_A^{-}] \quad \text{yoki}$$

$$\rho(x)=e[\rho_0\left(\exp\left(-\frac{e\varphi_s}{KT}\right)-1\right)-n_0(\exp\left(\frac{e\varphi_s}{KT}-1\right))] \tag{4}$$

Puasson tenglamasini (4) ifodani hisobga olib ishlaydigan bo'lsak, sig'im uchun quyidagi ifodaga ega bo'lamiz.

$$C_{sc}=\frac{\varepsilon\varepsilon_0}{2L_D}\left[\frac{\lambda\left(\exp\left(-\frac{e\varphi_s}{KT}\right)-1\right)-\lambda^{-1}\left(\exp\left(\frac{e\varphi_s}{KT}\right)-1\right)}{F(\varphi_s,\lambda)}\right] \tag{5}$$

Bu yerda $\lambda=\frac{P_0}{n_i}=\frac{P_i}{n_0}$; $L_D=\sqrt{\frac{\varepsilon\varepsilon_0 KT}{2e^2 n_i}}$; $\varphi_s=\Delta\varphi_k-U$; $F(\varphi_s,\lambda)=\pm[\lambda^{-1}\left(\exp\left(\frac{e\varphi_s}{KT}\right)-1\right)+\lambda\left(\exp\left(-\frac{e\varphi_s}{KT}\right)-1\right)+(\lambda-\lambda^{-1})y]^{\frac{1}{2}}$ bo'lib U- strukturaga qo'yilgan tashqi kuchlanish, $\Delta\varphi_k-por-Si/n+-c-Si$ qatlamlar orasidagi potensial to'siq balandligi.

(5) ifodadagi sirtiy potensial asosan $por-Si$ qatlam xossalariga bog'liq, chunki $c-Si$ qatlam sirtiga $por-Si$ qatlamni o'stirish bilan potensial to'siq hosil qilinadi va $por-Si/n^{+}-c-Si$ strukturani kontakt sohasi elektronlarga kambag'allashgan bo'ladi. Shuning uchun tashqi kuchlanish deyarli ushbu kontakt sohaga tushadi deb hisoblashimiz mumkin.

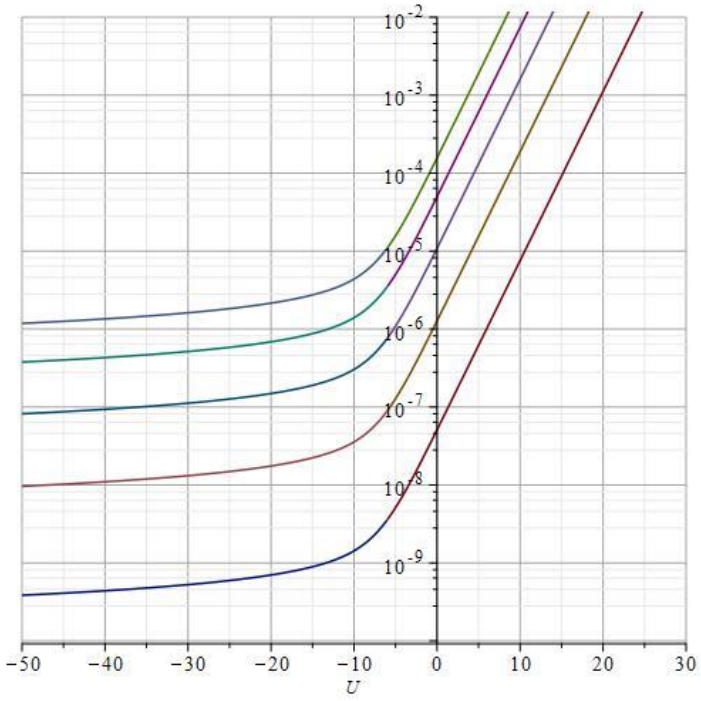
$\Delta\varphi_k$-kattalikni [6] ishda topilgan qiymatini hisobga olib (5) ifoda yordamida por-Si/n⁺-c-Si sohani differensial sig'imini sirtiy potensialga bog'liqligini turli xaroratlar uchun grafigi keltirilgan (2-rasm). Haqiqatan ham xarorat ortishi bilan asosan $n^{+}-c-S$i qatlamdagi tok tashuvchilar konsentrasiyasi ortadi va o'z navbatida differensial sig'im ham ortishi kuzatiladi. Bundan tashqari sirtga yaqin qatlamda tok tashuvchilar konsentratsiyasini o'zgarishi "sirtiy o'tkazuvchanlik" ni ham o'zgarishiga olib keladi. sirtiy o'tkazuvchanlikni quyidagi ifoda yordamida aniqlashimiz mumkin [7].

$$G_s=-en_i\mu_{ps}L_D\int_0^{\varphi_s}\frac{\lambda\left(\exp\left(-\frac{e\varphi_s}{KT}\right)-1\right)+b\lambda^{-1}\left(\exp\left(\frac{e\varphi_s}{KT}\right)-1\right)}{F(\varphi_s,\lambda)}d\varphi_s \tag{7}$$

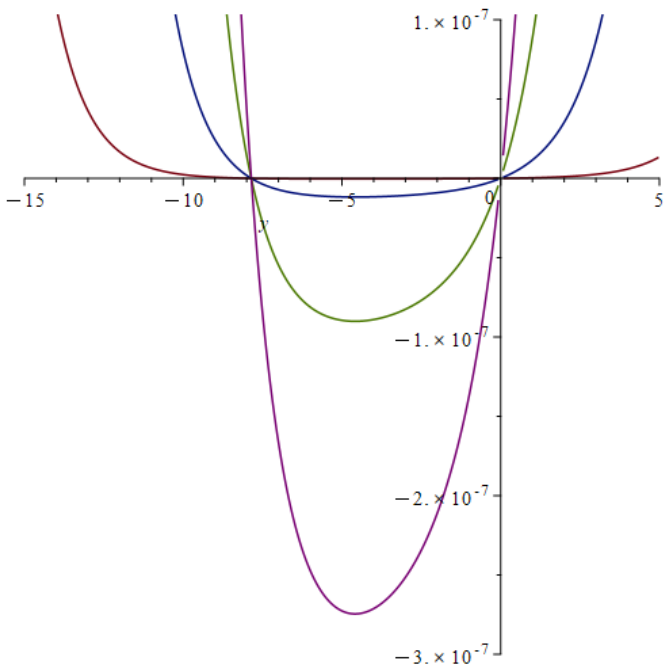
bu yerda $n_i=n_0\exp\left(-\frac{\Delta E}{KT}\right)$ va $L_D=\sqrt{\frac{\varepsilon\varepsilon_0 KT}{2e^2 n_i}}$ orqali aniqlanganligi uchun sirtiy o'tkazuvchanlik haroratga bog'liq bo'ladi.

Ushbu bog'lanishlarni hisobga olib (7) ifoda yordamida sirtiy o'tkazuvchanlikni haroratga bog'liqligi grafigini olamiz (3-rasm). Grafiklardan harorat ortishi bilan sirtiy o'tkazuvchanlikni qiymatini ortishini ko'rish mumkin. bundan tashqari qo'yilgan tashqi kuchlanishga bog'liq holda sirtiy o'tkazuvchanlikni ishorasini o'zgarishi sirtda to'planadigan zaryad tashuvchilarni ishorasini o'zgarganini anglatadi.

Xulosa. Demak $por-Si/n^{+}-c-Si$ strukturani hossalari uning qatlamlari orasidagi sirtlarning elektrofizik parametrlariga bog'liq ekan. 2 va 3- rasmlardagi grafiklarga ko'ra harorat ortishi bilan differensial sig'im va sirtiy o'tkazuvchanlikni ortishi $por-Si/n^{+}-c-Si$ ni kontakt sohasida tok tashuvchilarning konsentratsiyasi ortishini tasdiqlaydi. Ushbu xulosa [7] da olingan eksperimental grafiklarda o'z tasdig'ini topganini ko'rishimiz mumkin.



2-rasm. $por-Si/n^{+}-c-Si$ struktura uchun turli haroratlarda olingan VFX



3-rasm. Turli haroratda $por-Si/n^{+}-c-Si$ strukturaning sirtiy o'tkazuvchanligini tashqi kuchlanishga bog'liqligi.

Annotatsiya. *Ushbu maqolada sup metrika yordamida idempotent tekislikda giperbola va parabola tenglamalari o‘rganilgan. Fokuslar va direktrisa asosida ushbu egri chiziqlarning idempotent analoglari kiritilib, ularning kanonik tenglamalari hosil qilingan. Idempotent giperbola va parabolaning geometrik tuzilishi tahlil qilinib, ularning bo‘lakli-chiziqli figuralardan iborat ekanligi ko‘rsatilgan. Olingan natijalar idempotent geometriyada ikkinchi tartibli egri chiziqlar nazariyasini rivojlantirishga xizmat qiladi.*

Kalit so‘zlar: *idempotent geometriya, sup metrika, idempotent giperbola, idempotent parabola, kanonik tenglama, fokus, direktrisa, bo‘lakli-chiziqli figura.*

КАНОНИЧЕСКИЕ УРАВНЕНИЯ И ГЕОМЕТРИЧЕСКИЕ СВОЙСТВА ГИПЕРБОЛЫ И ПАРАБОЛЫ В ИДЕМПОТЕНТНОЙ ПЛОСКОСТИ С SUP-МЕТРИКОЙ

Аннотация. *В статье исследуются уравнения гиперболы и параболы в идемпотентной плоскости с sup-метрикой. На основе понятий фокуса и директрисы введены их идемпотентные аналоги и получены канонические уравнения. Изучена геометрическая структура данных кривых и показано, что они представляют собой кусочно-линейные фигуры. Полученные результаты могут быть использованы при дальнейшем развитии теории кривых второго порядка в идемпотентной геометрии.*

Ключевые слова: *идемпотентная геометрия, sup-метрика, идемпотентная гипербола, идемпотентная парабола, каноническое уравнение, фокус, директриса, кусочно-линейная фигура.*

CANONICAL EQUATIONS AND GEOMETRIC PROPERTIES OF HYPERBOLAS AND PARABOLAS IN THE SUP-METRIC IDEMPOTENT PLANE

Annotation. *This paper studies hyperbola and parabola equations in an idempotent plane equipped with the sup metric. Idempotent analogues based on the concepts of focus and directrix are introduced, and their canonical equations are derived. The geometric structure of these curves is investigated, showing that they are piecewise-linear figures. The obtained results contribute to the development of the theory of second-order curves in idempotent geometry.*

Keywords: *idempotent geometry, sup metric, idempotent hyperbola, idempotent parabola, canonical equation, focus, directrix, piecewise-linear figure.*

So‘nggi yillarda idempotent matematika va tropik geometriya zamonaviy matematikaning jadal rivojlanayotgan yo‘nalishlaridan biri sifatida shakllandi. Ushbu nazariyaning vujudga kelishi V.P. Maslov tomonidan taklif etilgan dekvantizatsiya g‘oyasi bilan bog‘liq bo‘lib, keyinchalik G.L. Litvinov, V.N. Kolokoltsov, M. Akian, S. Gaubert va boshqa olimlar tomonidan rivojlantirildi. Idempotent algebra va tropik geometriya optimallashtirish nazariyasi, diskret hodisalar dinamikasi, boshqaruv tizimlari, transport tarmoqlari, iqtisodiy modellashtirish hamda kompyuter fanlarida keng qo‘llanilmoqda.

Idempotent matematikaning asosiy obyektlaridan biri yarimhalqasi bo‘lib, unda qo‘shish amali maksimum operatsiyasi, ko‘paytirish amali esa odatdagi qo‘shish orqali aniqlanadi. Ushbu algebraik struktura klassik geometriyaning ko‘plab tushunchalarini yangi nuqtai nazardan talqin qilish imkonini beradi. Natijada idempotent fazolarda to‘g‘ri chiziqlar, tekisliklar, ko‘pburchaklar va ikkinchi tartibli egri chiziqlarning analoglarini qurish masalalari yuzaga keladi.

Idempotent matematikaning nazariy asoslari V.P. Maslov tomonidan ishlab chiqilgan dekvantizatsiya konsepsiyasiga borib taqaladi [1]. Keyinchalik G.L. Litvinov va V.N. Kolokoltsov tomonidan idempotent analiz hamda

idempotent algebra nazariyasi rivojlantirildi [2,3]. Tropik geometriyaning shakllanishi va rivojlanishida M. Akian, S. Gaubert va A. Gutermanlarning ishlari muhim o‘rin tutadi [4]. D. Maclagan va B. Sturmfels tomonidan tropik geometriyaning zamonaviy nazariyasi tizimli ravishda bayon qilingan [5]. Shu bilan bir qatorda, O‘zbekiston matematik olimi A.A. Zaitov va uning ilmiy maktabi tomonidan idempotent ehtimollik o‘lchovlari fazolari, idempotent funktorlar, ularning topologik va geometrik xossalari hamda idempotent strukturalarning metrik tavsiflariga bag‘ishlangan tadqiqotlar amalga oshirilgan. Idempotent fazolar geometriyasi va topologiyasi bilan bog‘liq mazkur natijalar idempotent matematikaning nazariy asoslarini rivojlantirishda muhim o‘rin egallaydi [8 – 11].

Sup metrika va unga asoslangan geometrik strukturalar max-plus algebra doirasida ham tadqiq etilgan. Xususan, F. Baccelli, G. Cohen, G.J. Olsder va J.P. Quadrat tomonidan max-plus algebra va uning tatbiqlari batafsil o‘rganilgan [6]. P. Butkovič tomonidan max-linear sistemalar nazariyasi ishlab chiqilib, idempotent fazolarning algebraik va geometrik xossalari tadqiq qilingan [7]. Shu bilan birga, mavjud tadqiqotlarning asosiy qismi algebraik strukturalar, optimallashtirish masalalari va tropik chiziqli obyektlarga bag‘ishlangan bo‘lib, sup metrik idempotent tekislikda klassik ikkinchi tartibli egri chiziqlarning analoglari yetarli darajada o‘rganilmagan.

Ma’lumki, klassik geometriyada giperbola fokuslargacha bo‘lgan masofalar ayirmasining moduli o‘zgarmas bo‘lgan nuqtalar to‘plami sifatida, parabola esa fokus va direktrisagacha bo‘lgan masofalari teng bo‘lgan nuqtalar to‘plami sifatida aniqlanadi. Ushbu ta’riflar Evklid metrikasiga asoslangan bo‘lib, natijada silliq kvadratik egri chiziqlar hosil bo‘ladi. Biroq sup metrikada masofa maksimum operatsiyasi orqali aniqlanganligi sababli mos geometrik obyektlarning tuzilishi sezilarli darajada o‘zgaradi. Natijada klassik egri chiziqlarning idempotent analoglari bo‘lakli-chiziqli geometrik figuralar ko‘rinishida namoyon bo‘ladi.

Shu munosabat bilan sup metrik idempotent tekislikda giperbola va parabolaning analitik tavsifini qurish, ularning mavjudlik shartlarini aniqlash hamda geometrik xossalarini tadqiq etish dolzarb ilmiy masala hisoblanadi. Ayniqsa, fokuslar va direktrisa yordamida aniqlanadigan klassik ikkinchi tartibli chiziqlarning idempotent analoglarini o‘rganish idempotent geometriyada ikkinchi tartibli egri chiziqlar nazariyasini rivojlantirish nuqtai nazaridan muhim ahamiyatga ega.

Ushbu ishning maqsadi sup metrik idempotent tekislikda giperbola va parabolaning kanonik tenglamalarini hosil qilish hamda ularning geometrik xossalarini tadqiq etishdan iborat. Tadqiqot davomida fokuslar va direktrisa asosidagi klassik ta'riflarning idempotent analoglari kiritildi, idempotent giperbolaning mavjudlik sharti aniqlandi, giperbola va parabolaning kanonik tenglamalari keltirib chiqarildi hamda ularning bo‘lakli-chiziqli geometrik strukturasi tavsiflandi.

Maqolaning ilmiy yangiligi shundan iboratki, sup metrik idempotent tekislikda giperbola va parabolaning kanonik tenglamalari fokusli yondashuv asosida hosil qilindi, idempotent giperbolaning mavjudlik sharti isbotlandi hamda mazkur egri chiziqlarning klassik analoglardan farqli ravishda bo‘lakli-chiziqli geometrik obyektlardan tashkil topishi ko‘rsatildi. Olingan natijalar idempotent geometriyada ikkinchi tartibli egri chiziqlar nazariyasini rivojlantirish va ularning idempotent analoglarini tadqiq etish uchun nazariy asos bo‘lib xizmat qiladi.

Max-plus algebra – bu an’anaviy algebraik tizimlardan farq qilgan holda, haqiqiy sonlardan iborat algebraik tuzilma bo‘lib, unda odatdagi qo‘shish va ko‘paytirish amallari mos ravishda, maksimumni olish va oddiy qo‘shish amallari bilan almashtiriladi. Aniqroq aytganda, $\mathbb{R}_{max}$ to‘plamni $\mathbb{R} \cup \{-\infty\}$ kabi belgilab olamiz, hamda $\mathbb{R}_{max}$ dagi ikki $\oplus$ va $\odot$ amallarini quyidagicha aniqlaymiz:$x \oplus y = max\{x, y\}$ va $x \odot y = x + y$.

Hosil bo‘lgan $\mathbb{R}max_{max}$ algebraik tuzilma max-plus algebra deyiladi. Bu algebra idempotent yarim maydon bo‘lib, mazkur algebra asosida qurilgan fazolar idempotent fazolar deb ataladi.

1-ta’rif. $\mathbb{R}_{max}$ idempotent yarim maydon ustidagi n -o‘lchamli max-plus chiziqli fazo quyidagicha aniqlanadi:

$$\square_{\max}^{n} = \underbrace{\square_{\max} \times \square_{\max} \times \ldots \times \square_{\max} \times \square_{\max}}_{n \text{ marta}}$$

1) n -o‘lchamli ustun vektorlardan iborat to‘plam aniqlanadi, bunda $x = (x_1, x_2, \ldots, x_n) \in \mathbb{R}_{max}^n$ elementni vektor deymiz;

2) $x,\ y \in \mathbb{R}_{max}^n$ vektorlar hamda $\lambda \in \mathbb{R}_{max}$ skalyar uchun $\oplus$ va $\odot$ amallar koordinatali aniqlanadi, ya’ni

$$x \oplus y = (max(x_1, y_1), max(x_2, y_2), \ldots, max(x_n, y_n)),$$
$$\lambda \odot x = (\lambda + x_1, \lambda + x_2, \ldots, \lambda + x_n).$$

Bizga ma’lumki sup metrika

$$d_\infty(A, B) = max\{|x_1 - x_2|,\ |y_1 - y_2|\},$$

bu yerda $A = (x_1, y_1)$, $B = (x_2, y_2) \in \mathbb{R}_{max}^2$ ko‘rinishda aniqlanadi.

Bu metrika idempotent geometriyada juda tabiiy, chunki unda “maksimum” operatsiyasi asosiy o‘rin tutadi.

Klassik geometriyada giperbola fokuslargacha bo‘lgan masofalar ayirmasining moduli o‘zgarmas bo‘lgan nuqtalar to‘plamidir.

Idempotent geometriyada ham shu g‘oya saqlanadi, ammo masofa Evklid metrikasi orqali emas, balki idempotent algebra tabiati bilan mos keluvchi sup metrika yordamida ifodalanadi.

Klassi giperbola ta'rifiga asosan idempotent giperbola ta'rifini kiritamiz.

2-ta'rif. $F_1,\ F_2 \in \mathbb{R}^2_{max}$ – ikkita turli nuqta bo'lsin. $k > 0$ son uchun idempotent giperbola deb

$$\mathcal{H}(F_1, F_2; k) = \left\{M \in \mathbb{R}^{2|d_\infty(M,F_1)-d_\infty(M,F_2)|}_{max}\{\}\right\}$$

to'plamga aytiladi.

Idempotent giperbolaning kanonik ko'rinishni keltirib chiqarish uchun fokuslarni OX -o'q bo'ylab simmetrik joylashtiramiz:

$$F_1 = (-c, 0),\ F_2 = (c, 0),\ c > 0.$$

Ixtiyoriy $M = (x, y)$ nuqta uchun fokuslargacha masofalar:

$$d_1 = d_\infty(M, F_1) = max\{|x + c|,\ |y|\},$$
$$d_2 = d_\infty(M, F_2) = max(|x - c|,\ |y|).$$

Shunda idempotent giperbola tenglamasi

$$|max\{|x + c|,\ |y|\} - max\{|x - c|,\ |y|\}| = k$$

ko'rinishga ega bo'ladi. Bu idempotent giperbolaning asosiy kanonik tenglamasidir.

Quyidagi lemma idempotent giperbolaning mavjudlik shartini ifodalaydi.

lemma. Idempotent giperbola mavjud bo'lishi uchun $0 < k \le 2c$ bo'lishi kerak.

Isbot. Ikki fokus orasidagi masofa

$$d_\infty(F_1, F_2) = max\{|(-c) - c|,\ 0\} = 2c.$$

Sup metrik fazoda har qanday $A,\ B,\ C$ nuqtalar uchun$d_\infty(A, C) \le d_\infty(A, B) + d_\infty(B, C)$ uchburchak tengsizligi bajariladi. Undan $d_\infty(A, C) - d_\infty(B, C) \le d_\infty(A, B)$ hosil qilamiz. A ni B ga o'rin almashtiramiz va simmetriklikdan foydalanamiz $d_\infty(B, C) - d_\infty(A, C) \le d_\infty(A, B)$ keyin ikkalasini birlashtirib $|d_\infty(A, C) - d_\infty(B, C)| \le d_\infty(A, B)$ hosil qilamiz. Endi lemma uchun $A = F_1,\ B = F_2,\ C = M$ olamiz. U holda $|d_\infty(M, F_1) - d_\infty(M, F_2)| \le d_\infty(F_1, F_2)$ bo'ladi. Lekin $F_1 = (-c, 0)$, $F_2 = (c, 0)$ bo'lgani uchun $d_\infty(F_1, F_2) = max\{|(-c) - c|,\ 0\} = max\{2c,\ 0\} = 2c$. Natijada

$$|d_\infty(M, F_1) - d_\infty(M, F_2)| \le 2c$$

hosil bo'ladi. Shuning uchun $k > 2c$ bo'lsa giperbola mavjud bo'lolmaydi. lemma isbotlandi.

Endi $0 < k < 2c$ shartda idempotent giperbola ko'rinishini aniqlaylik.

1-teorema. Ikki o'lchamli idempotent fazoda fokuslar $F_1 = (-c, 0)$, $F_2 = (c, 0)$, $c > 0$ ko'rinishda berilgan bo'lsin. Sup metrika bo'yicha aniqlangan idempotent giperbola

$$\mathcal{H}(F_1, F_2; k) = \left\{M = (x, y) \in \mathbb{R}^{2|d_\infty(M,F_1)-d_\infty(M,F_2)|}_{max}\{\}\right\}$$

bo'lsin, bu yerda $0 < k < 2c$. U holda $\mathcal{H}(F_1, F_2; k)$ ikki tarmoqli bo'lakli-chiziqli figura bo'lib, quyidagi oltita bo'lakdan tashkil topadi:

$$x = -\frac{k}{2},\ \ -\left(c - \frac{k}{2}\right) \le y \le c - \frac{k}{2}; \qquad x = \frac{k}{2},\ \ -\left(c - \frac{k}{2}\right) \le y \le c - \frac{k}{2};$$
$$y = x,\ x \ge \frac{k}{2}; \qquad y = -x,\ x \ge \frac{k}{2};$$
$$y = x,\ x \le -\frac{k}{2}; \qquad y = -x,\ x \le -\frac{k}{2}.$$

Isbot. Ushbu $|max\{|x + c|, |y|\} - max\{|x - c|, |y|\}| = k$ idempotent giperbola tenglamasida $d_1 = max\{|x + c|, |y|\}$ va $d_2 = max\{|x - c|, |y|\}$ almashtirishdan $|d_1 - d_2| = k$ tenglama hosil bo'ladi. Fokuslar Ox o'qiga nisbatan simmetrik joylashganligi sababli chiziq ham Ox hamda Oy o'qlariga nisbatan simmetrik bo'ladi.

Shuning uchun avval $x \ge 0$ qismini qaraymiz. Agar $x \ge 0$ bo'lsa, $|x + c| = x + c$. Shuningdek, bu qismda $d_1 \ge d_2$ bo'ladi. Shuning uchun $d_1 - d_2 = k$ tenglamani qarash kifoya.

1-holat. Agar $|y| \le |x - c|$ bo'lsa, u holda $d_1 = x + c,\ d_2 = |x - c|$. Endi $0 \le x \le c$ oraliqda $|x - c| = c - x$. Shuning uchun $(x + c) - (c - x) = k$. Bundan $2x = k$ va $x = \frac{k}{2}$ kelib chiqadi. Shartdan $|y| \le \left|\frac{k}{2} - c\right|$ ya'ni $|y| \le c - \frac{k}{2}$ hosil bo'ladi. Demak, o'ng tarmoqdagi vertikal bo'lak: $x = \frac{k}{2},\ -\left(c - \frac{k}{2}\right) \le y \le c - \frac{k}{2}$.

2-holat. Agar $|x - c| \le |y| \le x + c$ bo'lsa, u holda $d_1 = x + c,\ d_2 = |y|$. Tenglama: $x + c - |y| = k$. Bundan $|y| = x + c - k$. Demak, $y = x + c - k$ yoki $y = -x - c + k$. Shartlardan bu nurlar $x \ge \frac{k}{2}$ dan boshlanishi kelib chiqadi. Demak o'ng tarmoq $y = x + c - k,\ x \ge \frac{k}{2}$,$y = -x - c + k,\ x \ge \frac{k}{2}$. Simmetriya bo'yicha chap tarmoq quyidagicha hosil bo'ladi:

$$x = -\frac{k}{2}, \qquad -\left(c - \frac{k}{2}\right) \le y \le c - \frac{k}{2}, \quad y = -x + c - k,$$
$$x \le -\frac{k}{2}, \qquad y = x - c + k, \qquad x \le -\frac{k}{2}.$$

Shunday qilib, idempotent giperbola ikkita vertikal kesma va to'rtta qiya nurdan iborat bo'ladi. Ya'ni u oltita chiziqli bo'lakdan tashkil topgan bo'lakli-chiziqli figuradir. 1-teorema isbotlandi.

1-teoremaga ko'ra, $0 < k < 2c$ uchun simmetrik fokusli idempotent giperbola quyidagi ikki qismning birlashmasidan iborat:

$$\mathcal{H} = \left\{(x, y): |x| = \frac{k}{2},\ |y| \le c - \frac{k}{2}\right\} \cup \left\{(x, y): |y| = c + |x| - k,\ |y| \ge c - \frac{k}{2}\right\}.$$

Bu giperbola klassik silliq egri emas, balki bo'lakli-chiziqli figuradir.

Idempotent giperbolaning quyidagi maxsus hollarini qaraylik.

1-hol. $k = 0$. Bu holda $d_\infty(M, F_1) = d_\infty(M, F_2)$. Demak, nuqtalar fokuslardan teng uzoqlikda yotadi. Hisoblashdan $x = 0$, ya'ni markaziy vertikal o'q hosil bo'ladi.

2-hol. $k = 2c$. Bu holda markaziy kesmalar $x = \pm c$, $|y| \le 0$ ya'ni, faqat $(\pm c, 0)$ nuqtalarga qisqaradi, qiya qismlar esa nurlarga aylanadi $|y| = |x| - c$, $|x| \ge c$. Demak, bu holatda giperbola maksimal yoyilgan holatga ega bo'ladi.

Idempotent giperbolaning asosiy xossalari quyidagilar.

1^0. Simmetriya. Tenglama

$$|max\{|x + c|, |y|\} - max\{|x - c|, |y|\}| = k$$

faqat $|x|$ va $|y|$ orqali ifodalanadi. Shuning uchun egri chiziq

- x -o'qqa nisbatan,
- y -o'qqa nisbatan,
- koordinatalar boshiga nisbatan simmetrikdir.

2^0. Bo'lakli-chiziqlilik.

Klassik giperbola kvadratik egri bo'lsa, idempotent giperbola maksimum va modul amallari tufayli to'g'ri chiziqli bo'laklardan tashkil topadi.

3^0. Asimptotik yo'nalishlar.

Tashqi qismlarda $|y| = c + |x| - k$ bo'lgani uchun asimptotik yo'nalishlar

$$y = x + (c - k), \quad y = -x + (c - k),$$
$$y = x - (c - k), \quad y = -x - (c - k)$$

tipidagi qiya chiziqlar bilan mos keladi.

4^0. Ichki "yadro" qismi.

Giperbolaning markazga yaqin qismi vertikal kesmalar: $x = \pm\frac{k}{2}$

ko'rinishida chiqadi. Bu klassik giperboladan muhim farqdir.

5^0. Fokuslar orasidagi masofa $2c$ kattalashgani sayin, giperbola ham "kengayadi".

6^0. k kattalashgani sayin markaziy kesmalar qisqaradi va figura tashqariga suriladi.

1-misol. Fokuslar $F_1 = (-3,0)$, $F_2 = (3,0)$ va $k = 2$ bo'lsin. Bu holda $c = 3$ bo'lib, kanonik tenglama

$|max\{|x + 3|,\ |y|\} - max\{|x - 3|,\ |y|\}| = 2$

kabi bo'ladi.

Yuqoridagi formulaga ko'ra giperbola: $|x| = \frac{k}{2} = 1$, $|y| \le 3 - 1 = 2$ va $|y| = 3 + |x| - 2 = |x| + 1$, $|y| \ge 2$ qismlardan iborat. Demak, u quyidagi bo'laklardan tuzilgan (1-rasm):

$$x = 1, -2 \le y \le 2, \qquad x = -1, \quad -2 \le y \le 2,$$

hamda qiya nurlar:

$$y = x + 1, y = -x + 1, x \le -1,$$

$$y = -x - 1, x \ge 1, y = x - 1, x \le -1.$$

2-misol. Agar $F_1 = (-2,0)$, $F_2 = (2,0)$, $k = 4$, bo'lsa, bu yerda $2c = 4$, ya'ni maxsus 2- holat. Shunda:

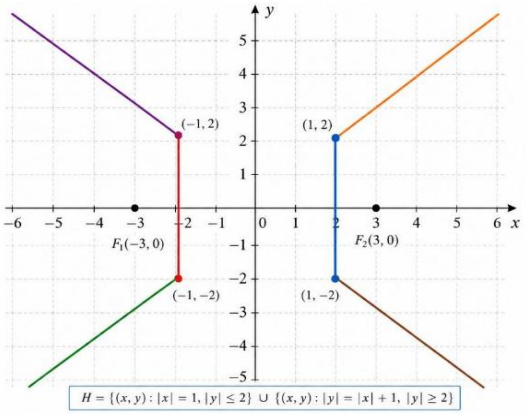
$$|x| = 2, |y| \le 0$$

faqat $(-2,0)$, $(2,0)$ nuqtalarni beradi, tashqi qismlar esa $|y| = |x| - 2$, $|x| \ge 2$, bundan

$y = x - 2$, $x \ge 2$ $y = -x + 2$, $x \ge 2$

$y = x + 2$, $x \le -2$ $y = x + 2$, $x \le -2$

ko'rinishdagi to'rtta nurga aylanadi (2-rasm).



1-rasm.

Klassik geometriyada fokuslar farqiga asoslangan giperbola:

$$|MF_1 - MF_2| = 2a$$

ko'rinishda bo'lib, silliq kvadratik egri chiziq hosil qiladi. Idempotent geometriyada esa:

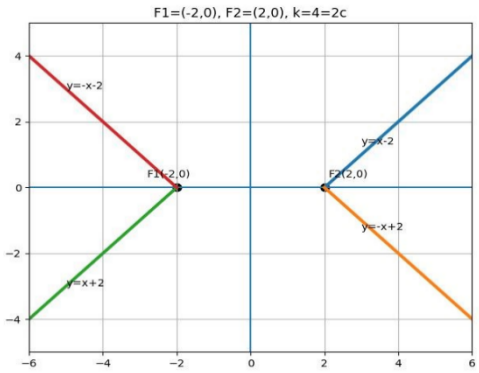
$$|d_\infty(M, F_1) - d_\infty(M, F_2)| = k$$

maksimumga asoslangan metrika sababli bo'lakli-chiziqli figura paydo bo'ladi.

Shunday qilib

- klassik giperbola – kvadratik egri;
- idempotent giperbola – maksimum va modul asosidagi bo'lakli-chiziqli figura.

Bu idempotent geometriyaning eng muhim xususiyatlaridan biridir.



2-rasm.

Endi idempotent parabola kanonik tenglamasi keltirib chiqaramiz va geometrik xossalarini tahlil qilamiz.

Klassik geometriyada parabola berilgan fokus nuqta bilan berilgan direktrisagacha bo'lgan masofalari teng bo'lgan nuqtalar to'plami sifatida aniqlanadi. Bu ta'rifga asosan sup metrika yordamida idempotent parabolani ta'riflaymiz.

3-ta'rif. $F \in \mathbb{R}^2_{max}$ nuqta va l to'g'ri chiziq berilgan bo'lsin.

Idempotent parabola deb, fokus F ga bo'lgan masofasi direktrisa l gacha bo'lgan masofasiga teng bo'lgan barcha nuqtalar to'plamiga aytiladi:

$$\mathcal{P}(F,l) = \left\{M \in \mathbb{R}^{2_\infty(M,F)_\infty}_{max}\{\}\right\}$$

bu yerda $d_\infty(M,l) -$ nuqtadan chiziqqacha bo'lgan masofa bo'lib,

$$d_\infty(M,l) = inf\{d_\infty(M,N): N \in l\}$$

orqali aniqlanadi.

Bu ta'rif klassik parabola ta'rifining idempotent analogidir.

Idempotent parabola tenglamasini chiqarish uchun, avvalo, d_∞ metrikada nuqtadan direktrisagacha masofani aniq topish kerak. Kanonik holatda direktrisa sifatida vertikal l: $x = -p, p > 0$ chiziqni olamiz, fokus esa $F = (p,0)$ bo'lsin. Bu tanlov klassik parabola uchun ham kanonik vaziyatga mos keladi. Fokus direktrisadan bir xil uzoqlikda va simmetriya o'qi x -o'q bo'ylab joylashadi.

Endi $M = (x,y)$ nuqtani olaylik. Direktrisadagi ixtiyoriy nuqta $N = (-p,t)$ ko'rinishda bo'ladi, bu yerda $t \in \mathbb{R}$. Shunda M dan N gacha masofa

$$d_\infty(M,N) = max\{|x+p|,\ |y-t|\}.$$

Endi t bo'yicha eng kichik qiymatni topamiz:

$$d_\infty(M,l) = \inf_{t\in\mathbb{R}} max\{|x+p|,\ |y-t|\}.$$

Agar $t = y$ deb olsak, unda $|y-t| = 0$, shuning uchun

$$d_\infty(M,N) = max\{|x+p|,0\} = |x+p|.$$

Demak, $d_\infty(M,l) \le |x+p|$, boshqa tomondan, ixtiyoriy t uchun $max\{|x+p|,\ |y-t|\} \ge |x+p|$, demak, $d_\infty(M,l) \ge |x+p|$. Har ikkala tengsizlikni birlashtirib, quyidagi natijani olamiz:

$$d_\infty(M,l) = |x+p|.$$

Endi $M = (x,y)$ nuqtaning fokus $F = (p,0)$ gacha masofasini yozamiz:

$$d_\infty(M,F) = max\{|x-p|,\ |y|\}.$$

Parabola ta'rifiga ko'ra

$$d_\infty(M,F) = d_\infty(M,l),$$

ya'ni,

$$max\{|x-p|,\ |y|\} = |x+p|.$$

Demak, idempotent parabola uchun kanonik tenglama:

$$max\{|x-p|,\ |y|\} = |x+p|$$

hosil bo'ladi. Bu $-$ fokus va direktrisa asosida aniqlangan idempotent parabolaning asosiy tenglamasidir.

Endi $max\{|x-p|,\ |y|\} = |x+p|$ tenglamani sohalar bo'yicha tahlil qilamiz.

Agar $x < -p$ bo'lsa, u holda

$$|x+p| = -(x+p),\ |x-p| = -(x-p) = p-x.$$

Lekin bu holda $p - x > -x - p$ chunki $(p-x) - (-x-p) = 2p > 0$. Demak, $|x-p| > |x+p|$. Shunday ekan,

$$max\{|x-p|,\ |y|\} \ge |x-p| > |x+p|,$$

bu esa tenglamani qanoatlantirmaydi. Shuning uchun parabola nuqtalari uchun zarur shart: $x \ge -p$. Demak, idempotent parabola direktrisaning chap tomonida emas, balki undan o'ng tomonda joylashadi.

Agar $-p \le x \le p$ bo'lsa, u holda

$$|x+p| = x+p,\ |x-p| = p-x.$$

Shuning uchun tenglama

$$max\{p-x,\ |y|\} = x+p$$

ko'rinishga keladi. Ammo $x+p \ge p-x$, chunki

$$(x+p) - (p-x) = 2x.$$

Bu yerda ikkita hol yuz beradi.

1-hol: $x \geq 0$. U holda

$$x + p \geq p - x.$$

Shunday qilib, maksimumning $x + p$ ga teng bo‘lishi uchun

$$|y| = x + p$$

bo‘lishi kerak yoki kamida

$$|y| \leq x + p$$

emas, balki aynan maksimum $x + p$ chiqishi uchun ikki imkoniyat bor:

• agar $p - x = x + p$, ya’ni $x = 0$,

• yoki $|y| = x + p$.

Chunki maksimumning qiymati $x + p$ bo‘lishi kerak.

Lekin $x > 0$ bo‘lsa, $p - x < x + p$, shunda faqat $|y| = x + p$ tenglikni beradi.

2-hol: $x = 0$. Bu holda

$$|x - p| = |x + p| = p,$$

Demak, $max\{p,\ |y|\} = p$ bo‘lishi uchun $|y| \leq p$ yetarli.

Shunday qilib, $x = 0$ da parabola vertikal kesmaga ega bo‘ladi:

$$x = 0, \qquad |y| \leq p$$

Bu holda

$$|x - p| = x - p, |x + p| = x + p.$$

Shuning uchun parabola tenglamasi

$$max\{x - p,\ |y|\} = x + p$$

ko‘rinishga ega bo‘ladi.

Bu yerda $x + p > x - p$, demak tenglik bajarilishi uchun

$$|y| = x + p$$

bo‘lishi kerak. Yuqoridagi barcha holatlarni birlashtirib, idempotent parabola quyidagi ko‘rinishga ega bo‘ladi:

$$\mathcal{P} = \{(x, y): x = 0,\ |y| \leq p\} \ \cup \ \{(x, y): |y| = x + p,\ x \geq 0\}$$

ya’ni u:

• markazda bitta vertikal kesma,

• undan chiqadigan ikki qiya nur

dan iborat. Buni yana bo‘laklab yozish mumkin:

$$\mathcal{P} = \{(0, y): -p \leq y \leq p\} \cup \{(x, y): y = x + p,\ x \geq 0\} \cup \{(x, y): y = -x - p,\ x \geq 0\}.$$

Bu idempotent parabolaning eng sodda kanonik ko‘rinishidir.

Klassik parabola silliq egri chiziq bo‘lib, fokus va direktrisagacha masofalar tengligidan hosil bo‘ladi. Idempotent holatda esa maksimum amali tufayli silliq egri emas, balki bo‘lakli-chiziqli figura hosil bo‘ladi.

Shu bois idempotent parabola quyidagicha tasvirlanadi:

• simmetriya o‘qi x -o‘q;

• uch qismdan iborat:

○ $x = 0$ vertikal kesma;

○ yuqoriga qaragan qiya nur;

○ pastga qaragan qiya nur.

Bu ko‘rinish klassik parabolaning idempotent analogi sifatida qaraladi.

Shunday qilib biz quyidagi teoremani isbotladik.

2-teorema. Fokus

$$F = (p, 0), p > 0$$

va direktrisa

$$l: x = -p$$

uchun d_∞-metrikada aniqlangan idempotent parabola

$$\mathcal{P} = \{M = (x, y):\ d_\infty(M, F) = d_\infty(M, l)\}$$

quyidagi tenglama bilan aniqlanadi:

$$max\{|x - p|,\ |y|\} = |x + p|,$$

va u ekvivalent ravishda

$$\mathcal{P} = \{(0, y): -p \leq y \leq p\} \cup \{(x, y): y = x + p,\ x \geq 0\} \cup \{(x, y): y = -x - p,\ x \geq 0\}$$

to‘plamdan .

Demak, idempotent parabola fokus-direktrisa prinsipi saqlangan holda, klassik paraboladan farqli ravishda, maksimum amali ta’sirida bo‘lakli-chiziqli geometrik obyekt sifatida namoyon bo‘ladi.

3-misol. $p = 2$ bo‘lsin. U holda fokus: $F = (2,0)$, direktrisa: $x = -2$. Parabola tenglamasi:

$$max\{\ |x - 2|,\ |y|\} = |x + 2|.$$

Kanonik ko‘rinishi:

$$x = 0,\ -2 \le y \le 2,$$
$$y = x + 2,\ x \ge 0,$$
$$y = -x - 2,\ x \ge 0.$$

Demak, figura $(0,-2)$ dan $(0,2)$ gacha vertikal kesma va undan o‘ng tomonga chiquvchi ikki nurdan iborat (3-rasm).

Demak, idempotent parabola fokus-direktrisa prinsipi saqlangan holda, klassik paraboladan farqli ravishda, maksimum amali ta’sirida bo‘lakli-chiziqli geometrik obyekt sifatida namoyon bo‘ladi.

Ushbu ishda sup metrik idempotent tekislikda giperbola va parabolaning fokusli ta’riflari asosida kanonik tenglamalari keltirib chiqarildi. Idempotent giperbolaning mavjudlik sharti aniqlanib, uning bo‘lakli-chiziqli geometrik tuzilishi tavsiflandi. Shuningdek, fokus va direktrisa yordamida idempotent parabola tenglamasi hosil qilinib, uning uch qismdan iborat bo‘lgan kanonik ko‘rinishi aniqlandi.

Olingan natijalar klassik ikkinchi tartibli egri chiziqlarning idempotent analoglarini qurishga imkon beradi hamda idempotent geometriyada ikkinchi tartibli egri chiziqlar nazariyasini rivojlantirish uchun asos bo‘lib xizmat qiladi. Kelgusida ushbu yondashuvni yuqori o‘lchamli idempotent sirtlar va tropik geometriya obyektlariga tatbiq etish rejalashtirilgan.

Annotatsiya; *Ushbu maqolada kremniy (Si) monokristaliga germaniy (Ge) atomlarini kiritish orqali $Si_{1-x}Ge_x$ qattiq qotishmasining taqiqlangan zona energiyasini (E_g) maqsadli boshqarish mexanizmlari va kristall panjarada hosil bo'ladigan strukturaviy nuqsonlar virtual laboratoriya muhitida modellashtirildi. Tadqiqot davomida Ge konsentratsiyasining o'zgarishi materialning asosiy elektrofizik parametrlari, xususan, panjara doimiysi (a), panjara nomuvofiqligi (lattice mismatch) va mexanik kuchlanish (strain) holatiga qanday ta'sir qilishi tahlil qilindi. Dasturiy simulyatsiya natijalari shuni ko'rsatadiki, Ge ulushining ortishi kutilganidek taqiqlangan zona energiyasining torayishiga olib keladi, bu esa infraqizil optoelektronika uchun qulaydir. Biroq, atom o'lchamlaridagi farq hisobiga yuzaga keladigan panjara nomuvofiqligi dislokatsiyalar va strukturaviy nuqsonlar darajasining oshishiga olib kelishi tasdiqlandi. Olingan xulosalar SiGe asosidagi zamonaviy yuqori chastotali tranzistorlar va fotodetektorlarni optimallashtirishda muhim amaliy ahamiyatga ega.*

Kalit so'zlar: *$Si_{1-x}Ge_x$ qotishmasi, taqiqlangan zona energiyasi (E_g), kremniy monokristali, panjara nomuvofiqligi (lattice mismatch), strukturaviy nuqsonlar, mexanik kuchlanish (strain), virtual modellashtirish, optoelektronika.*

CONTROLLING THE BAND GAP ENERGY AND ANALYZING RESULTING DEFECTS BY VARYING THE CONCENTRATION OF GE IMPURITY ATOMS IN A SILICON SINGLE CRYSTAL

Abstract: *This article models—within a virtual laboratory environment—the mechanisms for controlling the bandgap energy of $Si_{1-x}Ge_x$ solid solutions (formed by introducing germanium atoms into a silicon single crystal) and the structural defects arising in the crystal lattice. The study analyzes how the Ge concentration influences the material's key electrophysical parameters, lattice constant (a), lattice mismatch, and mechanical strain state. Software simulations demonstrate that increasing the Ge fraction leads to a narrowing of the bandgap energy, a property advantageous for infrared optoelectronics. It was confirmed that the difference in atomic properties leads to increased lattice mismatch and structural dislocations. These findings are significant for optimizing modern high-frequency transistors and photodetectors based on SiGe.*

Keywords: *$Si_{1-x}Ge_x$ alloy, bandgap energy, silicon single crystal, lattice mismatch, structural defects, mechanical strain, virtual modeling, optoelectronics.*

КОНТРОЛЬ ЭНЕРГИИ ЗОНЫ И АНАЛИЗ РЕЗУЛЬТАТИВНЫХ ДЕФЕКТОВ ПУТЕМ ИЗМЕНЕНИЯ КОНЦЕНТРАЦИИ АТОМОВ ПРИМЕСИ GE В МОНОКРИСТАЛЛЕ КРЕМНИЯ

Аннотация: В данной статье в виртуальной лабораторной среде моделируются механизмы контроля энергии зоны твердых растворов $Si_{1-x}Ge_x$ (образующихся при введении атомов германия в монокристалл кремния) и структурных дефектов, возникающих в кристаллической решетке. В исследовании анализируется влияние концентрации Ge на ключевые электрофизические параметры материала: постоянную решетки (a), несоответствие решетки и состояние механической

деформации. Программное моделирование показывает, что увеличение доли Ge приводит к сужению энергии зоны, что является преимуществом для инфракрасной оптоэлектроники. Было подтверждено, что разница в атомных свойствах приводит к увеличению несоответствия решетки и структурных дислокаций. Эти результаты имеют важное значение для оптимизации современных высокочастотных транзисторов и фотодетекторов на основе SiGe.

Ключевые слова: *сплав $Si_{1-x}Ge_x$, энергия запрещенной зоны, монокристалл кремния, несоответствие кристаллической решетки, структурные дефекты, механическое напряжение, виртуальное моделирование, оптоэлектроника.*

KIRISH

Zamonaviy yarimo'tkazgichlar elektronikasi va optoelektronikasida materiallarning energetik zonalarini maqsadli o'zgartirish (bandgap engineering) qurilmalar samaradorligini oshirishning asosiy usullaridan biri hisoblanadi. Kremniy (Si) arzonligi, yuqori sifatli va barqaror oksid qatlamini hosil qila olishi hamda texnologik qulayligi tufayli mikroelektronikaning asosiy "ishchi oti" bo'lib kelmoqda. Biroq, sof kremniyning taqiqlangan zona energiyasi nisbatan katta ($E_g \approx 1.12$ eV) bo'lib, uni to'g'ridan-to'g'ri infraqizil (IR) diapazondagi optoelektronik qurilmalarda va o'ta yuqori chastotali telekommunikatsiya tranzistorlarida qo'llashda qator cheklovlar yuzaga keladi. Ushbu muammoni hal qilishning eng istiqbolli yo'nalishlaridan biri – kremniy monokristali panjarasiga germaniy (Ge) kirishma atomlarini kiritish orqali $Si_{1-x}Ge_x$ qattiq qotishmasini sintez qilishdir.

Germaniy nisbatan kichikroq taqiqlangan zona energiyasiga ($E_g \approx 0.66$ eV) ega. Uning kremniy tarkibiga ulush sifatida (x) qo'shilishi qotishmaning umumiy taqiqlangan zonasini kamaytirishga (bandgap narrowing) xizmat qiladi. Bu esa o'z navbatida zaryad tashuvchilarning (elektron va kovaklarning) harakatchanligini sezilarli darajada oshiradi hamda heterotuzilmali bipolyar tranzistorlar (HBT) kabi qurilmalarning ishlash chastotasini teragerts (THz) chegaralarigacha ko'tarishga imkon beradi. Shunga qaramay, bu jarayon o'ziga xos fizik-kimyoviy va kristallografik qiyinchiliklarga ega. Asosiy muammo shundaki, Si va Ge atomlarining kristall panjara doimiylari o'rtasida sezilarli farq mavjud (Si uchun $a \approx 5.43$ Å, Ge uchun esa $a \approx 5.66$ Å, o'zaro farq taxminan 4.2%). Bu o'lchovdagi nomuvofiqlik (lattice mismatch) epitaksial qatlam o'stirish jarayonida kuchli ichki mexanik kuchlanishlarni (strain) yuzaga keltiradi. Agar qotishmadagi germaniy konsentratsiyasi ma'lum bir kritik qalinlikdan yoki miqdordan oshib ketsa, kristall panjarada ortiqcha kuchlanishni yengillashtirish uchun dislokatsiyalar, vakansiyalar va boshqa strukturaviy nuqsonlar avtomatik ravishda shakllanadi. Bunday nuqsonlar erkin zaryad tashuvchilar uchun rekombinatsiya yoki sochilish markazlariga aylanib, materialning elektrofizik xususiyatlarini yomonlashtiradi.

Ushbu tadqiqot ishining asosiy maqsadi – maxsus ishlab chiqilgan "Virtual Yarimo'tkazgichlar Laboratoriyasi" dasturiy ta'minoti yordamida $Si_{1-x}Ge_x$ qotishmasida germaniy konsentratsiyasini bosqichma-bosqich o'zgartirish orqali materialning energetik xususiyatlari (taqiqlangan zona torayishi) va strukturaviy barqarorligi (nuqsonlar ko'payishi hamda kuchlanish holati) o'rtasidagi bog'liqlikni vizual modellashtirish va chuqur tahlil qilishdan iborat.

NATIJALAR VA ULARNING TAHLILI

Parametr	Qiymat
Taqiqlangan zona (E_g)	1.016 eV
Fermi sathi (E_f)	0.795 eV
O'tkazuvchanlik (σ)	2.34×10^{-1} S/sm
μ_n (Elektron)	1462.8 sm²/Vs
μ_p (Kovak)	487.6 sm²/Vs
Xususiy konsentr. (n_i)	$1.51\times10^{+10}$ sm^{-3}
Panjara doimiysi (a)	5.4310 Å
Dielektrik (ε)	11.90
Sinish ko'rsatkichi	3.109
Eff. massa (m_e)	0.051 m_0
Eff. massa (m_h)	0.427 m_0
Debay uzunligi	0.1304 μm

1-rasm. Nazorat namunasi (sof Si) ning asosiy elektrofizik parametrlari.

Yuqorida keltirilgan 1-rasmdagi "Asosiy parametrlar" diagnostikasi shuni ko'rsatadiki, nazorat namunasi (sof Si) uchun xona haroratida taqiqlangan zona kengligi $E_g = 1.016$ eV ni tashkil etdi. Tajribada N-tipli aralashma ($N_d = 10^{15}$ sm^{-3} konsentratsiyali fosfor) kiritilganligi sababli, Fermi sathi (E_F) o'tkazuvchanlik zonasi tomonga siljib, taqiqlangan zona tubidan 0.795 eV yuqorida joylashdi. Zaryad tashuvchilarning harakatchanligi elektronlar uchun $\mu_n = 1462.8$ sm²/(V·s) va kovaklar uchun $\mu_p = 487.6$ sm²/(V·s) ni tashkil qilib, materialning o'tkazuvchanligi $\sigma = 2.34 \times 10^{-1}$ S/sm ga yetganligi qayd

etildi. Bu parametrlar klassik sof kremniyning adabiyotlardagi standart qiymatlariga to'la mos keladi va virtual simulyatsiya modelining yuqori aniqlikda ishlayotganini tasdiqlaydi. Dastlabki tayanch panjara doimiysi a = 5.4310 Å ekanligi aniqlandi. Keyingi bosqichlarda germaniy (Ge) atomlarining kiritilishi aynan ushbu tayanch nuqtaga nisbatan qanday o'zgarishlarga olib kelishi qiyosiy tahlil qilinadi.

Parametr	Qiymat
Taqiqlangan zona (E_g)	0.939 eV
Fermi sathi (E_f)	0.718 eV
O'tkazuvchanlik (σ)	2.34×10^{-1} S/sm
μ_n (Elektron)	1462.8 sm²/Vs
μ_p (Kovak)	487.6 sm²/Vs
Xususiy konsentr. (n_i)	$6.75\times10^{+10}$ sm^{-3}
Panjara doimiysi (a)	5.4759 Å
Dielektrik (ε)	12.75
Sinish ko'rsatkichi	3.172
Eff. massa (m_e)	0.047 m_0
Eff. massa (m_h)	0.417 m_0
Debay uzunligi	0.1350 μm

2-rasm. $Si_{0.8}Ge_{0.2}$ (80% Si, 20% Ge) qotishmasining asosiy elektrofizik parametrlari.

Tadqiqotning ikkinchi bosqichida kremniy monokristaliga 20% miqdorida germaniy atomlari kiritildi ($Si_{0.8}Ge_{0.2}$). 2-rasmda keltirilgan natijalar shuni ko'rsatadiki, qotishma tarkibida Ge ulushining paydo bo'lishi kutilganidek taqiqlangan zona energiyasining torayishiga (bandgap narrowing) olib keldi. Xususan, E_g qiymati sof kremniydagi 1.016 eV dan 0.939 eV gacha kamaydi. Fermi sathi (E_F) ham bunga mos ravishda o'zgarib, 0.718 eV ni tashkil etdi. Taqiqlangan zonaning qisqarishi hisobiga xususiy zaryad tashuvchilar konsentratsiyasi (n_i) eksponensial ravishda ortib, 1.51×10^{10} sm^{-3} dan 6.75×10^{10} sm^{-3} gacha o'sdi.

Strukturaviy jihatdan, Ge atomlari radiusi Si atomlarinikidan kattaroq bo'lganligi sababli (Vegard qonuniga asosan), panjara doimiysi (a) 5.4310 Å dan 5.4759 Å gacha kengaydi. Bu kengayish qotishmada ichki mexanik kuchlanishni (strain) yuzaga keltiradi. Shuningdek, dielektrik singdiruvchanlik (ε) 11.90 dan 12.75 gacha ortganligi kuzatildi. Yana bir muhim o'zgarish — elektron va kovaklarning effektiv massalari mos ravishda 0.051 m_0 dan 0.047 m_0 gacha va 0.427 m_0 dan 0.417 m_0 gacha kamaydi. Effektiv massaning bu darajada kamayishi zaryad tashuvchilarning dinamik xususiyatlarini yaxshilaydi va o'ta yuqori chastotali mikroelektron qurilmalarda tezkorlikni (ballistik transportni) oshirish uchun qulay sharoit yaratadi.

Parametr	Qiymat
Taqiqlangan zona (E_g)	0.840 eV
Fermi sathi (E_f)	0.619 eV
O'tkazuvchanlik (σ)	2.34×10^{-1} S/sm
μ_n (Elektron)	1462.8 sm²/Vs
μ_p (Kovak)	487.6 sm²/Vs
Xususiy konsentr. (n_i)	$4.54\times10^{+11}$ sm^{-3}
Panjara doimiysi (a)	5.5440 Å
Dielektrik (ε)	14.04
Sinish ko'rsatkichi	3.261
Eff. massa (m_e)	0.042 m_0
Eff. massa (m_h)	0.405 m_0
Debay uzunligi	0.1417 μm

3-rasm. $Si_{0.5}Ge_{0.5}$ (50% Si, 50% Ge) qotishmasining asosiy elektrofizik parametrlari.

Tadqiqotning uchinchi, so'nggi bosqichida kremniy va germaniy nisbati tenglashtirildi ($Si_{0.5}Ge_{0.5}$). 3-rasmdan ko'rinib turibdiki, Ge konsentratsiyasining 50% gacha oshirilishi taqiqlangan zona energiyasining yana-da keskin pasayishiga olib keldi. E_g qiymati endilikda 0.840 eV gacha tushdi. Taqiqlangan zonaning bunday torayishi materialning yaqin infraqizil (NIR) nurlanishlarga sezgirligini keskin oshiradi. Bunga mutanosib ravishda, xususiy zaryad tashuvchilar konsentratsiyasi (n_i) eksponensial o'sishda davom etib, 4.54×10^{11} sm^{-3} ga yetdi. Dielektrik singdiruvchanlik (ε) esa 14.04 ni tashkil etdi.

Zonalar strukturasidagi bu ijobiy o'zgarishlar bilan bir qatorda, kristall panjara doimiysi (a) sof kremniydagi 5.4310 Å dan 5.5440 Å gacha kengaydi. Bu sof kremniy tagligiga (substrate) nisbatan juda katta panjara nomuvofiqligini (lattice mismatch) anglatadi. Bunday yuqori darajadagi nomuvofiqlik epitaksial qatlamda kritik mexanik kuchlanishni (strain) yuzaga keltiradi. Fizika qonuniyatlariga ko'ra, qotishma qalinligi ma'lum bir kritik qiymatdan oshganda, bu kuchlanish

relaksatsiyaga uchraydi va natijada strukturada juda ko'p miqdorda dislokatsiyalar hamda vakansiyalar kabi nuqsonlar hosil bo'ladi. Bu esa, o'z navbatida, o'tkazuvchanlikning pasayishiga (nuqsonlar ta'siriga) olib keladi. Zaryad tashuvchilarning effektiv massasi elektronlar uchun 0.042 m_0 va kovaklar uchun 0.405 m_0 gacha pasaygan bo'lsa-da, kristall strukturaning buzilishi (nuqsonlar) amaliyotda harakatchanlikka salbiy ta'sir ko'rsatishi mumkin.

XULOSA

Ushbu tadqiqot ishi doirasida "Virtual Yarimo'tkazgichlar Laboratoriyasi" dasturi yordamida $Si_{1-x}Ge_x$ qotishmasining elektrofizik va strukturaviy xususiyatlari modellashtirildi. Olingan natijalarga asoslanib quyidagi ilmiy xulosalarni shakllantirish mumkin:

1. Energetik zonalarni boshqarish. Kremniy monokristaliga Ge atomlarining kiritilishi (x = 0 dan x = 0.5 gacha) taqiqlangan zona energiyasini (E_g) 1.016 eV dan 0.840 eV gacha muvaffaqiyatli kamaytirish imkonini berdi. Bu bandgap-muhandisligi infraqizil fotodetektorlar va yuqori samaradorlikka ega quyosh elementlari yaratish uchun g'oyat muhimdir.

2. Dinamik parametrlarning yaxshilanishi. Ge miqdorining ortishi elektronlar (0.051 m_0 → 0.042 m_0) va kovaklar (0.427 m_0 → 0.405 m_0) effektiv massasining kamayishiga olib keldi. Bu zaryad tashuvchilarning harakatchanligini oshirib, yuqori chastotali mikroelektronika (masalan, HBT tranzistorlar) uchun juda qulay sharoit yaratadi.

3. Strukturaviy barqarorlik va nuqsonlar. Fizik yutuqlar bilan bir qatorda, Ge ulushining ortishi panjara doimiysining sezilarli kengayishiga (5.4310 Å → 5.5440 Å) olib keldi. Yuqori konsentratsiyalarda (ayniqsa, 50% Ge) yuzaga keladigan kuchli panjara nomuvofiqligi va mexanik kuchlanishlar strukturaviy nuqsonlar (dislokatsiyalar) xavfini keskin oshiradi.

Umumiy qilib aytganda, $Si_{1-x}Ge_x$ qotishmasi zamonaviy nanoelektronika uchun ulkan salohiyatga ega bo'lsa-da, qurilmalarni loyihalashda taqiqlangan zona torayishidan olinadigan foyda va panjara nomuvofiqligi tufayli kelib chiqadigan strukturaviy nuqsonlar o'rtasidagi oltin o'rtaliqni (odatda $x \leq 0.2–0.3$) to'g'ri tanlash talab etiladi.

Annotatsiya: *Ushbu ishda kremniy tagliklarida o'stirilgan n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalarining fotoelektrik xossalari tadqiq qilindi. Spektral fotosensitivlik 1–3 eV oralig'ida o'rganilib, 1.26 eV atrofida asosiy maksimum kuzatildi. Gauss approksimatsiyasi yordamida spektr 1.23, 1.45, 1.64, 1.91, 2.21 va 2.45 eV energiyalarga mos oltita komponentga ajratildi. Aniqlangan fotocho'qqilar ZnSe, Ge_2 va $GaAs_1$-δBiδ komponentlari hamda oraliq energetik sathlar mavjudligi bilan izohlanadi. Olingan natijalar ushbu qattiq eritmalar infraqizil va ko'rinadigan spektr sohalarida ishlovchi selektiv fotoaktiv materiallar sifatida istiqbolli ekanligini ko'rsatadi.*

Kalit so'zlar: *kremniy, rodiy, diffuziya, legirlash, chuqur energetik sathlar, zaryad tashuvchilar konsentratsiyasi, harakatchanlik, termik ishlov, sovutish rejimi, Xoll effekti.*

ФОТОЭЛЕКТРИЧЕСКИЕ СВОЙСТВА ГЕТЕРОСТРУКТУР N-SI–P-$(GE_2)_{1-x-\gamma}(ZNSE)_x(GAAS_1\text{-}\Delta BI\Delta)_\gamma$

Аннотация: *В данной работе исследованы фотоэлектрические свойства гетероструктур n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$, выращенных на кремниевых подложках. Спектральная фоточувствительность изучалась в диапазоне 1–3 эВ, при этом основной максимум наблюдался около 1.26 эВ. С помощью гауссовой аппроксимации спектр был разложен на шесть компонент, соответствующих энергиям 1.23, 1.45, 1.64, 1.91, 2.21 и 2.45 эВ. Обнаруженные фотопики объясняются наличием компонентов ZnSe, Ge_2 и $GaAs_1$-δBiδ, а также промежуточных энергетических уровней. Полученные результаты показывают, что данные твердые растворы являются перспективными селективными фотоактивными материалами для инфракрасной и видимой областей спектра.*

Ключевые слова: *кремний, родий, диффузия, легирование, глубокие энергетические уровни, концентрация носителей заряда, подвижность, термическая обработка, режим охлаждения, эффект Холла.*

PHOTOELECTRIC PROPERTIES OF N-SI–P-$(GE_2)_{1-x-\gamma}(ZNSE)_x(GAAS_1\text{-}\Delta BI\Delta)_\gamma$ HETEROSTRUCTURES

Abstract: *This work investigates the photoelectric properties of n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ heterostructures grown on silicon substrates. The spectral photosensitivity was studied in the photon energy range of 1–3 eV, and the main maximum was observed near 1.26 eV. Using Gaussian approximation, the spectrum was decomposed into six components corresponding to energies of 1.23, 1.45, 1.64, 1.91, 2.21, and 2.45 eV. The detected photopeaks are associated with ZnSe, Ge_2, and $GaAs_1$-δBiδ components, as*

well as the presence of intermediate energy levels. The obtained results indicate that these solid solutions are promising selective photoactive materials for infrared and visible optoelectronic applications.

Keywords: *silicon, rhodium, diffusion, doping, deep energy levels, charge carrier concentration, mobility, thermal treatment, cooling regime, Xoll effect.*

Kirish

Yuqori samarali fotoelektrik va optoelektron qurilmalar yarimo'tkazgich materiallarning keng spektral diapazonda yorug'likka sezgirlik xossasiga bog'liq. Fotoaktiv elementlarda sezgirlik diapazonini kengaytirish energiya konversiyasi samaradorligini oshiradi hamda ularni quyosh energetikasi, fotodeteksiya va optik aloqa tizimlarida qo'llash imkoniyatini kengaytiradi. Bunday natijaga erishishning samarali usullaridan biri yarimo'tkazgich materialga, ayniqsa p–n o'tishning aktiv sohasiga, maxsus kirishmalar kiritishdir [1]. Natijada taqiqlangan zona ichida qo'shimcha energetik sathlar hosil bo'lib, fotonlar va zaryad tashuvchilar o'rtasidagi o'zaro ta'sir kuchayadi [2].

So'nggi yillarda epitaksial yarimo'tkazgich plyonkalarga izovalyent kirishmalar kiritish katta qiziqish uyg'otmoqda. Bunday kirishmalar valent yoki o'tkazuvchanlik zonalari yaqinida lokallashgan energetik sathlar hosil qilib, optik yutilish, rekombinatsiya va zaryad tashuvchilarning ko'chish xossalariga ta'sir ko'rsatadi. Shu sababli izovalyent kirishmalar asosida yaratilgan geterotuzilmalar turli nurlanish sharoitida samarali ishlaydigan optoelektron qurilmalar uchun istiqbolli hisoblanadi [3,4]. Ushbu ishda kremniy tagliklarida epitaksial o'stirilgan $(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ qattiq eritma geterotuzilmalarining fotoelektrik xossalari tadqiq qilinadi. Mazkur ko'p komponentli material tarkibida turli taqiqlangan zona kengligiga ega Ge_2, ZnSe va $(Ge_2)_1\text{-}(B_{i\delta})_\gamma$ komponentlari mavjud. ZnSe qisqa to'lqinli, Ge_2 esa uzun to'lqinli sezgirlikni ta'minlaydi. $GaAs_{1-\delta}B_{i\delta}$ komponentlari esa valent zona tuzilishini o'zgartirib, infraqizil sohada yutilishni kuchaytirishi mumkin.

Bunday qattiq eritmalarda fotosensitivlik spektrida oraliq energetik sathlarning paydo bo'lishi plyonka tarkibida nanoobyektlar shakllanishi bilan bog'liq. Ushbu nanoobyektlar geterotuzilmaning energiya zonalari tuzilmasini o'zgartirib, foton yutilishining yangi kanallarini hosil qiladi. Natijada materialning ko'rinadigan va infraqizil sohalardagi selektiv fotosensitivligi ortadi.

Shu bois $(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalari yuqori samarali fotoaktiv materiallar sifatida muhim ahamiyatga ega. Ularning kremniy tagliklarda olinishi esa mavjud yarimo'tkazgich texnologiyalari bilan moslashuvchanlikni ta'minlaydi va bunday tuzilmalarni keyingi avlod optoelektron qurilmalarida qo'llash imkoniyatini oshiradi [5].

NAMUNALAR TAYYORLASH VA TADQIQOT METODIKASI

Taglik sifatida radiusi 10 mm va taxminiy qalinligi 350 μm bo'lgan kremniy plastinkalar ishlatildi. Ushbu plastinkalar 10 Ω·sm solishtirma qarshilikka, $4.4\cdot10^{14}$ sm^{-3} zaryad tashuvchilar konsentratsiyasiga va 1439 $sm^2/(V\cdot s)$ tashuvchilar harakatchanligiga ega edi. Yuqori sifatli qattiq eritmalarni olish imkoniyati epitaksial plyonkalar qalinligini, boshlang'ich va yakuniy kristallanish temperaturalarini, shuningdek sovitish tezligini nazorat qilish orqali ta'minlandi. Dastlabki elektron mikroskopik tadqiqotlar asosida optimal texnologik sharoitlar aniqlandi: qatlamlarning boshlang'ich kristallanish temperaturasi 750°C etib belgilandi, epitaksial qatlamlarning kristallanish tezligi υ_k = 0.15 μm/min ga teng bo'ldi va majburiy sovitish tezligi 1°C/min ni tashkil etdi.

$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ epitaksial plyonkalarining boshlang'ich elektrofizik xossalari xona temperaturasida Van der Pauw usuli yordamida o'lchandi. Elektr o'tkazuvchanlik turi termik zona va Hall doimiysi yordamida aniqlangan. Legirlanmagan plyonkalar asosan p-tip (teshiklar) o'tkazuvchanlikka ega ekani aniqlandi. O'lchashlar natijasida xona temperaturasida epitaksial o'stirilgan plyonkalarning solishtirma qarshiligi, zaryad tashuvchilar konsentratsiyasi va harakatchanligi mos ravishda taxminan 10 Ω·sm, $1.8\cdot10^{15}$ sm^{-3} va 368 $sm^2/(V\cdot s)$ ga teng ekani aniqlandi. Bundan tashqari, dastlabki elektrofizik parametrlar asosida ozchilik tashuvchilarning harakatchanligi 4673 $sm^2/(V\cdot s)$ ga teng deb baholandi.

$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalar uchun ohmik kontaktlar oltin (Au) va kumush (Ag) yordamida hosil qilindi. Ushbu kontaktlarning ohmik xususiyati dastlab xarakterograf yordamida tasdiqlandi, so'ngra kuchlanish tushuvi va qarshilik o'lchashlari orqali tekshirildi. $(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ qattiq eritmalarining p-tip o'tkazuvchanligi hisobga olingan holda, past qarshilikka va chiziqli I–V xarakteristikaga ega optimal ohmik kontaktlar vakuum sharoitida 150°C temperaturada epitaksial sirtga Au va Ag ni termik bug'latish orqali hosil qilindi.

Hosil qilingan n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalarining fotosensitivligining spektral bog'liqligi CARL ZEISS JENA monoxromatori va kvarts optikasi bilan jihozlangan optik spektrometr yordamida tadqiq qilindi. Ushbu qurilma namunalarni 1 dan 3 eV gacha bo'lgan foton energiyasi diapazonida o'rganish imkonini berdi.

Olingan natijalar va ularning tahlillari

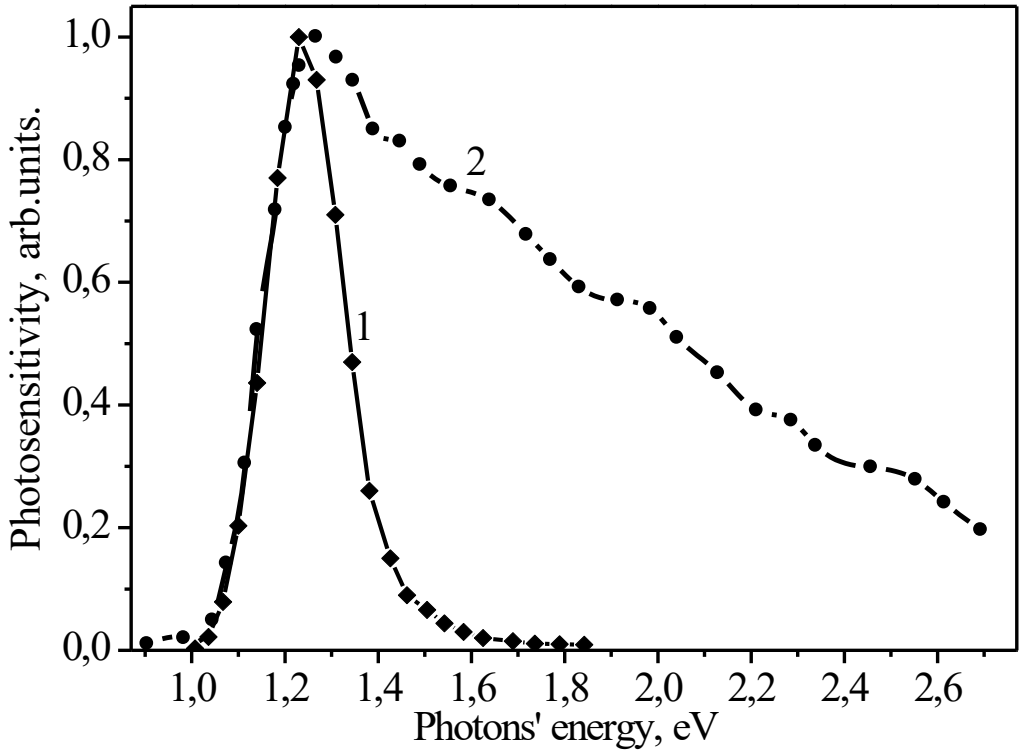
1-rasmda taxminan 10 μm qalinlikdagi epitaksial qatlamlar asosida olingan n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalarining fotosensitivlik spektri keltirilgan. Taqqoslash uchun etalon n-Si–p-Si tuzilmasining spektri ham

berilgan (1-rasm, Spektr 2). Taqqoslash natijalari shuni ko'rsatadiki, epitaksial qatlam tarkibida ZnSe va $GaAs_1$-δBiδ birikmalarining mavjudligi sezgirlik spektrining qisqa to'lqinlar (yuqori foton energiyalari, Eph ≥ 1.45 eV) tomon siljishiga olib keladi, Ge atomlarining kiritilishi esa spektrning uzun to'lqinlar tomonga qizil siljishini yuzaga keltiradi.

Fotosensitivlikning maksimal cho'qqisi 1.26 eV foton energiyasida kuzatiladi (1-rasm, Spektr 1), bu esa geterotuzilma kremniy sirtida yupqa Ge bufer qatlamini o'z ichiga olishini ko'rsatadi. Keyinchalik $(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ epitaksial qatlamlarining hosil bo'lishi davomida ZnSe molekulalari va Ge_2 atom juftlari o'rtasida qisman atom almashinuvi sodir bo'ladi, natijada taqiqlangan zonasi taxminan 1.26 eV ga teng bo'lgan qattiq eritma hosil bo'ladi. Ushbu taqiqlangan zona qiymati quyidagi tenglama yordamida tajribaviy ravishda aniqlandi [6]:

$$E_{g,s.s.}=(1-x-y)E_{g,Ge}+(x)E_{g,ZnSe}+(y)E_{g,GaAs/Bi}-\xi_1(x)(1-x-y)-\xi_2(y)(1-x-y) \quad (1)$$

Bu yerda x = 0.31 va y = 0.12 mos ravishda ZnSe va $GaAs_1$-δBiδ ning molyar ulushlari bo'lib, ular rentgen mikroanaliz yordamida aniqlangan. Ge, ZnSe va $GaAs_1$-δBiδ kristall panjaralari parametrlarining mos kelmaslik ko'rsatkichlari quyidagicha beriladi: $\xi_1 = 2|aGe - aZnSe|/(aGe + aZnSe) = 0.0017$ va $\xi_2 = 2|aGe - aGaAs/Bi|/(aGe + aGaAs/Bi) = 0.037$. Berilgan tarkib uchun $(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ epitaksial qatlamlarining hisoblangan taqiqlangan zona kengligi 1.248 eV ni tashkil etadi, bu esa tajribada kuzatilgan qiymatlar bilan juda yaxshi mos keladi.



1-rasm. n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ (1) va n-Si–p-Si (2) tuzilmalarining fotosensitivlik spektrlari.

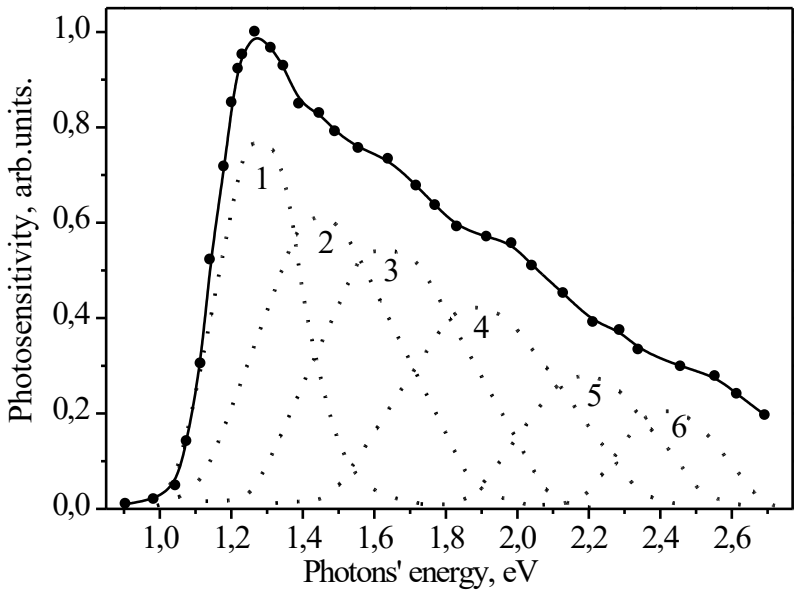
Bundan tashqari, n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalarining fotosensitivlik spektrida 1.45, 1.64, 1.91, 2.21 va 2.45 eV foton energiyalarida bir nechta zaif sezgirlik cho'qqilari kuzatildi. Spektral tahlil davomida turli intensivlikka ega bo'lgan bir nechta fotojavob cho'qqilarining sezilarli darajada ustma-ust tushishi aniqlangan bo'lib, bu holat plyonka tarkibiy qismlarining yutilish energiyalari o'zaro yaqin joylashganligi bilan bog'liq bo'lishi mumkin.

n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalarida fotoo'tkazuvchanlik mexanizmlarini yanada chuqur o'rganish maqsadida fotosensitivlik spektri Wolfram Mathematica 7 dasturida amalga oshirilgan Gauss approksimatsiya usuli yordamida qayta tahlil qilindi. Olingan spektr Gauss komponentlariga ajratildi. Har bir alohida fotocho'qqining boshlang'ich energiya qiymatlari (E_e) dastlabki egri chiziqda tajribada kuzatilgan maksimal sezgirlik nuqtalariga asoslanib tanlandi. Natijada fotosensitivlik spektri tajribaviy va umumiy Gauss egri chiziqlarga optimal mos keluvchi oltita Gauss komponent yordamida muvaffaqiyatli modellashtirildi. Hisoblangan cho'qqi energiyalari bilan jadval qiymatlari orasidagi farq 0.01 eV dan oshmadi, bu esa yuqori aniqlikni tasdiqlaydi.

Gauss moslashuvlariga mos keluvchi barcha oltita fotocho'qqi quyidagi foton energiya diapazonlarida kuzatildi:

$E_{ph,1}$ – 0,98-1,75 eV, $E_{ph,2}$ – 1,01-2,03 eV,
$E_{ph,3}$ – 1,15-2,28 eV, $E_{ph,4}$ – 1,34-2,52 eV,
$E_{ph,5}$ – 1.75-2.71 va $E_{ph,6}$ – 2.1-2,77 eV

Mos keluvchi maksimal sezgirlik cho‘qqilari mos ravishda 1.23, 1.45, 1.64, 1.91, 2.21 va 2.45 eV qiymatlarda aniqlangan (2-rasm). 2-rasmdan ko‘rinib turibdiki, asosiy Gauss egri chizig‘ining (1-punktir chiziq) 0.98 eV da boshlanishi sayoz sath mavjudligini ko‘rsatadi, bu esa Ge bufer qatlamining kristallanishining dastlabki bosqichida va keyingi epitaksiya jarayonida ZnSe molekulalari hamda Ge_2 atom juftlari o‘rtasidagi qisman almashinish natijasida hosil bo‘lgan kovalent bog‘lanish bilan izohlanadi [7]. Shuningdek, [8] ishda ta’kidlanishicha, xususan, germaniy qatlamining tarkibiy qismi bo‘lgan Zn atomlari, shuningdek boshqa rux atomlari va selen molekulalari akseptor tipli xususiyatlarga ega rekombinatsiya markazlari sifatida namoyon bo‘lishi mumkin, bu esa taxminan 1.0 eV dan boshlab spektrga sezgirlikning keskin ortishi bilan mos keladi. Yana bir tadqiqotda [9] ZnSe molekulalari va Ge_2 juftlari o‘rtasidagi kichik atom almashinuvi kristall panjaraning nuqsonlar zichligi yuqori bo‘lgan hududlarida o‘zgaruvchan o‘lcham va shaklga ega nanokristallarning spontan hosil bo‘lishiga olib kelishi qayd etilgan. Shunga o‘xshash tadqiqotda [10] $(GaAs)_{1-x-\gamma}(ZnSe)_x$ tuzilmalarida taqiqlangan zona oralig‘ida 1.23 eV atrofida energetik sath mavjudligi aniqlangan. Ushbu energiya qiymati bizning ishimizda birinchi Gauss komponentining birinchi maksimal qiymati bilan mos keladi. Bundan tashqari, boshqa adabiyotlarda [11] germaniy monokristallariga kiritilgan ZnSe nanokristallari akseptorga o‘xshash energetik sathlarni hosil qilishi ham qayd etilgan.



2-rasm. n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmalarining fotosensitivlik spektri Gauss approksimatsiyasida; – tajribaviy nuqtalar – uzluksiz chiziq – umumiy Gauss approksimatsiya chizig‘i; uzluksiz (punktir) chiziqlar – umumiy Gauss approksimatsiya chizig‘ini tashkil etuvchi komponentlar.

Ikkinchi Gauss komponentining maksimumi (5.4.2-rasm, 2-punktir chiziq) 1.53 eV foton energiyasida kuzatildi. Bu qiymat p-GaAs kristallarining ma’lum fotolyuminessensiya diapazoniga, odatda 1.35–1.65 eV oralig‘iga mos keladi va ularning geterotuzilma javobidagi spektral hissasini tasdiqlaydi [12].

Uchinchi Gauss komponenti o‘zining maksimal sezgirligini 1.64 eV da namoyon etdi (2-rasm, 3-punktir chiziq), bu GaAs qatlamlarida Ge–Se izovalyent aralashmalari bilan bog‘liq valent zona sathlarining hosil bo‘lishi bilan izohlanadi. [13] tadqiqotda GeSe bilan legirlangan GaAs qatlamlarida 1.43, 1.63 va 2.25 eV qiymatlarda uchta aniq fotojavob cho‘qqilari qayd etilgan bo‘lib, ularning barchasi ushbu ishda ham kuzatildi. Ularning ichida birinchi cho‘qqi bizning namunada uzun to‘lqinlar tomonga siljigan bo‘lsa, ikkinchi cho‘qqi 1.64 eV dagi uchinchi Gauss komponenti bilan mos keladi.

n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1\text{-}\delta Bi\delta)_\gamma$ geterotuzilmasining fotosensitivlik spektrida 1.34–3.71 eV foton energiya diapazonida yana ikkita Gauss komponenti aniqlangan bo‘lib, ular mos ravishda 1.91 eV va 2.21 eV da maksimal fotojavobni ko‘rsatadi (2-rasm, 4 va 5-punktir chiziqlar). [14] ga ko‘ra, suyuq fazali epitaksiya orqali o‘stirilgan $(GaAs)_{1-x}(ZnSe)_x$ qattiq eritmalarining fotolyuminessensiya spektri deyarli butun ko‘rinadigan diapazonni (400–760 nm) qamrab oladi. Bundan tashqari, [15] ishda GaSe ($h\nu_{max}$ = 1.88 eV), ZnAs ($h\nu_{max}$ = 2.15 eV) va ZnSe ($h\nu_{max}$ = 2.69 eV) bilan bog‘liq chuqur energetik sathlar aniqlangan. Ushbu tadqiqotda 1.91 eV va 2.21 eV da uchta fotojavob cho‘qqilari aniqlangan bo‘lib, bu kristall panjara ichida GaSe va ZnAs bilan bog‘liq atom darajasidagi o‘zgarishlar kuzatilgan spektrning qisqa to‘lqinlar tomon siljishiga sabab bo‘lishi mumkinligini ko‘rsatadi.

Bundan tashqari, oltinchi Gauss cho‘qqisi 2.45 eV da kuzatildi. Sof ZnSe ning taqiqlangan zona kengligi $E_{g,ZnSe}$ = 2.70 eV bo‘lishiga qaramay, ushbu qattiq eritmalarda ZnSe molekulalaridagi kovalent bog‘lanishlar Ge_2 va $GaAs_1\text{-}\delta Bi\delta$ komponentlari bilan o‘zaro ta’sir natijasida zaiflashadi. Bu talqin Zainabidinov va boshqalar [16] tomonidan olingan natijalar bilan mos keladi, ular bunday qattiq eritmalarda tetraedrik ZnSe kristall tuzilmalari GaAs yoki Ge_2 bilan qisman

almashinishga uchrashini, natijada Zn–Se bog‘lanishlari Ga, As va Ge atomlari bilan o‘zaro ta’sir tufayli zaiflashishini ko‘rsatgan. Qo‘shimcha dalillar Saidov va boshqalar [17] ishida ham keltirilgan bo‘lib, unda $(GaAs)_{1-x}(ZnSe)_x(Ge_2)_\gamma$ tizimida uzluksiz almashinish ZnSe ning valent zona chegarasidan pastda ($\Delta E_i = E_{ph} - Eg_{,t.r}$) kirishma sathlarining paydo bo‘lishiga olib kelishi aniqlangan. ZnSe ning to‘g‘ridan-to‘g‘ri taqiqlangan zonaga ega ekanligi va uning ushbu materialdagi molyar konsentratsiyasi (~10^{20} sm^{-3}) ni hisobga olgan holda, ushbu tuzilmalar 2.4 eV dan yuqori foton energiyalarida fotosensitivlik namoyon etadi.

Xulosa

n-Si–p-$(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1$-δBiδ$)_\gamma$ geterotuzilmalarining spektral fotosensitivlik tahlili natijalari shuni ko‘rsatdiki, $(Ge_2)_{1-x-\gamma}(ZnSe)_x(GaAs_1$-δBiδ$)_\gamma$ qattiq eritmalari tarkibga kiritilgan ZnSe va Ge komponentlari, shuningdek ularning ionlanishidagi ion-kovalent bog‘ energiyalarining farqi tufayli selektiv fotosensitivlikka ega. Energiya zonalari diagrammasi plyonkalar ichida $GaAs_1$-δBiδ birikmalari asosida hosil bo‘lgan nanoobyektlar mavjudligini ko‘rsatuvchi kirishma bilan bog‘liq sathlar mavjudligini namoyon qiladi. Xulosa qilib aytganda, ushbu natijalar olingan qattiq eritmalar ehtimoliy to‘siq-qavatli tuzilmalar ekanligini va ular infraqizil nurlanish spektrida giper/MW hamda ko‘rinadigan optoelektron qurilmalar uchun selektiv fotoaktiv materiallar sifatida ham qo‘llanilishi mumkinligini isbotlaydi.

RH VA B KIRISHMALARI TA'SIRIDA KREMNIY KRISTALL PANJARASINING STRUKTURAVIY O'ZGARISHLARI

Annotatsiya: *Ushbu tadqiqotda bor bilan legirlangan p-tipli kremniy monokristallarida rodiy atomlari diffuziyasining kristall panjara tuzilishi va fazaviy o'zgarishlarga ta'siri rentgen difraksion tahlil usuli yordamida o'rganildi. Tajriba uchun Czochralski usulida o'stirilgan p-Si<B> monokristallari asosida etalon, termik ishlov berilgan hamda rodiy diffuziyasidan so'ng sekin va tez sovitilgan namunalar tayyorlandi. O'lchovlar Empyrean Malvern difraktometrida 2θ = 10°–80° oralig'ida bajarildi. Natijalar barcha namunalarda asosiy difraksion maksimum Si(111) tekisligiga mos kelishini ko'rsatdi. Termik ishlov kristall panjaraning tartiblanishiga olib keldi. Rodiy diffuziyasi esa panjara parametrlari, mikrodeformatsiyalar va fazaviy tarkib o'zgarishiga sabab bo'ldi. Sekin sovitishda SiO_x va SiB_6 fazalari, tez sovitishda esa nanometr o'lchamli Si–Rh birikmalari shakllandi.*

Kalit so'zlar: *kremniy monokristallari, rodiy diffuziyasi, bor legirlash, rentgen difraksiyasi, kristall panjara, mikrodeformatsiya, SiB_6, SiO_x, silitsid fazalar.*

СТРУКТУРНЫЕ ИЗМЕНЕНИЯ КРИСТАЛЛИЧЕСКОЙ РЕШЁТКИ КРЕМНИЯ ПОД ВЛИЯНИЕМ ВХОЖДЕНИЙ Rh И B

Аннотация: *В данном исследовании методом рентгенодифракционного анализа изучено влияние диффузии атомов родия в легированных бором p-типных монокристаллах кремния на структуру кристаллической решётки и фазовые изменения. Для эксперимента были подготовлены эталонные, термически обработанные, а также медленно и быстро охлаждённые после диффузии родия образцы на основе монокристаллов p-Si<B>, выращенных методом Чохральского. Измерения проводились на дифрактометре Empyrean Malvern в диапазоне 2θ = 10°–80°. Результаты показали, что во всех образцах основной дифракционный максимум соответствует плоскости Si(111). Термическая обработка привела к упорядочению кристаллической решётки. Диффузия родия, в свою очередь, стала причиной изменения параметров решётки, микродеформаций и фазового состава. При медленном охлаждении сформировались фазы SiO_x и SiB_6, а при быстром охлаждении — соединения Si–Rh нанометрового размера.*

Ключевые слова: *монокристаллы кремния, диффузия родия, легирование бором, рентгеновская дифракция, кристаллическая решётка, микродеформация, SiB_6, SiO_x, силицидные фазы.*

STRUCTURAL CHANGES IN THE SILICON CRYSTAL LATTICE UNDER THE INFLUENCE OF Rh AND B INCORPORATION

Abstract: *In this study, the effect of rhodium atom diffusion in boron-doped p-type silicon single crystals on the crystal lattice structure and phase changes was studied using X-ray diffraction analysis. For the experiment, reference, thermally treated, and slowly and rapidly cooled samples after rhodium diffusion were prepared based on p-Si<B> single crystals grown by the Czochralski method. Measurements were carried out on an Empyrean Malvern diffractometer in the 2θ = 10°–80° range. The results showed that the main*

diffraction maximum in all samples corresponds to the Si(111) plane. Thermal treatment led to ordering of the crystal lattice. Rhodium diffusion caused changes in lattice parameters, microdeformations, and phase composition. During slow cooling, SiO_x and SiB_6 phases formed, while during rapid cooling, nanometer-sized Si–Rh compounds formed.

Keywords: *silicon single crystals, rhodium diffusion, boron doping, X-ray diffraction, crystal lattice, microdeformation, SiB_6, SiO_x, silicide phases.*

Kirish

Zamanaviy mikro va nanotexnologiya sohalarida olib borilayotgan ilmiy-tadqiqot ishlari asosan yuqori tozalikka, kristall tuzilishining mukammalligiga va nuqsonlar konsentratsiyasining minimal darajasiga ega bo'lgan monokristal materiallarni olishga qaratilgan. Ayniqsa, mikro- va nanoelektronika, fotonika hamda sensor texnologiyalarida kremniy asosiy funksional material sifatida xizmat qiladi. Shu bois, kremniy monokristallarining strukturasi, ulardagi kirishma atomlar va nuqsonlarning tabiati hamda taqsimlanishi materialning elektr, optik va mexanik xususiyatlariga bevosita ta'sir ko'rsatadi [1]. Kremniy asosidagi zamonaviy ishlab chiqarish jarayonlarida yuqori tozalikdagi va tarkibiy jihatdan barqaror monokristallardan foydalanish talab etiladi. Chunki kristall panjarasidagi begona atomlar, dislokatsiyalar, vakansiyalar va tuganlararo nuqsonlar yarimo'tkazgichning o'tkazuvchanligi, harakatchanlik koeffitsiyenti, rekombinatsiya jarayonlari va boshqa muhim parametrlariga sezilarli ta'sir ko'rsatadi [2]. Ayniqsa, legirlovchi yoki noodatiy kirishma atomlarning kiritilishi natijasida yangi energiya sathlari hosil bo'lishi, lokal kuchlanish maydonlari yuzaga kelishi va panjara parametrlarining o'zgarishi mumkin [3]. So'nggi yillarda o'tish metalllari, jumladan, rodiy (Rh) atomlarining kremniy kristall panjarasiga kiritilishiga bo'lgan qiziqish ortib bormoqda. Rh yuqori zichlikka va murakkab elektron tuzilishga ega bo'lgan 4d-qator elementi bo'lib, uning kremniy panjarasiga kirishi strukturada lokal deformatsiyalar, yangi fazalar yoki kirishma to'plamlari shakllanishiga olib kelishi mumkin [4]. Bu esa materialning elektrofizik va rekombinatsion xususiyatlarini o'zgartirishi ehtimolini yuzaga keltiradi. Shu munosabat bilan ushbu tadqiqot ishining Rh atomlarining p-tipli kremniy (p-Si) monokristalli kristall panjarasiga ta'sirini rentgenodifraksiyasi usuli orqali o'rganish maqsad qilib olingan

NAMUNALAR TAYYORLASH VA TADQIQOT METODIKASI

Tadqiqot obyekt sifatida Chaxral usulida o'stirilgan bor bilan legirlangan p-tipli kremniy monokristallari (p-Si<B>) tanlandi. Boshlang'ich namunalarning bor konsentratsiyasi p-tip o'tkazuvchanlikni ta'minlovchi miqdorda bo'lib, ular yuqori kristall sifatini saqlagan holda keyingi termik va diffuzion jarayonlar uchun tayyorlandi. Tadqiqot maqsadlariga muvofiq ravishda quyidagi to'rt turdagi namuna tayyorlandi.

Boshlang'ich p-Si<B> hech qanday qirishma va termik yoki diffuzion ishlovsiz, etalon (reference) sifatida xizmat qildi. Uning struktura parametrlari, panjara doimiysi va difraksion chiziqlari keyingi ishlov berilgan namunalar bilan solishtirish uchun asos sifatida qabul qilindi, 1300°C haroratda 5 soat termal ishlov berilgan p-Si<B> namuna rodiy kiritilmasdan, faqat yuqori haroratli termik ishlovdan o'tkazildi. Bu orqali yuqori harorat ta'sirida kristall panjarasidagi relaksatsiya jarayonlari, kislorod pretsipitatlari evolyutsiyasi va ichki kuchlanish o'zgarishlarini aniqlaadi. Bu namuna rodiy diffuziyasi ta'sirini aniq ajratish imkonini beradi, 1300°C haroratda 5 soat davomida Rh atomlari bilan legirlangan (diffuziyadan so'ng namuna pechda sekin sovitilgan (sl.c, $\theta = 5 \div 10$ °C/min)) namuna. Sekin sovitish jarayonida haroratning bosqichma-bosqich pasayishi kristall panjarasida termodinamik muvozanatga yaqin holat shakllanishiga sharoit yaratadi. Bu sharoitda rodiy atomlari kremniy panjarasida barqaror holatlarni egallashi, ehtimoliy Rh–Si birikmalari yoki kirishma to'plamlari (klasterlar) hosil bo'lishi mumkin. Shuningdek, ichki kuchlanishlar qisman relaksatsiyaga uchraydi va struktura nisbatan barqaror holatga keladi. 1300°C haroratda 5 soat davomida Rh atomlari bilan legirlangan (biroq diffuziyadan keyin namuna tez sovitilgan (rc, $\theta = 250 \div 300$ °C/min)) namuna. Tez sovitish natijasida yuqori haroratda shakllangan metastabil holatlar "muzlatib qo'yiladi". Bu jarayonda rodiy atomlarining nomuvozanat taqsimlanishi saqlanib qolishi, interstitsial holatlar konsentratsiyasi yuqori bo'lishi va panjarada lokal deformatsiya maydonlari yuzaga kelishi mumkin. Shuning uchun bu namuna struktura nuqsonlari va fazaviy o'zgarishlarning dinamik xususiyatlarini o'rganish uchun muhim ahamiyatga ega.

Tayyorlangan barcha namunalarning tuzilmaviy hamda fazaviy o'zgarishlarni aniqlash (Empyrean Malvern) rentgenodifraktometri yordamida amalga oshirildi. Rentgenodifraksion o'lchovlar Bregg-Brentano geometriyasida o'tkazilib, tarqalish burchi $2\theta = 10° \div 80°$ bo'lgan diapazonda uzluksiz skanerlash tezligi 1gradus/min etib belgilandi. Bunda burchak qadami 0.02 gradus etib olindi. Tuzilmaviy cho'qqilarning maksimal qiymatlarini aniqlash va olingan natijalarga grafik ishlov berish uchun OriginPro2022 dasturiy ta'minotidan foydalanildi.

Olingan natijalar va ularning tahlillari

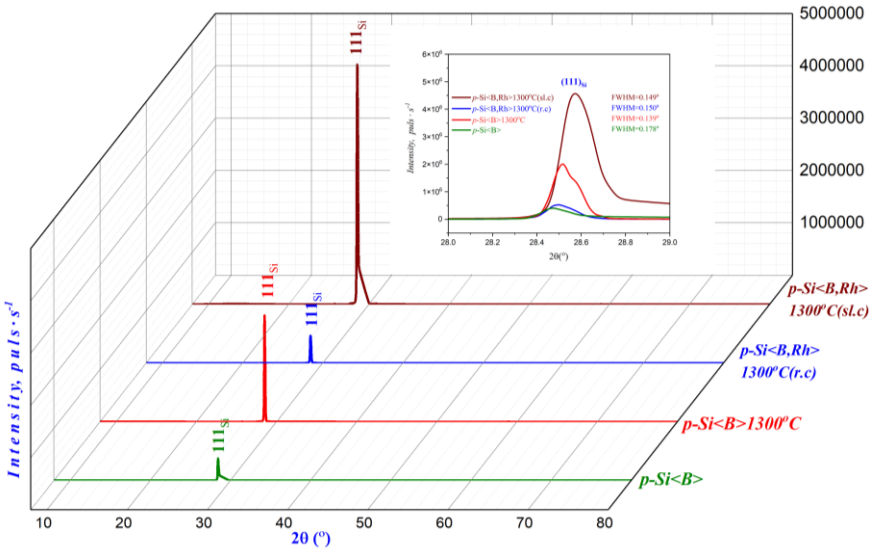
1-rasmda barcha tayyorlangan namunalar uchun rentgenogrammalar keltirilgan. Olingan rentgenogrammalarda yuqori intensivlikka ega bo'lgan asosiy difraksion (111)Si akslanish kuzatilgan. Bu holat namunalar sirtining (111) kristallografik (eng zich joylashgan va energetik jihatdan barqaror) yo'nalish mansub monokristal ekanligini tasdiqlaydi

[5]. Mazkur difraksion maksimumning aniq holati (2θ burchagi), intensivligi, tekisliklar orasidagi masofasi d kabi eksperimental qiymatalri yordamida va subkristallit o'lchami D va panjara qiymatlari hisoblab topilib, 1-jadvalda keltirilgan.

1-jadval

Namunalar	2θ (°)	Intensivlik *I*, (imp/s)	*d*, (Å)	Subkristallit D, (nm)	Panjara doimiysi a, (Å)
Boshlang'ich *p*-Si<B>	28.49°	421680	3.133	48.1	5.3574
p-Si<B> termik ishlov *(1300 oS)*	28.52°	2034600	3.127	62.2	5.3471
p-Si<B,Rh> sekin sovutilgan (1300 °C, θ = 10 °C/min)	28.54°	6710100	3.126	57.4	5.3454
p-Si<B,Rh> tez sovutilgan (θ = 300 °C/min)	28.50°	523770	3.129	57.4	5.3505

Jadvaldan termik ishlov berilgan hamda Rh atomlari bilan diffuziya qilinib, sekin sovitilgan namunalar rentgenogrammalrida (111)Si akslanish yuqori burchak tomon siljiganini tekisliklar orasidagi masofaning (d) kamayganligini ko'rsatadi. Bu esa o'z navbatida Rh atomining kovalent radiusi (rRh ≈ 1.25 Å) kremniynikidan (rSi ≈ 1.11 Å) axminan 12–13% farq qilganligi sababli, ularning panjaraga kirishi mahalliy deformatsiya hosil qilayotganligidan, ya'ni kristall panjara qisilib (panjara doimiysi a kamayib), mikrokuchlanishlar shakllanganidan dalolat beradi [6]. Tez sovitilgan namunalar rentgenorammalaridada esa (111)Si akslanish boshlang'ich p-Si<B> namunada kuzatilgan asosiy akslanish burchagiga yaqin holatda kuzatilgan. Bu holat nomuvozanat struktura saqlanganligini va to'liq relaksatsiya amalga oshmaganligini ko'rsatadi [7].

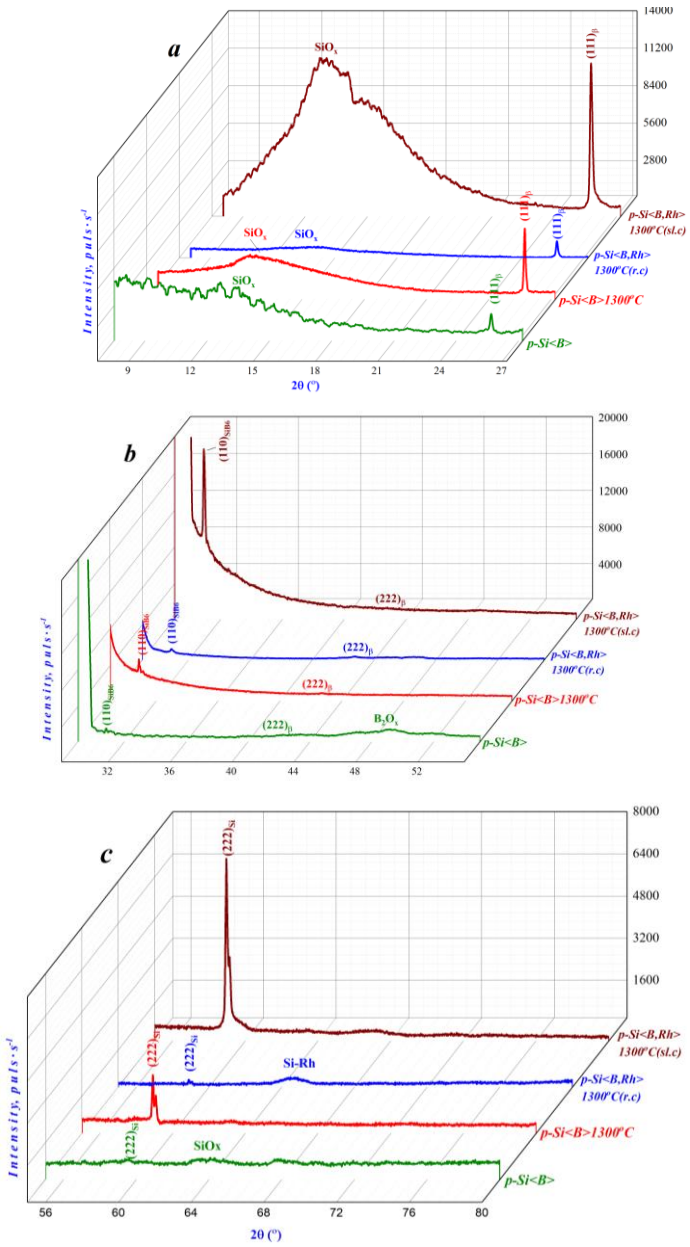


1-rasm. Boshlang'ich Si<B> (yashil chiziq), 1300 °C da 5 soat davomida termik ishlov berilgan Si<B> (qizil chiziq), 1300 °C da rodiy atomlari diffuziya qilinib tez sovutilgan Si<B> (ko'k chiziq) va), 1300 °C da rodiy atomlari diffuziya qilinib sekin sovutilgan Si<B> (jigarrang chiziq) rentgenogrammalari.

Intensivlikning keskin ortishi (ayniqsa sekin sovitilgan rodiy namunasida 6710100 imp/s) kristall tuzilishining yuqori darajada tartiblanganligini va struktura mukammalligining oshganligini anglatadi. 1300°C termik ishlovdan keyin intensivlikning oshishi kristall panjaradagi ichki kuchlanishlar relaksatsiyasi va nuqsonlar qisqarishi bilan bog'liq bo'lishi mumkin [8]. Tez sovitilgan namunada intensivlik nisbatan past bo'lib, bu yuqori haroratdagi metastabil holatlar "muzlatib qo'yilgani" va ichki deformatsiyalar saqlanganligini ko'rsatadi [9].

Boshlang'ich p-Si<B> namunada D ≈ 48.1 nm bo'lsa, termik ishlovdan keyin 62.2 nm gacha oshgan. Bu yuqori harorat ta'sirida kristallitlarning yiriklashishi va struktura yaxshilanishi bilan izohlanadi. Rh atomlari bilan legirlangan namunalarda D ≈ 57.4 nm bo'lib, bu termal ishlov bilan taqqoslaganda biroz kamaygan. Bu holat rodiy atomlarining panjarada qo'shimcha defekt markazlari hosil qilishi yoki kirishma klasterlar shakllanishi bilan bog'liq bo'lishi mumkin

[10]. Barcha namunalar rentgenogrammalarining 2θ ≈ 9°÷17° burchakli sochilishlar oralig'ida sohasida barcha namunalarda keng va past intensivlikli diffuzion akslanishlar kuzatilgan (2-a rasm). Mazkur akslanishlar amorf tabiatga ega bo'lgan SiO_x (kremniy oksidi) 1÷2 nm o'lchamdagi fragmentlar (klasterlar)ga mos keladi.



2-rasm. Kichik (a), o'rta (b) va yuqori (c) burchakli sochilishlarda boshlang'ich Si<B> (yashil chiziq), soat davomida termik ishlov berilgan Si<B> (qizil chiziq), 1300 °C da rodiy atomlari diffuziya qilinib tez sovı (ko'k chiziq), 1300 °C da rodiy atomlari diffuziya qilinib sekin sovutilgan Si<B> (jigarrang chiziq) rentg shakllari.

Ayniqsa, sekin sovitilgan Rh atomlari bilan legirlangan namunalarda SiO_x aksining intensivligi 11 983 imp/s gacha yetgan bo'lib, bu boshqa namunalarga nisbatan ancha yuqori. Bu holat Rh atomlarining kislorod bilan o'zaro ta'sirini kuchaytirganini ko'rsatadi [11]. Yuqori harorat sharoitida kremniy matritsasida mavjud bo'lgan kislorod atomlari rodiy bilan birgalikda Si–Rh–O tipli komplekslar hosil qilishi mumkin [12]. Sekin sovitish jarayonida termodinamik barqaror holat shakllangani sababli ushbu komplekslar mustahkamlanadi [13].

Shuningdek, namunalar rentgenogrammalarining 2θ ≈ 30.8°÷31.0° burchakli sochilishlarida qo'shimcha difraksion maksimum ham kuzatilgan (2-b rasm). Ushbu akslanish (110) kristallografik oriyentatsiyaga mansub bo'lgan SiB_6 fazasiga mos keladi. Mazkur akslanishning eksperimentpl qiymatlari yordamida fazoviy guruhi (Pm3m), panjara doimiysi (a = b = c = 4.131 Å) hamda kristallit o'lchami (sekin sovitilgan namunada) 62.6 nm ekanligi aniqlandi. SiB_6 fazasining paydo bo'lishi bor atomlarining yuqori haroratda qayta taqsimlanishi va lokal konsentratsiya ortganini ko'rsatadi [14]. Rh atomlarining diffuziyasi bor atomlarining harakatchanligini oshirib, ularning muayyan mintaqaga jamlanishiga turtki bergan bo'lishi

ham mumkin [15]. Sekin sovitilgan namunalarda SiB_6 kristallitlari yirikroq bo‘lishi termodinamik barqaror holat shakllanganini anglatadi. Bu holat struktura mukammalligining oshishi bilan uyg‘un holatida bo‘ladi.

Barcha namunalar rentgenogrammalarda (222)Si reflekslar ham kuzatilgan (2-c rasm). (222) tekisligi strukturadagi mayda o‘zgarishlarga va mikrokuchlanishlarga nisbatan sezgir hisoblanadi. Tajriba natijalariga ko‘ra, Rh atomlari bilan legirlangan namunalarda (222) akslanishning maksimumi $2\theta = 58.9°$ va $2\theta = 59.4°$ qiymatlarida kuzatilgan. Mazkur akslanishlar holatining siljishi panjaradagi ichki mikrokuchlanishlar mavjudligini ko‘rsatadi. Mikrokuchlanish $\varepsilon = \beta/(4\tan\theta)$ munosabat orqali baholanadi, bu yerda, β – difraksion pikning yarim balandlikdagi kengligi, θ – Bregg burchagi. Demak, Rh diffuziyasidan keyin (222)Si refleks kengayishi yoki ortishi kuzatilsa, bu panjarada dislokatsiyalar, nuqsonlar va kirishma klasterlari konsentratsiyasi oshganini dalolat beradi. Mazkur cho‘qqilarning tabiatidan sekin sovitish struktura relaksatsiyasiga yordam berishini, tez sovitish esa metastabil holatlarni saqlab qolishini bashorat qilish mumkin.

Bundan tashqari, . Rh atomlari bilan legirlanib tez sovitilgan p-Si<B,Rh> namunlar rrentgenogrammalrining $2\theta \approx 64.5°$ burchakli sochilishlarida yangi difraksion maksimum kuzatilgan (2-c rasm). Mazkur akslanish Si–Rh birikmasiga tegishli 7.3 nm o‘lchamdagi nanofaza shakllanganini ko‘rsatadi. Ushbu fazaning faqat tez sovitish sharoitida paydo bo‘lishi muhim ilmiy natijadir. Bu Rh atomlarining kremniy bilan termodinamik nomuvozanat holatda birikkanini ko‘rsatadi. Yuqori haroratda Rh atomlari kremniy panjarasida erkin harakatlanadi. Agar sovitish sekin amalga oshirilsa, ular muvozanat holatga o‘tadi va barqaror fazalar hosil qiladi. Biroq tez sovitishda yuqori haroratdagi metastabil holat “muzlatib qo‘yiladi” va nanoo‘lchamli Si–Rh birikmalari saqlanib qoladi.

Xulosa

1300°C haroratda termik ishlov berilgan namunalarda kristall tuzilishining mukammalligi oshgani, subkristallit o‘lchamining kattalashgani va ichki kuchlanishlarning relaksatsiyasi kuzatilgan. Rh atomlari bilan diffuziya qilingan namunalarda esa (111)Si akslanishning yuqori burchakli sochilishlar tomon siljigani panjara doimiysining kamayishi va mikrokuchlanishlar yuzaga kelishini tasdiqlagan.

Sekin sovitish sharoitida Rh atomlari kremniy panjarasida termodinamik barqaror holatga yaqin joylashib, struktura tartiblanganligi va intensivlikning keskin ortishi bilan baxolangan. Shu bilan birga SiO_x klasterlari va SiB_6 fazasining shakllanishi ham kzatilgan. Tez sovitish sharoitida esa metastabil holat saqlanib qolib, nanoo‘lchamli Si–Rh fazasining paydo bo‘lishi kuzatilgan.

Rh atomlari kremniy kristall panjarasiga kiritilganda uning tuzilmaviy holati, panjara parametrlari va fazaviy tarkibi sezilarli darajada o‘zgaritirishi agiqlangan. Sovitish tezligi esa struktura relaksatsiyasi yoki metastabil fazalarning saqlanishida hal qiluvchi omil ekanligi aniqlangan.

Annotatsiya: *Ushbu ishda Choxral usulida o'stirilgan, fosfor bilan legirlangan n-turdagi monokristall kremniy namunalarida rodiy (Rh) atomlarining diffuziyasi hamda turli sovutish rejimlarining elektrofizik xossalarga ta'siri tadqiq qilindi. Namunalar 1300°C haroratda 10 soat davomida diffuziya sharoitida ishlov berilib, keyinchalik sekin va tez sovutish rejimlarida sovitildi. 200–420 K temperatura oralig'ida Xoll usuli yordamida solishtirma qarshilik, zaryad tashuvchilar konsentratsiyasi va harakatchanligi aniqlandi. Tadqiqot natijalariga ko'ra, boshlang'ich n-Si<P> namunasida sayoz donor sathlar kuzatilgan bo'lsa, Rh bilan legirlangan namunalarda chuqur energetik sathlar hosil bo'lishi aniqlandi. Sekin sovitilgan n-Si<P,Rh> namunasida E_a = 0.44 eV, tez sovitilgan namunada esa E_a = 0.34 eV qiymatli chuqur sathlar qayd etildi. Harakatchanlikning temperaturaga bog'liqligi tahlili Rh kirishmasi va sovutish rejimi sochilish mexanizmlariga sezilarli ta'sir ko'rsatishini ko'rsatdi. Olingan natijalar Rh kirishmasi va termik ishlov yordamida kremniyning elektrofizik parametrlarini maqsadli boshqarish hamda bunday materiallardan tezkor yarimo'tkazgich asboblar va fotodetektorlarda foydalanish mumkinligini ko'rsatadi.*

Kalit so'zlar: *kremniy, rodiy, diffuziya, legirlash, chuqur energetik sathlar, zaryad tashuvchilar konsentratsiyasi, harakatchanlik, termik ishlov, sovutish rejimi, Xoll effekti.*

СТРУКТУРНЫЕ ФАКТОРЫ, ВЛИЯЮЩИЕ НА КОНЦЕНТРАТSIЮ И ПОДВИЖНОСТЬ НОСИТЕЛЕЙ ЗАРЯДА В КРИСТАЛЛАХ n-Si<P,Rh>

Аннотатsiя: *В данной работе исследовано влияние диффузии атомов родия (Rh) и различных режимов охлаждения на электрофизические свойства монокристаллического кремния n-типа, легированного фосфором и выращенного методом Чохральского. Образцы подвергались термической обработке при температуре 1300°C в течение 10 часов в условиях диффузии, после чего охлаждались в медленном и быстром режимах. В интервале температур 200–420 K методом Холла были определены удельное сопротивление, концентрatsiя носителей заряда и их подвижность. Результаты исследования показали, что исходный образец n-Si<P> характеризуется мелкими донорными уровнями, тогда как в образцах, легированных Rh, формируются глубокие энергетические уровни. В медленно охлажденном образце n-Si<P,Rh> наблюдался глубокий уровень с энергией активатsiи E_a = 0.44 эВ, а в быстро охлажденном образце — уровень с E_a = 0.34 эВ. Анализ температурной зависимости подвижности показал, что примесь Rh и режим охлаждения существенно влияют на механизмы рассеяния носителей заряда. Полученные результаты свидетельствуют о возможности целенаправленного*

управления электрофизическими параметрами кремния с помощью примеси Rh и термической обработки, а также о перспективности таких материалов для быстродействующих полупроводниковых приборов и фотодетекторов.

Ключевые слова: *кремний, родий, диффузия, легирование, глубокие энергетические уровни, концентратsiя носителей заряда, подвижность, термическая обработка, режим охлаждения, эффект Холла.*

STRUCTURAL FACTORS AFFECTING THE CONCENTRATION AND MOBILITY OF CHARGE CARRIERS IN n-Si<P,Rh> CRYSTALS

Abstract: *This paper investigates the influence of rhodium (Rh) diffusion and different cooling regimes on the electrophysical properties of phosphorus-doped n-type monocrystalline silicon grown by the Czochralski method. The samples were thermally treated at 1300°C for 5 hours under diffusion conditions and then cooled under slow and rapid cooling regimes. In the temperature range of 200–420 K, the resistivity, charge carrier concentration, and their mobility were determined using the Hall method. The results showed that the initial n-Si<P> sample is characterized by shallow donor levels, whereas deep energy levels are formed in the Rh-doped samples. In the slowly cooled n-Si<P,Rh> sample, a deep level with E_a = 0.44 eV was observed, while in the rapidly cooled sample a deep level with E_a = 0.34 eV was identified. The analysis of the temperature dependence of carrier mobility demonstrated that Rh impurity atoms and cooling conditions significantly affect the dominant scattering mechanisms. The obtained results indicate that Rh doping and thermal treatment can be used for targeted control of the electrophysical parameters of silicon and may be promising for fast semiconductor devices and photodetector applications.*

Keywords: *silicon, rhodium, diffusion, doping, deep energy levels, charge carrier concentration, mobility, thermal treatment, cooling regime, Xoll effect.*

Kirish

Yarimo‘tkazgichlar fizikasida material xossalarini maqsadli ravishda boshqarish zamonaviy elektronika va fotoelektronika taraqqiyotining muhim ilmiy-amaliy yo‘nalishlaridan biri hisoblanadi. Ayniqsa, kremniy asosidagi materiallarga turli metall kirishmalarini kiritish orqali ularning elektr, rekombinatsion va tuzilmaviy xususiyatlarini o‘zgartirish imkoniyati katta qiziqish uyg‘otmoqda. Kremniyning texnologiyada keng qo‘llanilishi, uning arzonligi, yuqori darajada o‘rganilganligi hamda integral sxemalar tayyorlashdagi ustunligi sababli ushbu materialda yuz beradigan legirlash va diffuziya jarayonlarini chuqur tadqiq etish dolzarb masalalardan biri bo‘lib qolmoqda. Shunday kirishmalar qatorida rodiy (Rh) atomlari alohida ahamiyatga ega. Rh kremniy kristall panjarasiga kiritilganda chuqur energetik sathlar va rekombinatsiya markazlarini hosil qilishi mumkin [1]. Bunday markazlar zaryad tashuvchilarning yashash vaqtiga, ularning rekombinatsiya tezligiga, solishtirma qarshiligiga, fotos sezgirligiga va tezkorlik parametrlariga sezilarli ta’sir ko‘rsatadi [2]. Shu sababli Rh bilan legirlangan kremniy namunalarini o‘rganish nafaqat fundamental nuqtai nazardan, balki tezkor yarimo‘tkazgich asboblar, fotodetektorlar va maxsus funksional elektron qurilmalar yaratish nuqtai nazaridan ham muhimdir. Ayniqsa, Rh atomlarini kremniyga diffuziya qilish jarayonidan keyin namunalarni sekin va tez sovutish tamoyillarini qiyosiy o‘rganish ilmiy jihatdan juda dolzarbdir. Sekin sovutish jarayonida atomlar nisbatan muvozanatga yaqin holatda qayta joylashishga ulguradi, natijada turli komplekslar, mikroto‘plamlar yoki barqaror nuqsoniy markazlar hosil bo‘lishi ehtimoli ortadi [3]. Tez sovutishda esa yuqori haroratda vujudga kelgan nomuvozanat holatlar “muzlatib qo‘yiladi”, ya’ni kirishma atomlari va nuqsonlar kristall ichida muvozanatsiz taqsimotda saqlanib qolishi mumkin [4]. Bu esa namunani elektr o‘tkazuvchanligi, rekombinatsion faolligi, tuzilmaviy bir jinsliligi va fazaviy holatiga turlicha ta’sir ko‘rsatadi. Shu nuqtai nazardan, yuqori haroratli termik ishlov, rodiy atomlarining diffuziyasi hamda keyingi sekin va tez sovutish rejimlarining kremniyning struktura va elektrofizik xususiyatlariga ta’sirini o‘rganish hozirgi kunda muhim ilmiy vazifalardan biri hisoblanadi.

NAMUNALAR TAYYORLASH VA TADQIQOT METODIKASI

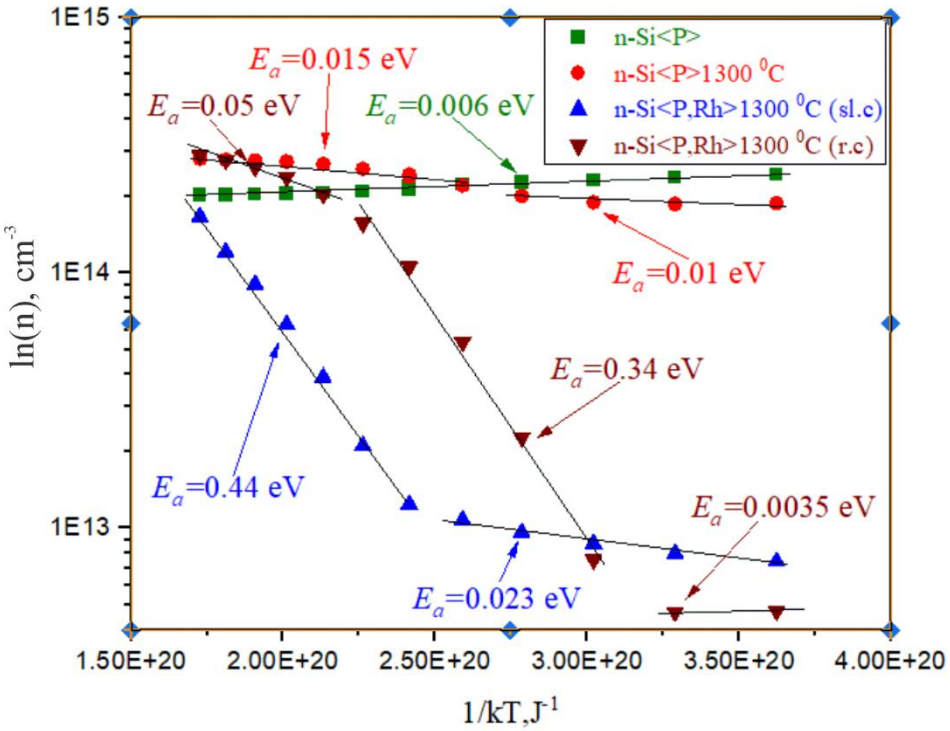
Tadqiqot obyekti sifatida Choxral usulida o‘stirilgan, fosfor atomlari bilan legirlangan *n*-turdagi monokristall kremniyning KEF15 turiga mansub namunalari tanlab olindi. Eksperimental uchun ushbu namunalar 10×10×1 mm^3 o‘lchamlarda tayyorlandi. Namunalar yuzasining yuqori darajada tozaligini ta’minlash maqsadida ularga ikki bosqichli ishlov berildi: dastlab yuza mexanik usulda sayqallandi, keyin esa kimyoviy ishlov orqali organik va anorganik tabiatli ifloslanishlardan tozalandi. VUP-4 ускунасида юқори vakuum (~10^{-7} mm.sim.ust.) olib, Rh metalini bug‘latish orqali amalga oshirildi. Ikki tomoniga rodiy o‘tkazgilgan namunalarni bir tomoni kavsharlangan kvars ampulaga solib vakuum olindi va ikkinchi tomoni ham kavsharlandi. Diffuziya jarayoni 1300 °C haroratda 10 soat davomida olib borildi. Shundan so‘ng Rh atomlari kiritilgan kremniy namunalari hamda ularda hosil bo‘lgan defektlarning fazoviy taqsimoti va material xossalariga sovutish rejimining ta’sirini baholash maqsadida namunalar ikki xil tartibda: sekin (sc, ~10 °C/min) va tez (rc, ~300 °C/min) tekliklarda sovutildi.

Tayyorlangan namunalarning elektrofizik xossalarini tadqiq qilish maqsadida MS-7000 Xoll qurilmasidan foydalanildi. Ushbu qurilma yordamida 200÷420 K harorat oralig‘ida namunalarning solishtirma qarshiliklari, zaryad

tashuvchilar konsentratsiyalari hamda ularning harakatchanliklari aniqlandi. Tajriba jarayonida olingan eksperimental natijalarni tizimlashtirish, ularga matematik va grafik ishlov berish, shuningdek, turli namuna parametrlarini qiyosiy tahlil qilish uchun OriginPro2022 dasturiy ta'minoti qo'llanildi.

Olingan natijalar va ularning tahlillari

Erkin elektronlar konsentratsiyasining temperaturaga bog'liqligi asosida tadqiq etilgan namunalardagi kirishma va defekt sathlarining energetik xususiyatlari tahlil qilindi. Buning uchun $ln(n) \sim 1/kT$ bog'lanishidan foydalanilib, namunalar uchun faollanish energiyalari aniqlandi (1-rasm). Tahlil natijalariga ko'ra, boshlang'ich n-Si<P> namunasida faollanish energiyasi E_a = 0.006 eV ga teng bo'ldi (1-rasm, yashil rangli chiziq). Bu qiymat fosfor donor sathining juda sayoz ekanini va xona haroratiga yaqin sohada donor atomlarining deyarli to'liq ionlashganini ko'rsatadi [5]. Natijada elektronlar o'tkazuvchanlik zonasiga oson o'tadi va namunada yuqori darajadagi *n*-tur o'tkazuvchanlik saqlanib qoladi.



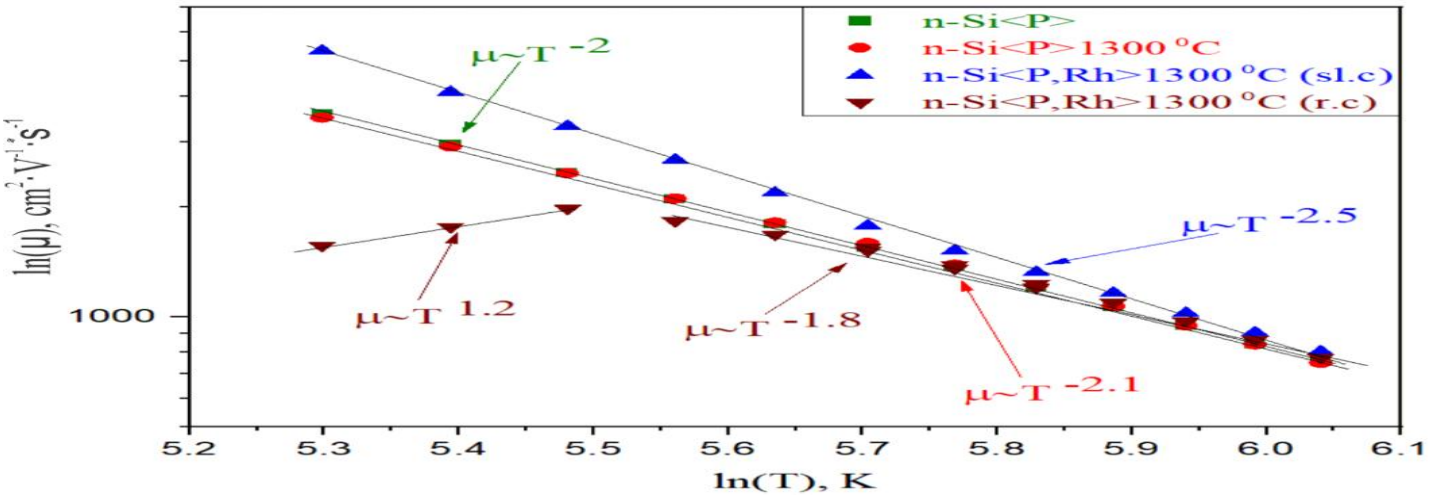
1-rasm. Boshlang'ich n-Si<P> namunasi (yashil chiziq), 1300°C da ishlov berilgan n-Si<P> 1300°C namunasi (qizil chiziq), 1300°C da ishlov berilib, sekin sovitilgan n-Si<P,Rh> namunasi (ko'k chiziq), 1300°C da ishlov berilib, tez sovitilgan n-Si<P,Rh> namunasi (jigarrang chiziq).

n-Si<P> 1300°C namunasida, ya'ni yuqori haroratli termik ishlovdan so'ng, E_a = 0.015 eV va E_a = 0.01 eV qiymatlarga ega bo'lgan sayoz energetik sathlar aniqlandi (1-rasm, qizil rangli chiziq). Bu holat yuqori harorat ta'sirida kremniy kristall panjarasida kirishma atomlari va nuqsonlarning qayta taqsimlanishi yuz berganini ko'rsatadi [6]. Bunday sayoz sathlar, ehtimol, fosfor atomlari bilan bog'liq holda qayta tashkil topgan nuqsoniy markazlar yoki termik ishlov natijasida hosil bo'lgan qo'shimcha donorsimon holatlar bilan izohlanishi mumkin [7]. Rh bilan legirlangan va 1300°C da ishlov berilib, sekin sovitilgan n-Si<P,Rh> namunasida esa E_a = 0.44 eV ga teng bo'lgan chuqur energetik sath kuzatildi (1-rasm, ko'k rangli chiziq). Ushbu qiymat Rh atomlarining kremniyda chuqur rekombinatsiya markazlarini hosil qilishini tasdiqlaydi. Bunday markazlar, odatda, Shokli-Riid mexanizmi bo'yicha zaryad tashuvchilar rekombinatsiyasini kuchaytiradi va natijada materialning elektr o'tkazuvchanligi pasayadi [8]. Shu bilan birga, mazkur namunalarda E_a = 0.023 eV bo'lgan sayoz sath ham qayd etildi. Bu esa namunada chuqur markazlar bilan bir qatorda nisbatan kichik energiyali kirishma yoki nuqsoniy holatlar ham mavjudligini ko'rsatadi [9].

1300°C da ishlov berilib, tez sovitilgan n-Si<P,Rh> namunasida esa E_a = 0.34 eV li chuqur defekt sathi aniqlandi (1-rasm, jigarrangli chiziq). Bu qiymat ham Rh bilan bog'liq chuqur markazlar mavjudligini ko'rsatadi, ammo sekin sovitilgan namunadagi 0.44 eV ga nisbatan kichikroq ekani sovutish rejimi defekt sathlarining energetik holati va barqarorligiga sezilarli ta'sir qilishini anglatadi [10]. Tez sovitish jarayonida yuqori haroratda hosil bo'lgan nuqsoniy konfiguratsiyalar muvozanatsiz holatda "muzlab qolishi" mumkin, shu bois Rh atomlari va ular bilan bog'liq defekt komplekslarining taqsimoti sekin sovitishdagiga nisbatan farq qiladi. Ushbu tez sovitilgan namunada yana E_a = 0.0035 eV ga teng juda kichik energiyali sath ham aniqlandi. Bunday kichik energiyali holat oddiy yakka donor sathidan ko'ra, ko'proq kuchli legirlash yoki kirishmalarning o'zaro ta'siri natijasida hosil bo'lgan kirishma zonasi mavjudligini ko'rsatadi [11]. Ya'ni, donor

sathlarining bir-biriga yaqin joylashishi oqibatida ular kollektiv energetik holat hosil qilib, elektronlarning juda kichik energiya hisobiga erkin holatga o‘tishini ta’minlashi mumkin.

2-rasm. Boshlang‘ich n-Si<P> namunasi (yashil chiziq), 1300°C da ishlov berilgan n-Si<P> 1300°C namunasi (qizil



chiziq), 1300°C da ishlov berilib, sekin sovitilgan n-Si<P,Rh> namunasi (ko‘k chiziq), 1300°C da ishlov berilib, tez sovitilgan n-Si<P,Rh> namunasi (jigarrang chiziq). Ma’lumki, yarimo‘tkazgich materiallarda zaryad tashuvchilarning harakatchanligi μ temperaturaga, kirishma atomlariga, nuqsonlar zichligiga, kristall panjaraning ideal yoki buzilgan holatiga hamda turli sochilish mexanizmlariga bevosita bog‘liq bo‘ladi [12]. 2-rasmda barcha namunalardagi zaryad tashuvchilarning harakatchanligini temperaturaga bog‘liqlik grafiklari keltirilgan bo‘lib, mazkur bog‘liqlik $\mu = \mu_0 T^m$ ko‘rinishidagi empirik munosabat orqali tahlil qilindi. Ushbu munosabatdagi daraja ko‘rsatkichi $m < 0$ bo‘lsa, temperatura ortishi bilan harakatchanlik kamayadi va bu, odatda, fononlar bilan sochilish mexanizmining ustunligini ko‘rsatadi [13]. Aksincha, daraja ko‘rsatkichi $m > 0$ bo‘lsa, ma’lum temperatura intervalida harakatchanlikning ortishi kuzatiladi va bu holat ionlashgan aralashmalar, nuqsonlar yoki klasterlar bilan bog‘liq sochilish mexanizmlarining muhim rol o‘ynayotganini anglatadi [14].

Boshlang‘ich n-Si<P> namunasi uchun m = -2.0 qiymat olingan bo‘lib (2-rasm, yashil rangli chiziq), bu zaryad tashuvchilar harakatining asosan fononlar bilan cheklanishini bildiradi. Bunday natija tozaroq kristall panjarali va nisbatan kam nuqsonli namunalarga xosdir [15]. Temperatura oshishi bilan panjara atomlarining issiqlik tebranishlari kuchayib, elektronlar ko‘proq sochiladi va natijada harakatchanlik pasayadi [14].

1300°C da termik ishlov berilgan n-Si<P> namunasida m = -2.1 qiymat kuzatilgan (2-rasm, qizil rangli chiziq). Bu qiymat avvalgi namunaga juda yaqin bo‘lsa-da, biroz kattaroq manfiy modulga ega. Bu esa yuqori temperaturali ishlov natijasida material ichidagi ichki kuchlanishlar, qayta taqsimlangan nuqsonlar yoki kirishma atomlarining yangi holatlari paydo bo‘lishi mumkinligini anglatadi [16]. Shunga qaramay, asosiy sochilish mexanizmi baribir fononlar bilan bog‘liq bo‘lib qolmoqda.

Rodiy bilan legirlangan va sekin sovitilgan n-Si<P,Rh> (sl.c) namunasida m = -2.5 qiymat aniqlangan (2-rasm, ko‘k rangli chiziq). Bu nisbatan katta manfiy qiymat harakatchanlikning temperaturaga juda sezgir ekanini ko‘rsatadi. Bu holatni ikki omil bilan tushuntirish mumkin: birinchidan, Rh atomlarining kristall panjaraga kirishi natijasida lokal deformatsiya maydonlari paydo bo‘ladi; ikkinchidan, sekin sovitish jarayonida ayrim kirishma komplekslari yoki agregatlari shakllanishi mumkin [17]. Natijada fononlar bilan sochilish samaradorligi ortadi va harakatchanlik keskinroq kamayadi. Tez sovitilgan n-Si<P,Rh> (r.c) namunasi esa ikki xil temperatura sohasida turlicha tabiatni namoyon qildi (2-rasm, jigarrangli chiziq). 200÷240 K oralig‘ida m = 1.2 bo‘lishi juda muhim fizik holatni ko‘rsatadi. Musbat daraja ko‘rsatkichi bu intervalda harakatchanlik temperatura oshishi bilan ortib borishini anglatadi. Bunday holat, odatda, past temperaturada lokal nuqsonlar, klasterlar, potensial to‘siqlar yoki kirishma markazlari zaryad tashuvchilar harakatiga kuchli to‘sqinlik qilayotganida yuzaga keladi [18]. Temperatura biroz oshganda zaryad tashuvchilarning bu to‘siqlarni yengib o‘tish ehtimoli ortadi va shu sababli harakatchanlik ham oshadi. 240÷450 K intervaliga o‘tilganda esa mazkur namuna uchun m = -1.8 qiymat kuzatildi (2-rasm, jigarrangli chiziq). Bu esa yuqoriroq temperaturada fonon sochilishi yana asosiy mexanizmga aylanishini bildiradi [19]. Ya’ni, past temperaturada nuqsonli muhit hal qiluvchi ahamiyatga ega bo‘lgan bo‘lsa, temperatura oshishi bilan panjara tebranishlari kuchayib, fonon mexanizmi ustunlikni qo‘lga oladi.

Xulosa

Boshlang‘ich namunada faollanish energiyasi E_a = 0.006 eV bo‘lib, bu fosfor donor sathlarining sayoz tabiatini ko‘rsatsa, Rh bilan legirlangan namunalarda E_a = 0.44 eV va E_a = 0.34 eV kabi chuqur sathlar hosil bo‘lishi aniqlandi. Bu esa Rh atomlari kremniyda chuqur rekombinatsiya markazlarini yuzaga keltirishini tasdiqlaydi. 1300°C da ishlov berilgan n-Si<P> namunasida sayoz energetik sathlar paydo bo‘lgan bo‘lsa, Rh bilan legirlangan namunalarda sekin va tez sovutish

natijasida chuqur sathlarning qiymati hamda barqarorligi o‘zaro farq qilishi kuzatildi. Boshlang‘ich n-Si<P> va 1300°C da ishlov berilgan n-Si<P> namunalarida $m = -2$ va $m = -2.1$ qiymatlar olinib, fononlar bilan sochilish asosiy mexanizm ekani ko‘rsatildi. Rh bilan legirlangan sekin sovutilgan namunada $m = -2.5$ qiymat aniqlanishi esa fonon sochilishi yanada kuchayishini ko‘rsatdi. 200÷240 K oralig‘ida $m = 1.2$ qiymat aniqlanishi struktura nuqsonlari, klasterlar va potensial to‘siqlar bilan bog‘liq sochilish ustunligini ko‘rsatsa, 240÷450 K da $m = -1.8$ bo‘lishi fonon sochilishi qaytadan asosiy mexanizmga aylanishini ko‘rsatdi. Olingan natijalar Rh kirishmasi va termik ishlov orqali kremniyning elektrofizik parametrlarini maqsadli ravishda o‘zgartirish, bunday materiallarni tezkor yarimo‘tkazgich asboblar, fotodetektorlar va maxsus funksional elektron qurilmalarda qo‘llash imkonini berishini ko‘rsatdi.

Annotatsiya.*Quyosh elementining tok–kuchlanish (I–V) xarakteristikasi uning fotoelektrik jarayonlarini to'liq tavsiflovchi asosiy eksperimental va nazariy vosita hisoblanadi. I–V egri chizig'i orqali yarimo'tkazgich materiallarining energetik xossalari, tashuvchilar generatsiyasi, rekombinatsiya mexanizmlari hamda ichki elektr maydonlarning ta'siri baholanadi. Shu sababli, ko'p qatlamli III–V quyosh elementlari samaradorligini oshirish masalasi bevosita ularning I–V xarakteristikalari tahliliga bog'liqdir.*

Kalit so'zlar. *Ko'p qatlamli quyosh elementlari, geterostruktura, III–V yarimo'tkazgichlar, GaInP/GaAs/GaInAs, AlGaAs, back-surface field (BSF), I–V xarakteristika, P–V xarakteristika, qisqa tutashuv toki (Jsc), ochiq zanjir kuchlanishi (Voc), to'ldirish koeffitsienti (FF), maksimal quvvat nuqtasi (MPP), energetik zonalar diagrammasi, geterointerfeys, rekombinatsiya jarayonlari, fotogeneratsiya, quyosh elementlari samaradorligi, fotoelektrik konversiya, yarimo'tkazgich fizikasi, modellashtirish.*

ANALYSIS OF MODELING RESULTS OF THREE- AND FOUR-LAYER HETEROSTRUCTURE SOLAR CELLS ANALYSIS OF I–V CHARACTERISTICS

Abstract.*The current–voltage (I–V) characteristic of a solar cell is the main experimental and theoretical tool that fully describes its photoelectric processes. The I–V curve makes it possible to evaluate the energy properties of semiconductor materials, carrier generation, recombination mechanisms, and the influence of internal electric fields. Therefore, improving the efficiency of multi-junction III–V solar cells is directly related to the analysis of their I–V characteristics.*

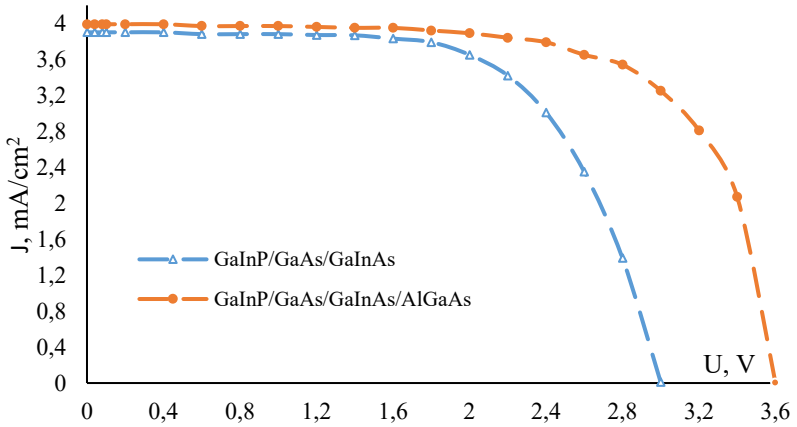
Keywords.*Multi-junction solar cells, heterostructure, III–V semiconductors, GaInP/GaAs/GaInAs, AlGaAs, back-surface field (BSF), I–V characteristics, P–V characteristics, short-circuit current (Jsc), open-circuit voltage (Voc), fill factor (FF), maximum power point (MPP), energy band diagram, heterointerface, recombination processes, photogeneration, solar cell efficiency, photoelectric conversion, semiconductor physics, modeling.*

АНАЛИЗ РЕЗУЛЬТАТОВ МОДЕЛИРОВАНИЯ ТРЁХ- И ЧЕТЫРЁХСЛОЙНЫХ ГЕТЕРОСТРУКТУРНЫХ СОЛНЕЧНЫХ ЭЛЕМЕНТОВ АНАЛИЗ ВОЛЬТ-АМПЕРНЫХ (I–V) ХАРАКТЕРИСТИК

Аннотация.*Вольт-амперная (I–V) характеристика солнечного элемента является основным экспериментальным и теоретическим инструментом, полностью описывающим фотоэлектрические процессы. По форме I–V кривой можно оценить энергетические свойства полупроводниковых материалов, генерацию носителей заряда, механизмы рекомбинации, а также влияние внутренних электрических полей. В связи с этим повышение эффективности многослойных солнечных элементов на основе III–V соединений непосредственно связано с анализом их I–V характеристик.*

Ключевые слова.*Многослойные солнечные элементы, гетероструктура, полупроводники III–V, GaInP/GaAs/GaInAs, AlGaAs, back-surface field (BSF), I–V характеристика, P–V характеристика, ток короткого замыкания (Jsc), напряжение холостого хода (Voc), коэффициент заполнения (FF), точка максимальной мощности (MPP), энергетическая зонная диаграмма, гетероинтерфейс, процессы рекомбинации, фотогенерация, эффективность солнечных элементов, фотоэлектрическое преобразование, физика полупроводников, моделирование.*

Mazkur tadqiqotda GaInP/GaAs/GaInAs (3 qatlamli) va GaInP/GaAs/GaInAs/AlGaAs (4 qatlamli) geterostruktural quyosh elementlarining I–V xarakteristikalari solishtirma tarzda o'rganildi. Olingan grafiklar asosida fotoelementlarning asosiy chiqish parametrlari — Isc, Voc va FF baholandi.



1. Grafik 3 va 4 qatlamli III–V quyosh elementlari uchun I–V xarakteristikalar taqqoslanishi

Qisqa tutashuv toki quyosh elementida tashqi zanjir qarshiligi nolga teng bo‘lgan holatda hosil bo‘ladigan maksimal fototokni ifodalaydi. U asosan yutilgan fotonlar soni va hosil bo‘lgan elektron–kovak juftlarining ajralish samaradorligi bilan belgilanadi:

$$I_{sc} = q \int_{\lambda}^{\lambda} \Phi(\lambda) \cdot A(\lambda) \cdot \eta_{col}(\lambda) d\lambda \quad (1)$$

bu yerda: Φ(λ)-tushayotgan fotonlar oqimi, A(λ)-yutilish koeffitsienti,η_{col}-tashuvchilarni yig‘ish samaradorligi.

Tahlillar shuni ko‘rsatdiki, 3 va 4 qatlamli strukturalarda Isc qiymatlarining deyarli teng bo‘lishi kuzatiladi. Bu holat AlGaAs qatlamining optik yutilish jarayonida faol ishtirok etmasligi bilan izohlanadi. AlGaAs ning asosiy vazifasi fototokni oshirish emas, balki tashuvchilarni rekombinatsiyadan himoyalash orqali kuchlanish va samaradorlikni oshirishdan iborat. Mazkur natija adabiyotlarda keltirilgan ko‘p qatlamli III–V quyosh elementlari bo‘yicha ilmiy tadqiqotlar bilan mos keladi, ularda BSF qatlamning Isc ga ta’siri cheklanganligi qayd etilgan.

Ochiq zanjir kuchlanishi quyosh elementida tok nolga teng bo‘lganda hosil bo‘ladigan maksimal kuchlanishni ifodalaydi va u rekombinatsiya jarayonlariga juda sezgir parametr hisoblanadi:

$$V_{oc} = \frac{kT}{q} \ln\left(\frac{I_{ph}}{I_0} + 1\right) \quad (2)$$

Bu yerda: I_{ph}-fototok, I_0 -to‘yinganlik toki, k-Boltsman doimiysi,T-harorat.

4 qatlamli GaInP/GaAs/GaInAs/AlGaAs strukturada V_{oc} ning oshishi AlGaAs back-surface field (BSF) qatlamining mavjudligi bilan bog‘liq. BSF qatlam o‘tkazuvchanlik zonasi bo‘yicha qo‘shimcha energetik to‘siq hosil qilib, elektronlarning orqa kontakt tomonga diffuziyasini cheklaydi.Natijada:orqa sirt rekombinatsiyasi kamayadi;tashuvchilarning umr davomiyligi ortadi;to‘yinganlik toki I_0 kamayadi.Bu esa yuqoridagi ifodaga muvofiq ravishda Voc ning ortishiga olib keladi. Mazkur mexanizm III–V geterostruktural quyosh elementlari bo‘yicha yetakchi ilmiy ishlarda asosiy samaradorlikni oshiruvchi omil sifatida qayd etilgan.

To‘ldirish koeffitsienti quyosh elementining real ish rejimidagi quvvat yo‘qotishlarini tavsiflaydi va quyidagi ifoda bilan aniqlanadi:

$$FF = \frac{V_{mp} I_{mp}}{V_{oc} I_{sc}} \quad (3)$$

FF qiymati ichki ketma-ket qarshiliklar, rekombinatsiya jarayonlari va kontakt sifati bilan bevosita bog‘liq. I–V egri chiziqlarning shakli shuni ko‘rsatadiki, 4 qatlamli strukturada egri chiziqning “bukilish sohasi” ancha keskin bo‘lib, bu ichki yo‘qotishlarning kamayganini bildiradi.

AlGaAs BSF qatlamining mavjudligi:tashuvchilar oqimini yo‘naltiradi;ichki elektr maydonni kuchaytiradi;quvvat yo‘qotishlarini kamaytiradi.

Natijada, FF ning oshishi kuzatiladi va bu umumiy energiya konversiyasi samaradorligiga ijobiy ta’sir ko‘rsatadi.

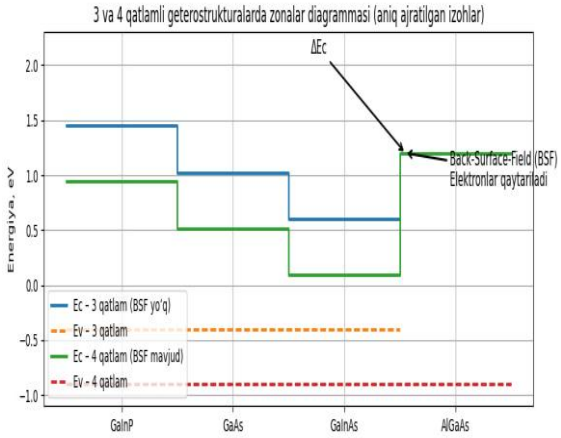
Olingan I–V xarakteristikalar shakli va parametrlarining o‘zgarish tendensiyalari ko‘p qatlamli III–V quyosh elementlari uchun adabiyotlarda keltirilgan nazariy modellar bilan yuqori darajada mos keladi. Xususan:I_{sc} ning qatlamlar soniga nisbatan barqarorligi;V_{oc} ning BSF qatlam bilan oshishi;FF ning egri chiziq shakli bilan bog‘liqligi ko‘p marotaba ilmiy tadqiqotlarda tasdiqlangan.

I–V xarakteristikalar tahlili shuni ko‘rsatdiki, GaInP/GaAs/GaInAs/AlGaAs asosidagi 4 qatlamli quyosh elementi rekombinatsiya yo‘qotishlarini samarali kamaytirishi, ochiq zanjir kuchlanishini oshirishi va to‘ldirish koeffitsientini yaxshilashi bilan ajralib turadi. Ushbu natijalar BSF qatlamining ko‘p qatlamli III–V quyosh elementlari samaradorligini oshirishdagi hal qiluvchi rolini ilmiy jihatdan asoslaydi.

Energetik zonalar diagrammasi va geterointerfeyslar tahlili

Ushbu bo‘limda GaInP/GaAs/GaInAs (3 qatlamli) hamda GaInP/GaAs/GaInAs/AlGaAs (4 qatlamli) ko‘p qatlamli

III–V quyosh elementlarining energetik zonalar diagrammasi tahlil qilinadi. Energetik zonalar diagrammasi geterostruktural fotoelementlarda tashuvchilar harakati, ichki elektr maydonlar, rekombinatsiya jarayonlari hamda fotoelektrik samaradorlikni belgilovchi asosiy fizik mexanizmlarni tushuntirishda muhim ahamiyatga ega.



2-rasm. 3 va 4 qatlamli (GaInP/GaAs/GaInAs(/AlGaAs) geterostrukturalar uchun energetik zonalar diagrammasi.

Rasmda gorizontal o‘q bo‘ylab qatlamlarning fazoviy joylashuvi, vertikal o‘q bo‘ylab esa energetik darajalar ifodalangan. Diagrammada o‘tkazuvchanlik zonasi **(E_c),** valent zona **(E_v)** hamda Fermi darajasi **(E_f)** ning qatlamlar bo‘yicha o‘zgarishi tasvirlangan.

3 qatlamli GaInP/GaAs/GaInAs strukturada har bir qatlamning taqiqlangan zona kengligi (**Eg**) turlicha bo‘lib, bu yuqori energiyali fotonlardan boshlab past energiyali fotonlargacha bo‘lgan spektral diapazonni qamrab olish imkonini beradi. Biroq ushbu strukturaning muhim kamchiliklaridan biri orqa sirt sohasida energetik to‘siqning yetarli darajada shakllanmaganligidir.

GaInAs qatlamidan keyin to‘g‘ridan-to‘g‘ri metall kontakt joylashgani sababli, o‘tkazuvchanlik zonasi bo‘yicha elektronlar uchun erkin chiqish yo‘li mavjud bo‘ladi. Bu holat quyidagi salbiy jarayonlarga olib keladi:elektronlarning orqa kontakt tomon diffuziyasi;orqa sirt rekombinatsiyasining kuchayishi;tashuv-chilar umr davomiyligining qisqarishi.

Natijada, to‘yinganlik toki I_0 ortadi va bu holat 4.1-bo‘limda ko‘rsatilganidek, ochiq zanjir kuchlanishining (**Voc**) kamayishiga sabab bo‘ladi.

4 qatlamli GaInP/GaAs/GaInAs/AlGaAs strukturada AlGaAs **back-surface field (BSF)** qatlamining joriy etilishi energetik zonalar diagrammasida tub o‘zgarishlarni yuzaga keltiradi. AlGaAs ning nisbatan keng taqiqlangan zonaga ega bo‘lishi natijasida GaInAs/AlGaAs chegarasida o‘tkazuvchanlik zonasi bo‘yicha qo‘shimcha energetik to‘siq (ΔE_c) hosil bo‘ladi.Ushbu to‘siq:elektronlarning orqa kontakt tomon harakatini cheklaydi;ularni faol yutuvchi qatlamlarga qaytaradi;orqa sirt rekombinatsiyasini sezilarli darajada kamaytiradi.Shu bilan birga, valent zona bo‘yicha hosil bo‘ladigan to‘siq kovaklarning (teskari tashuvchilarning) harakatiga deyarli halaqit bermaydi. Bu esa tashuvchilarni selektiv tarzda ajratish imkonini beradi va fotoelementning ichki elektr maydonini kuchaytiradi.

Energetik zonalar diagrammasidan ko‘rinishicha, geterointerfeyslar sohasida zonalarning egilishi ichki elektr maydonlarning mavjudligidan dalolat beradi. Ushbu maydonlar:elektron–kovak juftlarini tezroq ajratadi;rekombinatsiya ehtimolini kamaytiradi;tashuvchilarni kontaktlarga yo‘naltiradi.Ayniqsa, AlGaAs BSF qatlam bilan hosil bo‘lgan qo‘shimcha elektr maydon fotoelementning orqa sohasida tashuvchilarni “ituvchi” mexanizm vazifasini bajaradi. Bu mexanizm ko‘p qatlamli III–V quyosh elementlari samaradorligini oshirishda asosiy omillardan biri sifatida qaraladi.

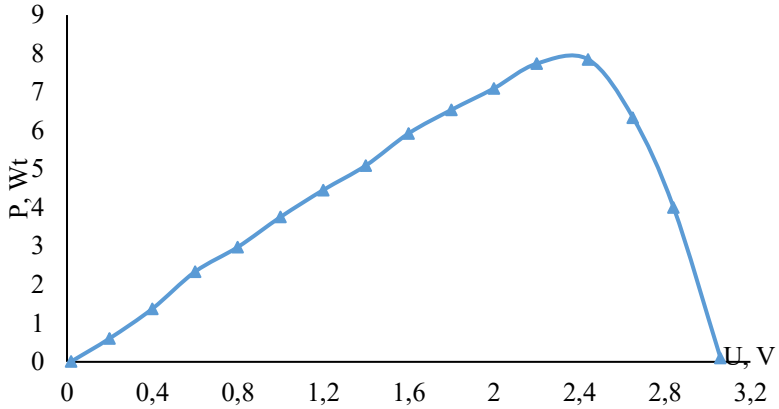
Energetik zonalar diagrammasi va I–V xarakteristikalar o‘rtasidagi bog‘liqlik 2-rasmda keltirilgan energetik zonalar diagrammasi 1-bo‘limda olingan I–V xarakteristikalar natijalarini to‘liq tushuntirib beradi. Xususan: BSF qatlam bilan **Voc ning oshishi** energetik to‘siq orqali I_0 ning kamayishi bilan izohlanadi;tashuvchilar yig‘ilishining yaxshilanishi **FF ning oshishiga** olib keladi;Isc ning deyarli o‘zgarmasligi AlGaAs qatlamning optik yutilishda ishtirok etmasligi bilan bog‘liq.Shu tarzda, energetik zonalar diagrammasi va eksperimental I–V natijalari o‘zaro mantiqiy va fizik jihatdan uzviy bog‘liq ekanligi ko‘rsatildi.

Energetik zonalar diagrammasi tahlili shuni ko‘rsatdiki, AlGaAs BSF qatlamining kiritilishi GaInP/GaAs/GaInAs asosidagi ko‘p qatlamli quyosh elementlarida tashuvchilarni boshqarish mexanizmini tubdan yaxshilaydi. Orqa sirt rekombinatsiyasining kamayishi, ichki elektr maydonning kuchayishi va energetik zonalarning optimal moslashuvi fotoelementning ochiq zanjir kuchlanishi hamda umumiy samaradorligini oshirishga xizmat qiladi.

P–V xarakteristika va maksimal quvvat nuqtasi tahlili

Ushbu bo‘limda GaInP/GaAs/GaInAs (3 qatlamli) hamda GaInP/GaAs/GaInAs/AlGaAs (4 qatlamli) ko‘p qatlamli III–V quyosh elementlarining quvvat–kuchlanish (P–V) xarakteristikalari tahlil qilinadi. P–V xarakteristika quyosh

elementining real ish sharoitidagi energiya ishlab chiqarish imkoniyatini baholashda muhim ahamiyatga ega bo‘lib, aynan shu grafik orqali maksimal quvvat nuqtasi aniqlanadi.



3-rasm. GaInP/GaAs/GaInAs quyosh elementining P–V xarakteristikasi

Grafikda gorizontal o‘q bo‘ylab kuchlanish, vertikal o‘q bo‘ylab esa chiqish quvvati qiymatlari keltirilgan. Quvvat quyidagi ifoda orqali aniqlanadi:

$$P(V) = V \cdot I(V) \quad (4)$$

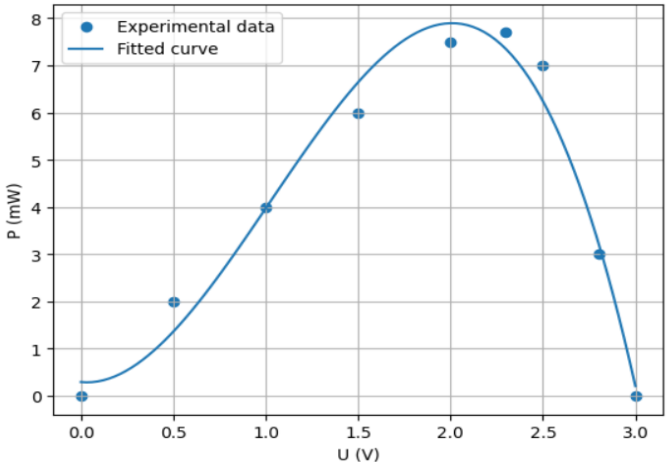
ya’ni P-V xarakteristika bevosita 1-bo‘limda tahlil qilingan I–V egri chizig‘i asosida hosil qilinadi.

P–V egri chizig‘idan ko‘rinishicha, kuchlanish ortib borishi bilan chiqish quvvati dastlab ortadi va ma’lum bir kuchlanish qiymatida maksimal qiymatga erishadi. Ushbu nuqta maksimal quvvat nuqtasi deb ataladi va unga mos keluvchi kuchlanish hamda tok qiymatlari mos ravishda $\mathbf{V_{mp}}$ va $\mathbf{I_{mp}}$ bilan belgilanadi:

$$P_{max}=V_{mp}\cdot I_{mp} \quad (5)$$

Tadqiqot natijalariga ko‘ra, GaInP/GaAs/GaInAs quyosh elementida maksimal quvvat taxminan **Vmp ≈ 2.2–2.4 V** oralig‘ida kuzatiladi. Bu kuchlanish qiymati ochiq zanjir kuchlanishining ma’lum bir ulushiga to‘g‘ri kelib, fotoelementning optimal ish rejimini ifodalaydi.Maksimal quvvat nuqtasining mavjudligi va P–V egri chizig‘ining silliq, aniq maksimumga ega bo‘lishi fotoelementda tashuvchilar transporti samarali tashkil etilganini va ichki yo‘qotishlar nisbatan kichik ekanini ko‘rsatadi.P–V xarakteristikaning shakli bir nechta asosiy fizik omillar bilan belgilanadi:ichki ketma-ket qarshilik;rekombinatsiya jarayonlari; ichki elektr maydonning kuchi; geterointerfeyslar sifati. 3-rasmda keltirilgan P–V egri chiziqning yuqori va tor cho‘qqiga ega bo‘lishi fotoelementning to‘ldirish koeffitsienti **(FF)** yuqori ekanidan dalolat beradi. Bu holat 1-bo‘limda aniqlangan I–V xarakteristikalarning shakli bilan to‘liq mos keladi.

Shuningdek, P–V xarakteristika orqali quyosh elementining kuchlanish bo‘yicha ishlash diapazoni aniqlanadi. Kuchlanish juda kichik bo‘lganda quvvat nolga teng bo‘lib, bu qisqa tutashuv holatiga mos keladi. Aksincha, kuchlanish **Voc** ga yaqinlashganda tok kamayib, quvvat yana nolga tenglashadi. Demak, fotoelement faqat $\mathbf{V_{mp}}$ atrofida maksimal samaradorlik bilan ishlaydi.



4-rasm. 3 va 4 qatlamli III–V quyosh elementlari uchun P–V xarakteristikalar taqqoslanishi

Solishtirma tahlil shuni ko‘rsatadiki, 4 qatlamli GaInP/GaAs/GaInAs/AlGaAs strukturada maksimal quvvat qiymati 3 qatlamli strukturaga nisbatan yuqoriroq. Bu holat birinchi navbatda **Voc ning oshishi** va **FF ning yaxshilanishi** bilan izohlanadi.

AlGaAs BSF qatlamining mavjudligi orqa sirt rekombinatsiyasini kamaytirib, tashuvchilarning faol sohada samaraliroq ishtirok etishini ta’minlaydi. Natijada, maksimal quvvat nuqtasiga mos keluvchi kuchlanish qiymati yuqoriroq

bo‘lib, umumiy energiya chiqishi ortadi.

Maksimal quvvat qiymati quyosh elementining energiya konversiyasi samaradorligini (**η**) aniqlashda asosiy parametr hisoblanadi:

$$\eta = \frac{P_{max}}{P_{in}} \times 100\% \quad (6)$$

bu yerda:

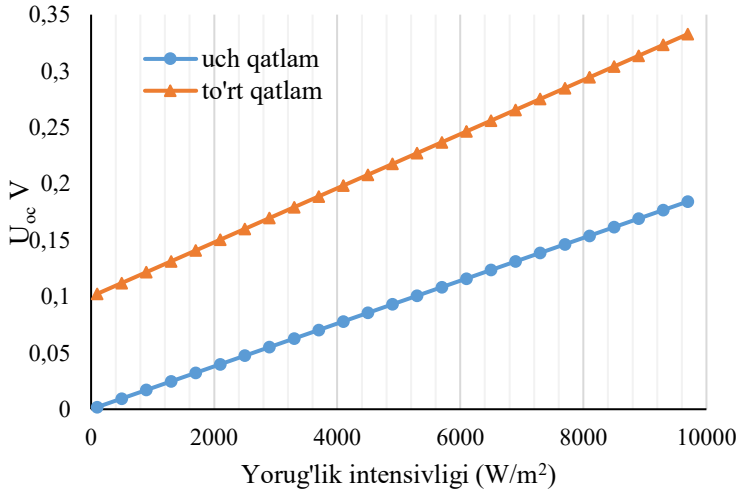
P_{in} — fotoelementga tushayotgan quyosh nurlanish quvvati.

4 qatlamli struktura uchun P_{max} ning oshishi bevosita **η ning ortishiga** olib keladi. Shu tariqa, P–V xarakteristikalar tahlili 2-bo‘limda ko‘rib chiqilgan energetik zonalar diagrammasi va 1-bo‘limdagi I–V xarakteristikalar natijalarini mantiqan to‘ldiradi.

P–V xarakteristikalar tahlili shuni ko‘rsatdiki, GaInP/GaAs/GaInAs/AlGaAs asosidagi 4 qatlamli quyosh elementi maksimal quvvat nuqtasida yuqori energiya ishlab chiqarish qobiliyatiga ega. AlGaAs BSF qatlamining kiritilishi kuchlanish va to‘ldirish koeffitsientining oshishiga olib kelib, umumiy energiya konversiyasi samaradorligini sezilarli darajada yaxshilaydi.

Ochiq zanjir kuchlanishining (Voc) yorug‘lik intensivligiga (P_{in}) bog‘liqligi

Ushbu bo‘limda GaInP/GaAs/GaInAs (3 qatlamli) hamda GaInP/GaAs/GaInAs/AlGaAs (4 qatlamli) ko‘p qatlamli III–V quyosh elementlarida ochiq zanjir kuchlanishining (**V_{oc}**) tushayotgan yorug‘lik intensivligiga (**P_{in}**) bog‘liqligi tahlil qilinadi. Voc–Pin bog‘lanishi quyosh elementlarida rekombinatsiya mexanizmlarini aniqlash va ichki yo‘qotishlarni baholash uchun muhim diagnostik vosita hisoblanadi.



5-rasm. 3 va 4 qatlamli III–V quyosh elementlari uchun Voc ning yorug‘lik intensivligiga (Pin) bog‘liqligi

Grafikda gorizontal o‘qda yorug‘lik intensivligi **P_{in}** , vertikal o‘qda esa ochiq zanjir kuchlanishi **V_{oc}** qiymatlari keltirilgan. Tadqiqotlar standart AM1.5G spektri sharoitida turli yorug‘lik intensivliklarida o‘tkazilgan.

Nazariy jihatdan ochiq zanjir kuchlanishi quyidagi ifoda bilan aniqlanadi:

$$V_{oc} = \frac{kT}{q} \ln\left(\frac{I_{ph}}{I_0} + 1\right) \quad (7)$$

bu yerda:I_{ph}-fototok,I_0-to‘yinganlik toki,k-Boltsman doimiysi,T-absolut harorat,

q-elementar zaryad.

Yorug‘lik intensivligi oshishi bilan fototok I_{ph} deyarli chiziqli ravishda ortadi, natijada **V_{oc} ning logarifmik o‘sishi** kuzatiladi. Shu sababli V_{oc}-P_{in} bog‘lanishi ko‘p hollarda yarim logarifmik xarakterga ega bo‘ladi.

5-rasmdan ko‘rinishicha, har ikkala strukturada yorug‘lik intensivligi ortishi bilan **V_{oc} qiymati oshib boradi.** Biroq 4 qatlamli GaInP/GaAs/GaInAs/AlGaAs strukturada V_{oc} ning mutlaq qiymati barcha P_{in} oralig‘ida 3 qatlamli strukturaga nisbatan yuqoriroq ekani aniqlanadi.Bu holat quyidagi fizik omillar bilan izohlanadi:AlGaAs **back-surface field (BSF)** qatlamining mavjudligi;orqa sirt rekombinatsiyasining kamayishi;tashuvchilar umr davomiyligining ortishi;to‘yinganlik toki I_0 ning kamayishi.Natijada, bir xil yorug‘lik intensivligida 4 qatlamli strukturada ichki potensial farq kattaroq bo‘lib, bu **V_{oc} ning yuqori qiymatlariga olib keladi.**

V_{oc}-P_{in} grafigining qiyaligi rekombinatsiya mexanizmlarini aniqlash imkonini beradi. Agar V_{oc} ning P_{in} ga bog‘liqligi ideal holatga yaqin bo‘lsa, bu holda radiatsion rekombinatsiya ustun hisoblanadi. Aksincha, V_{oc} ning o‘sishi sekinlashsa, bu sirt yoki hajmiy (non-radiatsion) rekombinatsiyaning kuchayganidan dalolat beradi.

Tahlillar shuni ko‘rsatadiki, 4 qatlamli strukturada V_{oc} ning P_{in} ga bog‘liqlik qiyaligi nisbatan pastroq bo‘lib, bu **rekombinatsiya jarayonlarining samarali bostirilganini** ko‘rsatadi. AlGaAs BSF qatlam ushbu jarayonda asosiy rol o‘ynaydi.

4.4-bo‘limda olingan Voc–Pin natijalari 1-bo‘limda tahlil qilingan I–V xarakteristikalar bilan to‘liq mos keladi.

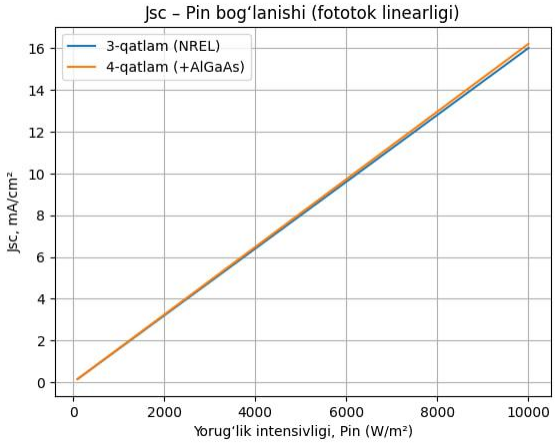
Xususan:BSF qatlam bilan **V_{oc} ning oshishi** I–V egri chiziqda ochiq zanjir nuqtasining yuqoriroqqa siljishi bilan tasdiqlanadi;

yuqori Voc qiymatlari P–V xarakteristikada maksimal quvvatning oshishiga olib keladi (3-bo‘lim);rekombinatsiya yo‘qotishlarining kamayishi umumiy samaradorlikka ijobiy ta’sir ko‘rsatadi.

Ochiq zanjir kuchlanishining yorug‘lik intensivligiga bog‘liqligi tahlili shuni ko‘rsatdiki, GaInP/GaAs/GaInAs/AlGaAs asosidagi 4 qatlamli quyosh elementi barcha yorug‘lik intensivliklarida yuqori V_{oc} qiymatlarini ta’minlaydi. AlGaAs BSF qatlamining mavjudligi rekombinatsiya jarayonlarini samarali kamaytirib, ichki elektr xossalarni yaxshilaydi va fotoelektrik konversiya samaradorligini oshirishga xizmat qiladi.

Qisqa tutashuv toki (J_{sc}) ning yorug‘lik intensivligiga (P_{in}) bog‘liqligi

Ushbu bo‘limda GaInP/GaAs/GaInAs (3 qatlamli) hamda GaInP/GaAs/GaInAs/AlGaAs (4 qatlamli) ko‘p qatlamli III–V quyosh elementlarida qisqa tutashuv tok zichligining **(J_{sc})** tushayotgan yorug‘lik intensivligiga **(P_{in})** bog‘liqligi tahlil qilinadi. J_{sc}–P_{in} bog‘lanishi quyosh elementlarida fotogeneratsiya jarayonining samaradorligini va yutilgan fotonlarning elektr tokka aylanish darajasini baholash imkonini beradi.



6-rasm. 3 va 4 qatlamli III–V quyosh elementlari uchun Jsc ning yorug‘lik intensivligiga (Pin) bog‘liqligi

Grafikda gorizontal o‘qda yorug‘lik intensivligi **Pin (W/m²),** vertikal o‘qda esa qisqa tutashuv tok zichligi **Jsc (mA/cm²)** qiymatlari keltirilgan. O‘lchovlar AM1.5G standart spektri sharoitida, yorug‘lik intensivligi keng diapazonda o‘zgartirilgan holda amalga oshirilgan.

Nazariy jihatdan qisqa tutashuv tok zichligi yutilgan fotonlar soniga to‘g‘ridan-to‘g‘ri bog‘liq bo‘lib, quyidagi ifoda bilan aniqlanadi:

$$J_{sc} = q \int_{\lambda}^{\lambda} \Phi(\lambda, Pin) \cdot A(\lambda) \cdot \eta_{col}(\lambda) d\lambda \quad (8)$$

Bu yerda: Φ(λ,Pin)- tushayotgan fotonlar oqimi,A(λ)-spektral yutilish koeffitsienti,

η_{col}-tashuvchilarni yig‘ish samaradorligi.Yorug‘lik intensivligi oshishi bilan fotonlar oqimi chiziqli ravishda ortadi, shuning uchun ideal holatda **Jsc ning Pin ga chiziqli bog‘liqligi** kuzatiladi.

6-rasmdan ko‘rinishicha, har ikkala strukturada ham yorug‘lik intensivligi oshishi bilan **J_{sc} deyarli chiziqli ravishda ortib boradi.** Bu holat ko‘p qatlamli III–V quyosh elementlarida fotogeneratsiya jarayoni samarali tashkil etilganini va tashuvchilarni yig‘ish darajasi yuqori ekanini ko‘rsatadi.

Muhim jihati shundaki, 3 va 4 qatlamli strukturalar uchun **J_{sc} qiymatlari bir-biriga juda yaqin.** Bu holat AlGaAs BSF qatlamining optik yutilish jarayonida deyarli ishtirok etmasligi bilan izohlanadi. AlGaAs qatlamning asosiy vazifasi:elektr maydonni kuchaytirish;rekombinatsiyani kamaytirish;kuchlanish va samaradorlikni oshirish bo‘lib, u fototok miqdorini sezilarli oshirmaydi.

Yorug‘lik intensivligining yuqori qiymatlarida Jsc–Pin bog‘lanishining chiziqlilikdan biroz og‘ishi kuzatilishi mumkin. Bu holat quyidagi omillar bilan bog‘liq:tashuvchilar rekombinatsiyasining kuchayishi;ichki elektr maydonning qisman ekranlanishi;issiqlik ta’siri tufayli tashuvchilar harakatchanligining kamayishi.Biroq tahlillar shuni ko‘rsatadiki, 4 qatlamli GaInP/GaAs/GaInAs/AlGaAs strukturada yuqori Pin sohasida ham Jsc ning barqarorroq o‘zgarishi kuzatiladi. Bu AlGaAs BSF qatlamining tashuvchilarni faol sohada ushlab turish mexanizmi bilan bog‘liq.

5-bo‘limda olingan J_{sc}–Pin natijalari oldingi bo‘limlar bilan mantiqan uzviy bog‘liq:1-bo‘limda ko‘rsatilganidek, **Isc ning qatlamlar soniga bog‘liq emasligi** Jsc–Pin grafigida ham tasdiqlanadi; 3-bo‘limda ko‘rib chiqilgan maksimal quvvatning oshishi Jsc emas, balki **V_{oc} va FF ning ortishi** bilan bog‘liq;4-bo‘limda aniqlangan rekombinatsiya mexanizmlarining bostirilishi yuqori P_{in} sohasida J_{sc} ning barqarorligini ta’minlaydi.

Xulosa. Qisqa tutashuv tok zichligining yorug‘lik intensivligiga bog‘liqligi tahlili shuni ko‘rsatdiki, GaInP/GaAs/GaInAs/AlGaAs asosidagi 4 qatlamli quyosh elementi fotogeneratsiya nuqtai nazaridan 3 qatlamli analogiga

o‘xshash xatti-harakatga ega. AlGaAs BSF qatlamining asosiy afzalligi fototokni oshirish emas, balki kuchlanish, to‘ldirish koeffitsienti va umumiy samaradorlikni yaxshilashdan iborat ekani ilmiy jihatdan tasdiqlandi.

Annotatsiya. *Ushbu ishda $n^+–p–p^+$ strukturali kremniy asosli ikki tomonlama quyosh elementining chiqish parametrlariga yorug'likning ta'siri nazariy jihatdan o'rganildi. Yorug'lik intensivligi asosida fotonlar oqimi, qisqa tutashuv toki zichligi va salt ishlash kuchlanishi aniqlanib, qurilmaning samaradorligi baholandi. Hisoblash natijalariga ko'ra, quyosh elementining foydali ish koeffitsiyenti taxminan 29.1 % ni tashkil etishi aniqlandi. Olingan natijalar ikki tomonlama quyosh elementlarining samaradorligini oshirishda muhim ahamiyatga ega.*

Kalit so'zlar: *ikki tomonlama quyosh elementi, $n^+–p–p^+$ struktura, kremniy, yorug'lik intensivligi, qisqa tutashuv toki, samaradorlik.*

ИССЛЕДОВАНИЕ ВЛИЯНИЯ СВЕТА НА ВЫХОДНЫЕ ПАРАМЕТРЫ ДВУХСТОРОННЕЙ СОЛНЕЧНОЙ БАТАРЕИ НА ОСНОВЕ КРЕМНИЯ СО СТРУКТУРОЙ $N^+–P–P^+$

Аннотация. *В данной работе теоретически исследовано влияние освещённости на выходные параметры кремниевого двустороннего солнечного элемента со структурой $n^+–p–p^+$. На основе интенсивности падающего излучения определены поток фотонов, плотность тока короткого замыкания и напряжение холостого хода, а также оценена эффективность устройства. Результаты расчётов показали, что коэффициент полезного действия солнечного элемента составляет примерно 29.1 %. Полученные результаты имеют важное значение для повышения эффективности двусторонних солнечных элементов.*

Ключевые слова: *двусторонний солнечный элемент, структура $n^+–p–p^+$, кремний, интенсивность света, ток короткого замыкания, эффективность.*

STUDY OF THE INFLUENCE OF LIGHT ON THE OUTPUT PARAMETERS OF A $n^+–p–p^+$ STRUCTURED SILICON-BASED DOUBLE-SIDED SENSITIVE SOLAR CELL

Abstract. *In this work, the effect of illumination on the output parameters of a silicon double-sided solar cell with an $n^+–p–p^+$ structure was theoretically investigated. Based on the incident light intensity, the photon flux, short-circuit current density, and open-circuit voltage were determined, and the efficiency of the device was evaluated. The calculation results showed that the efficiency of the solar cell is approximately 29.1%. The obtained results are important for improving the performance of double-sided solar cells.*

Keywords: *bifacial solar cell, $n^+–p–p^+$ structure, silicon, light intensity, short-circuit current, efficiency.*

Kirish

Yarimo‘tkazgichli qurilmalar asosida elektr energiyasini ishlab chiqarish texnologiyalari hozirgi kunda jadal sur’atlarda rivojlanib bormoqda. Xususan, quyosh energiyasidan elektr energiya olish texnologiyasi ilk bor 1954-yilda amaliyotga joriy etilgan bo‘lib, bugungi kunda u qayta tiklanuvchi energiya manbalari orasida yetakchi yo‘nalishlardan biriga aylangan [1].

Tabiatda keng tarqalgan kremniy materiali asosida tayyorlangan quyosh elementlari sanoatda eng ko‘p qo‘llaniladigan fotoelektrik qurilmalar hisoblanadi. Biroq kremniy asosli quyosh elementlarining maksimal samaradorligi fundamental fizik cheklovlar bilan belgilanadi. Jumladan, kristall kremniyli quyosh elementlari uchun foydali ish koeffitsiyenti taxminan 25.6 % ga teng ekanligi aniqlangan [2]. Ushbu cheklanish asosan zaryad tashuvchilarning rekombinatsiya jarayonlari, optik yo‘qotishlar hamda ichki qarshiliklar bilan bog‘liq.

Kremniy yer qobig‘ida eng ko‘p uchraydigan elementlardan biri bo‘lganligi sababli, hozirgi kunda ishlab chiqarilayotgan quyosh elementlarining qariyb 85 % aynan ushbu material asosida tayyorlanadi [3]. Shu bilan birga, quyosh energiyasidan foydalanish samaradorligini oshirish maqsadida yangi konstruktiv yechimlar, xususan, ikki tomonlama quyosh elementlari ishlab chiqilmoqda.

Ikki tomonlama quyosh elementlarining asosiy afzalligi shundan iboratki, ular nafaqat to‘g‘ridan-to‘g‘ri tushayotgan quyosh nurlarini, balki atrof-muhitdan qaytgan diffuz va reflektiv nurlanishni ham qabul qila oladi. Bu esa umumiy generatsiya quvvatining oshishiga olib keladi. Tahlillarga ko‘ra, 2028-yilga borib bifatsial quyosh elementlarining ulushi bir tomonlama elementlarga nisbatan sezilarli darajada ortib, taxminan 40 % gacha yetishi prognoz qilinmoqda [4].

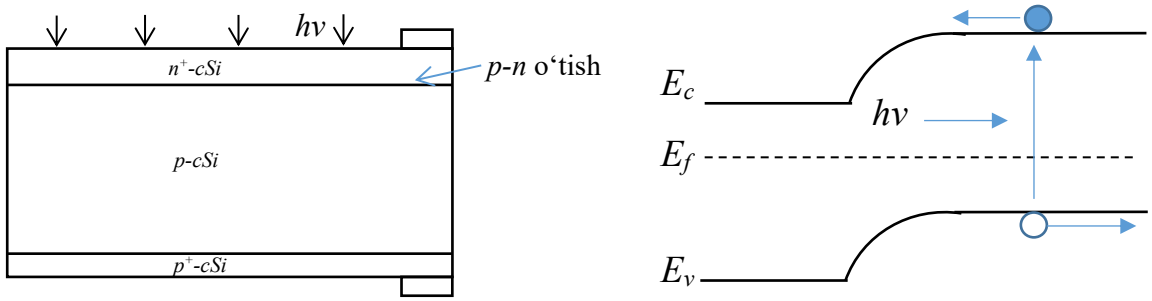
Quyosh elementlarining samaradorligini oshirishda ularning konstruktiv tuzilishini takomillashtirish bilan bir qatorda, fotoelektrik parametrlarning yorug‘lik sharoitlariga bog‘liqligini chuqur o‘rganish muhim ilmiy ahamiyat kasb etadi. Ma’lumki, yorug‘lik modda sirtiga tushganda uning bir qismi yutiladi, bir qismi qaytadi va yana bir qismi muhit orqali o‘tadi [5]. Aynan ushbu jarayonlar quyosh elementlarining chiqish parametrlariga bevosita ta’sir ko‘rsatadi.

Ikki tomonlama sezgir quyosh elementlari yorug‘likni old va orqa sirt orqali qabul qilishi bilan ajralib turadi [6]. Biroq diffuz nurlanish ta’sirida ularning chiqish parametrlarining kompleks tahlili yetarli darajada o‘rganilmagan.

Shu munosabat bilan, mazkur ishda n^+–p–p^+ strukturali kremniy asosli ikki tomonlama quyosh elementining chiqish parametrlariga yorug‘lik ta’siri kompleks tarzda tadqiq etiladi. Tadqiqot natijalari quyosh elementlarining samaradorligini oshirish hamda ularni amaliy qo‘llash imkoniyatlarini kengaytirishda muhim ilmiy ahamiyatga ega.

Metod

Quyosh enegiyasi uning intensivligi bilan aniqlanadi. Quyoshdan kelayotgan yorug‘lik intensivligini pironometr yordamida aniqlab olinadi. Ko‘zga ko‘rinuvchi yorug‘lik to‘lqini 380-760 nm orasida joylashgan. Shunig uchun eng kichik ko‘za ko‘rinuvchi yorug‘lik to‘lqini hisoblanib unga 350 W/m² yorug‘lik nuri tushmoqda deb olinadi. Ikki tomonlama quyosh elementi tarkibi kremniy elementidan iborat ekanligini hisobga olib undan olindan elektr energiyaning maksimal qiymatini aniqlaymiz, yani uning FIKni. Bunda tajriba qurilmalari orqali olingan natijani nazariy hisoblash usuli bilan keltirib o‘tamiz. Bunda pironometr va termometrdan foydalanish yetarlidir. Pironometr orqali yorug‘lik intensivligi va termometr orqali namuna qancha haroratda turganligini aniqlanadi. Barcha quyosh elementlari elektr toki hosil qilishda p-n o‘tish xossasi muhim vazifa bajaradi. Shuni aytish mumkinki, yorug‘lik zarrasi dastlab modda sirtida yutiladi, so‘ng nomuvozanatli zaryad tashuvchilarni hosil qiladi va ularning dreyf, diffusion harakati yuzaga keladi. Natijaga generastiya va rekombinatsiya jarayoni yuzaga keladi. Quyida ikki tomonlama quyosh elementi va uning zona diogrammasi ko‘rsatilgan 1-rasm. Asosan namuna kremniy elementidan iborat ekanligini hisobga olsa uning taqiqlangan soxa energiyasi temperaturaga bog‘liq ravishda $E_{(T)} = 1.12$ eV ga teng. Quyida uning exemasi va zona diagrammasi keltirilgan. Bunda n^+-p-p^+ struktura olingan.



1-rasm. a) n^+-p-p^+ strukturaga ega ikki tomonlama quyosh elementi, b) ikki tomonlama quyosh elementining energiya zona diogramamasi.

Hisoblash uchun kerakli paramterlar ushbu turdagi namunasi uchun quyidagi 1-jadvalda keltirilgan.

1-jadval

Fizik parametr	Belgisi	Qiymati
Birlik sirtga tushayotgan yorug‘lik oqimi, W/m^2	Φ	350
Yorug‘lik energiyasi, eV	E	1.63
Yorug‘lik to‘lqin uzunligi chegarasi, nm	λ	400-760
Taqiqlangan soxa energiyasi, eV	E_g	1.12
Temperatura, K	T	300
Elektronlar uchun harakatchanlik, $sm^2/(s\ V)$	μ_n	1000
Kovaklar uchun harakatchanlik, $sm^2/(s\ V)$	μ_p	400
Elektronlar uchun yashash vaqti, s	τ_n	10^{-7}
Kovaklar uchun yashash vaqti, s	τ_p	10^{-5}
Donorlar kirishma konsentrastiyasi, sm^{-3}	N_d	10^{-19}
Akseptorlar kirishma konsentrastiyasi, sm^{-3}	N_a	10^{-17}
Xususiy zaryad tashuvchilar konsentratsiyasi	n_i	10^{10}
Elektron zaryadi, C	e	$1.6\ 10^{-19}$
Boltsman doimiysi, J/K	k	$1.38\ 10^{-23}$

Namuna uchun emitter qatlami 1 mkm baza qatlam qalinligi 180 mkm deb olingan. Emitter va baza uchun kirishma konsentarstisyasi qiymati 10^{19}-10^{17} sm^{-3} ekanligini belgilangan. Zaryad tashuvchilarning yashash vaqti va harakatchalik qiymatlari tashqi temperaturaga bog‘lik. Ikki tomonlama quyosh elementi birlik sirt yuzaga tushayotgan fotonlar oqimi 350 W/m^2 ekanligini hisobga olib, ushbu yorug‘lik energiyasiga mos kelgan fotonlar soni N_{ph} ni aniqlaymiz. Buning uchun quyidagi tenglama yordamida aniqlaymiz.

$$N_{ph} = \frac{\Phi}{E} = \frac{350}{1.63*1.6\ 10^{-19}} = 1.3419\ 10^{21} \quad \left(\frac{1}{m^2 s}\right) \tag{1}$$

Ushbu N_{ph} aniqlangan natija tushayotgan fotonlar sonining umumiy qiymatini bildiradi. Agar ushbu tushayotgan fotonlarning har biri tok tashuvchi elektron kovak jufti hosil qilsa undagi tok zichligi J_{sc} ifoda bilan topiladi. Bu ifoda birlik yuzadan yutilayotgan 1 ta foton 1 ta elektron kovak juftligini hosil qilishini bildiradi va quyidagicha aniqlanadi.

$$J_{sc} = e\ N_{ph} = 1.6\ 10^{-19}(Cl) * 1.3419\ 10^{21} \left(\frac{1}{m^2 s}\right) = 21.4704\ \left(\frac{mA}{sm^2}\right) \tag{2}$$

Aniqlangan natijadan shuni ko‘rish mumkinki, har bir foton hosil qilgan tok tashuvchi nomuvozanatli zaryad tashuvchilar kontaktlarga yetib borib tok hosil qilishi bildiradi.

Yuqorida keltirilgan elektron hamda kovakning harakatchanligidan foydalanib ularning namunadagi erkin yugurish yo‘li aniqlanadi. Buning uchun diffuziya koeffitsiyenti yordami orqali topiladi. Diffuziya koeffitsiyenti zaryad tashuvchilarning harakatchanligi va temperaturaga kuchli bog‘langan. Temperatura ortishi bilan uning qiymati chiziqli ravishda ortadi. Buni quyidagi tenglama yordamida aniqlaymiz.

$$L_n = \sqrt{D_n \tau_n}\,; \qquad L_p = \sqrt{D_p \tau_p}\,; \qquad D_n = \frac{kT}{q}\mu_n\,; \qquad D_p = \frac{kT}{q}\mu_p \tag{3}$$

$$L_n = \sqrt{\frac{1.38\ 10^{-23} * 300 * 1000}{1.6\ 10^{-19}} 10^{-7}} = 1.608^{-3}\ sm = 16.08\ \mu m \tag{4}$$

Ushbu tenglamadan elektron uchun erkin yugurish yo‘li aniq qiymatini ko‘ramiz. Shundan so‘ng kovak uchun ushbu qiymat quyidagicha ekanligi kelib chiqadi.

$$L_p = \sqrt{\frac{1.38\ 10^{-23} * 300 * 400}{1.6\ 10^{-19}} 10^{-5}} = 10.17^{-3}\ sm = 101.7\ \mu m \tag{5}$$

Ushbu aniqlangan qiymatlar yordamida quyosh elementi uchun to‘yinish toki son qiymatini aniqlaymiz.

$$J_o = q n_i^2 \left(\frac{D_n}{L_n N_d} + \frac{D_p}{L_p N_a}\right) = 1.6^{-19} 10^{20} \left(\frac{26}{1.6^{-3} 10^{19}} + \frac{10.4}{1.017^{-2} 10^{17}}\right) = 2^{-13}\ \frac{A}{sm^2} \tag{6}$$

Ushbu ishlab chiqilgan tenglama natijasida salt ishlash kuchlanishi aniqlaymiz.

$U_{oc} = \frac{kT}{q} ln\left(\frac{J_{sc}}{J_o} + 1\right)$ tenglamadan ko‘rinadiki $J_{sc}/J_o >> 1$ ushbu shartni hisobga olib 1 qiymatni tashlab yuborsak bo‘ladi. Natijada quyidagicha tenglikga ega bo‘lamiz.

$U_{oc} = \frac{kT}{q} ln\left(\frac{J_{sc}}{J_o}\right)$ ushbu tenglama yordamida dastlab tok zichliklar nisbati olinadi. Jumladan bu qiymat quyidagicha bo‘ladi.

$\frac{J_{sc}}{J_o} = \frac{0.02147}{2^{-13}} = 10.7352^{10}$ ekanligi kelib chiqadi, quyida o‘zgarmas kattalik sifatida kT/q belgilab qiymatini aniqlab olamiz. Uning qiymati 0.026 V, ekanligi kelib chiqadi.

$$U_{oc} = \frac{kT}{q} ln\left(\frac{J_{sc}}{J_o}\right) = 0.026 ln(10.7352^{10}) = 0.617\ V \tag{7}$$

Yuqorida keltirilgan kattaliklar orqali quvvat ifodasini topish yetarlidir.

$$P_{max} = FF\ J_{sc} U_{oc} = 0.77 * 0.02147 * 0.617 = 0.0102\ \frac{Wt}{sm^2} \tag{8}$$

Erishilgan maksimal quvvat yordamida quyosh elementining foydali ish koeffitsiyentini quyida aniqlanadi.

$$\eta = \frac{P_{max}}{\Phi} = \frac{0.0102}{0.035} = 0.291 = 29.1\ \% \quad (9)$$

Ikki tomonlama quyosh elementi sirtiga yorug‘lik tushishi natijasida undan olinayotgan quvvat orqali samaradorlikni topishga erishildi. Ko‘rishimiz mumkinki samaradorli quyosh elementining salt ishlash kuchlanishiga, qisqa tutashuv toki, to‘yinish toki, zaryad tashuvchilarning yashash vaqti, harakatchanligi va boshqa elektrofizik kattalikarga bog‘liq ekan.

Xulosa

Ushbu ishda nazariy hisoblashlar asosida n^+–p–p^+ strukturali kremniy asosli ikki tomonlama quyosh elementining maksimal foydali ish koeffitsiyenti baholandi. Olingan natijalarga ko‘ra, kremniy asosli quyosh elementi uchun samaradorlikning maksimal qiymati taxminan 29.1 % ni tashkil etishi aniqlandi. Ushbu qiymat bir p–n o‘tishli quyosh elementlari uchun nazariy chegaraga yaqin bo‘lib, qurilmaning ishlash samaradorligi fundamental fizik omillar bilan cheklanishini ko‘rsatadi. Shu bilan birga, quyosh elementining konstruktiv tuzilishini takomillashtirish, xususan, material tarkibi va qatlamlar konfiguratsiyasini o‘zgartirish orqali samaradorlikni oshirish imkoniyati mavjud. Bu, ayniqsa, yangi avlod fotoelektrik materiallar va ko‘p qatlamli strukturalardan foydalanishda muhim ahamiyat kasb etadi.

Tadqiqot natijalari shuni ko‘rsatadiki, yorug‘lik spektrining o‘rtacha energiyasi taxminan 1.4–1.5 eV atrofida bo‘lgan sharoitda quyosh elementi uchun optimal ish rejimi yuzaga keladi. Ushbu energiya diapazonida zaryad tashuvchilar kamroq rekombinatsiyaga uchraydi va ularning kontaktlarga yetib borish ehtimoli ortadi, bu esa chiqish parametrlarining yaxshilanishiga olib keladi. Natijada, ikki tomonlama quyosh elementlarida yorug‘likdan samarali foydalanish va zaryad tashuvchilarni yig‘ish jarayonlarini optimallashtirish orqali yuqori samaradorlikka erishish mumkinligi ko‘rsatildi.

Annotatsiya: *Mazkur ilmiy ishda qatlamli silikat materiali sifatida tabiiy Vermikulit asosida yuqori darajada to'ldirilgan organo-noorganik polimer kompozit materiallar sintez qilindi va ularning spektral xossalari o'rganildi. Tajriba jarayonida vermikulit sulfat kislota (H_2SO_4) va xlorid kislota (HCl) yordamida kimyoviy modifikatsiyalandi. Keyinchalik ortiqcha kislotalar ammiak eritmasi hamda natriy gidrokarbonat ($NaHCO_3$) yordamida neytrallandi, mahsulot filtrlash va quritish bosqichlaridan o'tkazildi. Kompozit materiallar tayyorlashda polimer matritsa sifatida Polietilen (PE), Polipropilen (PP) va Poliamid (PA) tanlab olindi. Modifikatsiya jarayoni eritilgan holatda, 10:1 (polimer:vermikulit) massa nisbatida amalga oshirildi. Olingan kompozitlar Raman spektroskopiya usuli yordamida tahlil qilindi. Spektral natijalar polimer zanjirlari bilan modifikatsiyalangan vermikulit o'rtasida molekulyar darajadagi o'zaro ta'sir mavjudligini ko'rsatdi.*

Kalit so'zlar: *vermikulit, qatlamli silikatlar, polimer kompozitlar, Raman spektroskopiyasi , organo-noorganik materiallar, modifikatsiya.*

STUDY OF THE SPECTRA OF HIGHLY FILLED ORGANO-INORGANIC POLYMER MATERIALS BASED ON LAYERED SILICATE MATERIALS USING THE RAMAN SPECTROSCOPY METHOD

Abstract:*In this scientific study, highly filled organo-inorganic polymer composite materials based on natural vermiculite as a layered silicate material were synthesized, and their spectral properties were studied. During the experiment, vermiculite was chemically modified using sulfuric acid (H_2SO_4) and hydrochloric acid (HCl). Subsequently, the excess acids were neutralized with an ammonia solution and sodium bicarbonate ($NaHCO_3$), and the product was subjected to filtration and drying. Polyethylene (PE), Polypropylene (PP), and Polyamide (PA) were selected as the polymer matrix for the preparation of the composite materials. The modification process was carried out in the melt at a mass ratio of 10:1 (polymer:vermiculite). The resulting composites were analyzed using Raman spectroscopy methods. Spectral results showed the existence of molecular-level interactions between polymer chains and modified vermiculite.*

Keywords: *vermiculite, layered silicates, polymer composites, Raman spectroscopy, organo-inorganic materials, modification.*

ИССЛЕДОВАНИЕ СПЕКТРОВ ВЫСОКОЗАПОЛНЕННЫХ ОРГАНО-НЕОРГАНИЧЕСКИХ ПОЛИМЕРНЫХ МАТЕРИАЛОВ НА ОСНОВЕ СЛОИСТЫХ СИЛИКАТНЫХ МАТЕРИАЛОВ МЕТОДОМ РАМАНОВСКОЙ СПЕКТРОСКОПИИ

Аннотация: *В рамках данного научного исследования были синтезированы высокозаполненные органо-неорганические полимерные композиционные материалы на основе природного вермикулита как слоистого силикатного материала, а также изучены их спектральные свойства. В ходе эксперимента вермикулит подвергали химической модификации с использованием серной кислоты (H_2SO_4) и соляной кислоты (HCl). Затем избыток кислот был нейтрализован раствором*

аммиака и бикарбонатом натрия ($NaHCO_3$), после чего продукт подвергался фильтрации и сушке. В качестве полимерной матрицы для получения композиционных материалов были выбраны полиэтилен (PE), полипропилен (PP) и полиамид (PA). Процесс модификации проводился в расплаве при массовом соотношении 10:1 (полимер:мусковит). Полученные композиты были проанализированы методом рамановской спектроскопии. Результаты спектрального анализа указывают на наличие взаимодействия на молекулярном уровне между вермикулитом и полимерными цепями.

Ключевые слова: *вермикулит, слоистые силикаты, полимерные композиты, рамановская спектроскопия, органо-неорганические материалы, модификация.*

Adabiyotlar tahlili

Polimer nanokompozitlar so‘nggi yillarda materialshunoslikda muhim yo‘nalishlardan biri bo‘lib, ular polimer matritsaga nanoo‘lchamli to‘ldiruvchilar qo‘shish orqali yuqori xossalarga ega materiallar olishga asoslanadi. Giannelis (1996) va Alexandre & Dubois (2000) ishlarida qatlamli silikatlar bilan mustahkamlangan polimer nanokompozitlarning tuzilishi, xususan interkalatsiya va eksfoliatsiya jarayonlari muhim ekanligi ko‘rsatilgan. Eksfoliatsiyalangan struktura materialning mexanik mustahkamligi va barqarorligini sezilarli oshiradi.Beyer (2002) tadqiqotlarida bunday nanokompozitlarning olovga chidamli materiallar sifatida qo‘llanilishi yoritilgan bo‘lib, ular yonish jarayonini sekinlashtirishi va xavfsizlikni oshirishi aniqlangan. Haider va hamkorlari (2016) esa turli polimer tizimlarida silikatlarning ta’sirini o‘rganib, nanozarralarning bir tekis taqsimlanishi material xossalarini yaxshilashini ta’kidlagan.Shuningdek, Ferrari va Basko (2013) grafen materialini Raman spektroskopiya yordamida o‘rganishning ahamiyatini ko‘rsatgan bo‘lib, grafenning yuqori elektr va mexanik xossalari uni istiqbolli nanomaterialga aylantiradi.Umuman olganda, adabiyotlar tahlili shuni ko‘rsatadiki, polimer nanokompozitlar va grafen asosidagi materiallar zamonaviy sanoatda yuqori mustahkamlik, issiqlikka chidamlilik va funksional xossalarga ega yangi avlod materiallarini yaratishda muhim ahamiyatga ega.

Kirish (Introduction)

Mazkur ishda polietilen, polipropilen hamda poliamid asosidagi organo-noorganik kompozit materiallarning ichki tuzilishini aniqlash va komponentlar o‘rtasidagi o‘zaro ta’sir mexanizmlarini baholash maqsadida Raman spektroskopiya usuli qo‘llanildi. Ushbu yondashuv polimer matritsa va qatlamli silikat (vermikulit) o‘rtasidagi bog‘lanish xususiyatlarini turli darajalarda - elektron va molekulyar darajada - kompleks o‘rganish imkonini berdi.

Polimer va silikat (yoki umuman olganda noorganik material) ning har qanday jismoniy aralashmasi majburiy ravishda nanokompozit hosil qilavermaydi. Bu holat polimer aralashmalariga o'xshaydi. Ko'p hollarda alohida fazalarga ajralish sodir bo'ladi. Aralashmaydigan tizimlarda organik va noorganik komponentlar o'rtasidagi zaif jismoniy tortishish nisbatan past mexanik xususiyatlarga olib keladi. Bundan tashqari, zarrachalarning aglomeratsiyasi mustahkamlikni kamaytirib, zaifroq materiallar hosil qilishga moyil hisoblangan [1]. Shunday qilib, polimer silikat qatlamlari orasiga interkalatsiya qila olmaganda, fazaviy ajralgan kompozit hosil bo'ladi, uning xususiyatlari an'anaviy mikrokompozitlarnikiga mos kelgan [2,3].

Vermikulit - $(Mg, Fe, Al)_3(Al, Si)_4O_{10}(OH)_2 \cdot 4H_2O$ umumiy formulaga ega bo‘lgan gidratlangan qatlamli silikat minerali hisoblanadi. Uning kristall tuzilishi 2:1 tipdagi qatlamli tuzilishga ega bo‘lib, bu esa uning fizik-kimyoviy xossalarini belgilaydi. Vermikulit odatda oltinsimon, jigarrang yoki bronza ranglarda uchraydi.

1-rasm. Vermikulit ko‘rinishi

Shu bilan birga, vermikulit yengil va g‘ovak tuzilishga ega bo‘lib, issiqlik va tovush izolyatsiyasi xossalari yuqori darajada namoyon bo‘ladi. U namlikni yaxshi ushlab turadi hamda kimyoviy jihatdan barqaror material hisoblanadi. Nanogillar poliamidlar, polistirol, polietilen va polipropilen kabi bir nechta tijorat polimerlari bilan birlasha oladi [4].

Qatlamli silikatlar (ayniqsa montmorillonit, kaolinit va vermikulit) asosida olingan organo-noorganik polimer nanokompozitlar hozirgi zamon materialshunosligining eng istiqbolli yo‘nalishlaridan biri hisoblanadi. Ushbu materiallarning strukturasi va xossalarini chuqur o‘rganishda spektral tahlil usullaridan IQ-spektroskopiya, Raman spektroskopiya, UV-Vis va boshqalar muhim ahamiyat kasb etadi.

Metodologiya (Materials and Methods)

Vermikulitga kimyoviy ishlov berish

Vermikulit asosidagi qatlamli silikatning ishlov berish bosqichi quyidagi jarayonlarni o‘z ichiga oladi:

Vermikulitni ishchi holatga keltirish uchun 42 g namunaga 200 ml suvga qo‘shilgan 40 ml konsentrlangan H_2SO_4 eritmasi bilan kimyoviy ishlov berildi, aralashma 80°C da quritildi va mexanik aralashtirgichda 1000 ayl/min tezlikda 10 soat davomida aralashtirildi. Natijada, quyuq va yaltiroq modifikatsiyalangan holga o’tganini ko’rsatadi (2- rasm).

2-rasm. Kislota bilan ta’sirlashuvdan keyingi tayyor bo’lgan aralashmali vermikulit.

Hosil bo‘lgan mahsulotdagi ortiqcha kislotani neytrallash uchun ikki bosqichli yuvish amalga oshirildi. Dastlab mahsulot 60 ml suvga qo‘shilgan 20 ml ammiak eritmasi bilan ishlov berilib, pH universal indikator orqali nazorat qilindi. Keyingi bosqichda distillangan suvga tayyorlangan $NaHCO_3$ eritmasi yordamida yuvish bajarildi; bu jarayonda $NaHCO_3$ kislota bilan reaksiyaga kirib, natriy tuzi, suv va CO_2 hosil qiladi. Shu orqali mahsulotdagi kislotali aralashmalar bartaraf etildi. Tozalangan massa filtratsiya qilinib, erkin oqishi ta’minlandi (3-rasm).

3-rasm. Filtr qog’ozdav vermikutning o’tish jarayoni va indikator qog’ozi

Vermikulitni modifikatsiyalash jarayoni tezlashtirish maqsadida tayyor aralashma yuzasi keng idishlarga solinib, xona haroratida 1 sutka davomida quritildi. Quritish davomida mahsulotning fizik holati, rangi va tuzilmasi kuzatildi, pH universal indikator bilan nazorat qilindi. Neytrallash va suvli qatlamdan tuzlar ajratilgach, mahsulot qattiq holatga o‘tdi; bug‘lanish jarayoni molekulalarni yaqinlashtirib, kristallanish yoki amorf tuzilishga olib keldi. Shu orqali vermikulit polimerlar bilan modifikatsiyalash jarayoniga tayyor holatga keldi va mahsulot saqlanishi hamda tahlilga yaroqliligi oshdi (4-rasm).

4 – rasm. Quritilgan va maydalangan vermikulit

Namlikdan tozalangan mahsulot uzoq muddat saqlanishi, fizik-kimyoviy tahlillarga tayyor bo‘lishi va boshqa bosqichlar (presslash, analitik o‘lchovlar) uchun moslashini ta’minlaydi. Shu bilan birga, yuzasi keng idishga yoyilgan modda asta-sekin bug‘lanib, qattiq holatga o‘tadi - bu jarayon **quritish va qotish** deb ataladi.

1 - jadval

Bosqich	pH qiymati
Sulfat kislotali eritma	1.5
Vermikulit qo’shilgach	2.5
Mishelka bilan aralashtirilganda	3.0
10 soatdan so’ng (massaning holati)	3.2
Ammiak qo’shilgach	6.5
$NaHCO_3$ bilan yuvilgach	7.0

Kompozitlarni tayyorlash

Tajriba davomida vermikulit oldindan kimyoviy faollashtirilish maqsadida H_2SO_4 ning distillangan suvdagi eritmasi bilan ishlov berildi. Quritilgan va elangan vermikulit eritmaga qo‘shilib, bir jinsli massa hosil qilindi va 80-90 °C da 10 soat davomida qizdirildi, natijada quyuq, yarim yopishqoq holatga kelgan massa olingan. Modifikatsiyalash jarayonida polimerlar - polietilen (PE), polipropilen (PP) va poliamid (PA) - har birining suyuqlanish haroratiga mos tarzda alohida

ishlov berildi. Shu orqali vermikulit asosidagi yuqori to‘ldirilgan organo-noorganik kompozit materiallar tayyorlandi (5-rasm), bu esa fazalararo o‘zaro ta’sir va mexanik xossalarni yaxshilashga xizmat qiladi.

5 – rasm. Polimer materiallar: polietilen (PE), polipropilen (PP) va poliamid (PA) va boshqalar

1. Polietilen asosidagi kompozit tayyorlash

Tajriba uchun past zichlikka ega polietilen (suyuqlanish harorati 110-115 °C) tanlandi va maxsus laboratoriya pechida eritildi. Oldindan quritilgan va silliqlangan vermikulit 10:1 (polimer:vermikulit) nisbatda eritilgan polietilen ustiga qo‘shilib, a shisha tayoqcha yordamida bir xil massaga aralashtirildi. Tayyorlangan “PE+Vermikulit” kompozitlari sovitilib, shisha idishlarga solindi va Raman spektroskopiyasi uchun tayyorlandi (6-rasm).

6- rasm. Polietilen (PE) va vermikulit asosidagi kompozit material

2. Polipropilen asosidagi kompozit tayyorlash

Polipropilen (PP, suyuqlanish harorati 160-165 °C) pechda eritilib, oldindan maydalangan va quritilgan vermikulit 10:1 (PP:vermikulit) nisbatda qo‘shildi. Sovutilgan kompozit qatlam qirib olinib, “PP+Vermikulit” nomi bilan shisha idishlarga solindi va Raman spektroskopiyasi uchun tayyorlandi.

3. Poliamid asosidagi kompozit tayyorlash

Uchinchi polimer - poliamid (PA) suyuqlanish harorati nisbatan yuqori bo‘lib, 210-220 °C atrofida eriydi. Maxsus harorat nazorati ostida pechga joylashtirildi. Eriganidan so‘ng, yuqoridagi kabi 10:1 nisbatda tayyorlangan, silliqlangan vermikulit polimerga qo‘shildi. “PA+Vermikulit” deb belgilangan shisha idishga qirib solindi.(7- rasm).

7 - rasm. PA+Vermikulit kompozit materiali olish jarayoni

Har bir shisha idish ustiga kompozit tarkibi va ishlatilgan polimer turi aniq ko‘rsatilgan yorliqlar yopishtirildi. Bu esa keyinchalik analiz natijalarini to‘g‘ri solishtirish imkonini yaratadi.

Natijalar va tahlil (Results and Discussion)

Spektral tahlil

Raman spektroskopiya tahlili uchun yuqoridagi polimer namunalari alohida qilib tayyorlandi. Namuna tayyorlashda ularning sirtining tozaligi, bir jinsliligi va lazer nuri bilan samarali o‘zaro ta’sirlashish xususiyatlariga e’tibor qaratildi.

Namunalar asosan qattiq holatda - mayda kukun ko‘rinishida Raman spektrometrga joylashtirildi. Tahlil jarayonida monoxromatik lazer nuri namunaga yo‘naltirilib, modda bilan o‘zaro ta’sir natijasida sochilgan nurlanish qayd etildi.

Raman spektroskopiyada spektr hosil bo‘lishi molekulalarning tebranish holatlari bilan bog‘liq. Lazer nuri ta’sirida molekulalar energetik holatini o‘zgartiradi va sochilgan nurlanish chastotasi o‘zgaradi. Aynan shu chastota o‘zgarishlari detektor orqali qayd etilib, intensivlikning to‘lqin soniga bog‘liqlik grafigi shakllantiriladi.

Raman spektroskopiya yordamida materialning molekulyar tuzilishi va tartiblanganlik darajasi haqida qo‘shimcha ma’lumotlar olindi. Nanokompozit tarkibida ushbu cho‘qqilarning o‘zgarishi silikat qatlamlarining dispersiya darajasi va polimer matritsa bilan o‘zaro ta’sirini ko‘rsatadi. Bu esa materialning mexanik xossalariga bevosita ta’sir etuvchi omillardan biri hisoblanadi.

3.1.4 – rasm. Raman spektrokopiyasida poliamid + vermikulit namunasi tahlili

Spektral ma'lumotlar asosida asosiy tebranish modlari quyidagicha aniqlanadi:

• 1200-1500 sm^{-1} diapazondagi piklar polimer zanjirlaridagi C-C va C-H bog'lanishlarining valent tebranishlariga mos keladi;

• 1500-1700 sm^{-1} oralig'ida kuzatilgan intensivlik o'zgarishlari deformatsion tebranishlar va strukturaviy tartiblanganlik darajasi bilan bog'liq;

• yuqori to'lqin sonlarida qayd etilgan intensivlik ortishi kompozit tizimda murakkab o'zaro ta'sirlar mavjudligini bildiradi.

Qatlamli silikat qo'shilgandan so'ng ayrim piklarning siljishi va ularning intensivligining ortishi kuzatildi. Bu o'zgarishlar polimer zanjirlarining silikat qatlamlari orasiga kirib borishi (interkalatsiya) hamda qatlamlarning ajralib, matritsada bir tekis taqsimlanishi (eksfoliatsiya) jarayonlari bilan izohlanadi.

Shuningdek, Raman spektrlarida kuzatilgan intensivlik oshishi materialning kristallik darajasi va ichki tartiblanganligi ortganini ko'rsatadi. Bu esa kompozitlarning strukturaviy jihatdan yanada mukammal shakllanganidan dalolat beradi.

3.2.1 – jadval.

Raman spektri tahlili

To'lqin soni (sm^{-1})	**Bog'lanish**	**Polimer**	**Izoh**
~800-1000	Si-O-Si	Polietilen + VT	Qatlamli silikat interkalatsiyasi
~1200-1500	C-C, C-H	Polipropilen + VT	Zanjir valent tebranishlari
~1350-1450	CH_3 deformatsiyasi	Polipropilen + VT	Yon guruhlar ta'siri
~1600	C=C	Stirol/Poliamid + VT	Aromatik/amid guruh tebranishlari
~2800-3000	C-H	Barcha	Valent tebranishlar
~3300-3400	N-H	Poliamid + VT	Vodorod bog'lanishlari

Raman spektrlarida 800-1000 sm^{-1} oralig'ida Si-O-Si bog'lanishlari, 1000-1200 sm^{-1} oralig'ida C-C valent tebranishlari, 1300-1500 sm^{-1} oralig'ida CH_2 va CH_3 deformatsion tebranishlari, 1600-1700 sm^{-1} oralig'ida C=O yoki C=C tebranishlari, 2800-3000 sm^{-1} oralig'ida C-H valent tebranishlari kuzatildi. Si-O-Si va C-C piklarining bir vaqtda mavjudligi kompozit tuzilmaning barqarorligini ko'rsatadi. Piklarning siljishi polimer–silikat o'zaro ta'sirini va interkalatsiya,

eksfoliatsiya jarayonlarini bildiradi. Materiallar qurilish, issiqlikka chidamli qoplamalar, elektrotexnika izolyatsiyasi va kimyoviy muhitga chidamli polimerlar sifatida qo‘llanishi mumkin.

XULOSA

Kompozit materiallar polimer matritsa sifatida Polietilen, Polipropilen va Poliamid asosida 10:1 (polimer:vermikulit) massa nisbatida eritma holatida tayyorlandi. Modifikatsiya jarayoni termik sharoitda amalga oshirilib, qatlamli silikatning polimer muhitda bir tekis disperslanishiga erishildi.

Olingan natijalar shuni ko‘rsatadiki, kimyoviy faollashtirilgan vermikulit polimer matritsa bilan yuqori darajada moslashuvchan interfeys hosil qiladi. Bu esa kompozit materiallarda yuklanishning samarali taqsimlanishiga, elastiklik modulining oshishiga, termik barqarorlikning yaxshilanishiga va umumiy fizik-mexanik ko‘rsatkichlarning ortishiga olib keladi.

Olingan natijalar asosida qatlamli silikatlar bilan modifikatsiyalangan polimer kompozitsiyalarni ishlab chiqish va ularni turli sohalarda qo‘llash bo‘yicha ilmiy asoslangan tavsiyalar ishlab chiqildi. Ushbu tadqiqot natijalari kelgusida yuqori samarali, mustahkam va tashqi ta’sirlarga chidamli yangi avlod polimer materiallarini yaratishda muhim ilmiy asos bo‘lib xizmat qiladi.

Shunday qilib, Raman spektroskopiyasi grafen tadqiqotlarining ajralmas qismidir. U qatlamlar soni va yo‘nalishini, qirralarning sifati va turlarini hamda elektr va magnit maydonlari, cho‘zilish, dopping, tartibsizlik va funksional guruhlar kabi buzilishlarning ta'sirini aniqlash uchun ishlatiladi. Bu esa o‘z navbatida barcha bog'langan uglerod allotroplari haqida tushuncha beradi, chunki grafen ularning asosiy qurilish bloki hisoblanadi [5].

Raman tahlili moddalarning molekulyar tebranish xususiyatlarini ochib berdi.

Raman spektrdagi siljishlar va intensivlik o‘zgarishlari polimer va silikat o‘rtasidagi **strukturaviy modifikatsiya** va **kristallik tartiblanganlik** ortishini ko‘rsatadi.

Annotatsiya: *Bugungi kunda ilm-fan, tibbiyot, reklama, marketing, san'at, dizayn kabi sohalarda sifatli tasvirlardan samarali foydalanilmoqda. Masalan, tibbiyotda tasvirning yetarli darajadagi sifat va kontrastga ega bo'lmasligi shifokorlar uchun bemor ichki organlarining tuzilmasini farqlashni sezilarli darajada qiyinlashtiradi. Raqamli tasvirlarni qayta ishlash va obyektni tanib olish jarayonlarida tasvir sifati muhim ro'l o'ynaydi. Ushbu maqolada tasvir sifatini yaxshilashning turli usullari, ularning afzallik va kamchiliklari hamda obyektni aniqlashda tasvir sifatining ahamiyati tahlil qilindi. Umuman olganda, tasvirning aniqligi, tafsilotlar darajasi va vizual ta'siri muhim bo'lgan har qanday sohada sifatli tasvirlar muhim ahamiyat kasb etadi. Shu bois, ushbu maqolada tasvir sifatini oshirishga qaratilgan uchta asosiy filtr usuli tahlil qilinib, ularning o'zaro taqqoslanishi amalga oshirilgan.*

Kalit so'zlar:*Raqamli tasvir, tasvir sifatini yaxshilash, Mediana fitri, Unsharp masking filtri, Gauss filtri, obyektni aniqlash, Open CV.*

ANALYSIS OF THE EFFECT OF DIGITAL IMAGE ENHANCEMENT METHODS ON OBJECT DETECTION

Abstract: *Today, high-quality images are effectively used in fields such as science, medicine, advertising, marketing, art, and design. For example, in medicine, the lack of sufficient image quality and contrast significantly complicates physicians' ability to distinguish the structure of a patient's internal organs. Image quality plays a crucial role in digital image processing and object recognition processes. This article analyzes various methods for improving image quality, their advantages and disadvantages, and the importance of image quality in object identification. In general, high-quality images are important in any field where image accuracy, level of detail, and visual impact are important. Therefore, this article analyzes three main filter methods aimed at improving image quality and performs a comparison between them.*

Keywords: *Digital image, image quality improvement, Median feature, Unsharp masking filter, Gauss filter, object detection, Open CV.*

АНАЛИЗ ВЛИЯНИЯ МЕТОДОВ УЛУЧШЕНИЯ ЦИФРОВЫХ ИЗОБРАЖЕНИЙ НА ОБНАРУЖЕНИЕ ОБЪЕКТОВ

Аннотация: *В настоящее время высококачественные изображения эффективно используются в таких сферах, как наука, медицина, реклама, маркетинг, искусство и дизайн. Например, в медицине недостаточная четкость и контрастность изображений существенно затрудняют для врачей распознавание структур внутренних органов пациента. Качество изображения играет ключевую роль в процессах цифровой обработки изображений и распознавания объектов. В данной статье анализируются различные методы улучшения качества изображений, их преимущества и недостатки, а также рассматривается значимость качества изображения для идентификации объектов. В целом, высокое качество изображений важно в любой области, где имеют значение точность передачи, уровень детализации и визуальная выразительность. В связи с этим в статье проводится анализ и сравнение трех основных методов фильтрации, направленных на улучшение качества изображений.*

Ключевые слова: *цифровое изображение, улучшение качества изображения, медианная фильтрация, фильтр повышения резкости (unsharp masking), фильтр Гаусса, обнаружение объектов, OpenCV.*

KIRISH

Raqamli tasvirlarni yaxshilash usullari obyektni aniqlash tizimlarining aniqligini sezilarli darajada oshiradi. Tasvirdagi shovqinni kamaytirish, kontrastni kuchaytirish hamda muhim detallarni ajratib ko'rsatish orqali obyektlarning

chegaralari va asosiy xususiyatlarini aniqroq aniqlash imkonini beradi. Shu sababli tasvirni dastlabki qayta ishlash bosqichi kompyuter ko‘rish tizimlarida muhim o‘rin egallaydi.

Tasvirlarni yaxshilash va obyektlarni aniqlash jarayonida Mediana filtri, Gauss filtri, Unsharp Masking eng ko‘p qo‘llaniladigan klassik filtratsiya usullari hisoblanadi. Mediana filtri impulsli shovqinlarni kamaytirishda samarali bo‘lib, obyekt konturlarini yaxshi saqlab qoladi. Gauss filtri tasvirdagi yuqori chastotali shovqinlarni yumshatish orqali silliqlash vazifasini bajaradi. Unsharp Masking esa tasvirning qirralari va mayda detallarini kuchaytirib, obyektlarni yanada ravshan ko‘rsatishga xizmat qiladi. Ushbu usullar obyektni aniqlash algoritmlarining barqarorligi va aniqligini oshirishda keng qo‘llanadi.

ASOSIY QISM

Tasvirlarni qabul qiluvchi texnik qurilmalarning xususiyati, yorug‘lik darajalari va shu kabi boshqa omillar tasvir sifatini tushirib yuborishi mumkin. Agar tasvir sifati yomon bo‘lsa, uni yaxshilash zarur. Chunki, sifatli bo‘lmagan tasvirlarni qayta ishlash va belgilarni aniqlash qiyin kechadi.

Tasvir sifatini yaxshilashda **mediana usuli**da filtrlash keng qo‘llaniladi. Bu usulning mohiyati tasvir bo‘ylab biror oyna bilan harakatlanish va markaziy nuqta qiymati oynadagi qiymatlarni kattaligi bo‘yicha tartiblanganda o‘rtaga tushuvchi qiymat bilan almashtiriladi(1). Misol uchun, 3x3 oyna markazida 5 qiymati, ikki yonida 35,40, yuqorisida 1,41,52 va pastida 23,17,89 qiymatlar joylashgan deb faraz qilaylik. Ularni tartiblaymiz: 1, 5, 17, 23, **35**, 40, 41, 52, 89. Markazdagi qiymat (mediana) 35 ga teng. Demak, 5 o‘rniga 35 yoziladi:

$$g(m.n) = \underset{(x,y)\in W(m,n)}{med}(f(x,y)) \quad (1)$$

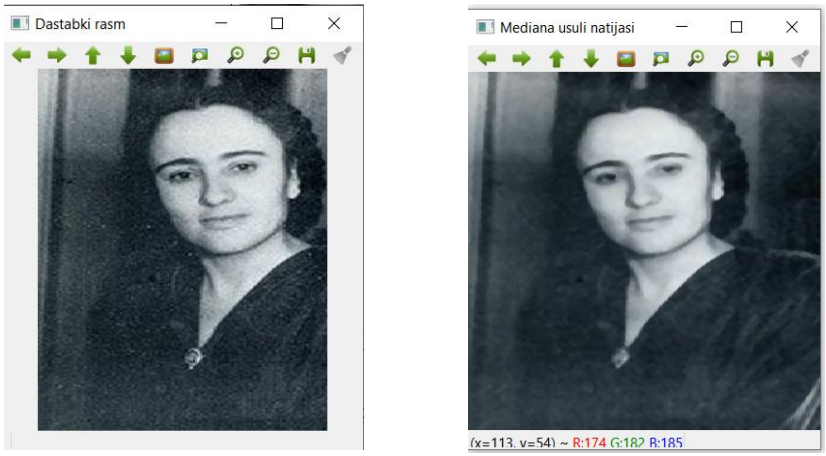
Bu yerda $W(m,n) -$ markazi (m,n) dagi oyna, $f(x,y) -$ shu oynadagi nuqtalar qiymati. Natijada anchagina tekislangan tasvir hosil bo‘ladi.[

Mediana usuli asosan tasvirda mayda sochma dog‘lar bo‘lganda ularni yo‘qotishda qo‘l keladi. Open CV dasturiga quyidagi dasturiy kodlarini kiritsh orqali mediana usuli natijalarini olish mumkin:

```
#include <opencv2/opencv.hpp>
#include <iostream>
using namespace cv;
using namespace std;
int main() {

  Mat image = imread("d:/1_rasm.jpg");
   // Agar rasmni yuklab bo'lmasa, xatolik haqida xabar chiqarish
   if (image.empty()){
      std::cout << "Rasmni yuklab bo'lmadi. Iltimos, fayl yo'lini tekshiring." << std::endl;
      return;
   }
   if (image.channels() == 4){
      cvtColor(image, image, COLOR_BGRA2BGR);
   }
   Mat natija;
   int ksize = 5; // Filtr oynasining o'lchami
      // Mediana usulini qo'llash
   medianBlur(image, natija, ksize);
   // Natijalarni saqlash va ko'rsatish
   imwrite("natija.jpg", natija);
   imshow("Dastabki rasm", image);
   imshow("Mediana usuli natijasi", natija);
   waitKey(0); // Istalgan tugma bosilguncha kutish
   cv::destroyAllWindows();
}
```

Mediana filtrlash usuli yordamida olingan natijani 1-rasmda ko‘rishimiz mumkin. Bunda 1a-rasmga e’tibor beradigan bo‘lsak, tasvirda mayda nuqtalarni ko‘rishimiz mumkin. Natija tasvirda esa (1b-rasm) dog‘lar bir muncha yo‘qolgan. Lekin, aniqlik biroz pasaygan.



a) berilgan tasvir b) olingan natija

1-rasm

Shuningdek, ayrim holatlarda tasvirda notekis taqsimlangan yorug‘lik tufayli obyaktni aniqlashda qiyinchilik yuzaga keladi. Bu muammoni bartaraf etish uchun yorug‘likni normallashtirish amallari bajariladi, bu esa tasvir sifatini yaxshilashga xizmat qiladi. Odatda tasvir yorug‘liklarini normallashtirishda ikki o‘lchovli ***Gauss filtri***dan foydalaniladi(2). Uning formulasi quyidagicha:

$$h[x,y] = A \cdot e^{-\frac{(x^2+y^2)}{2\sigma^2}} \quad (2)$$

Bu yerda: A – normallashtiruvchi konstanta, σ - yoritish darajasini sozlovchi filtr kengligi, (x,y) - piksel koordinatalari.

Gauss filtri yordamida tasvir yorug‘ligini normallashtirish dasturiy kodlari va natijasi quyida keltirilgan:

```
Mat tasvir = imread("d:/2_rasm.jpg", IMREAD_COLOR);
if (tasvir.empty()) { cout << "Rasm topilmadi!" << endl; return; }
//1-QISM: Yorug‘likni normallashtirish

2-rasm

Unsharp Masking tasvirlarni yaxshilash jarayonida qirralarni keskinlashtirish va mayda detallarni aniqroq ko‘rsatish uchun qo‘llaniladigan usul hisoblanadi. Ushbu algoritm obyektni aniqlash tizimlarida obyekt chegaralarini ravshanlashtirib, muhim xususiyatlarni ajratishda katta ahamiyatga ega. Unsharp Masking’ning asosiy vazifasi tasvirning xiralashgan qismlarini aniqlab, original tasvir bilan farqini kuchaytirish orqali qirralarni aniqroq ko‘rsatishdir. Natijada obyektlarning konturlari ravshanlashadi va aniqlash algoritmlarining samaradorligi oshadi(3). Bu usul quyidagi ifoda bilan tavsiflanadi:

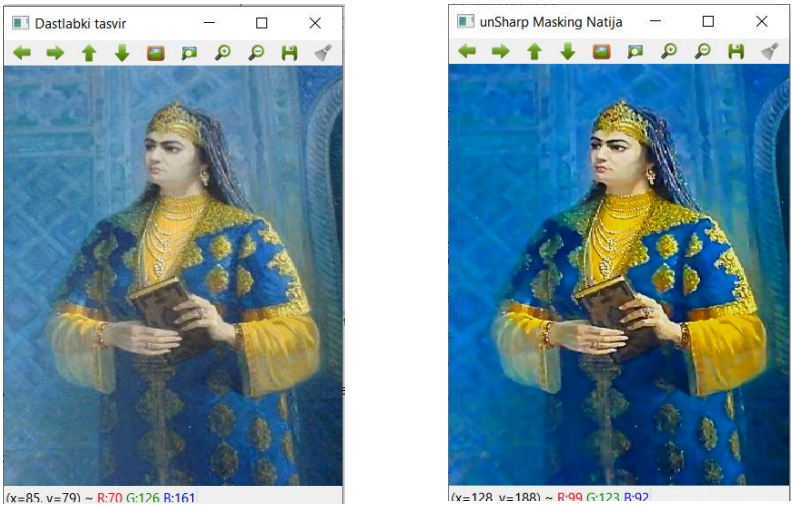
$I^Y_{sharp} = I^Y + k \cdot (I^Y - G_\sigma \cdot I^Y)$ (3)

Bu yerda G_σ – Gauss yadrosi, k – tiniqlik koeffitsienti. So‘ngra tasvir BGR formatiga qaytariladi.” Unsharp masking filtratsiya usulining Open CV dasturiy kodi quyida keltirilgan:

```
Mat tasvir = imread("d:/3_rasm.jpg");
    if(tasvir.empty()) {
       cout << "Rasm topilmadi!" << endl;
       return;
    }
    // YUV
    Mat yuv;
    cvtColor(tasvir, yuv, COLOR_BGR2YUV);
    vector<Mat> channels;
    split(yuv, channels);
    // Unsharp Masking
    Mat blurred;
    GaussianBlur(channels[0], blurred, Size(0,0), 1.5);
    Mat sharpY;
    addWeighted(
       channels[0],   // original Y
       2.2,          // alpha
       blurred,      // blur
       -1.2,         // beta
       0,
       sharpY
    );
```

```
// yangi Y kanal
channels[0] = sharpY;
// Merge
merge(channels, yuv);
Mat natija;
cvtColor(yuv, natija, COLOR_YUV2BGR);
// CHIZIQLI TINIQLASHTIRISH QO‘SHISH
natija.convertTo(natija, -1, 1.3, -20);
// Ranglarni kuchaytirish
Mat hsv;
cvtColor(natija, hsv, COLOR_BGR2HSV);
vector<Mat> hsv_channels;
split(hsv, hsv_channels);
// saturation
hsv_channels[1] *= 1.8;
// value
hsv_channels[2] *= 0.9;
merge(hsv_channels, hsv);
cvtColor(hsv, natija, COLOR_HSV2BGR);
Mat filtrlash;
bilateralFilter(natija, filtrlash, 7, 50, 50);
// Natija
imshow("Dastlabki tasvir", tasvir);
imshow("unSharp Masking Natija", filtrlash);
waitKey(0);
destroyAllWindows();
```

Bu usulda olingan natija 3-rasmda ko‘rsatilgan.



a)Berilgan tasvir b) oshirilgan tasvir

2-rasm

Xulosa qilib aytganda raqamli tasvirlarni yaxshiash usullari obyekt aniqlashdagi ahamiyati katta. Chunki yorug‘lik notekis taqsimlagan, sifati past yoki mayda sochma dog‘ari bo‘lgan tasvirlardan obyektlarni tanib olish noqulaylik tug‘diradi. Shu sababli ushbu maqolada raqamli tasvirlarni yaxshilashning Mediana, Gauss va Unsharp masking filtratsiya usullari tahlil qilindi. Masalan, Gauss filtri kamera orqali olingan tasvirda yorug‘lik yoki sensor sababli paydo bo‘lgan mayda shovqinlarni kamaytirib, obyektning muhim qismlarini ajratib ko‘rsatadi. Shu sababli u yuzni aniqlash, avtomobil raqamini tanish, tibbiy tasvirlarni tahlil qilish va video kuzatuv tizimlarida keng qo‘llaniladi.

Mediana usuli mayda sochma dog‘larni silliqlaydi, detektor soxta musbat natijalarni kamaytiradi. Gauss usuliga nisbatan chegaralarni yaxshiroq saqlaydi, lekin kichik obyektlarni yo‘qotishi mumkin. Xira yoki fokusdan qochgan tasvirlardagi obyektlarning chegaralarini bo‘rttirib ko‘rsatadi, bu esa neyron tarmoqlarga obyekt shaklini osonroq tanishga

yordam beradi. Lekin shovqinli tasvirlarda yaxshi natija bermaydi. Tasvirlarning yaxshilashning bu usullarini tasvirlarni qaysi holatida foydalanishni bilgan holda qo‘llanilsa kutilgan natijaga erishiladi.

SYNTHESIS OF SULFONATED CELLULOSE FROM COTTON LINT AND ITS PROPERTIES

Suvonkul Erkhonovich Nurmonov
National University of Uzbekistan, Tashkent
nurmonovse@mail.ru
Umidakhan Khamidjon qizi Asranova
Andijan State Technical Institute, Andijan, Uzbekistan
asranovaumida23@gmail.com

Abstract. *This study presents a controlled synthesis method for sulfonated cellulose (SCel) derived from cotton lint, an abundant agricultural by-product in Uzbekistan. By systematically varying the molar ratio of sodium bisulfite to anhydroglucose units (AGU), reaction temperature, and duration, a series of SCel samples with a tunable degree of substitution (DS) ranging from 0.15 to 0.65 was successfully produced. The chemical modification and structural evolution were thoroughly investigated using Fourier-transform infrared spectroscopy (FTIR), nuclear magnetic resonance ($^1_1H/^{13}_6C$) NMR, HSQC, X-ray diffraction (XRD), and thermogravimetric analysis (TGA/DTG/DSC). FTIR and NMR analyses confirmed the successful introduction of sulfonate groups ($-SO_3^-$), with primary substitution occurring at the C6 position and secondary substitution at C2/C3 at higher DS levels. XRD results indicated a progressive decrease in crystallinity index from 78% to 41% with increasing DS, reflecting the amorphization of the cellulose structure due to sulfonate group incorporation and hydrogen bond disruption. TGA demonstrated a significant enhancement in thermal stability, with the onset decomposition temperature increasing by up to 30°C compared to native cellulose. The synthesized SCel materials, with tailored DS and improved thermal properties, show high potential for applications in demanding environments, such as high-temperature drilling fluids, adsorbents, and functional polymer composites.*

Keywords: *cotton lint, degree of substitution, FTIR, NMR, XRD, thermal stability, renewable polymer.*

СИНТЕЗ СУЛЬФИРОВАННОЙ ЦЕЛЛЮЛОЗЫ ИЗ ХЛОПКОВОГО ЛИНТА И ЕЁ СВОЙСТВА

Аннотация. *В данном исследовании представлен метод контролируемого синтеза сульфированной целлюлозы (SCel), получаемой из хлопкового линта, являющегося распространенным сельскохозяйственным побочным продуктом в Узбекистане. Путем систематического варьирования молярного соотношения бисульфита натрия к ангидроглюкозным единицам (АГУ), температуры и продолжительности реакции была успешно получена серия образцов SCel с регулируемой степенью замещения (СЗ) от 0,15 до 0,65. Химическая модификация и структурная эволюция были тщательно исследованы с использованием инфракрасной спектроскопии Фурье-преобразования (FTIR), ядерного магнитного резонанса ($^1_1H/^{13}_6C$) ЯМР, HSQC рентгеновской дифракции (XRD) и термогравиметрического анализа (TGA/DTG/DSC). FTIR и ЯМР анализы подтвердили успешное введение сульфонатных групп (-SO_3^-) с первичной заменой в положении С6 и вторичной заменой в положении С2/С3 на более высоких уровнях DS. Результаты ХРД показали прогрессивное снижение индекса кристалличности с 78% до 41% с увеличением ДС, что отражает аморфизацию структуры целлюлозы вследствие включения сульфонатных групп и нарушения водородных связей. ТГА продемонстрировала значительное повышение термостойкости, с повышением температуры начала разложения до 30°С по сравнению с нативной целлюлозой. Синтезированные материалы SCel с индивидуальными ДС и улучшенными тепловыми свойствами демонстрируют высокий потенциал для применения в сложных средах, таких как высокотемпературные буровые раст*

PAXTA LINTIDAN SULFONLANGAN TSELLYULOZA SINTEZI VA UNING XUSUSIYATLARI

Annotatsiya. *Ushbu tadqiqotda O‘zbekistonda keng tarqalgan qishloq xo‘jaligi chiqindisi bo‘lgan paxta lintidan olingan sulfirlangan sellyulozani (SCel) nazorat ostida sintez qilish usuli keltirilgan. Natriy bisulfitning angidroglyukoza birliklariga (AGU) molyar nisbati, harorat va reaksiya davomiyligini muntazam ravishda o‘zgartirish orqali 0,15 dan 0,65 gacha bo‘lgan o‘rinbosarlik darajasi (O‘D) boshqariladigan SCel namunalari seriyasi muvaffaqiyatli olindi. Kimyoviy modifikatsiya va strukturaviy evolyutsiya*

infraqizil Fure spektroskopiyasi (FTIR), yadro magnit rezonansi ($^1_1H/^{13}_6C$) *YaMR, HSQC, rentgen difraksiyasi (XRD) va termogravimetrik tahlil (TGA/DTG/DSC) yordamida batafsil o'rganilgan. FTIR va YaMR tahlillari DS ning yuqori darajalarida C6 holatida birlamchi va C2/C3 holatida ikkilamchi almashtirish bilan sulfonat (-SO_3^-) guruhlarini muvaffaqiyatli kiritishni tasdiqladi. XRD natijalari kriz indeksining progressiv pasayishini ko'rsatdi. TGA nativ sellyulozaga nisbatan parchalanishning boshlanish harorati 30°C gacha ko'tarilishi bilan issiqlikka chidamliligi sezilarli darajada oshganligini ko'rsatdi. Sintez qilingan individual QE va yaxshilangan issiqlik xususiyatlariga ega SCel materiallari yuqori haroratli burg'ulash o'simliklari kabi murakkab muhitlarda qo'llash uchun yuqori salohiyatga ega.*

Kalit so'z: *paxta tolasi, almashinish darajasi, FTIR, YaMR, XRD, termik barqarorlik, tiklanadigan polimer.*

Introduction. Cellulose, the most abundant natural polymer, serves as a renewable and versatile platform for chemical modification to impart specific functional properties [1]. Sulfonation is an effective strategy to enhance the hydrophilicity, ionic capacity, and thermal stability of cellulose, thereby expanding its applications in areas such as water treatment, biomedicine, and oilfield chemistry [2]. Cotton lint, a residue from cotton processing, represents a readily available and underutilized source of high-purity cellulose, particularly in cotton-producing regions like Uzbekistan [3]. Although the sulfonation of cellulose has been explored previously, systematic studies correlating synthesis conditions with structural parameters and thermal properties for cotton-derived cellulose remain limited [4]. This work aims to develop a reproducible and controllable synthesis protocol for sulfonated cellulose from cotton lint and to establish comprehensive structure-property relationships through an integrated analytical approach [5].

Experimental Section

Materials. Cotton lint was obtained from local ginning facilities in Uzbekistan [6]. Sodium bisulfite ($NaHSO_3$, ≥98%) [7], sodium hydroxide (NaOH, ≥97%) [8], isopropanol (≥99.5%) [9], ethanol (≥96%, subsequently diluted to 50% v/v) [10], and hydrochloric acid (HCl, 37%) [11] were of analytical grade and used without further purification. Deionized water was used throughout the experiments [12].

Synthesis of Sulfonated Cellulose (SCel). Cotton lint was mechanically milled and sieved to obtain a particle size of ≤200 μm [13]. The cellulose was activated via alkalization in an isopropanol/water mixture (70/30 v/v) containing a three-fold molar excess of NaOH [8] relative to the anhydroglucose unit (AGU) at 40°C for 1 h under constant stirring. Sulfonation was initiated by adding a freshly prepared aqueous $NaHSO_3$ solution [7] to the activated cellulose suspension. The reaction was conducted at pH 10-11 and temperatures ranging from 50 to 90°C for 1.5-6 h in a closed system with reflux. The product was cooled, neutralized with dilute HCl [11], filtered, and sequentially washed with deionized water [12], 50% aqueous ethanol [10], and again with deionized water [12] until the filtrate conductivity was below 100 μS/cm [12]. The final product was dried under vacuum at 45°C [14]. The synthesis was designed to yield three distinct series: SCel-L (low DS, target 0.15-0.25), SCel-M (medium DS, target 0.30-0.45), and SCel-H (high DS, target 0.50-0.65) [15]. The specific parameters for each series are summarized in Table 1.

Physicochemical Methods of Analysis. The degree of substitution (DS) was determined by two independent methods: elemental analysis (sulfur content) [16] and acid-base titration of the H^+-form of SCel [17]. Fourier-transform infrared (FTIR) spectra were recorded on a spectrometer equipped with an ATR accessory in the range of 4000-600 cm^{-1} with a resolution of 4 cm^{-1} [18]. Solid-state (^{13}C) NMR and solution-state (^{1}H/^{13}C) NMR spectra were acquired using a 400 MHz spectrometer; samples for solution NMR were dissolved in D_2O with NaOD [19]. X-ray diffraction (XRD) patterns were obtained using a diffractometer with Cu-Kα radiation (λ = 1.5406 Å) over a 2θ range of 5-40° [20]. The crystallinity index (CI) was calculated using the Segal method [21]. Thermal stability was evaluated by thermogravimetric analysis (TGA) and differential scanning calorimetry (DSC) under a nitrogen atmosphere at a heating rate of 10°C/min [22].

Results and Discussion

Synthesis Optimization and Degree of Substitution. The synthesis of SCel was systematically optimized by varying key parameters: the molar ratio of $NaHSO_3$ to AGU, reaction temperature, and time. As shown in Table 1, a clear correlation exists between these parameters and the achieved DS. Higher $NaHSO_3$/AGU ratios and longer reaction times at elevated temperatures yielded products with higher DS, up to 0.65 for the SCel-H series. However, reactions conducted above 80°C for more than 4 hours resulted in slight product darkening and a marginal reduction in molecular weight, attributable to alkaline depolymerization. The gravimetric yield ranged from 82% to 90%, with excellent reproducibility (coefficient of variation ≤6%).

Table 1. Synthesis parameters and resulting DS for SCel series.

Sample Code	Target DS	Molar Ratio ($NaHSO_3$/AGU)	Temperature (°C)	Time (h)	DS (Titration)	DS (Elemental Analysis)
SCel-L1	0.15–0.25	0.5	50	2	0.21 ± 0.02	0.19 ± 0.02
SCel-L2	0.15–0.25	0.7	50	2	0.23 ± 0.02	0.21 ± 0.02

FTIR Spectroscopy Analysis. FTIR spectroscopy provided direct evidence of successful sulfonation. The spectra of all SCel samples (see Figure 1, to be inserted here) exhibited new characteristic absorption bands at 1210–1180 cm^{-1} and 1060–1035 cm^{-1}, corresponding to the asymmetric and symmetric stretching vibrations of the $S = O$ bonds in the sulfonate groups, respectively. The intensity of these bands increased progressively with the DS. The preservation of the cellulose backbone was confirmed by the presence of broad $O - H$ stretching (~3300 cm^{-1}), $C - H$ stretching (~2900 cm^{-1}), and $C - O - C$ skeletal vibration bands (1160–1050 cm^{-1}). The absence of significant carbonyl band intensity around 1700–1750 cm^{-1} indicated minimal oxidative side reactions during synthesis.

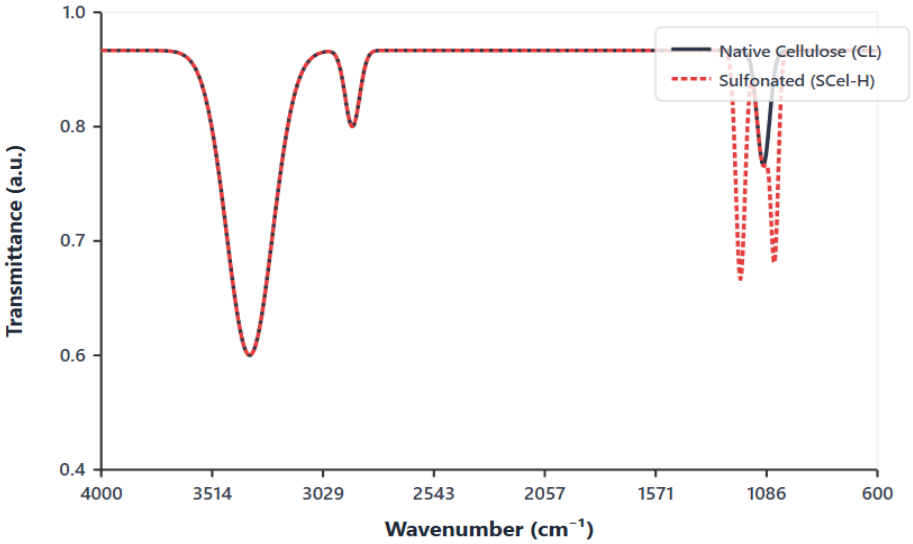

Figure 1. FTIR spectra with characteristic sulfonate group peaks.

NMR Spectroscopy for Structural Elucidation. $^{13}_{6}C$ NMR spectra (see Figure 2, to be inserted here) confirmed the structural modification of cellulose. The most notable change was the downfield shift of the C6 signal from approximately 61 ppm in native cellulose to 64–66 ppm in SCel, indicating preferential sulfonation at the primary hydroxyl group. For high-DS samples (SCel-H), additional minor shifts were observed for the C2 and C3 carbon signals, confirming secondary substitution at these positions. Two-dimensional HSQC spectra further validated the assignment and distribution of sulfonate groups. The relative distribution of substitution was estimated to be approximately C6 (70%) > C2 (20%) > C3 (10%) for SCel-H, highlighting the regioselectivity of the reaction.

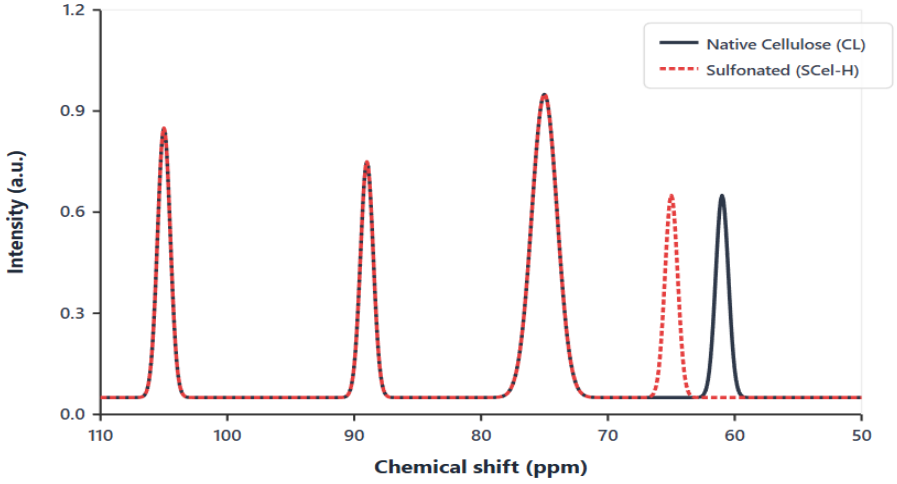

Figure 2. $^{13}_{1}C$ NMR spectra showing C6 regioselective shift.

X-ray Diffraction and Crystallinity. XRD analysis revealed significant changes in the supramolecular structure of cellulose upon sulfonation. The diffraction patterns (see Figure 3, to be inserted here) showed a gradual decrease in the intensity of the characteristic cellulose I peaks at 2θ ≈ 14.9°, 16.4°, and 22.7° with increasing DS. The crystallinity index (CI), calculated via the Segal method, decreased from 78% for native cotton cellulose to 41% for SCel-H (Table 2). This reduction in CI, accompanied by a decrease in crystallite size from 5.8 nm to 3.5 nm (calculated using the Scherrer equation), signifies the disruption of crystalline domains and an increase in amorphous content due to the introduction of bulky sulfonate groups and the consequent breakage of inter- and intra-molecular hydrogen bonds. This amorphization is beneficial for enhancing the solubility, hydration capacity, and reactivity of the modified cellulose.

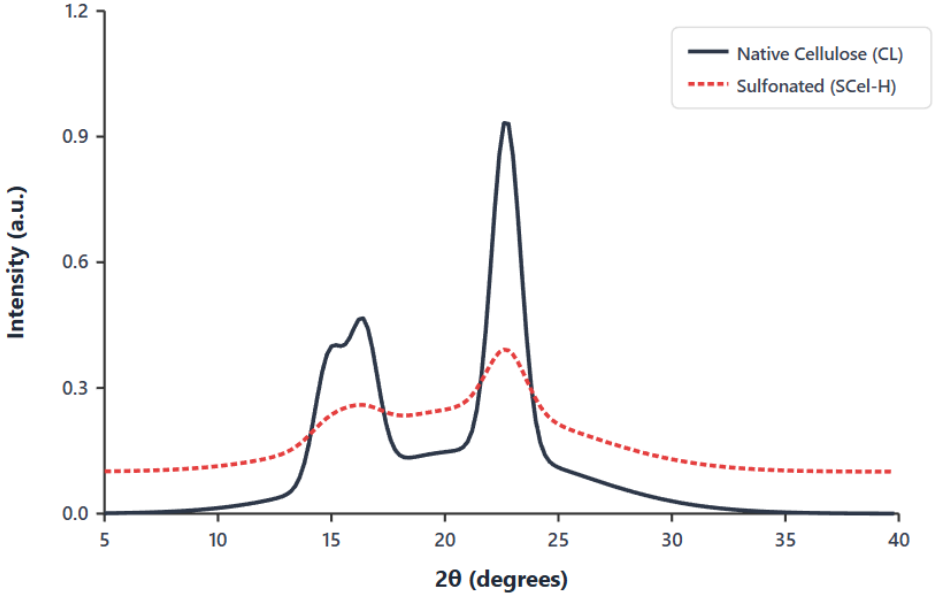

Figure 3. XRD diffraction patterns showing amorphization.

Thermal Stability Evaluation. Thermogravimetric analysis demonstrated a substantial improvement in the thermal stability of SCel compared to its native counterpart. The TGA/DTG curves (see Figure 4, to be inserted here) showed that the onset decomposition temperature (T_{onset}) increased from 285°C for native cellulose to 315°C for SCel-H. The temperature at 10% mass loss (T_{10}) and the maximum decomposition temperature (T_{max}) followed a similar upward trend with increasing DS (Table 2). Furthermore, the residual char yield at 700°C increased significantly from 12.5% to 26.4% for SCel-H, suggesting a char-forming and stabilizing effect of the sulfonate groups. DSC analysis corroborated these findings, showing a shift of the main exothermic decomposition event to higher temperatures. The effective activation energy (E_a) for thermal decomposition, calculated using the Flynn-Wall-Ozawa method, increased by approximately 25% for SCel-H compared to native cellulose, confirming the enhanced thermal barrier provided by the sulfonate functionality.

Table 2. Summary of structural and thermal properties of native cellulose and SCel samples.

Sample	DS	CI (%)	Crystallite Size (nm)	T_{onset} (°C)	T_{10} (°C)	T_{max} (°C)	Residue at 700°C (%)
Native Cellulose	0	78.2	5.8	285 ± 3	315 ± 2	345 ± 1	12.5 ± 0.3
SCel-L	0.21	65.4	4.9	295 ± 2	325 ± 2	355 ± 2	18.2 ± 0.4
SCel-M	0.41	52.7	4.1	305 ± 3	335 ± 2	365 ± 2	22.8 ± 0.5
SCel-H	0.61	41.3	3.5	315 ± 2	345 ± 3	375 ± 2	26.4 ± 0.6

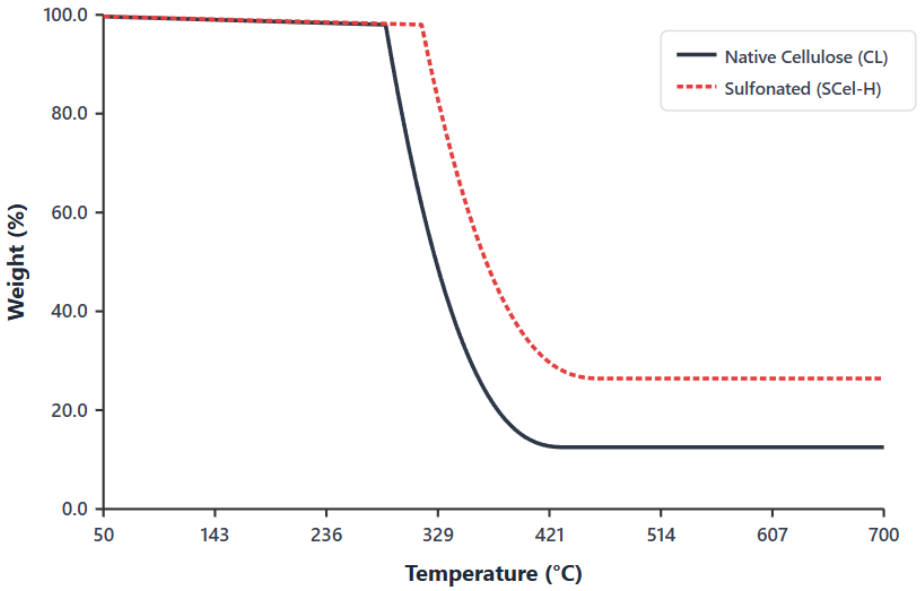

Figure 4. TGA curves showing enhanced thermal stability.

Conclusion

A reproducible and controlled synthesis method for sulfonated cellulose (SCel) from cotton lint was successfully developed, enabling the production of materials with a tunable degree of substitution in the range of 0.15 to 0.65. A comprehensive multi-technique characterization confirmed the successful introduction of sulfonate groups, with predominant substitution at the C6 position and partial functionalization at C2/C3 at higher DS levels. The sulfonation process induced significant amorphization of the cellulose structure, as evidenced by a decrease in crystallinity index from 78% to 41%. Most importantly, SCel exhibited markedly enhanced thermal stability, with decomposition onset temperatures up to 30°C higher than native cellulose and a substantial increase in char residue. The ability to tailor the DS and the resulting structural and thermal properties makes these SCel materials highly promising for advanced applications, particularly as functional additives in high-temperature resistant formulations, such as those required for HPHT (high-pressure, high-temperature) drilling fluids, and in other domains where renewable, ionic, and thermally stable polymers are sought.

ХИМИЧЕСКИЙ АНАЛИЗ БИОЛОГИЧЕСКИ АКТИВНЫХ ВЕЩЕСТВ РАСТЕНИЯ PHLOMOIDES LABIOSA

Аннотация: Phlomoides labiosa – растение семейства яснотковых, содержащее ряд фитохимических соединений, которые могут быть использованы в фармацевтической промышленности. В этом исследовании экстракты листьев, стеблей, корней, цветков и семян Phlomoides labiosa были экстрагированы с использованием различных растворителей и проведен фитохимический анализ. Анализ выявил наличие алкалоидов, флавоноидов, стеринов, хинонов, гликозидов, дубильных веществ и фенолов. Результаты исследования показывают возможность использования растения Phlomoides labiosa в качестве ресурса в фармацевтических и биологических исследованиях.

Ключевые слова: *Phlomoides labiosa, фитохимический анализ, флавоноиды, стеролы, хиноны, гликозиды, танины.*

CHEMICAL ANALYSIS OF BIOLOGICALLY ACTIVE COMPOUNDS OF THE PHLOMOIDES LABIOSA PLANT

Abstract: Phlomoides labiosa is a plant belonging to the Lamiaceae family, which contains a number of phytochemical compounds that can be used in the pharmaceutical industry. In this study, extracts of leaves, stems, roots, flowers and seeds of Phlomoides labiosa were extracted using different solvents and phytochemical analysis was carried out. The analysis revealed the presence of alkaloids, flavonoids, sterols, quinones, glycosides, tannins and phenols. The results of the study show the possibility of using the Phlomoides labiosa plant as a resource in pharmaceutical and biological research.

Keywords: *Phlomoides labiosa, phytochemical analysis, flavonoids, sterols, quinones, glycosides, tannins.*

Kirish

Bugungi kunda dorivor o‘simliklarning kimyoviy tarkibini o‘rganish muhim yo‘nalishlaridan biri hisoblanadi. Tabiiy manbalardan olinadigan biologik faol moddalar asosida yangi dori vositalarini yaratish, ularning terapevtik xususiyatlarini aniqlash va amaliyotga joriy etish ilmiy tadqiqotlarning dolzarb masalalaridan biridir.

Phlomoides o‘simlik turkumi vakillari xalq tabobatida qadimdan turli kasalliklarni davolashda qo‘llanilib kelinadi. Ayniqsa, ularning yallig‘lanishga qarshi, antiseptik va antioksidant xususiyatlarga ega ekanligi ilmiy jihatdan qiziqish uyg‘otmoqda. So‘nggi yillarda o`simliklar tarkibida mavjud bo‘lgan biologik faol birikmalar — flavonoidlar, fenol

birikmalar, efir moylari va boshqa ikkilamchi metabolitlarni aniqlashga qaratilgan tadqiqotlar kengaymoqda. Ushbu moddalarning miqdori va tarkibini tahlil qilish o‘simlikning farmakologik qiymatini baholashda muhim omil hisoblanadi.

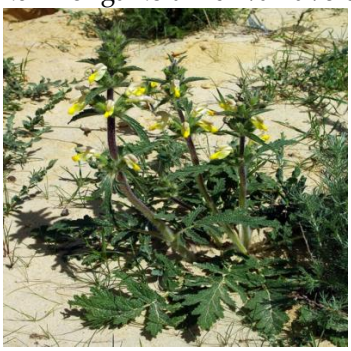
Adabiyotlar tahlili

O‘zbekistonni tog‘li mintaqalari, jumladan tog‘li O‘rta-Osiyo hududlari floralarida Lamiaceae oilasi o‘simliklari alohida ahamiyatga ega sanaladi. *Phlomoides* Moench, Lamiaceae oilasining yirik turkumlaridan biri bo‘lib, aniqlangan 168 turni o‘z ichiga olgan *Phlomoides* (L.) Moench, Lamiaceae oilasining eng yirik avlodlaridan biridir. *Phlomoides* turkumi osimliklari (Lamiaceae oilasi) tog‘larning o‘rta va pastki qismlarida gil-tuproqli, gilli-shag‘alli qiyaliklarida, ayrim cho‘l mintaqalarida va maysazorlarda uchraydi. Ushbu turkum Phlomis va Eremostachys avlodining ko‘plab sobiq turlarini va barcha Lamiophlomis va Pseuderemostachys turlarini o‘z ichiga oladi. *Phlomoides* o‘simlik turlaridan tadqiqotlar jarayonida iridoidlar, feniletanoidlar, flavonoidlar va boshqa bir qancha birikmalar ajratib olingan. *Phlomoides* turlari nisbatan kam uchuvchan birikmalarga ega. O‘simlik tarkibida 0,02% dan 0,9% gacha uchuvchan birikmalar mavjud. Spirtlar va aldegidlar kabi terpen bo‘lmagan uglevodorodlar uchuvchan birikmalarning asosiy komponentlari hisoblanadi [1; 2; 3].

Adabiyot manbalarida *Phlomoides* o‘simlik turlarining farmakologik ta‘siri menopauza belgilarini bartaraf etish, yallig‘lanishga qarshi faollik va osteoporozga qarshi faollikni ko‘rsatgan [4; 5; 6].

Tadqiqot metodologiyasi

Phlomoides labiosa o‘simligining barglari, poyasi, ildizlari va urug‘lari Andijon viloyati Asaka tumani Imom ota qishlog‘idan yig‘ib olindi. O‘simlik materiallari sirtida mavjud bo‘lgan iflosliklarni tozalash maqsadida distillangan suvda yaxshilab yuvildi va 30 kun davomida havo aylanadigan joyda soyada quritildi. Har bir namuna alohida holda elektr blender yordamida mayda kukun holiga keltirildi va havo o‘tkazmaydigan idishlarda xona haroratida saqlab qo‘yildi.



1-rasm. *Phlomoides labiosa* o‘simligi yer ustki qismi

Phlomoides labiosa o‘simligi tarkibida qanday moddalar borligini aniqlash uchun o‘simlikning quritilib maydalangan 5 ta qismidan - ildiz, poya, barg, gul va urug‘idan bir gramdan tortib olindi. Bir grammdan tortib olingan o‘simlikni maydalangan har bir qismini 25 ta sterillangan 25-30 ml li kolbaga solib, har biriga 20 ml dan suv, metanol, xloroform, benzin, benzol quyildi va yorliq yopishtirildi. U 72 soatga qoldirildi. Hosil bo‘lgan ekstraktlarni filtr qog‘oz orqali alohida idishlarga filtrlandi, nomlari yozilgan yorliqlar yopishtirildi. So‘ngra o‘simlik tarkibida qanday fiziologik moddalar borligini aniqlash uchun ularga sifat reaksiyalari o‘tkazildi.

Fitokimyoviy birikmalarni aniqlash bo‘yicha o‘tkazilgan sinovlar

A) Alkaloidlar uchun testlar

1) Dragendorf testi: 1 ml dan olingan na’munalarning har bir probirkasiga bir necha tomchi Dragendorf reaktivi (kaliy vismut yodid eritmasi) qo‘shildi. Alkaloidlarning mavjudligi bildiruvchi qizil jigarrang cho‘kma kuzatildi.

2) Vagner testi: na’munalarning har biriga bir necha ml dan Vagner reagenti (J_2+KJ) qo‘shildi, natijada alkaloidlar mavjudligini ko‘rsatuvchi jigarrang cho‘kma hosil bo‘ldi.

3) Tanik kislota testi: Bir necha ml 10% tanin kislotasi 1 ml dan olingan har bir na’munaga qo‘shildi, alkaloidlar mavjudligini ko‘rsatuvchi och sarg‘ish-jigarrang cho‘kma hosil bo‘ldi.

4) $FeCl_3$ testi: Na’munalarning har biriga $FeCl_3$ eritmasidan bir tomchidan qo‘shildi. Hosil bo‘lgan sariq cho‘kma alkaloidlar mavjudligini ko‘rsatdi.

B) Glikozidlar uchun testlar

1. Bromli suv testi: Bromli suv bilan ishlanganda sinov eritmasi sariq cho‘kma beradi.

2. Kellar Kiliani testi: Probirkaga 1ml konsentrlangan sulfat kislota olib, keyin 5ml ekstrakt va 2ml sovuq sirka kislotasi bo‘lgan bir tomchi temir xlorid qo‘shildi, reaktsiya ko‘k rang hosil bo‘lishini ko‘rsatadi.

3. Konsentrlangan sulfat kislota sinovi: sinov namunasiga kons.H_2SO_4 qo‘shilganda, qizil rang paydo bo‘lishiga olib keldi.

4. Molish testi: sinov namunalariga alfa naftol va konsentrlangan H_2SO_4 qo‘shildi. ikki qatlamning birlashishi natijasida qizil binafsha halqa hosil bo‘ldi.

C) Tanin va fenollar uchun testlar

1. Temir (III) xlorid testi: namuna eritmasiga temir (III) xloriddan bir necha tomchi qo‘shilganda qora rangdagi cho‘kma paydo bo‘ldi.

2. Qo‘rg‘oshin atsetat: har xil probirkalarga bir necha ml sinov namunalaridan olindi, so‘ngra qo‘rg‘oshin asetat qo‘shildi, natijada qizg‘ish-qo‘ng‘ir rangdagi katta hajmli cho‘kma hosil bo‘ldi.

3. Ishqoriy reaktiv: namuna eritmasiga natriy gidroksid eritmasi qo‘shilishi natijasida sariqdan qizil ranggacha cho‘kma hosil bo‘ldi.

4. Elagik kislota sinovi: Na’munaga 5% li sovutilgan sirka kislotasi va 5% bo‘lsa natriy nitrit qo‘shildi. Natijada fenollarga xos bo‘lgan jigarrang loyqa paydo bo‘ldi.

D) Flavonoidlar uchun testlar

1. Rux gidroxloridni qaytarish testi: Namunaga rux kukuni va konsentrlangan xlorid kislota aralashmasi qo‘shganda, qizil rang hosil bo‘lishiga olib keldi.

2. Qo‘rg‘oshin atsetat testi: namunasiga qo‘rg‘oshin asetat eritmasidan qo‘shilganda qizil jigarrang cho‘kma paydo bo‘ldi.

3. Temir (III) xlorid sinovi: bir necha ml dan alohida-alohida olingan sinov namunalariga temir (III) xlorid eritmasidan bir necha tomchi qo‘shildi va qora-qizil rangdagi cho‘kma hosil bo‘ldi.

4. Shinoda testi (magniy gidroxloridni qaytarish testi): Sinov eritmasiga magniyning bir necha bo‘lagi va konsentrlangan xlorid kislota qo‘shilganda qizg‘ish-pushti rang hosil bo‘ldi.

E) Sterollar uchun testlar

1. Liberman-Bushard testi: Namunalar bir necha tomchi sirka angidrid bilan ishlanganidan so‘ng qaynatildi va bir necha tomchi konsentrlangan sulfat kislota probirka devori bo‘ylab tomizildi, ikki qatlam birlashgan joyda jigarrang halqa hosil bo‘ldi. Yuqori qatlam steroidlar mavjudligini bildiruvchi yashil rangga o‘zgardi.

2. Salkovskiy testi: Xloroformli namunalarga bir necha tomchi konsentrlangan sulfat kislota qo‘shilganda, pastki qatlamda sterollar uchun xos bo‘lgan qizil rang paydo bo‘ldi.

F) Xinonlar uchun testlar

Spirtli KOH testi: Na’munaga spirtli KOH qo‘shilganda xinonlar uchun ijobiy hisoblangan qizildan ko‘kkacha rang paydo bo‘ldi.

G) Saponinlar uchun testlar

1. Ko‘pik testi: 5 ml ekstrakt kuchli silkitilganda barqaror doimiy ko‘pik hosil bo‘ldi. Keyin ko‘pik aralashtirildi va uch tomchi zaytun moyi qo‘shilganda saponinlar mavjudligini ko‘rsatadigan emulsiya shakllanishi kuzatildi.

Natijalar va ularning tahlili

Phlomoides labiosa ning bargi, novdasi, ildizi, guli va urug‘i ekstraktlarining dastlabki fitokimyoviy tekshirilgangi, ya’ni biologik faollik ko‘rsatuvchi fitokimyoviy birikmalarni aniqlash va tahlil qilish uchun turli erituvchilar, ya’ni suvli, metanol, xloroform, ekstraksion benzin va benzolli yordamida amalga oshirildi. Ushbu tahlil uchun standart usullar qo‘llanildi. UB va normal yorug‘likda barcha ekstraktlarning fluoresan tahlili jadvalda keltirilgan (Jadval 1). Turli erituvchilar UB va normal yorug‘likda turli ranglarni ko‘rsatdi.

Labiosa o`simligining barglari, poyasi, ildizi va urug‘ ekstraktlarida mavjud bo‘lgan quyidagi bioaktiv birikmalarni aniqlash chun standart sifatli protseduralar qo‘llaniladi.

1. Alkaloidlar: O‘simlikning barcha qismlarida (barg, poya, ildiz, urug‘, gul) aniqlangan. Ushbu o‘simlikning yer ustki qismi nafas yo`llari kasalliklari, meda-ichak buzilishlari va yalig`lanishga qarshi damlama sifatida qo`llaniladi.

2. Glikozidlar: Barg, poya asosan ildiz va gul qisimlarda aniqlandi, lekin urug` qismida aniqlanmadi. Bu moddalar yurak faoliyatiga ijobiy ta’sir ko‘rsatishi bilan tanilgan.

3. **Flavonoidlar**: O‘simlikning barcha qismlarida (barg, poya, ildiz, urug‘, gul) aniqlangan. Bu moddalar kuchli antioksidant xususiyatga ega bo‘lib, organizmni erkin radikallardan himoya qiladi, yallig‘lanishga qarshi va kuchli antikanser (saratonning oldini oluvchi) ta’sirga ega.

4. **Taninlar/Fenollar**: O‘simlikning barg, poya, gul, ildiz va urug` qismlarida aniqlangan. Bu moddalar antiseptik, antimikrob va siqilish xususiyatlariga ega.

5. Xinonlar: O‘simlikning barcha qismlarida aniqlangan. Ular antimikrob va sitotoksik faollik bilan mashhur.

Xulosa

Yuqoridagi fitokimyoviy tadqiqotga ko‘ra, *Phlomoides labiosa* o‘simligining barg, poya, ildiz, gul va urug‘ ekstraktlarida aniqlangan alkaloidlar, flavonoidlar, fenol birikmalar, tanninlar, glikozidlar, sterollar hamda xinonlar o‘simlikning farmakologik jihatdan istiqbolli manba ekanligini tasdiqlaydi. Olingan natijalar ushbu o‘simlikni nafaqat xalq tabobatida, balki zamonaviy farmatsevtika sanoatida ham qo‘llash imkoniyatlari mavjudligini ko‘rsatadi. Ayniqsa, uning tarkibidagi tabiiy antioksidant va biologik faol moddalar asosida yangi dori vositalari yaratish istiqbollari mavjud.

Annotatsiya. *Ushbu maqolada meva-sabzavotlarni saqlash va qayta ishlash jarayonida hosil bo'ladigan chiqindilarni qayta ishlash va ulardan samarali foydalanish masalalari tadqiq etilgan. Tadqiqot davomida chiqindilarni qayta ishlashning turli texnologiyalari, shuningdek, qayta ishlangan meva-sabzavot chiqindilaridan olingan mahsulotlar va ularning iqtisodiy samaradorligi o'rganilgan. Tadqiqot ishining maqsadi meva-sabzavot chiqindilarini qayta ishlash jarayonini samarali tashkil etish va uning iqtisodiy, ekologik foydalarini kengaytirish uchun yangi ilmiy yondashuvlarni ishlab chiqishdan iborat.*

Kalit so'zlar. *Meva, sabzavot, chiqindilarni qayta ishlash, ekologiya, biogaz, kompost, qayta ishlash texnologiyalari, chiqindilarni boshqarish, resurslarni samarali foydalanish, yashil texnologiyalar.*

ВОЗМОЖНОСТИ ЭФФЕКТИВНОГО ИСПОЛЬЗОВАНИЯ РЕСУРСОВ НА ОСНОВЕ ПЕРЕРАБОТКИ ОТХОДОВ ФРУКТОВ И ОВОЩЕЙ

Аннотация. *В данной статье исследуются вопросы переработки отходов, образующихся в процессе хранения и переработки фруктов и овощей, а также их эффективного использования. В ходе исследования были изучены различные технологии переработки отходов, а также продукция, получаемая из переработанных отходов фруктов и овощей, и их экономическая эффективность. Целью исследования является разработка новых научных подходов к эффективной организации процесса переработки отходов фруктов и овощей и расширению его экономических и экологических преимуществ.*

Ключевые слова. *Фрукты, овощи, переработка отходов, экология, биогаз, компост, технологии переработки, управление отходами, эффективное использование ресурсов, зелёные технологии.*

OPPORTUNITIES FOR EFFICIENT RESOURCE UTILIZATION THROUGH THE PROCESSING OF FRUIT AND VEGETABLE WASTE

Abstract. *This article examines the issues of recycling and efficient utilization of waste generated during the storage and processing of fruits and vegetables. During the study, various waste processing technologies were analyzed, as well as the products obtained from processed fruit and vegetable waste and their economic efficiency. The aim of the research is to develop new scientific approaches to effectively organize the process of recycling fruit and vegetable waste and to expand its economic and environmental benefits.*

Keywords. *Fruits, vegetables, waste recycling, ecology, biogas, compost, recycling technologies, waste management, efficient use of resources, green technologies.*

KIRISH. Jahonda sifatli oziq-ovqat mahsulotlariga bo'lgan talabni qondirish, ishlab chiqarish jarayonlarini takomillashtirish, samaradorligi yuqori, avtomatlashtirilgan boshqaruvga ega zamonaviy texnologik jarayonlar va qurilmalar yaratish bo'yicha keng qamrovli izlanishlar olib borilmoqda. Respublikamizda bugungi kunda meva va sabzavotlar yetishtirish hajmini ko'paytirish, ularni saqlash va qayta ishlash jarayonida hosil bo'ladigan chiqindilarni kompleks qayta ishlaydigan mavjud texnologiyalarni takomillashtirish, tarmoq korxonalarini zamonaviy, energiyatejamkor va yuqori samaradorlikka ega uskunalar bilan qayta jihozlashga alohida e'tibor berilib, muayyan natijalarga erishilmoqda [1].

Aholi sonining ortib borishi va oziq-ovqat mahsulotlariga bo‘lgan talabning oshishi natijasida meva va sabzavot chiqindilari hajmi ham sezilarli darajada ko‘paymoqda. Ushbu chiqindilarni samarali qayta ishlash nafaqat atrof-muhitni muhofaza qilish, balki iqtisodiy foyda olish imkonini ham beradi. Meva va sabzavot chiqindilari tarkibida organik moddalar ko‘p bo‘lib, ular mikroorganizmlar yordamida biologik usulda qayta ishlanishi mumkin. Shu sababli mikrobiologik qayta ishlash usullari hozirgi kunda eng samarali va ekologik toza texnologiyalardan biri sifatida qaralmoqda.

MAVZUGA OID ADABIYOTLAR TAHLILI. Meva va sabzavotlarni saqlash hamda qayta ishlash sanoatida hosil bo’ladigan chiqindilarni qayta ishlash va ulardan foydalanish masalasi jahon miqyosida keng o‘rganilgan va ushbu sohada bir qator ilmiy izlanishlar amalga oshirilgan. Yirik xalqaro tashkilotlar va soha mutaxassislari tomonidan olib borilgan tadqiqotlar chiqindilarni boshqarish va qayta ishlashning turli metodlarini, texnologiyalarini va iqtisodiy samaradorligini o‘rganishga qaratilgan. Jumladan, Jahon banki va Birlashgan Millatlar Sanoatni Rivojlantirish Tashkiloti tomonidan nashr etilgan hisobotlarda chiqindilarni qayta ishlashning ijtimoiy va ekologik foydalari, shuningdek, uning iqtisodiy samaradorligi batafsil tahlil qilingan. Ushbu tadqiqotlarda meva-sabzavot chiqindilarini qayta ishlash orqali energiya ishlab chiqarish, yangi mahsulotlar yaratish va ekologik xavfsizlikni ta’minlash imkoniyatlari ko‘rib chiqilgan [1]. O‘zbekiston olimlari ham ushbu sohada o‘z ilmiy ishlarini olib bormoqda. A.M.Rustamov va M.A.Qudratov o‘zlarining tadqiqotlarida oziq-ovqat sanoatidagi chiqindilarni kamaytirish va ularni qayta ishlash bo‘yicha mavjud yondashuvlarni tahlil qilib, bu jarayonning iqtisodiy samaradorligini oshirish uchun kerakli innovatsiyalarni ko‘rsatganlar. Ularning ilmiy ishlarida ekologik toza texnologiyalarni qo‘llashning ahamiyati, chiqindilarni boshqarishning yangi mexanizmlari va qayta ishlashni rivojlantirishning ijtimoiy-iqtisodiy ta’siri yoritilgan [3].

TADQIQOT METODOLOGIYASI. Ushbu tadqiqot ishida meva va sabzavotlarni saqlash hamda qayta ishlash sanoatida hosil bo’ladigan chiqindilarni kompleks qayta ishlash va ulardan samarali foydalanishning iqtisodiy va ekologik jihatlarini o‘rganish uchun zamonaviy ilmiy tadqiqot yondashuvlari asosida metodologik asoslar tanlab olindi. Tadqiqot mavzusiga doir mahalliy va xorijiy olimlarning ilmiy tadqiqot ishlari, sohaga oid xalqaro tashkilotlarning statistik ma’lumotlari o‘rganilib, mavjud muammolar va ularning yechimlari umumlashtirildi. Tadqiqot metodologiyasi asosida olingan natijalar O‘zbekiston oziq-ovqat sanoatida chiqindilarni samarali boshqarish, ulardan foydali mahsulotlar olish va ekologik xavfsizlikni ta’minlash bo‘yicha takliflar ishlab chiqishda ilmiy asos bo‘lib xizmat qiladi.

TAHLIL VA NATIJALAR. Meva va sabzavotlarni saqlash va qayta ishlash jarayonida hosil bo‘ladigan chiqindilarni kompleks qayta ishlash hamda ulardan samarali foydalanish borasida olib borilgan tahlillar shuni ko‘rsatadiki, mazkur yo‘nalish nafaqat ekologik xatarlarning oldini olishga xizmat qiladi, balki iqtisodiy samaradorlikni oshirishda ham muhim ahamiyat kasb etadi. So‘nggi yillarda chiqindilarni qayta ishlash jarayoni hali hamon to‘g‘ri yo‘lga qo‘yilmagan yoki yetishtirilgan meva-sabzavotlar muvofiq sharoitda saqlanmayapti. Bu esa, o‘z navbatida, atrof-muhitga salbiy ta’sir ko‘rsatishi bilan birga, iqtisodiy zararlarni ham keltirib chiqaradi. Statistik ma’lumotlarga ko‘ra, mamlakatimizdagi oziq-ovqat ishlab chiqarish subyektlari, jumladan meva-sabzavotlarni saqlash va qayta ishlash korxonalarida har yili minglab tonna organik chiqindilar yuzaga keladi. Ushbu chiqindilarning aksariyat qismi qishloq xo‘jaligida tabiiy o‘g‘it sifatida, bioyoqilg‘i olish yoki chorvachilikda ozuqa sifatida qayta ishlanishi mumkin. Biroq mavjud texnik quvvatlar va zamonaviy uskunalarning yetishmovchiligi sababli bu imkoniyatlar to‘liq ishga tushirilmayapti [1, 2].

Tahliliy ma’lumotlarga ko’ra meva-sabzavotlarni konservalash sanoati (po‘st, urug‘, sharbat qoldiqlari), go‘sht va go‘sht mahsulotlarini tayyorlash, sutni qayta ishlash sohasi, non va shirinlik mahsulotlari ishlab chiqarish sanoati eng ko‘p chiqindi hosil qiluvchi sohalar hisoblanadi. Rivojlangan mamlakatlar tajribasi shuni ko‘rsatmoqdaki, meva-sabzavot chiqindilarining 60÷80 foizi takroriy foydalanishga yo‘naltiriladi. Masalan, Germaniyada chiqindilardan bioenergiya va kompost olinib, energiya va qishloq xo‘jaligi ehtiyojlari ta’minlanmoqda. Shvetsiyada esa chiqindilardan metan gazi olinadi va transport vositalari uchun yoqilg‘i sifatida ishlatiladi. O‘zbekiston sharoitida bu ko‘rsatkich hozircha 15÷20 foiz atrofida bo‘lib, bu sohada sezilarli imkoniyatlar mavjudligini anglatadi [1, 3].

Tahlil natijalariga ko‘ra, tegishli texnologik jihozlarning yetarli emasligi, moliya va investitsiya manbalarining cheklanganligi, me’yoriy-huquqiy bazaning zaifligi, aholi va ishlab chiqaruvchi tashkilotlar orasida ekologik bilim va madaniyatning pastligi meva-sabzavot chiqindilarini qayta ishlash jarayonining past darajada bo‘lishiga sabab bo‘lmoqda. Shuningdek, iqtisodiy hisob-kitoblar shuni ko‘rsatadiki, chiqindilardan samarali foydalanish orqali mahsulot tannarxini 10÷15% ga kamaytirish, ishlab chiqarish jarayonidagi chiqindilar miqdorini 30÷40% ga qisqartirish hamda qo‘shimcha daromad manbalarini shakllantirish mumkin.

1-jadval

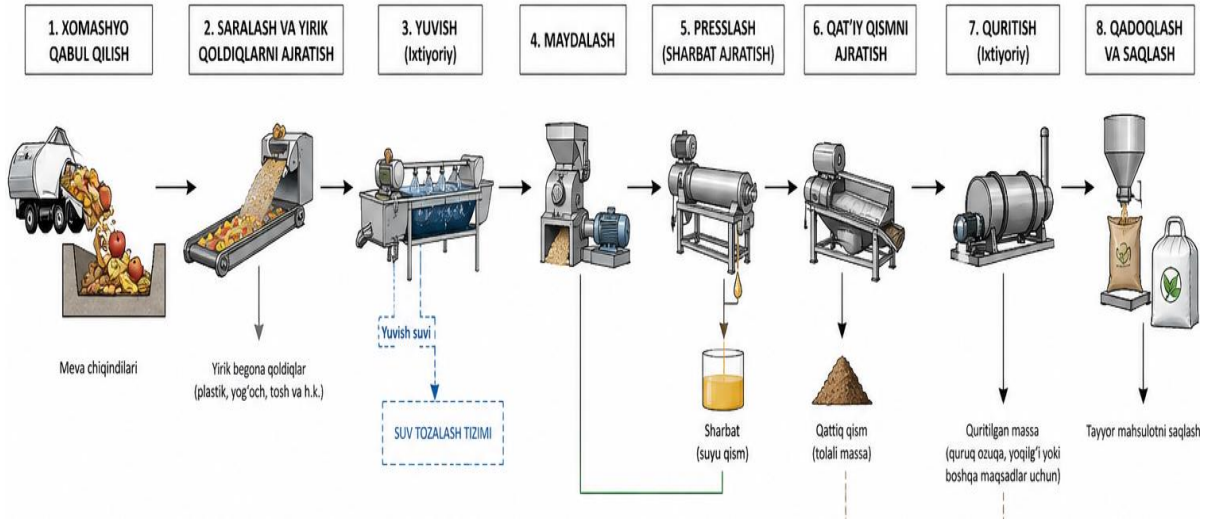
Oziq-ovqat chiqindilarining asosiy manbalari va ularni qayta ishlash imkoniyatlari

Yo‘nalish	Chiqindi turlari	Qayta ishlash imkoniyati
Go‘sht mahsulotlari sanoati	Po‘choqlar, urug‘lar, sharbat qoldiqlari	Kompost, o‘g‘it, bioenergiya

Meva-sabzavot konservalash	Po‘choqlar, urug‘lar, sharbat qoldiqlari	Kompost, o‘g‘it, bioenergiya
Sut mahsulotlari ishlab chiqarish	Zardob, suvat	Hayvonlar uchun ichimlik, qayta ishlangan zardob
Non va qandolat sanoati	Ortiqcha xamir, yaroqsiz mahsulotlar	Chorva yemi, organik o‘g‘it

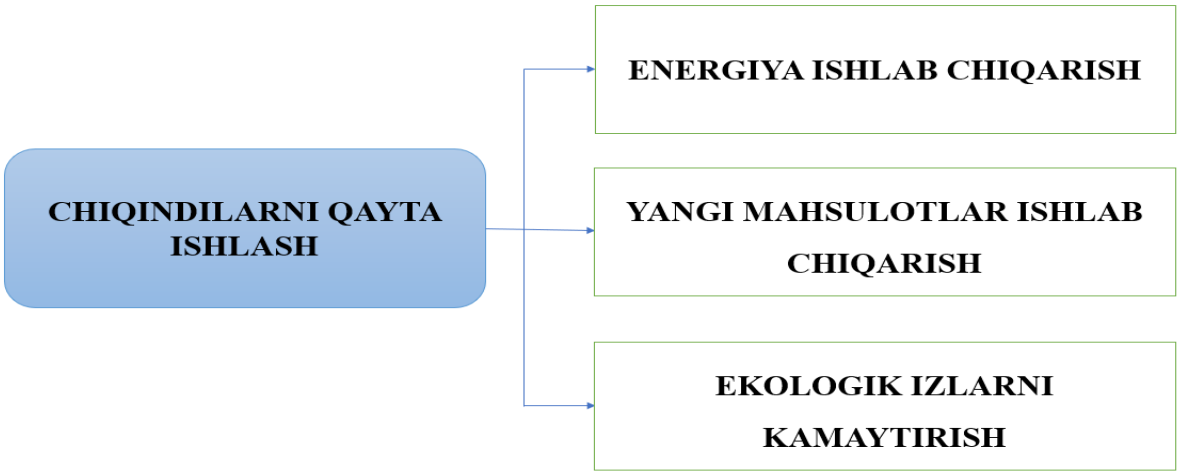
Ushbu jadvalda O‘zbekiston oziq-ovqat sanoatining turli yo‘nalishlarida hosil bo‘ladigan chiqindilar, ularning turlari va ularni ikkilamchi resurs sifatida qanday foydalanish mumkinligi aks ettirilgan. Maqsad - chiqindi manbalarini aniqlash va ulardan iqtisodiy hamda ekologik foyda keltiradigan yo‘llar bilan foydalanish imkoniyatlarini ko‘rsatish.

Bu jadval chiqindilarni faqatgina “keraksiz mahsulot” sifatida emas, balki foydali iqtisodiy resurs sifatida ko‘rishga asos yaratadi. Shu orqali resurslardan samarali foydalanish va ekologik barqarorlikka erishish maqsad qilingan.



1-rasm. Meva chiqindilarini qayta ishlash liniyasi

Chiqindilarni zararsizlantirish va ularni qayta ishlash iqlim o‘zgarishiga kuchli ta’sir ko‘rsatadigan issiqxona gazlarining ajralishiga olib keladi. Ayniqsa, chiqindixonalarda saqlanayotgan organik moddalarning parchalanishi natijasida yuzaga keladigan metan – eng muhim issiqxona gazlaridan biri hisoblanadi.



2-rasm. Meva-sabzavotlarini qayta ishlash va ulardan foydalanish imkoniyatlari

2-rasmda meva-sabzavot chiqindilarini qayta ishlash jarayonining asosiy yo‘nalishlari va ular orqali erishiladigan natijalar aks ettirilgan. Diagrammaning markazida joylashgan “Chiqindilarni qayta ishlash” konsepti uch muhim natija bilan bog‘langan bo‘lib, ushbu yo‘nalishlar quyidagilardan iborat:

1. Energiya ishlab chiqarish - Oziq-ovqat chiqindilarini qayta ishlash orqali biogaz, bioyoqilg‘i kabi qayta tiklanuvchi energiya manbalarini ishlab chiqarish mumkin. Bu esa energiya xavfsizligini ta’minlashda muhim rol o‘ynaydi.

2. Yangi mahsulotlar ishlab chiqarish - Chiqindilardan o‘g‘it, hayvonlar uchun yem, biologik faol moddalar kabi mahsulotlar olinishi mumkin. Bu esa iqtisodiy samaradorlikni oshiradi va import o‘rnini bosuvchi mahsulotlar ishlab chiqarishga xizmat qiladi.

3. Ekologik izni kamaytirish - Qayta ishlash orqali chiqindilarning atrof-muhitga zararli ta’siri kamayadi. Bu atmosfera, suv va tuproqning ifloslanishining oldini oladi va barqaror ekologik muhitni saqlashga yordam beradi.

Chiqindilarni qayta ishlash yangi ish o‘rinlarini yaratadi, aholi bandligini oshiradi va ijtimoiy-iqtisodiy barqarorlikni ta'minlashga xizmat qiladi.

XULOSA. Tadqiqot davomida mavzuga oid mahalliy va xorijiy olimlarning ilmiy ishlanmalari, patentlar, me’yoriy-huquqiy hujjatlarni tahlil qilib, quyidagi xulosaga keldim. Meva va sabzavot chiqindilari yuqori namlik, organik moddalarga boylik hamda tez parchalanish xususiyati bilan ajralib turadi. Ularning tarkibida uglevodlar, tolalar, vitaminlar va mineral moddalar ko‘p bo‘lgani sababli, mazkur chiqindilar ekologik jihatdan xavf tug‘dirishi bilan birga, katta iqtisodiy resurs sifatida ham ahamiyat kasb etadi. Tadqiqotlar shuni ko‘rsatadiki, ushbu chiqindilar noto‘g‘ri boshqarilganda atrof-muhitning ifloslanishiga, yoqimsiz hidlar tarqalishiga va sanitariya-gigiyena muammolarining yuzaga kelishiga sabab bo‘ladi. Shu bilan birga, ularni qayta ishlash orqali biogaz, kompost, ozuqa qo‘shimchalari va boshqa foydali mahsulotlar olish mumkin. Xulosa qilib aytganda, meva-sabzavot chiqindilarining asosiy xususiyatlarini chuqur o‘rganish ularni samarali qayta ishlash texnologiyalarini ishlab chiqish va amaliyotga joriy etish uchun muhim ilmiy asos bo‘lib xizmat qiladi. Bu esa resurslardan oqilona foydalanish, ekologik barqarorlikni ta’minlash hamda iqtisodiy samaradorlikni oshirishga imkon yaratadi.

Tadqiqot natijalari asosida quyidagi tavsiyalar ilgari suriladi:

Birinchidan, texnologik bazani mustahkamlash. Bunda, meva-sabzavot chiqindilarini qayta ishlash uchun ilg‘or jihozlar va zamonaviy texnologiyalarni joriy etishga yo‘naltirilgan investitsiya mablag‘larini jalb etish nazarda tutiladi.

Ikkinchidan, huquqiy-me’yoriy asoslarni yanada kuchaytirish. Unga muvofiq chiqindilarni boshqarish, ularni ajratib yig‘ish va takror ishlatishni rag‘batlantiruvchi qonuniy mexanizmlarni yaratish, chiqindi manbalariga differensial soliq stavkalarini joriy etish maqsadga muvofiq.

Uchinchidan, davlat va nodavlat sektorlar o‘rtasida hamkorlikni mustahkamlash. Bunda ijtimoiy sheriklik asosida xususiy investorlarni jalb etish, ularga soliq yengilliklari, grant va subsidiyalar ajratish orqali meva-sabzavot chiqindilarini qayta ishlash infratuzilmasini rivojlantirish nazarda tutiladi.

Annotatsiya: *Mazkur maqolada mahalliy bir yillik o‘simlik- g‘o‘zadan sellyuloza ajratib olishning nitrat kislotali usuli o‘rganilgan. Oqartirish maqsadida vodorod peroksidning ishqor bilan aralashmasidan foydalanilgan. Ajratilgan sellyulozaning tuzilmasi IQ-spektroskopiya, termik tahlil va boshqa usullar yordamida o‘rganildi. IQ-spektroskopiyadagi har bir olingan natijalar bir-biri bilan solishtirildi. Natijalarga ko‘ra, mahalliy o‘simlik-g’o’za o’simligidan olingan sellyuloza ishqoriy usuldan farqli ravishda kislotali usulda yaxshi ajratib olinishi aniqlandi.*

Kalit so‘zlar: *bir yillik o‘simliklar, sellyuloza, oqartirish, vodorod peroksid va ishqor aralashmasi, nitrat kislotali usul, IQ-spektroskopiya*

ISOLATION OF CELLULOSE FROM COTTON PLANT BY ACID METHOD AND ITS IR ANALYSIS

Annotation: *In this article, the nitric acid method of extracting cellulose from the local annual plant - cotton is studied. A mixture of hydrogen peroxide and alkali was used for bleaching. The structure of the isolated cellulose was studied using IR-spectroscopy, thermal analysis and other methods. Each obtained result in IR-spectroscopy was compared with each other. According to the results, it was found that the cellulose obtained from the local plant-cotton plant is better isolated by acid method than alkaline method.*

Keywords: *annual plants, cellulose, bleaching, hydrogen peroxide, nitric acid method, IR spectroscopy*

ВЫДЕЛЕНИЕ ЦЕЛЛЮЛОЗЫ ИЗ ХЛОПЧАТНИКА КИСЛОТНЫМ МЕТОДОМ И ЕЕ ИК-АНАЛИЗ

Аннотация: *В данной статье изучен азотнокислотный метод извлечения целлюлозы из местного однолетнего растения - хлопка. Для отбеливания использовалась смесь перекиси водорода и щелочи. Структуру выделенной целлюлозы изучали с помощью ИК-спектроскопии, термического анализа и других методов. Каждый полученный результат в ИК-спектроскопии сравнивался между собой. По результатам установлено, что целлюлоза, полученная из местного растения-хлопчатника, лучше выделяется кислотным методом, чем щелочным.*

Ключевые слова: *однолетние растения, целлюлоза, отбеливание, смесь перекиси водорода и щелочей, азотнокислый метод, ИК-спектроскопия*

Kirish

Sellyuloza tabiatda eng keng tarqalgan organik moddalardan biri bo‘lib, o‘simlik hujayra devorining asosiy tarkibiy qismi hisoblanadi. Ayniqsa, g‘o‘za o‘simligi tarkibida sellyuloza miqdori yuqori bo‘lib, uni ajratib olish sanoat uchun muhim ahamiyatga ega.

Bugungi kunda ekologik toza va qayta tiklanuvchi xom ashyolardan foydalanish dolzarb masalalardan biri hisoblanadi. Shu sababli g‘o‘za poyasi va boshqa qoldiqlaridan sellyuloza ajratib olish texnologiyalarini takomillashtirish muhimdir.

Adabiyotlar sharhi

Sellyuloza - bu o‘simlik hujayra devorining bosh tarkibiy qismi bo‘lib, murakkab uglevodlar (polisaxaridlar) guruhiga kiradi. Uning molekulasi juda uzun β-D-glyukopiranoza halqalaridan hosil bo‘lgan zanjirdan iborat. Glyukozalar β-1,4-glikozid bog‘lari bilan ulanadi, bu esa sellyulozaga mustahkam va erimaydigan tuzilma beradi. Kimyoviy formulasi: $(C_6H_{10}O_5)_n$, oq, tolali modda, suvda va oddiy organik erituvchilarda erimaydi, juda mustahkam, egiluvchan, yuqori haroratda parchalanadi, yonadi. O‘simliklarning poyasi, bargi, urug‘ qobig‘i va yog‘ochida ko‘p miqdorda bo‘ladi (paxtada 95–98%, yog‘ochda 40–50%).Ba’zi bakteriyalar (masalan, Acetobacter xylinum) ham sellyuloza sintez qiladi.[1]

Sellyuloza - Yer yuzidagi eng ko‘p tarqalgan tabiiy polimerlardan biri bo‘lib, ko‘plab ishlab chiqarish sohalarida asosiy xomashyo sifatida ishlatiladi:

a) Qog‘oz va karton ishlab chiqarish- qog‘oz sanoati sellyulozaning eng yirik iste’molchisi. Yog‘och massasi yoki paxta tolalaridan olinadi. Yozuv, bosma, qadoqlash materiallari tayyorlanadi.

b) To‘qimachilik sanoati-paxta tolasi asosan sof sellyulozadan iborat. Viskoza, asetat tolalari kabi sun’iy tola ishlab chiqarishda sellyuloza kimyoviy qayta ishlanadi.

c) Kimyo sanoati-nitrosellyuloza (portlovchi moddalar, lak-bo‘yoqlar). Sellyuloza atsetat (foto plyonkalar, plastik buyumlar). Karboksimetilsellyuloza (oziq-ovqat va dori vositalarida qovushqoqlik beruvchi moddalar)

d) Oziq-ovqat sanoati-qalinlashtiruvchi va stabilizator sifatida (E460) ishlatiladi. Kaloriyasiz to‘ldiruvchi sifatida parhez mahsulotlarda qo‘llanadi.

f) Qadoqlash va biopolimerlar-Sellyuloza asosidagi bio-degradatsiyalanuvchi plyonkalar atrof-muhitga zarar yetkazmaydi.

Sellyuloza nafaqat sanoatda, balki ilmiy tadqiqotlarda ham katta ahamiyatga ega.

a) Materialshunoslik-nanotsellyuloza (nano-crystalline cellulose, NCC) yuqori mustahkamlikka ega bo‘lib, kompozit materiallar yaratishda ishlatiladi. Yangi turdagi engil, ammo bardoshli konstruksiyalar uchun xomashyo.

b) Biotibbiyot-yaralarni davolash uchun bioaktiv bog‘lov materiallari.Dori moddalari tashuvchisi sifatida modifikatsiyalangan sellyuloza.[2]

Tadqiqot metodologiyasi

Bugungi kunda o’simliklardan sellyuloza ajratib olishning ko’plab usullari mavjud bo’lib, har bitta metod sellyulozaning sifati, usulning o’ziga xosligi bilan ajralib turadi.

Kislotali usulga sulfit, bisulfit va azotli-kislotali usullarni misol qilib keltiriladi. Sulfit usulida qaynatish jarayonida sulfit kislota asosiy qism hisoblanadi. Oqartirilgan va oqartirilmagan sulfit sellyuloza gazeta ishlab chiqarish bosmaxona, yozuv, bosma qog‘oz va sun’iy tola olishda asosiy yarimtayyor mahsulot deb qaraladi.[3]

Bisulfit usuli 10-15 yildan buyon sanoat miqyosida qo‘llanilib kelinmoqda. Bu usulda kimyoviy modda sifatida natriy yoki magniy bisulfitning suvli eritmasidan ishlatilyapti. Bisulfit sellyuloza xossalari bo‘yicha sulfit sellyuloza bilan deyarli bir xil, faqat o ‘zining mexanik pishiqligi va tolalarga oson ajralish qobiliyati bilan sulfit usulidan ustun turadi.

Sulfat usulida ishqor va natriy sulfid aralashmasi kimyoviy moddalar vazifasini bajaradi. Hozirgi kunda barcha sellyuloza olish usullari ichida sulfat usuli eng keng tarqalgan usul hisoblanadi. Sulfat usulida ham natron usuli kabi barcha daraxt navlaridan foydalanish mumkin. Mexanik pishiqlikning barcha ko‘rsatkichlari bo‘yicha sulfat sellyuloza sulfit sellyulozadan yuqori turadi. Sulfat sellyuloza sulfit sellyulozaga nisbatan qiyin oqaradi va qiyin yanchiladi, lekin, oson yelimlanadi, issiqlikka chidamli va xizmat qilish muddati uzoqdir.[4]

Ishqorli sulfit usulida kimyoviy modda sifatida ishqor va natriy sulfit aralashmasidan foydalaniladi. Ushbu usul sulfat usuliga nisbatan sellyuloza va yarimsellyulozaning hosil bo’lish miqdorining yuqoriligi bilan ajralib turadi. Bosqichma-bosqich usulida odatda, bitta usuldan foydalanilmaydi, bunda turli, lekin, bir-biriga yaqin bo‘lgan reagentlar bilan xomashyoga ketma-ket ishlov beriladi.

Neytral usulida sellyuloza olish guruhiga monosulfit va gidrotrop usullar kiradi. Monosulfit usuli ko‘pincha neytral-sulfit usuli deb ham yuritiladi. Reagent sifatida natriy sulfit va ba’zan, ammoniy sulfitdan foydalaniladi. Monosulfit usulida faqat yaproqli daraxt navlaridan sellyuloza olish mumkin.[5]

Natijalar va ularning tahlili

Yuqoridagi usullar bilan tanishib chiqilganda, ba’zilarida olingan sellyulozaning tozalik darajasi kamroq bo’lganligi sababli tajriba uchun nitratli usul tanlandi. Bunda g’o’za o’simlik poyasi olib kelinib, maydalandi va shu maydalangan namunadan 40 gr olib, 4 qismga bo’lib, 10 gr dan teng miqdorda olindi. Olingan namunalarni HNO_3 ni 3 %, 5 %, 7 %, 9 % lisida 3 soat davomida qaynatildi. Bunda tarkibidagi qo’shimchalardan va qisman lignindan tozalandi.

Qaynatilgan namunani suv bilan yuvib quritish shkafida quritildi.

Quritilgandan so’ng, barcha namunalarni massasi o’lchandi:

3 % li HNO_3 eritmasida qaynatilgan namuna- 2,23 gr;

5 % li HNO_3 eritmasida qaynatilgan namuna- 1,78 gr;

7 % li HNO_3 eritmasida qaynatilgan namununa- 1,52 gr;

9 % li HNO_3 eritmasida qaynatilgan namuna-1,88 gr;

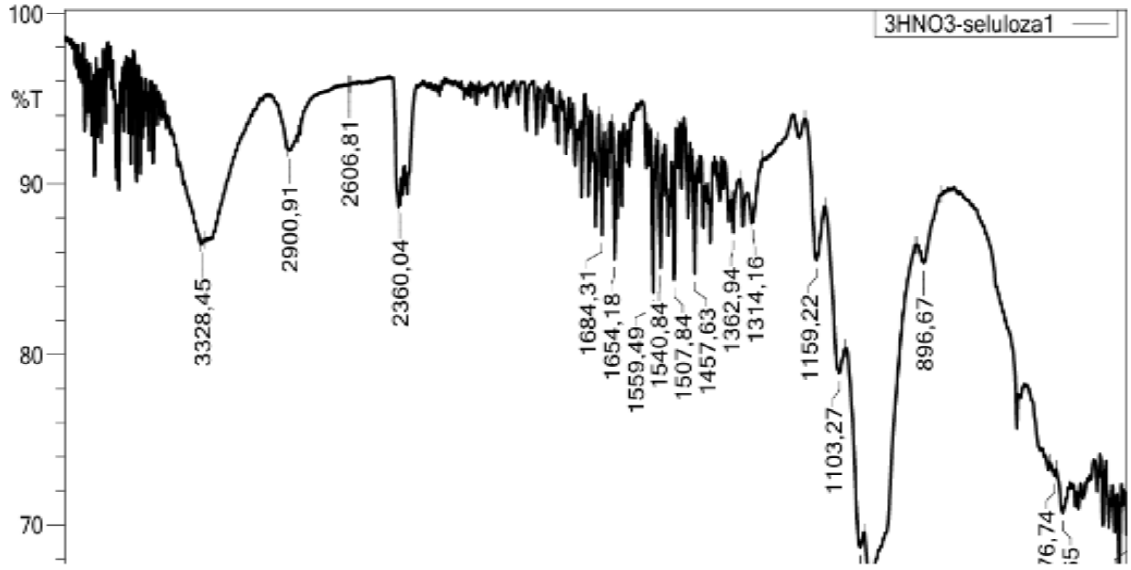
Ushbu namunalarni oqartirish maqsadida 3 % li NaOH va H_2O_2 ning 200ml li eritmasidan foydalanildi. 4 ta kislotada qaynatilgan namunalarni ushbu ishqor vodorod peroksidi aralashmasida 1 soat qaynatildi. Bunda konsentratsiya ortishiga qarab sariq rang ocharib bordi.

1-jadval

Oqartirish natijalari

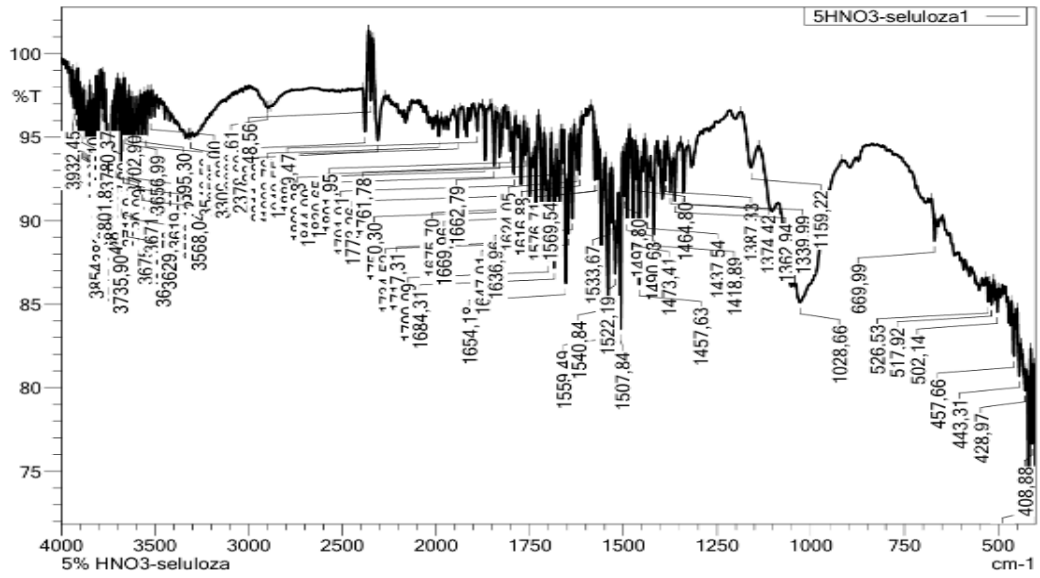
Namunalar	Rangi
3 % li HNO_3 dagi namuna	sariq
5 % li HNO_3 dagi namuna	och sariq
7 % li HNO_3 dagi namuna	oq
9 % li HNO_3 dagi namuna	Sarg'ish

Olingan sellyuloza namunalarini IQ-spektroskopiyasida ko'rildi va tahlil qilindi.



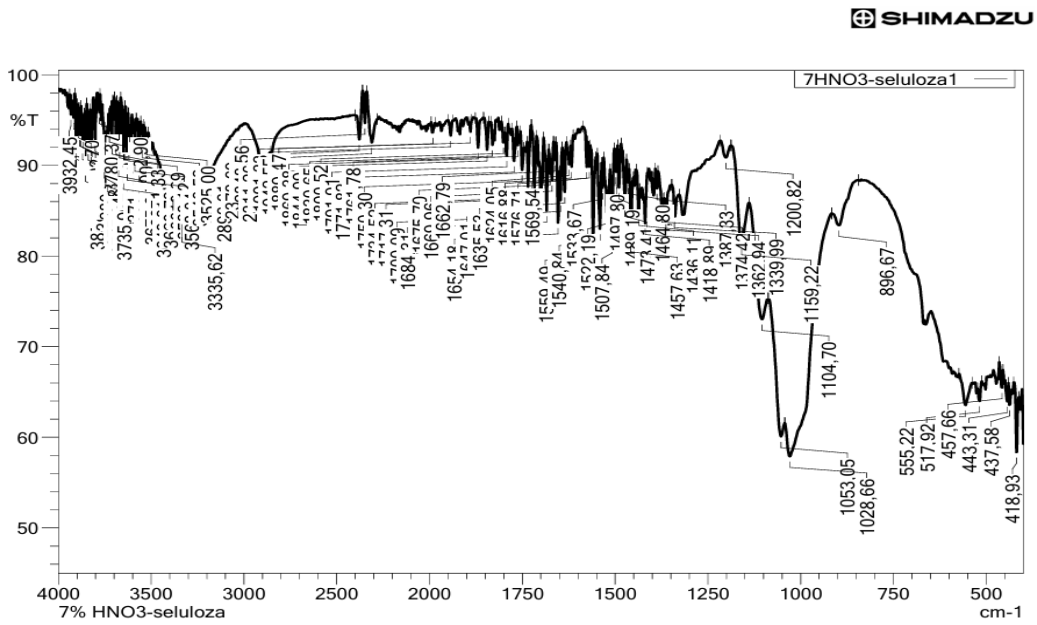
1-rasm. 3 % li HNO_3 dagi namunalarning IQ-spekri

1-rasmda 3 % li HNO_3 eritmasidagi namunaning IQ-spektri keltirilgan. Bunda ushbu namuna tarkibida gidroksil, metil, aromatik halqa, aldegid va keton kabi funksional guruhlar spektrlarda bergan piklariga ko'ra aniqlandi.



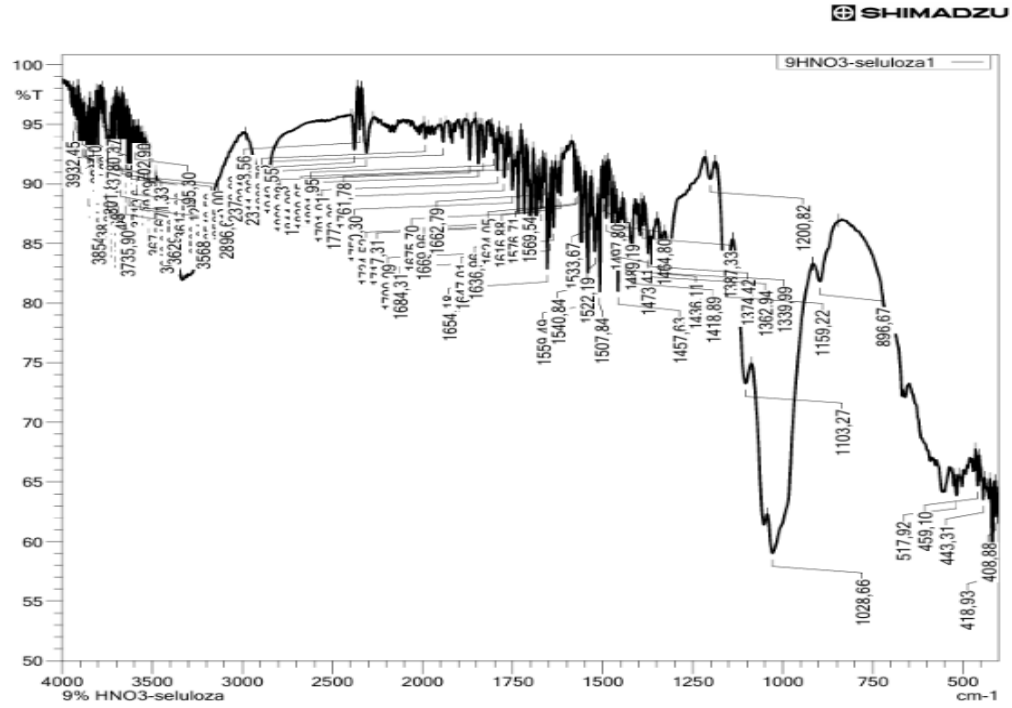
2-rasm. 5 % li HNO_3 dagi namunalarning IQ-spekri

2-rasmda 5 % li HNO_3 eritmasidagi namuna IQ-spektri keltirilgan. Bunda ushbu namuna tarkibida gidroksil, metil, aromatik halqa, aldegid va keton kabi funksional guruhlar spektrlarda bergan piklariga ko'ra aniqlandi.



3-rasm. 7 % li HNO_3 dagi namunalarning IQ-spekri

3-rasmda 7 % li HNO_3 eritmasidagi namuna IQ-spektri keltirilgan. Bunda ushbu namuna tarkibida gidroksil, metil, aromatik halqa, aldegid va keton kabi funksional guruhlar spektrlarda bergan piklariga ko'ra aniqlandi.



4-rasm. 9 % li HNO_3 dagi namunalarning IQ-spekri

4-rasmda 9 % li HNO_3 eritmasidagi namuna IQ-spektri keltirilgan. Bunda ushbu namuna tarkibida gidroksil, metil, aromatik halqa, aldegid va keton kabi funksional guruhlar spektrlarda bergan piklariga ko'ra aniqlandi.

Xulosa

G'o'za o'simligidan kislotali usul yordamida sellyuloza ajratib olish samarali usullardan biri hisoblanadi. Ushbu usul yordamida yuqori sifatli sellyuloza olish mumkin. Kelgusida texnologiyani takomillashtirish orqali ekologik va iqtisodiy samaradorlikni yanada oshirish mumkin. Go'za o'simligidan sellyuloza ajratib olish ekologik toza jarayon bo'lib, chiqindilar sonini kamayishida muhim ro'l o'ynaydi. G'o'za o'simligining poyasidan sellyuloza ajratib olishda nitratli usul ishqoriy usuldan ko'ra samaraliroq. Ushbu usulda aynan 7 % li HNO_3 dagi namuna qolgan konsentratsiyali eritmalardan ko'ra yaxshiroq natija berdi.

СОРБЦИОННАЯ АКТИВНОСТ ПОЛИСАХАРИДНЫХ КОМПЛЕКСОВ

Аннотация: *В данном исследовании изучались сорбционные свойства комплексов, полученных в лабораторных условиях на основе местных полисахаридов — хитозана и карбоксиметилцеллюлозы. В процессе исследования были проанализированы физико-химические свойства полученных комплексов, а также их сорбционная способность в средах с различным pH. Эффективность связывания тяжелых металлов и органических загрязнителей комплексами хитозан–карбоксиметилцеллюлозы была оценена с помощью экспериментальных методов. Кроме того, изучались факторы, влияющие на сорбционные процессы, таких как, pH среды, концентрация полисахаридов и время взаимодействия. Результаты исследования служат научной основой для создания новых эффективных сорбентов на основе хитозана и карбоксиметилцеллюлозы.*

SORPTION ACTIVITY OF POLYSACCHARIDE COMPLEXES

Annotation: *This study investigated the sorption properties of complexes prepared in the laboratory based on local polysaccharides, chitosan and carboxymethyl cellulose. The physical-chemical properties of the obtained complexes, as well as their sorption capacity in media with different pH values, were analyzed. The efficiency of binding heavy metal ions and organic pollutants by chitosan–carboxymethyl cellulose complexes was evaluated using experimental methods. Additionally, factors affecting the sorption processes, including pH, polysaccharide concentration, and interaction time, were tested. The results provide a scientific basis for the development of new effective sorbents based on chitosan and carboxymethyl cellulose.*

Kirish

Bugungi kunda dunyoda suv va atrof-muhitni ifloslanishidan himoya qilish zamonaviy ilmiy va ekologik muammolardan biri hisoblanadi. 2025 yil 31-noyabrdan kuchga kirgan O'zbekston Respubliksining Suv Kodeksininig asosiy vazifalaridan biri suvlarni zararli ta'sirini oldini olish va uni bartaraf etish hisoblanadi [1].

Respublikasmizda faoliyat olib borayotgan kimyoviy ishlab chiqarish, korxona va zavodlardan tashqi muhitga chiqayotgan chiqindi suvlar tarkibigi og'ir metallar ionlari, organik va organo-metall kabi ifloslantiruvchilar inson sog'lig'i va ekotizim uchun katta xavf tug'diradi.

Shu bois, yetarlicha zaxiraga ega bo'lgan va narxi qimmat bo'lmagan biopolimerlardan yangi turdagi sorbentlarni yaratish masalasi dolzarb ahamiyat kasb etadi.

Xitozan tabiiy polisaxarid bo‘lib, bioparchalanishi va tarkibida faol funksional guruhlari xisobida metall ionlarni, shuningdek organik moddalarni biriktirib olish hususiyati bilan ajralib turadi [2]. KMS (karboksimetilsellyuloza) esa sellyulozadan sintetik yo‘l bilan olinadi va suvda yaxshi eriydi, sorbsion va mexanik xususiyatlarini yaxshilashda qo‘llaniladi. Ushbu ikki polisaxaridning kompleksi yangi sorbentlar yaratishda yuqori samaradorlik ko‘rsatishi mumkinligi aniqlanmoqda.

Ushbu tadqiqot ishlari bo‘yicha jahonda qator yirik olimlar ilmiy tadqiqot ishlarini olib bormoqda. Rinaudo M. (Fransiya) [3] xitozanning fizik-ximyoviy xususiyatlari va ekologik qo‘llanishini keng yoritgan. Xitozanning ion almashinuvi, metallar va organik moddalarni bog‘lash samaradorligi ta’kidlangan. Crini G. (Italy) [4] xitozan va uning turli modifikatsiyalari asosida sorbentlar yaratish va ularni suvni tozalashda qo‘llash haqida amaliy tadqiqotlar o‘tkazgan. Kumar M.N. (Xindiston) [5] xitozanning biomosligi, degradatsiyalanishi va farmakologik hamda ekologik qo‘llanilishi bo‘yicha asoslangan natijadlarga erishgan.

Adabiyot tahlili shuni ko‘rsatadiki, xitozan va KMS kompleksi yuqori sorbsion samaradorlikka ega bo‘lib [6], chiqindi suvni tozalash va ekologik materiallar yaratishda katta imkoniyatlar taqdim etadi. Shuningdek, rivojlangan xorijiy tadqiqotlar natijalari ko‘ra [7], O‘zbekistondagi mahalliy tadqiqotlar uchun ilmiy asos sifatida xizmat qiladi.

Tadqiqot metodologiyasi

Ushbu tadqiqot ishimizda xitozan va karboksimetilsellyuloza (KMS) asosida polisaxarid komplekslarining sorbsion xususiyatlarini tahlil qilindi. Tajriba ishlari quyidagi bosqichlarni o‘z ichiga oldi:

Dastlab, komplekslarni tayyorlash bosqichida xitozan va KMS turli nisbatlarda aralashtirildi. Komplekslar asosida suvda erimaydigan plyonkalar xosil qilindi.

Olingan plyonkalarni funksional guruhlari va molekulyar tuzilishi spektroskopik (FTIR) va mikroskopik usullar orqali o‘rganildi. Molekulyar massa, polimer zichligi va pH qiymatlari tajribalar asosida aniqlandi.

Olingan plyonkalarngi sorbsion sinovlari turli konsentratsiyadagi og‘ir metall ionlari (Pb^{2+}, Ag^{+}, Cu^{2+}) va organik ifloslantiruvchilar bilan kontaktda sorbsiya darajasi baholandi. Sorbsiyaning unumiga vaqt, harorat va pH muhiti ta’siri o‘rganildi. Komplekslarning sorbsion samaradorligi va uning optimal sharoitlari aniqlandi.

Natijalar va ularning tahlili

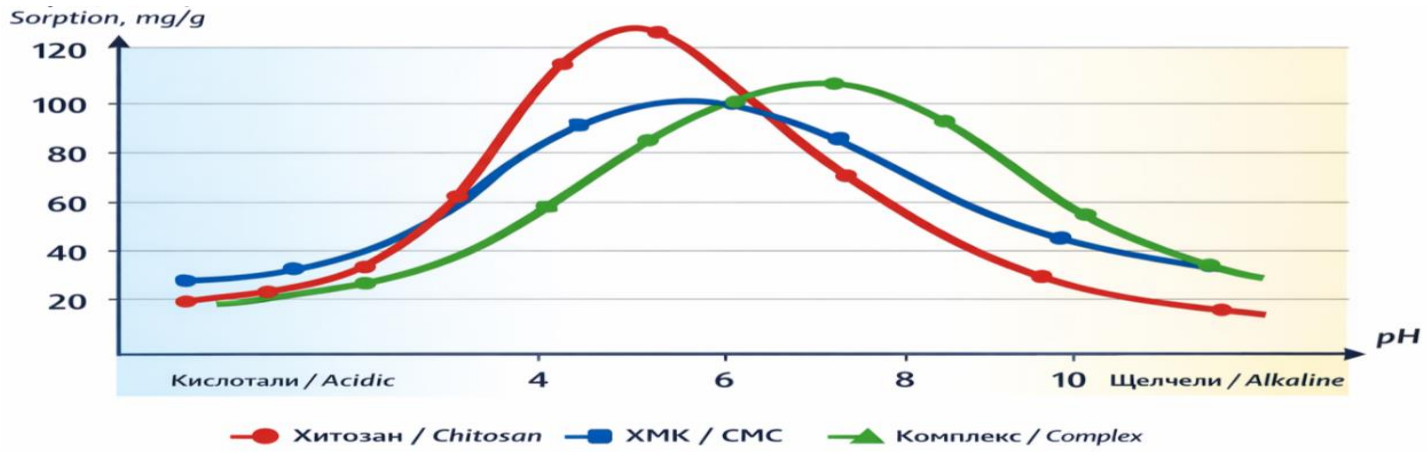
Xitozan molekulasi tarkibidagi amino guruhlarining miqdoriga teng nisbatda gidroksil guruhlari mavjud bo‘ladi. Shu sababli, polifunksional guruhli sorbentlarda sorbsiya jarayoni borishi uchun ma’lum guruhlarning miqdoriy nisbatlarini aniqlash murakkab jarayondir. Natijada, o‘rganilayotgan sorbent namunalarining sorbsiya samaradorligini qiyosiy baholash bilangina, sorbsiyaning miqdoriy qiymatlaridan va termokinetik parametrlarining o‘zgarishidan foydalanib bilish mumkin.

Tadqiqot natijalari shuni ko‘rsatdiki, xitozan va karboksimetilsellyuloza asosida hosil qilingan komplekslar metall ionlari va organik moddalarni sorbsiya qiladi. Tajriba uchun ammoniy-asetat (pH=4,8-9,0), ammiakli (pH=8,2-10,2) va asetatli (pH=3-6) bufer eritmalaridan foydalanildi.

Bufer eritmaning tabiati orqali xitozan va Na-KMS dan xosil qilingan plyonkalarga metall ionlarining absorbsiyalanishi o‘rganildi.

Xitozandan xosil qilingan plyonkalarga nisbatan, xitozan va Na-KMS dan olingan plyonka namunalari tarkibidagi funksional guruhlar miqdorini ortishi natijasida, metall ionlarini sorbsiya miqdorlari xam ortganligini kuzatildi. Bir vaqtning o‘zida metallarni sorbsiyasiga muhitning (chiqindi suvlarni pH ini xisobiga) bog‘liqlig‘i xam o‘rganildi.

Tajribalar natijasida ammoniy-asetatli va ammiakli bufer eritmalarda sorbsiyalangan metall ionlarining miqdori yuqori ekanligi aniqlandi.

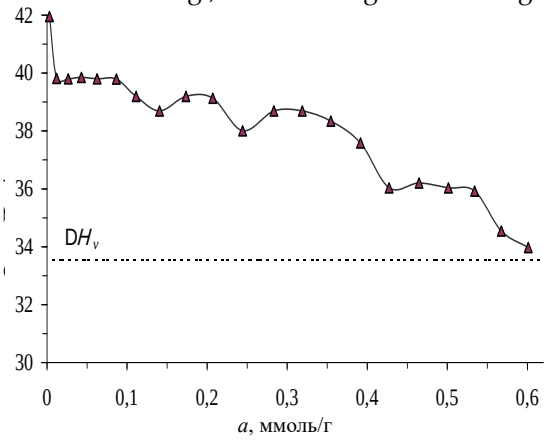


1-rasm xitozan, xitozan-KMS va KMS plyonkalariga yutilgan metallarning miqdorini pHga bog‘liqligi.

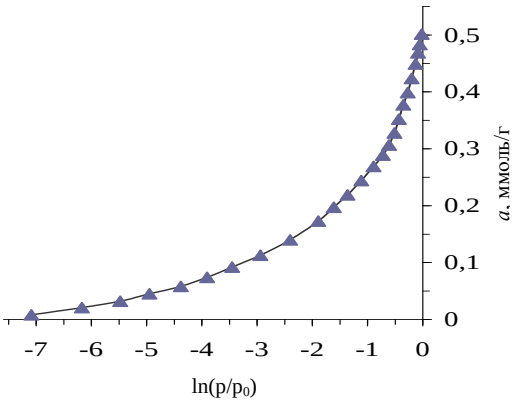
Xitozan va xitozan/Na-KMS polisaxaridlaridan xosil qilingan plyonkalarga Ag^{+}, Cu^{2+}, Pb^{2+} ionlarini sorbsiya miqdorlarini eritmaning tabiati va ushbu eritmalarning pH muhitiga bog‘liq bo‘ldi.

Shuni ta’kidlash kerakki, ko‘rib chiqilayotgan barcha bufer eritmalar kuchli kislotali va kuchli ishqoriy muhitda metall ionlarining sezilarli darajada absorbsiyalanmasligi bilan tavsiflandi. Ushbu holat, bir tomondan, kuchli kislotali muhitda xitozan tarkibidagi amino guruhlarning protonlanishi bilan izohlanadi. Boshqa tomondan, eritmaning yuqori pH qiymatlari ammiakning yuqori konsentratsiyasiga to‘g‘ri keladi. Shuning uchun, pH>8 da, metall kationlari birlashib, maksimal koordinatsion soniga ega kuchli ammiakli komplekslarini hosil qiladi.

Olingan plyonkalarga organik moddalarni sorbsiyasini tekshirish maqsadida, sirt yuzasi, plyonkalarning aktiv markazlarini diametri va kattaligi, zarrachaning o‘lchamlariga bog‘liq parametrlari tekshirildi.



2-rasm. 303 K da xitozan plyonkasiga benzol adsorbsiyasi izotermasi.



3-rasm. 303 K da Xitozan/Na-KMS plyonkaga benzol adsorbsiyasi differensial issiqliklari

Adsorbsiyalangan (a) benzol molekulalarini hisoblashda tadqiqot ishida olingan ishchi hajm (p_0), adsorbat olingan hajm va muvozanat qaror topgan hajmning qiymat konsentratsiyalari olinadi. Adsorbat olingan hajm konsentratsiyasidan ishchi hajm konsentratsiyasi va muvozanat qaror topgan hajm konsentratsiyalari ayiriladi.

Gibbs tenglamasi bo‘yicha xitozan plyonkasiga benzol adsorbsiyasining differensial molyar entropiyasi (ΔS_d) (suyuq benzolni entropiyasi nolga teng deb qabul qilindi) hisoblandi.

$$\Delta S_{\mathrm{d}} = \frac{\Delta H - \Delta G}{T} = \frac{-(Q_{\mathrm{d}} - \lambda) + A}{T}$$

Bu erda, λ-issiqlik kondensatsiyasi, ΔH i ΔG-entalpiya va erkin energiya o‘zgarishi, T – harorat [8].

Xitozan/Na-KMS plyonkasiga benzol adsorbsiyasi muvozanat vaqti (termokinetikasi) keltirilgan. Dastlabki termokinetksi 2.19 soat davom etadi.

Olingan natijalar asosida chiqindi suvlarni tarkibidagi metall ionlari va organik moddalarni xitozan-KMS komplekslari orqali ajaratib olish va sanoat sohalarida samarali qo‘llash imkoniyatini tasdiqladi.

Xulosa

Ushbu tadqiqotda xitozan va karboksimetilsellyuloza asosida hosil qilingan polisaxarid komplekslarining sorbsion xossalari tahlil qilindi. Tadqiqot natijalari shuni ko‘rsatdiki, mazkur komplekslar og‘ir metall ionlari va organik ifloslantiruvchilarni yuqori samaradorlik bilan sorbsiya qiladi. Sorbsiya jarayoni asosan, pH muhiti, modda konsentratsiyasi va kontakt vaqtiga bog‘liq ekanligi aniqlandi. FTIR va mikroskopik tahlillar kompleksning strukturasi va funksional guruhlari sorbsiya samaradorligida muhim ahamiyatga ega ekanligini tasdiqladi.

Tadqiqot natijalari xitozan–KMS komplekslarini suvni tozalash, ekologik muhofaza va sanoat sohalarida samarali qo‘llash imkoniyatini ko‘rsatdi. Shuningdek, olingan ma’lumotlar yangi sorbentlar yaratish va ularning texnologiyalik qo‘llanishini rivojlantirish uchun ilmiy asos sifatida xizmat qiladi.

Annotasiya. *Ushbu maqolada mahalliy xomashyodan tayyorlangan yangi quyma kompozitning IR spektrlari orqali 400 sm^{-1} chastotadagi bog'lanishlar bilan bog'liq cho'zilish va deformatsiyalarning tebranish xususiyatlari tahlil qilindi. Shuningdek, po'lat simlar va ular orqali o'tadigan metall ion bog'lanishlarining yuzasida organik moddalarning ta'siri natijasida sirt tarangligini oshirish metodlari ko'rib chiqildi. Kompozitning mexanik va kimyoviy xususiyatlarini chuqurroq baholash uchun SEM-EDS skanerlash tahlili o'tkazilib, tarkibiy elementlarning nisbiy miqdorlari aniqlangan. Tahlil natijalariga ko'ra, kompozitning elementar tarkibi quyidagicha: uglerod (C) – 67,02%, kislorod (O) – 28,42%, natriy (Na) – 3,40%, magniy (Mg) – 0,21%, alyuminiy (Al) – 0,19%, kremniy (Si) – 0,26%, oltingugurt (S) – 0,16%, xlor (Cl) – 0,14% va kalsiy (Ca) – 0,18%. Ushbu natijalar kompozitning struktura va kimyoviy tarkibini isbotlash bilan birga, uning mexanik va sirt xususiyatlarini optimallashtirish imkoniyatlarini ham ko'rsatadi.*

Kalit so'zlar: *SEM-EDS skaner, kalsiy stearat, natriy stearat, bura va talk ,uglerod, pH, quruq surkov kompozit.*

ПОЛУЧЕНИЕ МАСЛЯНОЙ ЭМУЛЬСИИ НА ОСНОВЕ МЕСТНОГО СЫРЬЯ ДЛЯ ПРОЦЕССОВ ВОЛОЧЕНИЯ ЦВЕТНЫХ МЕТАЛЛОВ.

Абстрактный. *В данной статье с помощью ИК-спектров нового литого композита, изготовленного из местного сырья, были проанализированы колебательные свойства растяжения и деформации, связанных со связями на частоте 400 $см^{-1}$. Также были рассмотрены методы повышения поверхностного натяжения в результате воздействия органических веществ на поверхность стальных проволок и проходящих через них связей ионов металла. Для более глубокой оценки механических и химических свойств композита был проведен сканирующий анализ SEM-EDS, и определены относительные количества составляющих элементов. По результатам анализа элементный состав композита следующий: углерод (C) – 67,02%, кислород (O) – 28,42%, натрий (Na) – 3,40%, магний (Mg) – 0,21%, алюминий (Al) – 0,19%, кремний (Si) – 0,26%, сера (S) – 0,16%, хлор (Cl) – 0,14% и кальций (Ca) – 0,18%. Эти результаты, помимо подтверждения структурного и химического состава композита, также указывают на возможности оптимизации его механических и поверхностных свойств.*

Ключевые слова: *сканер SEM-EDS, стеарат кальция, стеарат натрия, тальк и тальк, углерод, pH, сухой порошковый композит.*

DEVELOPMENT OF AN OIL-BASED EMULSION DERIVED FROM LOCAL RAW MATERIALS FOR THE DRAWING OF NON-FERROUS METALS.

Abstract. *In this article, the vibrational properties of the elongation and deformation associated with the bonds at a frequency of 400 cm^{-1} were analyzed using IR spectra of a new cast composite made from local raw materials. Also, methods for increasing the surface tension as a result of the action of organic substances on the surface of steel wires and metal ion bonds passing through them were considered. For a more in-depth assessment of the mechanical and chemical properties of the composite, SEM-EDS scanning analysis was performed, and the relative amounts of constituent elements were determined. According to the analysis results, the elemental composition of the composite is as follows: carbon (C) – 67.02%, oxygen (O) – 28.42%, sodium (Na) – 3.40%, magnesium (Mg) – 0.21%, aluminum (Al) – 0.19%, silicon (Si) – 0.26%, sulfur (S) – 0.16%, chlorine (Cl) – 0.14% and calcium (Ca) – 0.18%.*

These results, in addition to proving the structural and chemical composition of the composite, also indicate the possibilities of optimizing its mechanical and surface properties.

Keywords: *SEM-EDS scanner, calcium stearate, sodium stearate, flea and talc, carbon, pH, dry powder composite.*

Kirish. Dunyoda qurilish sanoatining doimiy o‘sishi va yangi, sifatli mahsulotlarga bo‘lgan talabning ortishi, ushbu sohani rivojlantirishning eng muhim vazifalaridan biri hisoblanadi. Shu nuqtai nazardan, qurilish materiallarini arzon va tabiiy resurslardan tayyorlash muhim omil sifatida ajralib turadi [1]. Qurilish materiallarining asosiy komponentlaridan biri bo‘lgan metallarni turli o‘lcham va shakllarga keltirish, shuningdek, po‘lat simlarning tarkibi va yuzasidagi mexanik ta’sirlarni chuqur tahlil qilish zaruriyati mavjud. Shu sababli, metallarni cho‘zish va ularni ishlov berishda moyli emulsiyalardan foydalanish katta ahamiyat kasb etadi. Shu yo‘nalishda metallarni cho‘zish uchun moyli emulsiyalarni yaratish hamda ularni mahalliy xomashyolardan olish texnologiyasini ishlab chiqish dolzarb vazifa hisoblanadi [2,3].

Jahon tajribasida metallarga ishlov berish uchun quruq moyli emulsiyalarni ishlab chiqarish va texnologiyasini rivojlantirish bo‘yicha bir qator ilmiy izlanishlar amalga oshirilmoqda. Ayniqsa, kompozit tarkibidagi kalsiy stearat va natriy stearat tuzlarini quruq moyli emulsiyalarni olish jarayonida optimallashtirish, to‘ldiruvchi materiallarning xilma-xilligini oshirish, kompozitning yuqori haroratga chidamliligini tekshirish, turli sharoitlarda ishlashga mos emulsiyalar ishlab chiqish hamda po‘lat simlarni cho‘zish orqali turli mahsulotlar (sim, mix, shurup va boshqa) tayyorlashda moyli emulsiyaning fizik-kimyoviy xossalarini chuqur o‘rganishga e’tibor qaratilmoqda. Shu bilan birga, ushbu emulsiyalarni metallurgiya sanoatida sinovdan o‘tkazish muhim ilmiy-amaliy ahamiyatga ega [4,5].

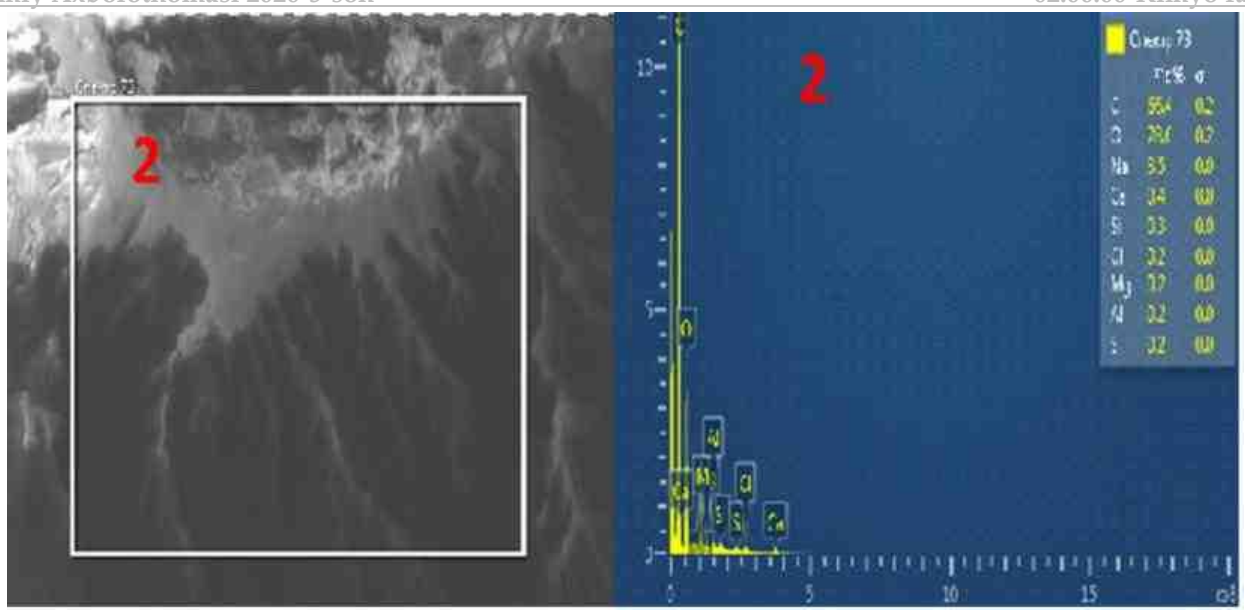
Asosiy qism. Metallarni cho‘zishda qo‘llaniladigan moyli emulsiyalar tarkibini aniqlash hamda komponentlar o‘rtasidagi o‘zaro bog‘lanishlarni baholash maqsadida namunalar zamonaviy skanerlash qurilmalari asosida tahlil qilindi. Olingan natijalar emulsiyalar tarkibidagi organik tuzlar miqdorini aniqlash, shuningdek, qo‘shimcha moddalarning mavjud yoki mavjud emasligini baholashga qaratildi [6,7]. Dastlab tahlil obyekti sifatida Xitoydan import qilingan mahsulot o‘rganildi. Keyingi bosqichda avvalgi texnologiya asosida olingan namunalar tekshirildi. Yakuniy bosqichda esa yangi ishlab chiqilgan texnologiya asosida olingan kompozitning tarkibiy tahlili amalga oshirildi. Olingan ma’lumotlarga ko‘ra, import mahsulot tarkibida organik tuzlar — natriy va kaliy stearatlarning yuqori miqdorda ekani hamda qo‘shimcha komponentlar mavjud emasligi aniqlandi (1-rasm).

Tarkibiy va element tahlillari skanerlovchi elektron mikroskopiya hamda energiyaviy dispers spektroskopiya, ya’ni SEM–EDS usuli orqali bajarildi. Ushbu usul namuna tarkibidagi elementlarning miqdoriy nisbatini aniqlash imkonini beradi. Spektral tahlil natijalariga ko‘ra, birinchi nuqtada uglerod elementining yuqori ulushi qayd etildi. Ma’lumki, kalsiy stearat tarkibida taxminan 22 %, natriy stearatda 10 % atrofida, bura va talk tarkibida esa o‘rtacha 14 % uglerod mavjud. Import mahsulot tarkibida organik tuzlar ulushi 60 % dan ortiq ekanligi inobatga olinsa, kompozit tarkibida uglerod eng ko‘p uchraydigan elementlardan biri ekanligi ilmiy jihatdan asoslanadi [8,9].

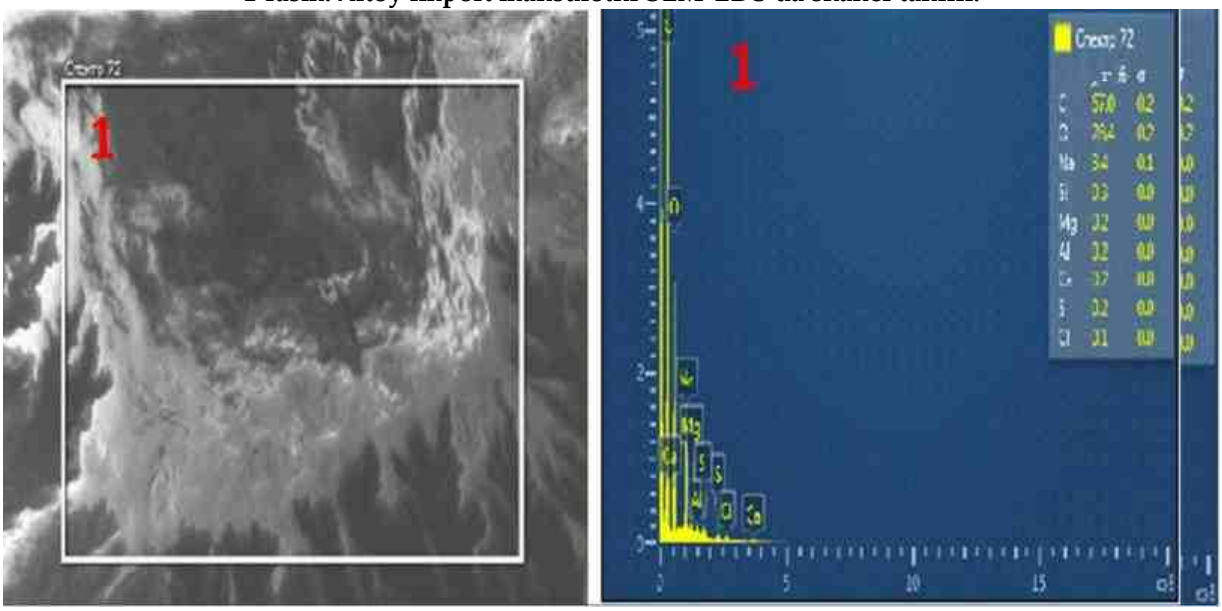
Ikkinchi spektral cho‘qqi kislorod elementiga to‘g‘ri keladi. Bu holat tadqiq etilgan namunadagi deyarli barcha komponentlar tarkibida kislorod mavjudligi bilan izohlanadi. Ma’lumki, organik stearatlar, shuningdek, mineral qo‘shimchalar (masalan, silikat va borat tabiatli birikmalar) tarkibida kislorod muhim strukturaviy element sifatida ishtirok etadi. Shu bois kislorodning yuqori intensivlikdagi signali kompozitning ko‘p komponentli oksidli va organik tuzilishga ega ekanligini tasdiqlaydi.

Uchinchi spektral cho‘qqida kremniy va alyuminiy elementlariga xos kichik intensivlikdagi piklar qayd etildi. Bu esa namuna tarkibida silikat tabiatli to‘ldiruvchilar yoki alyumosilikat birikmalari mavjudligini ko‘rsatadi. To‘rtinchi cho‘qqi tahlilida esa aniqlangan elementlar (Al, Si, Ca) orasida kalsiyning nisbatan yuqori ulushga ega ekanligi kuzatildi. Mazkur holat ushbu nuqtaning avval tahlil qilingan ikkita nuqtadan tarkibiy jihatdan farq qilishini ko‘rsatadi va kompozit tuzilmasining geterogen xususiyatga ega ekanligini tasdiqlaydi.

Uchinchi nuqta spektrida uglerod va kislorod elementlarining ustunligi aniqlangan. Bu, ehtimol, tahlil qilinayotgan zarrachaning o‘lchami boshqa nuqtalarga nisbatan kichikligi bilan bog‘liq. Natijada, elektron nurining o‘zaro ta’sir hajmi kengayib, signalning ma’lum qismi zarracha atrofidagi hududdan yoki kompozitning matritsa qismidan kelib tushishi mumkin. Mazkur holat mikrohududiy tahlil natijalarini interpretatsiya qilishda namunaning morfologik xususiyatlarini ham inobatga olish zarurligini ko‘rsatadi.



1-rasm. Xitoy import mahsulotni SEM-EDS da skaner tahlili.



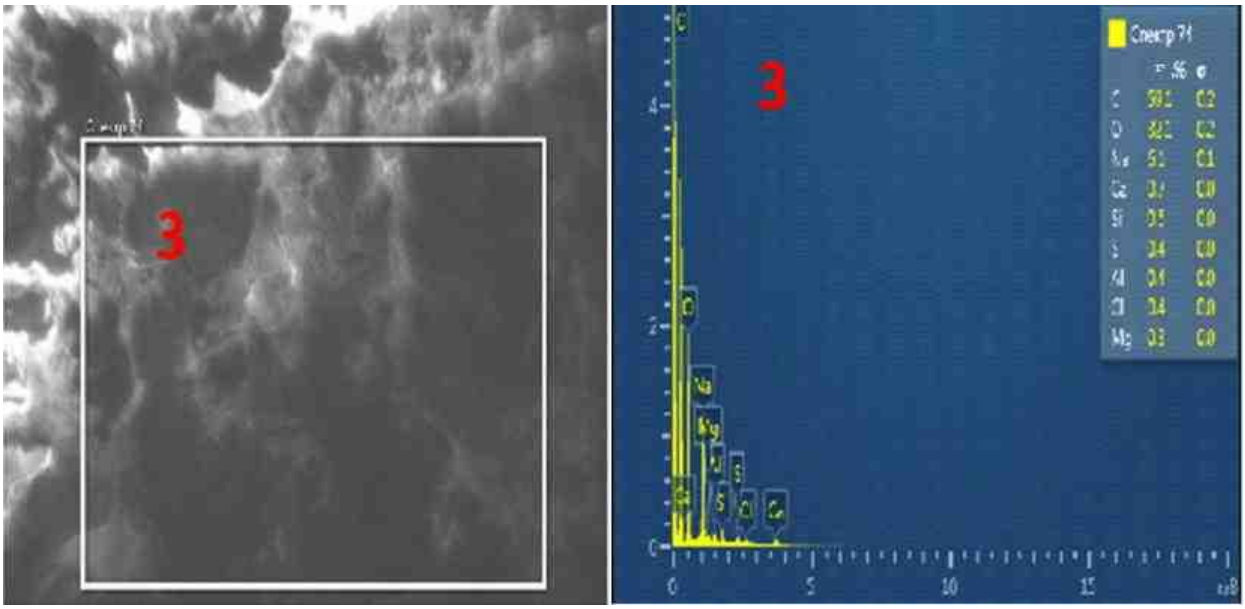
2-rasm. Birinchi namunani SEM-EDS da skanerlangan kompozit.

SEM–EDS tahlil natijalariga ko‘ra, Xitoydan import qilingan mahsulot tarkibida kalsiy (Ca) va uglerod (C) elementlarining yuqori ulushi kuzatildi. Ushbu holat kompozit tarkibida kalsiy stearat va boshqa organik birikmalar miqdori salmoqli ekanligini ko‘rsatadi. 1-namunaning moylash (lubrikatsion) xossalari nisbatan past bo‘lishiga qaramay, uning adgezion xususiyati, ya’ni moyli emulsiyaning metall yuzasiga yopishish qobiliyati boshqa namunalarga nisbatan yuqoriroq ekanligi aniqlandi.

Import mahsulot tarkibida uglerod miqdori 57 % (ayrim o‘lchovlarda 55,4 %) ni, natriy esa mos ravishda 3,4–5,1 % ni tashkil etadi. Bu ko‘rsatkichlar kompozit tarkibida organik komponentlar ulushi yuqori ekanligidan dalolat beradi. Organik moddalarning ko‘pligi emulsiyaning yuqori harorat sharoitida termik barqarorligini pasaytirishi mumkin. Shu bilan birga, qayta ishlatish koeffitsientining yuqoriligi aniqlangan bo‘lib, bu texnologik jarayonda iqtisodiy samaradorlikni ta’minlaydi. Mazkur turdagi emulsiyalar po‘lat simlarni yuqori tezlikda cho‘zish jarayonlarida samarali qo‘llanishi mumkin.

Element tahliliga ko‘ra, import mahsulot tarkibida kremniy 0,3–0,5 %, magniy 0,2–0,3 %, shuningdek, ayrim namunalarda xlor va oltingugurt elementlari 0,4 % atrofida aniqlangan. 1-namunada birinchi nuqta asosan kremniy elementi bilan tavsiflanadi. Ikkinchi nuqtada kremniy va alyuminiyning past intensivlikdagi cho‘qqilari qayd etilgan. Uchinchi nuqtada esa aniqlangan uchta element (Al, Si, Ca) orasida kremniy miqdor jihatidan ustun ekani kuzatildi, bu esa avvalgi nuqtalardan farqli tarkibiy xususiyatni ko‘rsatadi va kompozitning geterogen tuzilishga ega ekanligini tasdiqlaydi.

Shuningdek, tarkibda kalsiy stearat miqdorining 1-namunaga nisbatan ko‘proq bo‘lishi emulsiyaning po‘lat sim yuzasiga adgezion qobiliyatini oshiradi. Kaolin va talk kabi mineral qo‘shimchalar bilan birgalikda bu komponentlar kompozitning issiqlikka chidamliligini yaxshilaydi hamda yuqori harorat sharoitida barqaror ishlashini ta’minlaydi (2-rasm). Umuman olganda, element tarkibining miqdoriy nisbatlari emulsiyaning tribologik va termik xossalarini belgilovchi asosiy omillardan biri ekanligi ilmiy jihatdan asoslanadi.

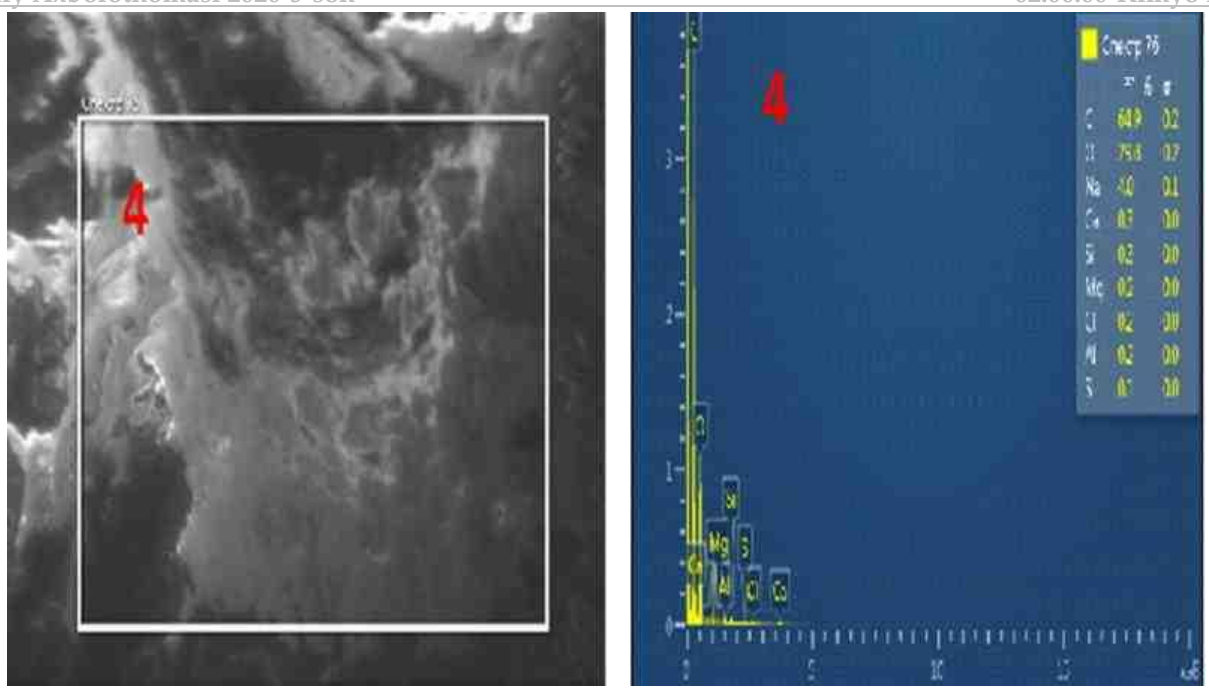


3-rasm. Uchinchi namunani SEM-EDS da skanerlangan kompozit.

SEM–EDS tahlil natijalariga ko‘ra, 3-namunada birinchi tahlil nuqtasi asosan kremniy (Si) elementi bilan tavsiflanadi. Ikkinchi nuqtada kremniy va alyuminiy (Al) elementlariga xos past intensivlikdagi spektral cho‘qqilar qayd etilgan (3-rasm). Uchinchi nuqtada aniqlangan uchta asosiy element (Al, Si, Ca) orasida kremniyning miqdoriy ustunligi kuzatildi. Mazkur holat avval tahlil qilingan ikkita nuqtadan farqli tarkibiy xususiyat mavjudligini ko‘rsatadi va kompozitning mikrostrukturaviy geterogenligini tasdiqlaydi.

Tarkibda kalsiy stearat miqdorining avvalgi namunalarga nisbatan yuqoriroq bo‘lishi surkov kompozitning po‘lat sim yuzasiga adgezion qobiliyatini oshiradi. Shu bilan birga, kompozit tarkibiga qo‘shilgan kaolin va talk kabi mineral komponentlar bilan o‘zaro ta’sir natijasida materialning termik barqarorligi yaxshilanadi hamda yuqori harorat sharoitida ishlashga chidamliligi ortadi. 3-namunaning moylash (tribologik) xususiyati nisbatan pastroq bo‘lsa-da, uning adgezion ko‘rsatkichlari boshqa namunalarga qaraganda yuqori ekani aniqlandi.

Element tarkibi tahliliga ko‘ra, ushbu namunada uglerod miqdori 59,1 %, natriy esa 5,1 % ni tashkil etadi. Bu ko‘rsatkichlar kompozit tarkibida organik komponentlar ulushi yuqori ekanligini bildiradi. Organik va metallorganik birikmalar miqdorining ko‘pligi kompozitning ma’lum sharoitlarda issiqlikka chidamliligini ta’minlashi bilan birga, texnologik jarayonda qayta foydalanish koeffitsientining ham yuqori bo‘lishiga olib keladi. Shu sababli bunday turdagi surkov kompozitlar po‘lat simlarni yuqori tezlikda cho‘zish jarayonlarida qo‘llash uchun maqsadga muvofiq hisoblanadi. Qo‘shimcha elementlar miqdoriy tahliliga ko‘ra, surkov kompozit tarkibida kremniy 0,4 %, xlor 0,4 %, oltingugurt 0,4 % hamda magniy 0,3 % miqdorda aniqlangan. Ushbu elementlar kompozitning strukturaviy va funksional xossalariga, xususan, issiqlik barqarorligi, ishqalanishga chidamlilik va metall yuzasi bilan o‘zaro ta’sir mexanizmlariga ma’lum darajada ta’sir ko‘rsatadi. Umuman olganda, olingan natijalar 3-namunaning yuqori adgezion xususiyatga ega, termik barqarorligi yaxshilangan va sanoat sharoitida qo‘llash uchun istiqbolli kompozit ekanligini ko‘rsatadi.



4-rasm. To‘rtinchi namunani SEM-EDS da skanerlangan kompozit.

Olingan moyli emulsiyaning skanerlovchi elektron mikroskop (SEM) asosida bajarilgan element tahlili kompozitning tarkibiy tuzilishi hamda uning mexanik xususiyatlarini kompleks baholash imkonini beradi. Energiya-dispers spektroskopiya (EDS) natijalari kompozitning mikrostrukturaviy geterogenligini va alohida fazalar o‘rtasidagi taqsimotni aniqlashda muhim ahamiyat kasb etadi.

Ikkinchi tahlil nuqtasida kremniy (Si) va alyuminiy (Al) elementlariga xos past intensivlikdagi spektral cho‘qqilar qayd etildi, bu esa namuna tarkibida silikat yoki alyumosilikat tabiatli komponentlar mavjudligini ko‘rsatadi. Uchinchi nuqtada esa aniqlangan uchta asosiy element (Al, Si, Ca) orasida kremniyning miqdoriy ustunligi kuzatildi. Mazkur holat ushbu mikrohududning tarkibiy jihatdan oldingi ikki nuqtadan farq qilishini tasdiqlaydi hamda kompozit tuzilmasida turli fazalar mavjudligini ko‘rsatadi.

Shu tariqa, SEM–EDS tahlili asosida kompozit tarkibining elementlar bo‘yicha taqsimlanishi aniqlanib, bu ma’lumotlar materialning mexanik mustahkamligi, adgezion qobiliyati va termik barqarorligi kabi funksional xususiyatlarini ilmiy asosda izohlash imkonini beradi.

Xulosa. Xitoydan import qilinayotgan mahsulot hamda yangi texnologiya asosida olingan kompozitlar infraqizil spektroskopiya (IR), differensial skanerlash kalorimetriyasi (DSC), rentgen struktur tahlili (XRD) va SEM–EDS usullari yordamida kompleks ravishda tadqiq etildi. Olingan natijalar shuni ko‘rsatadiki, import mahsulot tarkibida organik birikmalar va organik tuzlarning massa ulushi 50 % dan ortiqni tashkil etadi. Element va fazaviy tahlillar kompozit tarkibining ko‘p komponentli hamda geterogen tuzilishga ega ekanligini tasdiqladi.

Infraqizil spektroskopiya va DSC tahlillari orqali qizdirilmasdan olingan namunalarning komponent diagrammalari o‘rganildi. Spektral va termik ko‘rsatkichlar asosida modda tarkibidagi funksional guruhlar o‘rtasida barqaror molekulalararo o‘zaro ta’sirlarning yetarli darajada shakllanmaganligi aniqlandi. Organik tuzlar miqdorining yuqoriligi va strukturaning nisbatan bo‘shligi sababli, simlar filyeradan o‘tkazilganda ikkilamchi (keraksiz) mahsulot hosil bo‘lishi 20 % gacha yetishi kuzatildi. Bu holat materialning termomexanik barqarorligi pastligini ko‘rsatadi.

Dastlabki texnologiya asosida olingan namuna bilan yangi texnologiya asosida sintez qilingan kompozit o‘rtasidagi asosiy farq issiqlik bilan ishlov berish ketma-ketligida namoyon bo‘ladi. Dastlabki usulda avval organik tuzlar eritilib, so‘ngra noorganik komponentlar qo‘shiladi. Natijada organik tuzlarning parchalanish haroratiga yaqinlashuvi strukturada monolit qattiqlikning ortishiga, biroq molekulalararo bog‘lanishlarning cheklangan holda shakllanishiga olib keladi.

Annotatsiya: *Ushbu tadqiqotda yangi turdagi trisiklik izoksazolopirimdinon hosilalarini sintez qilishning samarali usullari va ularning VEGFR (Vaskulyar endotelial o'sish faktori retseptori) bilan bog'lanish potensiali o'rganildi. Sintez qilingan birikmalarning tuzilishi zamonaviy fizik-kimyoviy usullar yordamida tasdiqlandi. Molekulyar docking tadqiqotlari natijasida olingan hosilalarning VEGFR faol markazi bilan barqaror komplekslar hosil qilishi va yuqori bog'lanish energiyasiga egaligi aniqlandi. Olingan natijalar ushbu karkas asosida yangi saratonga qarshi birikmalarni loyihalashda muhim ahamiyat kasb etadi.*

Kalit so'zlar: *angiogenez, geterotsiklik birikmalar, molekulyar doking, sintez, saratonga qarshi faollik, trisiklik izoksazolopirimidinonlar, VEGFR 2 ingibitorlari.*

SYNTHESIS AND MOLECULAR DOCKING STUDIES OF NEW TRICYCLIC ISOXAZOLOPYRIMIDINONE DERIVATIVES AS POTENTIAL VEGFR INHIBITORS.

Annotation: *This study describes the efficient synthesis of novel tricyclic isoxazolopyrimidinone derivatives and explores their binding affinity toward the Vascular Endothelial Growth Factor Receptor (VEGFR). The chemical structures of the synthesized compounds were elucidated using spectroscopic techniques. In silico molecular docking simulations revealed that the target molecules exhibit significant binding potential within the VEGFR active site, forming stable interactions with key amino acid residues. These findings suggest that the tricyclic isoxazolopyrimidinone scaffold serves as a promising template for the development of potent anti-angiogenic agents in cancer therapy.*

Keywords: *anticancer activity, angiogenesis, heterocyclic synthesis, molecular docking, tricyclic isoxazolopyrimidinones, VEGFR inhibitors.*

СИНТЕЗ НОВЫХ ТРИЦИКЛИЧЕСКИХ ПРОИЗВОДНЫХ ИЗОКСАЗОЛОПИРИМИДИНОНА И ИХ МОЛЕКУЛЯРНЫЙ ДОКИНГ-АНАЛИЗ В КАЧЕСТВЕ ИНГИБИТОРОВ VEGFR.

Аннотация: *В данной работе описан эффективный синтез новых трициклических производных изоксазолопиримидинона и изучено их сродство (аффинность) к рецептору фактора роста эндотелия сосудов (VEGFR). Химическая структура синтезированных соединений была расшифрована с помощью спектроскопических методов анализа. Моделирование методом молекулярного докинга in silico показало, что целевые молекулы обладают значительным потенциалом связывания в активном центре VEGFR, образуя стабильные взаимодействия с ключевыми аминокислотными остатками. Полученные результаты свидетельствуют о том, что трициклический каркас изоксазолопиримидинона является перспективной платформой для разработки эффективных антиангиогенных агентов в терапии рака.*

Ключевые слова: *ангиогенез, гетероциклический синтез, ингибиторы VEGFR, молекулярный докинг, трициклические изоксазолопиримидиноны, противораковая активность.*

Kirish

Kondensirlangan pirimidinon tizimlari zamonaviy geterotsiklik kimyoning muhim va istiqbolli yo'nalishlaridan biri hisoblanadi. Ushbu birikmalar tarkibida pirimidinon halqasining boshqa aromatik yoki geterotsiklik halqalar bilan tutashishi natijasida murakkab ko'p halqali strukturalar hosil bo'ladi. Bunday tuzilish ularning fizik-kimyoviy xossalarini sezilarli darajada o'zgartirib, biologik faolligini oshiradi. Shu sababli kondensirlangan pirimidinon hosilalari farmatsevtika,

tibbiyot va biokimyo sohalarida keng qo‘llanilmoqda. Mazkur birikmalar antiviral, antibakterial, yallig‘lanishga qarshi va saratonga qarshi faollikka ega ekanligi bilan alohida ahamiyat kasb etadi. Bundan tashqari, ular fermentlar ingibitorlari sifatida ham samarali ta’sir ko‘rsatadi. Pirimidinon yadrosining elektron tuzilishi hamda reaksion qobiliyati turli xil kimyoviy modifikatsiyalarni amalga oshirish imkonini beradi. Natijada yangi, yuqori samaradorlikka ega biologik faol moddalarni sintez qilish imkoniyati kengayadi. Kondensirlangan pirimidinon tizimlarini sintez qilishda kondensatsiya, siklizatsiya va annellanish reaksiyalari muhim o‘rin tutadi. Ushbu jarayonlar orqali tuzilishi murakkab, ammo barqaror geterotsiklik birikmalar olinadi. So‘nggi yillarda bu sohada olib borilayotgan ilmiy tadqiqotlar ularning amaliy ahamiyatini yanada oshirmoqda. Shuning uchun kondensirlangan pirimidinon tizimlarini o‘rganish nazariy va amaliy jihatdan dolzarb ilmiy yo‘nalish hisoblanadi.

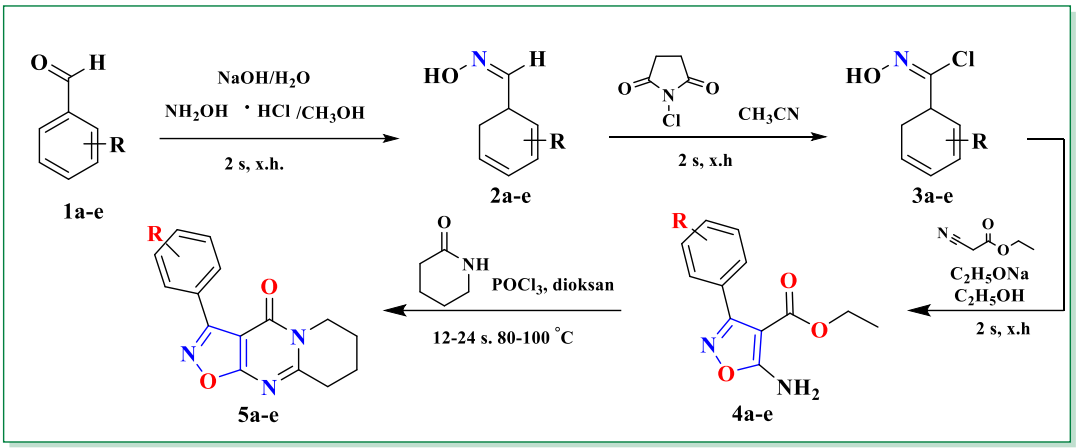
Adabiyotlar tahlili

Protein kinazalar faolligini susaytiruvchi kichik molekulyar ingibitorlarni ishlab chiqish zamonaviy dorivor kimyoning ustuvor yo‘nalishlaridan biri bo‘lib qolmoqda. Xususan, vaskulyar endotelial o‘sish faktori retseptorlari (VEGFR) o‘simta angiogenezi jarayonida, ya’ni yangi qon tomirlarining hosil bo‘lishida markaziy rol o‘ynaydi[1-3]. Shu sababli, VEGFR retseptorlarini nishonga oluvchi birikmalar onkologik kasalliklarni davolashda samarali strategiya hisoblanadi. Geterotsiklik birikmalarning ko‘p sonli vakillari orasida kondensirlangan pirimidinon tizimlari o‘zining biologik faollik spektri, jumladan, sitotoksik va antiproliferativ xususiyatlari bilan alohida ajralib turadi[4-6]. Ushbu tizimlarga izoksazol halqasining birikishi natijasida hosil bo‘lgan trisiklik karkaslar molekulaning konformatsion jihatdan barqarorligini oshirib, retseptorning faol markazi bilan yanada selektiv va kuchli bog‘lanishni ta’minlash imkonini beradi.

Mazkur tadqiqotning dolzarbligi shundaki, trisiklik izoksazolopirimidinon hosilalarining sintezi va ularning VEGFR ingibitorlari sifatida o‘rganilishi ilmiy adabiyotlarda hali yetarlicha yoritilmagan. Ushbu ishda yangi qator trisiklik hosilalarni sintez qilishning samarali metodologiyasi ishlab chiqildi hamda molekulyar doking tahlillari orqali ularning VEGFR faol markazi bilan o‘zaro ta’sirlashish potensiali o‘rganildi. Olingan natijalar yangi avlod kinaza ingibitorlarini yaratishda muhim nazariy va amaliy asos bo‘lib xizmat qiladi.

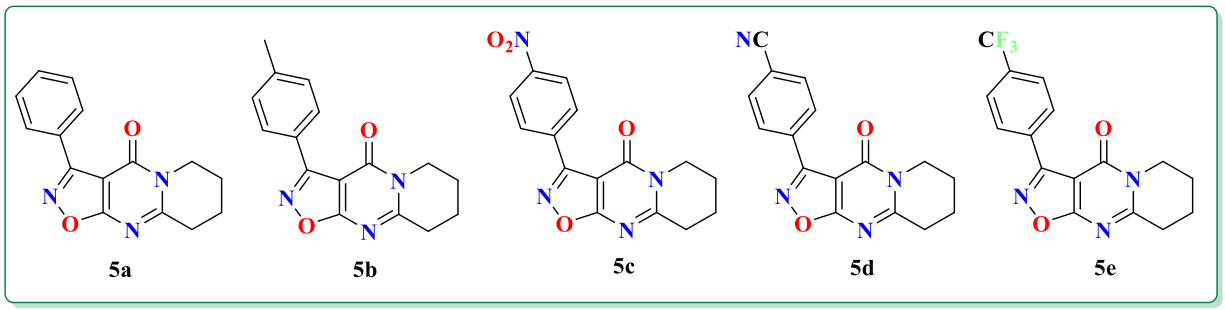
Tadqiqot metadologiyasi

Uch halqali izoksazolo[5,4-*d*]pirimidinon hosilalari 4 bosqichda olib borildi. Boshlang‘ich modda sifatida turli xil o‘rinbosarli aromatik aldegidlardan foydalanildi. Birinchi bosqichda benzaldegid **1a** (uning hosilasi(***1b-e***)) metanolda eritilib, ishqor hamda gidroksilamingidroxloridi bilan xona haroratida reaksiyaga kirishtirildi. 2 soat davomida olib borilgan reaksiya natijasida benzaldoksim **2a** va uning hosilalari(***2b-e***) olindi.



1-sxema: 3-aril-7,8-digidroizoksazolo[5,4-*d*]pirrolo[1,2-*a*]pirimidin-4(6*H*)-onlar sintezi.

Ushbu birikmalarning(***2a-e***) atsetonitril muhitida *N*-xlorsuksinimid bilan reaksiyasi olib borilib, turli o‘rinbosarli benzaldoksimxloridlar(***3a-e***) hosil qilindi. Uchinchi bosqichda etilsiyanoatsetat spirtli muhitda ***3a-e*** birikmalar bilan intramolekulyar sikllanishga uchrab, turli o‘rinbosarli 5-amino-3-aril-izoksazolo-4-karbon kislota etil efiri(***4a-e***)ni hosil qildi. So‘nggi bosqichda ***4a-e*** birikmalar siklik laktam piperidon-2 bilan fosforoksixlorid yordamida dioksan muhitida kondensatsiya reaksiyasiga kirishtirilib, uch halqali izoksazol birikmalari(***5a-e***) sintez qilindi.



2-sxema: 5a-e birikmalarining srtuktur tuzilishi.

Har bir bosqich so‘ngida reaksion aralashma 3 marta dixlormetan bilan eksrtaksiya qilindi va organik qism quritildi. Filtrlandi va erituvchi past bosim ostida haydaldi. Yakuniy toza mahsulot olish uchun ustunli xromatografiya usuli qo‘llanildi.

Natijalar va ularning tahlili

Sintez qilingan trisiklik izoksazolopirimidinon hosilalarining VEGFR retseptori bilan bog‘lanish samaradorligi molekulyar doking usuli yordamida baholandi (1-jadval). Olingan natijalarga ko‘ra, barcha o‘rganilgan birikmalar retseptorning faol markazi bilan barqaror termodinamik komplekslar hosil qilib, bog‘lanish energiyasi -7.186 dan -9.107 kkal/mol gacha bo‘lgan qiymatlarni ko‘rsatdi.

1-jadval.

Sintez qilingan birikma(*5a-e*)larning doking tadqiqot natijalari:

Modda	5a	5b	5c	5d	5e
VEGFR bilan bog‘lanish potensiali, Δkkal/mol	**-9.107**	-7.629	-7.292	-7.186	-7.509

Tahlillar shuni ko‘rsatdiki, **5a** moddasi eng yuqori bog‘lanish potensialiga (-9.107 kkal/mol) ega bo‘lib, bu uning VEGFR faol markazidagi aminokislota qoldiqlari bilan yanada kuchli vodorod bog‘lari va gidrofob o‘zaro ta’sirlar hosil qilishi bilan izohlanadi. Boshqa tomondan, **5b** (-7.629 kkal/mol) va **5e** (-7.509 kkal/mol) hosilalari ham yuqori yaqinlik ko‘rsatdi. **5d** birikmasi esa eng past ko‘rsatkichni (-7.186 kkal/mol) qayd etgan bo‘lsa-da, u baribir VEGFR ingibitori sifatida o‘rtacha faollikni saqlab qoladi. Bu natijalar trisiklik tizimdagi radikallarning tabiati bog‘lanish energiyasiga sezilarli ta’sir ko‘rsatishini tasdiqlaydi.

Xulosa

O‘tkazilgan tadqiqotlar natijasida yangi turdagi trisiklik izoksazolopirimidinon hosilalarini sintez qilishning samarali metodologiyasi ishlab chiqildi va ularning VEGFR retseptori bilan bog‘lanish imkoniyatlari kompyuter modellashtirish (*in silico*) yordamida batafsil o‘rganildi. Maqsadli trisiklik tizimlar yuqori unum bilan sintez qilindi va ularning kimyoviy tuzilishi zamonaviy fizik-kimyoviy tahlil usullari yordamida to‘liq tasdiqlandi. Barcha sintez qilingan birikmalar VEGFR faol markazi bilan barqaror termodinamik komplekslar hosil qilishi aniqlandi. Ayniqsa, **5a** moddasi eng yuqori bog‘lanish energiyasini (-9.107 kkal/mol) ko‘rsatib, ushbu qatordagi eng istiqbolli birikma ekanligini namoyon etdi. Olingan natijalar trisiklik skaffolddagi radikallarning tabiati retseptor bilan bog‘lanish kuchiga sezilarli ta’sir ko‘rsatishini tasdiqladi. Bu esa kelgusida molekulalarni modifikatsiya qilish orqali ularning selektivligini oshirish imkonini beradi. o‘rganilgan trisiklik izoksazolopirimidinonlar yangi avlod antikanser agentlarini, xususan, angiogenez jarayonini tormozlovchi samarali dori vositalarini yaratishda muhim boshlang‘ich molekulalar bo‘lib xizmat qilishi mumkin. Kelgusida ushbu birikmalarning *in vitro* sharoitida biologik faolligini o‘rganish maqsadga muvofiqdir.

SCHOENOPLECTUS LACUSTRIS SUBSP. HIPPOLYTI EKSTRAKTLARINING UMUMIY FENOL MIQDORI VA ANTIOKSIDANTLIK FAOLLIGINI QIYOSIY TAHLILI

Yusupov Islombek Abdumutalib o‘g‘li
Farg‘ona davlat universiteti tayanch doktoranti,
Email: yusupovislombek1992@gmail.com

Annotatsiya: *Mazkur tadqiqotda Schoenoplectus lacustris subsp. hippolyti o‘simligining yer ustki va ildiz qismlaridan olingan suvli hamda spirtli ekstraktlarida umumiy fenolik birikmalar miqdori va antioksidantlik faolligi o‘rganildi. Umumiy fenol miqdori “Prussiya ko‘ki” usuli yordamida aniqlanib, gall kislota ekvivalentida ifodalandi. Antioksidantlik faolligi esa “fenantrolin” usuli asosida baholanib, L-askorbin kislota ekvivalentlarida ifodalandi. Natijalar shuni ko‘rsatdiki, poya ekstraktlarida fenolik birikmalar miqdori ildizga nisbatan yuqori bo‘lib, eng yuqori qiymat spirtli ekstraktda kuzatildi. Antioksidantlik faolligi ham spirtli ekstraktlarda yuqoriroq bo‘ldi. Olingan natijalar fenolik birikmalar va antioksidantlik o‘rtasida to‘g‘ri bog‘liqlik mavjudligini ko‘rsatadi. Mazkur o‘simlik tabiiy antioksidant manbai sifatida istiqbolli hisoblanadi*

Kalit so‘zlar: *Schoenoplectus lacustris subsp. hippolyti, fenolik birikmalar, antioksidantlik, Prussiya ko‘ki usuli, fenantrolin usuli, ekstraktlar*

СРАВНИТЕЛЬНЫЙ АНАЛИЗ ОБЩЕГО СОДЕРЖАНИЯ ФЕНОЛОВ И АНТИОКСИДАНТНОЙ АКТИВНОСТИ ЭКСТРАКТОВ SCHOENOPLECTUS LACUSTRIS SUBSP. HIPPOLYTI

Аннотация: *В настоящем исследовании изучались водные и спиртовые экстракты надземной и корневой частей растения Schoenoplectus lacustris subsp. hippolyti с целью определения общего содержания фенольных соединений и антиоксидантной активности. Общее содержание фенолов определялось методом «прусского синего» и выражалось в эквивалентах галловой кислоты. Антиоксидантная активность оценивалась методом фенантролина и выражалась в эквивалентах L-аскорбиновой кислоты. Результаты показали, что экстракты стебля содержат большее количество фенольных соединений по сравнению с корнями, при этом максимальное значение наблюдалось в спиртовом экстракте. Антиоксидантная активность также была выше в спиртовых экстрактах. Полученные данные свидетельствуют о прямой зависимости между содержанием фенольных соединений и антиоксидантной активностью. Растение рассматривается как перспективный источник природных антиоксидантов.*

Ключевые слова: *Schoenoplectus lacustris subsp. hippolyti, фенольные соединения, антиоксидантная активность, метод «прусского синего», метод фенантролина, экстракты*

COMPARATIVE ANALYSIS OF TOTAL PHENOL CONTENT AND ANTIOXIDANT ACTIVITY IN EXTRACTS OF SCHOENOPLECTUS LACUSTRIS SUBSP. HIPPOLYTI

Abstract: *This study investigated the total phenolic content and antioxidant activity of aqueous and alcoholic extracts obtained from the aerial and root parts of Schoenoplectus lacustris subsp. hippolyti. Total phenolic content was determined using the Prussian Blue method and expressed in gallic acid equivalents. Antioxidant activity was assessed using the ferrozine (1,10-phenanthroline) method and expressed in L-ascorbic acid equivalents. Results showed that phenolic content in aerial part extracts was higher than in root extracts, with the highest value observed in the alcoholic extract. Similarly, antioxidant activity was higher in alcoholic extracts. The findings indicate a direct correlation between phenolic content and antioxidant activity, suggesting that this plant is a promising natural source of antioxidants.*

Keywords: *Schoenoplectus lacustris subsp. hippolyti, phenolic compounds, antioxidant activity, Prussian Blue method, ferrozine method, extracts*

Kirish

Suv va botqoqlik ekotizimlarida tarqalgan o‘simliklar ekologik hamda biokimyoviy jihatdan muhim ahamiyatga ega. *Schoenoplectus lacustris* subsp. *hippolyti* Cyperaceae oilasiga mansub bo‘lib, suv muhitiga moslashgan o‘simlik hisoblanadi.

Ushbu turkum vakillari tuproq barqarorligini ta'minlash, eroziya jarayonlarini kamaytirish va biogen moddalarning tabiiy filtrasiyasida muhim rol o'ynaydi [1].

Fenolik birikmalar o'simliklarning muhim ikkilamchi metabolitlari bo'lib, ular antioksidant, antimikrob va himoya funksiyalarini bajaradi. Shu sababli o'simlik ekstraktlarining fenolik tarkibini va antioksidantlik xususiyatlarini o'rganish dolzarb ilmiy yo'nalishlardan biri hisoblanadi.

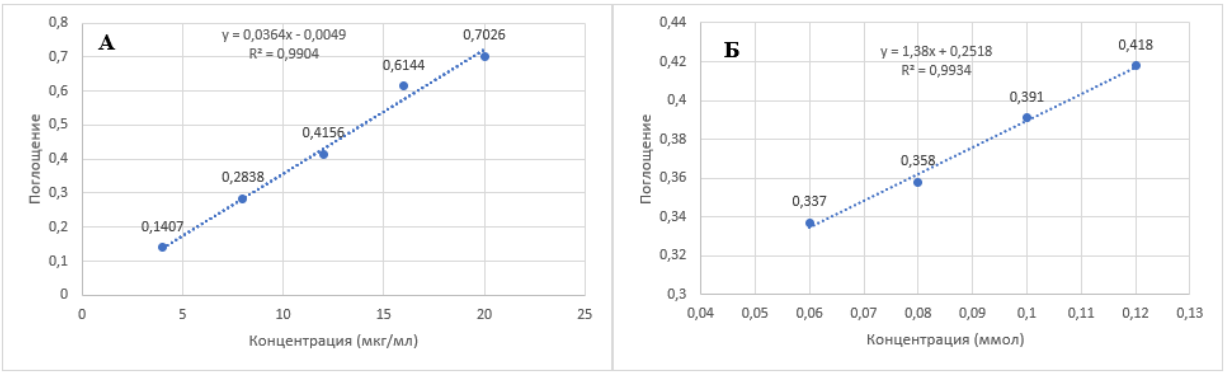
Mazkur tadqiqotning maqsadi — *Schoenoplectus lacustris* subsp. *hippolyti* o'simligining turli qismlaridan olingan ekstraktlarda umumiy fenol miqdori va antioksidantlik faolligini aniqlash hamda ularni qiyosiy tahlil qilishdan iborat.

MATERIALLAR VA USULLAR

Ushbu kenja tur ko'p yillik o'simlik bo'lib, gidrofil sharoitlarga yaxshi moslashgan. Tabiiy holda u asosan Yevrosiyoning kontinental iqlim hukmron bo'lgan hududlarida uchraydi. Zamonaviy xalqaro taksonomik va floristik manbalariga ko'ra, mazkur o'simlik Markaziy Osiyo florasining muhim tarkibiy qismi hisoblanadi va uning tabiiy tarqalish areali O'zbekiston hududini ham o'z ichiga oladi [2]

Schoenoplectus lacustris subsp. *hippolyti* o'simligining yer ustki va ildiz qismlaridan olingan suvli hamda spirtli ekstraktlarda fenolik birikmalarning umumiy miqdori *"Prussiya ko'ki"* usuli yordamida aniqlanib [3], natijalar gall kislotasi ekvivalentida (mg/g quruq massa) ifodalandi. Umumiy antioksidantlik faolligi esa *"fenantrolin"* usuli asosida baholanib [4], L-askorbin kislota ekvivalentlarida ifodalandi.

Kalibrlash egri chiziqlari gall kislotasining (4, 8, 12, 16, 20 mkg/ml) hamda L-askorbin kislotaning (0,06; 0,08; 0,10; 0,12 mmol) standart eritmalari asosida qurildi. Ushbu egri chiziqlarga tayangan holda quyidagi regressiya tenglamalari olindi: y = 0,0364x − 0,0049 (gall kislotasi uchun) hamda y = 1,38x + 0,2518 (L-askorbin kislota uchun) (1-rasm).



I-rasm. Gall kislotasi (A) va L-askorbin kislota (B) standart eritmalari asosida tuzilgan kalibrlash egri chiziqlari

Schoenoplectus lacustris subsp. *hippolyti* o'simligining yer ustki qismi va ildizlaridan olingan suvli hamda spirtli ekstraktlar uchun aniqlangan optik zichlik qiymatlari yuqorida keltirilgan tenglamalarga qo'yildi va shu asosda tegishli konsentratsiyalar hisoblab chiqildi. Olingan natijalarni o'simlik xomashyosining quruq massasiga nisbatan ifodalash uchun quyidagi formula qo'llanildi:

UFM yoki UAK = C × V / m

bu yerda:

C — suyultirish koeffitsiyenti hisobga olingan konsentratsiya;

V — dastlabki eritmaning hajmi (ml);

m — o'simlik namunasi quruq massasi (g).

Hisoblash natijalari 1-jadvalda keltirilgan.

Tajriba qismi. Umumiy fenolik birikmalar miqdorini "Prussiya ko'ki" usulida aniqlash. Tahlil uchun olingan namunalar ultratoza suv yordamida 1:50 (h/h) nisbatda suyultirildi. So'ngra 1 ml namuna eritmasiga 0,01 mol/l HCl asosida tayyorlangan 0,50 mmol/l konsentratsiyali temir(III) xlorid geksagidrat ($FeCl_3 \cdot 6H_2O$) eritmasidan 1 ml qo'shildi va aralashma 2 daqiqa davomida reaksiyaga qoldirildi. Keyingi bosqichda xuddi shu konsentratsiyadagi (0,50 mmol/l) kaliy geksatsianoferrat(III) – $K_3[Fe(CN)_6]$ eritmasidan 1 ml qo'shilib, kyuvetalar 20 soniya davomida aralashtirildi. Reaksiya qorong'i sharoitda 25 °C haroratda 15 daqiqa davom ettirildi. Shundan so'ng eritmaning optik zichligi 725 nm to'lqin uzunligida UV-755 spektrofotometr yordamida o'lchandi.

Umumiy antioksidantlik faolligini fenantrolin usulida aniqlash. Hajmi 10 ml bo'lgan o'lchov kolbasiga 0,6 ml suvli yoki spirtli o'simlik ekstrakti, 1 ml 0,2% li $FeCl_3$ eritmasi (etanolda) hamda 0,5 ml 0,5% li 1,10-fenantrolin eritmasi (etanolda) kiritildi. So'ngra eritma hajmi etanol bilan belgilangan chiziqqacha yetkazildi. Hosil bo'lgan aralashma yaxshilab aralashtirilib, xona haroratida qorong'i muhitda 20 daqiqa davomida inkubatsiya qilindi. Keyinchalik hosil bo'lgan to'q sariq-qizil rangli eritmaning optik zichligi 510 nm to'lqin uzunligida UV-755 spektrofotometrda o'lchandi.

NATIJALAR

Olingan natijalar (1-jadval) shuni ko‘rsatdiki, fenolik birikmalar miqdori o‘simlik organlariga va ekstraksiya usuliga bog‘liq holda sezilarli darajada farqlanadi. Poya qismida fenolik birikmalar miqdori ildizga nisbatan yuqori ekanligi aniqlandi. Eng yuqori ko‘rsatkich poyaning spirtli ekstraktida (5,059 mg GKE/g QM) kuzatildi.

I-jadval

***Schoenoplectus lacustris* subsp. *hippolyti* o‘simligida umumiy fenolik birikmalar miqdori va antioksidantlik faolligini aniqlash natijalari**

Ekstrakt	Umumiy fenolik birikmalar miqdori (mg GKE/g QM)		Umumiy antioksidantlik faolligi (mmol AKE/g QM)	
	Suvli	Spirtli	Suvli	Spirtli
Ildiz	1,148 ± 0,124	3,27 ± 0,16	0,265 ± 0,051	0,552 ± 0,061
Poya	5,05 ± 0,079	5,059 ± 0,135	0,268 ± 0,025	0,584 ± 0,048

Antioksidantlik faolligi ham shunga o‘xshash tendensiyani namoyon etdi. Spirtli ekstraktlar suvli ekstraktlarga nisbatan yuqori faollik ko‘rsatdi. Eng yuqori antioksidantlik poyaning spirtli ekstraktida (0,584 mmol AKE/g QM) qayd etildi.

MUHOKAMA

Ushbu tadqiqot natijalari *Schoenoplectus lacustris* subsp. *hippolyti* o‘simligining turli qismlarida fenolik birikmalar miqdori va antioksidantlik faolligi o‘rtasida sezilarli farqlar mavjudligini ko‘rsatdi. Xususan, poya ekstraktlarida fenolik birikmalar miqdorining ildizga nisbatan yuqori bo‘lishi o‘simlikning fotosintetik faol qismida ikkilamchi metabolitlarning ko‘proq sintez qilinishi bilan izohlanadi. Bu holat boshqa botqoq o‘simliklari va *Cyperaceae* oilasi vakillarida ham kuzatilgan [5].

Fenolik birikmalar o‘simliklarda antioksidant himoya tizimining muhim komponentlari hisoblanadi. Ular erkin radikallarni neytrallash, oksidlovchi stressni kamaytirish hamda hujayra strukturalarini himoya qilishda faol ishtirok etadi [6]. Shu sababli mazkur tadqiqotda aniqlangan yuqori fenol miqdori bilan antioksidantlik faolligi o‘rtasidagi to‘g‘ri proporsional bog‘liqlik ilmiy jihatdan asosli hisoblanadi. Shunga o‘xshash natijalar turli dorivor o‘simliklar ekstraktlari bo‘yicha olib borilgan tadqiqotlarda ham qayd etilgan [7].

Ekstraksiya turi ham muhim omillardan biri sifatida namoyon bo‘ldi. Spirtli ekstraktlarda fenolik birikmalar miqdori va antioksidantlik faolligining yuqori bo‘lishi fenolik moddalarning etanol muhitida yaxshi eruvchanligi bilan izohlanadi. Ilmiy adabiyotlarda etanol va boshqa organik erituvchilarning fenolik birikmalarni ajratib olish samaradorligi yuqori ekanligi ko‘p marotaba ta’kidlangan [8]. Bu esa olingan natijalar ishonchliligini yana bir bor tasdiqlaydi.

Bundan tashqari, ildiz va poya o‘rtasidagi farqlar o‘simlikning ekologik moslanish xususiyatlari bilan ham bog‘liq bo‘lishi mumkin. Poya qismi tashqi muhit omillariga, xususan, ultrabinafsha nurlanish va oksidlovchi stressga ko‘proq duch keladi, bu esa fenolik birikmalar sintezini rag‘batlantiradi [9]. Shu sababli yer ustki organlarda antioksidant moddalarning ko‘proq to‘planishi tabiiy deb qaraladi.

Olingan natijalar boshqa tadqiqotchilar tomonidan *Cyperaceae* oilasiga mansub o‘simliklarda aniqlangan ma’lumotlar bilan mos keladi. Xususan, ushbu oilaga mansub ayrim turlarda fenolik birikmalar miqdori va antioksidantlik faolligi o‘rtasida kuchli korrelyatsiya mavjudligi aniqlangan [10]. Bu esa *Schoenoplectus lacustris* subsp. *hippolyti* o‘simligining ham biologik faol moddalarga boy ekanligini ko‘rsatadi.

Umuman olganda, tadqiqot natijalari mazkur o‘simlikni tabiiy antioksidant manbai sifatida baholash imkonini beradi hamda uni farmatsevtika va oziq-ovqat sanoatida qo‘llash istiqbollarini ochib beradi.

XULOSA

Mazkur tadqiqot natijalari *Schoenoplectus lacustris* subsp. *hippolyti* o‘simligining fenolik birikmalarga boy ekanligini va sezilarli antioksidantlik faolligiga ega ekanligini ko‘rsatdi. O‘simlikning turli qismlari va ekstraksiya usullariga bog‘liq holda fenolik moddalarning miqdori hamda antioksidantlik darajasi farqlanishi aniqlandi. Xususan, poya qismida fenolik birikmalar miqdori ildizga nisbatan yuqori bo‘lib, eng yuqori ko‘rsatkich spirtli ekstraktda kuzatildi.

Shuningdek, antioksidantlik faolligi ham spirtli ekstraktlarda yuqori bo‘lib, bu fenolik birikmalar miqdori bilan uzviy bog‘liqligini tasdiqlaydi. Olingan natijalar fenolik birikmalar o‘simlik ekstraktlarining asosiy antioksidant komponentlari ekanligini ko‘rsatdi.

Umuman olganda, *Schoenoplectus lacustris* subsp. *hippolyti* o‘simligi tabiiy antioksidant manbai sifatida istiqbolli hisoblanadi. Kelgusida uning biologik faol moddalari tarkibini chuqurroq o‘rganish hamda farmatsevtika va oziq-ovqat sanoatida qo‘llash imkoniyatlarini kengaytirish maqsadga muvofiqdir.

Annotatsiya. *Ushbu maqolada oraliq metallarning kompleks birikmalarini olish uchun keng ko'lamdagi turli terminal o'rinbosarlar saqlagan ko'pfunksional polidentat ketoal'degid ligandlarni sintez qilishning samarali usullarini yaratish masalasi chuqur tahlil qilinadi.*

Kalit so'zlar. *Tridentat ligandlar, benzoilsirka al'degid aroilgidrazonlari, aroilsirka aldegid, β-ketoal'degid, salitsil al'degid.*

СТРУКТУРА ПАРАЗАМЕЩЕННЫХ ПРОИЗВОДНЫХ ТРИДЕНТАТНЫХ ЛИГАНДОВ, СОДЕРЖАЩИХ N, O И S, ОТДЕЛЬНЫХ БИОГЕННЫХ 3D-МЕТАЛЛОВ

Аннотация. *В данной статье будет проведен углубленный анализ вопроса создания эффективных методов синтеза многофункциональных полидентатных кетоальдегидных лигандов, содержащих широкий спектр различных концевых заместителей для получения комплексных соединений промежуточных металлов.*

Ключевые слова. *Тридентат лиганды, бензоилсульфоальдегид ароилгидразоны, ароилсульфоальдегид, β-кетоальдегид, салициловый альдегид.*

STRUCTURE OF PARA-SUBSTITUTED PRODUCTS OF TRIDENTATE LIGANDS CONTAINING N, O AND S OF SOME BIOGENIC 3D METALS

Abstract. *This article analyzes in depth the issue of creating effective methods for synthesizing multifunctional polydentate ketoal'dehyde ligands, which have stored a wide range of different terminal substituents to obtain complex compounds of intermediate metals.*

Keywords. *Tridentate ligands, benzoylsyrka Al'degid aroilhydrazones, aroilsirka aldehyde, β-ketoal'degid, salicyl Al'degid.*

Kirish. Dunyoda kimyo, kimyoviy texnologiya, farmakologiya va qishloq xo'jaligida ishlatiladigan kompleks birikmalar tadqiqoti olimlarni diqqat e'tiborida bo'lib, ularning sintezi va qo'llanilishi jadal rivojlanmoqda. Chunki, havo va tuproq strukturasini buzilishi, shuningdek, yer maydoni va suv resurslari kabi tabiiy manbalarining cheklanganligi insoniyatning oziq-ovqat, qishloq xo'jaligi mahsulotlariga bo'lgan talablarini yildan-yilga ortib borayotganligi yerdan unumli foydalanish, yerlarning meliorativ holatini va tuproq unumdorligini oshirish orqali ekinlar hosildorligini oshirishga katta e'tibor qaratilmoqda.

Adabiyotlar taxlili. Respublikamizda organik ligandlar asosida metall ionlari bilan kompleks birikmalarning sintezi va tadqiqoti sohasidagi ilmiy ishlarni amalga oshirish hamda rivojlantirish borasida N.A. Parpiyev, H.T. Sharipov, O.F. Xodjayev, O.A. Shobilolov, B.B. Umarov, T.A. Azizov, H.X. To'rayev, Sh.A. Qodirovalar shug'ullanishmoqdalar. Ushbu olimlarimiz tomonidan yangi ko'pfunksional polidentat ligandlar, shuningdek ularning oraliq metallar bilan komplekslari olingan, ularning tuzilishi hamda xossalari atroflich o'rganilgan va tahlil qilingan.

Xorijiy mamlakatda ushbu yo'nalishda Geraldes C. F., Barros M. T., Agrawal A., Prasad R.N., Dutta R.L., Hamza S.M., Woodruff D. N., Stadler A.-M., Iskander M.F kabi olimlar keng ishlarni amalga oshirishdilar. Ular tomonidan ko'pdentatli ligandlarning metal komplekslari, Ni, Zn, Cu, Co, Fe, Mn, V kabi metallar komplekslari katalitik va biologik faol xossalari o'rganilgan.

2,4-dioksopentan kislota efirlarining *para*-almashingan benzoy kislota gidrazidlari bilan o'zaro kondensatlanishidan olingan organik tridentat ligandlar asosida Ni(II), Cu(II), Zn(II), Mn(II) va Co(II) metallar bilan kompleks birikmalar kimyoviy jarayonlarda katalizator, o'simliklarni o'sishini tezlashtiruvchi biofaol moddalar, turli mikroorganizmlarga qarshi baktritsid va fungitsidlar kabi yuqori samara beradigan preparatlarni olishda va tibbiyotda keng miqiyosida

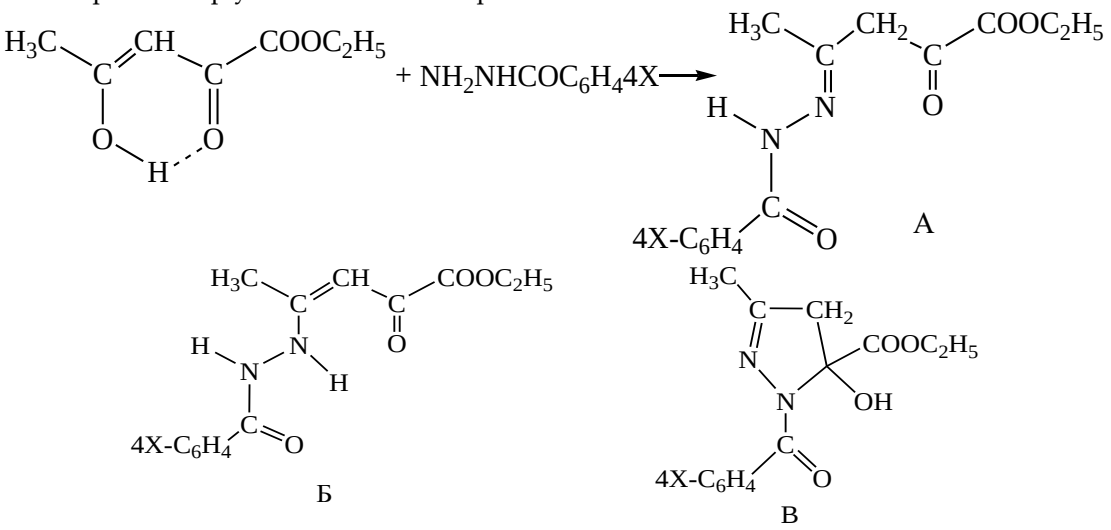
ishlatilish masalariga alohida e'tibor qaratilmoqda. Shuning uchun turli terminal o'rinbosarlar saqlagan ko'pfunksional polidentat ketoeferlarni sintez qilishning samarali usullarini yaratish dolzarb vazifalardan hisoblanadi.

Tadqiqot metodologiyasi. 2,4-dioksopentan kislota etil efirining *para*-almashingan benzoy kislota gidrazidlari bilan kondensat-lanish mahsulotlarining geometrik tuzilishi eritmada gidrazon, chiziqli yengidrazin va halqali 5-gidroksi-2-pirazolin tautomer shaklda uchrashi isbotlandi.

Ketoefirlarning *para*-almashingan aroilgidrazonlari kristall holatda va deteriylangan xloroformdagi ($CDCl_3$) eritmasida halqali 5-gidroksi-2-pirazolin tuzilishda, qutbli erituvchi DMCO-d_6 dagi eritmasida esa gidrazon va chiziqli yengidrazin tautomer muvozanatda bo'lishi IQ-, YaMR-^{1}H spektroskopiyalari va RSA orqali aniqlandi.

Taxlillar va natijalar. 1,3-diketonlar atsil- va tioatsilgidrazonlari tautomer imkoniyatlar nuqtai nazaridan juda ahamiyatli birikmalar sinfini tashkil qilib, olimlarimiz tomonidan ularga bo'lgan qiziqish kun sayin ortib bormoqda [5, 6]. 2,4-dioksopentan kislota etil efiri aroilgidrazonlarining tuzilishiga bo'lgan qiziqish, birinchi navbatda shu bilan belgilanadiki, ular turli tautomer shakllarda mavjud bo'lish qobiliyatiga ega. Dikarbonil komponentning tuzilish xususiyatlariga bog'liq holda 1,3-diketonlar aroilgidrazonlarining qatorida chiziqli (gidrazon, yengidrazin) va halqali tautomer shakllar orasida uchlamchi halqa-zanjir muvozanatlarni kuzatishimiz mumkin. Shuni ta'kidlash joizki, juft prototrop muvozanat 1,3-ketoefirlar atsilgidrazonlari va 1,3-ketoaldegidlar hosilalari uchun kuzatiladi [5].

Biz bitiruv malakaviy ishni bajarish davomida 2,4-dioksopentan kislota etil efirining *para*-almashingan aromatik kislotalar gidrazidlari bilan kondensatlanish mahsulotlarining tuzilishi o'rgandik va uchta yangi tridentat organik ligandlar oldik. YaMR-^{1}H spektroskopiya ma'lumotlariga ko'ra, erkin 1,3-ketoefir, aynan 2,4-dioksopentan kislotaning etil efiri keto-yenol shaklda mavjud bo'ladi. Ketoefir asosida olingan aroilgidrazonlarning (H_2L^1 – H_2L^3) tarkibi va tuzilishi element analiz, IQ- va YaMR-^{1}H spektroskopiya usullari bilan aniqlandi:



X = H (H_2L^1), NO_2 (H_2L^2), $(CH_3)_2N$ (H_2L^3).

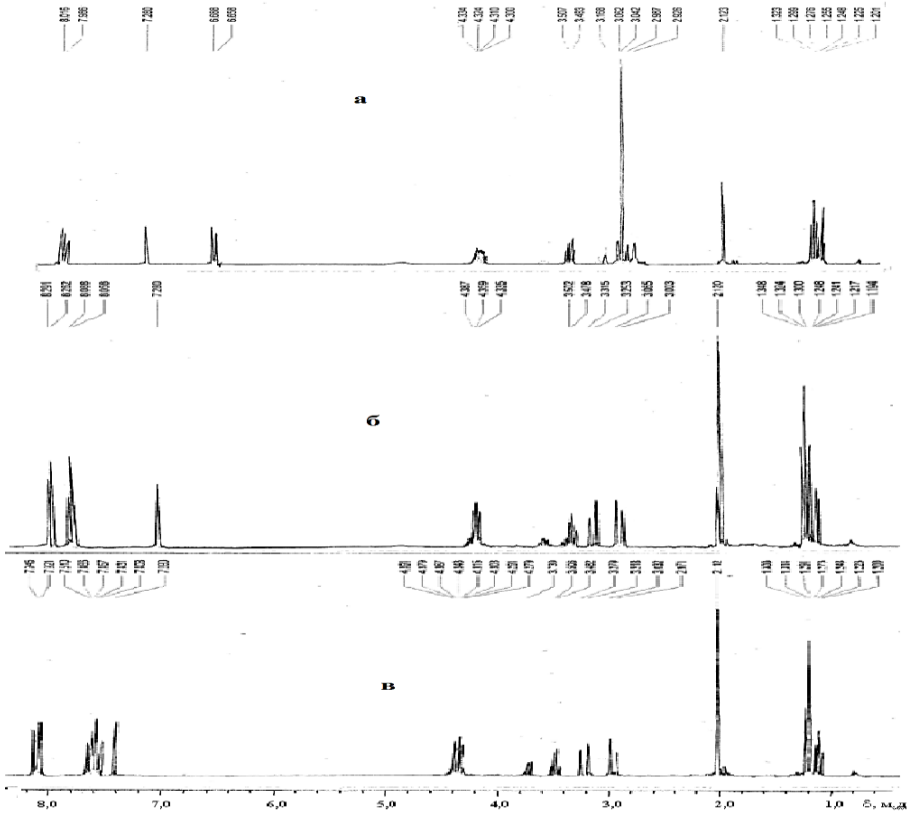
1-sxema

H_2L^1–H_2L^3 birikmalar molekulasi infraqizil spektrlarida β-diketon qismining murakkab efir fragmentidagi karbonil guruhi (C=O) bog' valent tebranish chiziqlari 1750-1765 sm^{-1} da kuzatiladi. Bu birikmalarning IQ spektrlari uchun ~3400 sm^{-1} sohada $\nu_{(O-H)}$ valent tebranishlarning keng chizig'i xarakterli hisoblanadi, amidli fragmentning valent tebranishlari yutilish chizig'i 1660-1680 sm^{-1} da qayd qilinadi. Birikmalarning IQ spektrlarida karrali bog'larning valent tebranishlari sohasida intensiv yutilish chiziqlari 1633, 1595, 1574, 1558 va 1490 sm^{-1} da mavjud. 1633 sm^{-1} dagi yutilish chizig'i C=N bog'ning mavjudligidan darak beradi, qolgan yutilish chiziqlari aromatik halqaning bog'lariga va N–H bog'ning deformatsion tebranishlariga tegishlidir. IQ spektrlarning tahlili shundan dalolat beradiki, sintez qilingan H_2L^1–H_2L^3 birikmalar qattiq holatda halqali 5-gidroksi-2-pirazolin tautomer (B) shaklda mavjud bo'ladi.

Sintez qilib olingan H_2L^1–H_2L^3 birikmalarning eritmadagi tuzilishi haqidagi xulosalarni batamom tasdiqlash maqsadida biz ularning $CDCl_3$ eritmasida YaMR-^{1}H spektrlarini oldik. Olingan spektr ma'lumotlari halqali tautomer (B) shaklning saqlanib qolinishini tasdiqladi.

Misol sifatida H_2L^1 ning YaMR-^{1}H spektrini parametrlarini tahlil qilamiz. Muhim ma'lumotni pirazolin halqasidagi metilen guruhi protonlarining δ 2,98-3,03 va 3,17-3,28 m.h. da nosimmetrik dublet signallari namoyon qilib, SSTK J_{AB} = 21 Gs bo'lgan tipik AB-sistemani hosil qiladi (4-rasm, 2-jadval). Bu molekula tarkibida xiral markazning mavjudligi bilan tushintiriladi, bu markaz 5-gidroksi-2-pirazolin halqaning to'rtinchi holatidagi uglerod atomi hisoblanadi [9,24]. H_2L^3 ning β-dikarbonil qismidagi etil guruhi protonlari δ 1,28 m.h.da va gidrazon fragmentidagi $(CH_3)_2N$ o'rinbosari δ 4,34 m.h.da 3:2 nisbatda triplet va kvadruplet signallarni beradi, fenil halqasining beshta protonlari (5H) esa, δ 7,46 va 7,93 m.h.da kengaygan multiplet signallar ko'rinishida rezonanslashdi.

Barcha ligandlar uchun 5-gidroksi-2-pirazolin halqaning beshinchi uglerod atomi bilan bog‘langan gidroksil guruhning yakka protonning signali δ 7,28 m.h.da kuzatiladi (2-jadval). Molekulaning amid qismidagi benzol halqasida *para*-holatda joylashgan o‘rinbosarlar o‘zining elektron donor yoki elektron akseptor tabiati bilan molekulaning barcha chetki o‘rinbosarlar va funksional guruhlardagi protonlarning kimyoviy siljishiga kuchli ta’sir ko‘rsatadi (3-rasm, 2-jadval) [7]. Ayniqsa bu aromatik yadro va pirazolin halqada 4-holatda joylashgan uglerod atomi protonlaridan chiqadigan signallar uchun ma’lumot beradi. Elektron akseptor nitro-guruhning ta’siri ostida bu protonlarning signallari H_2L^2 birikma uchun kuchsiz maydonlar sohasida δ 0,35-0,61 m.h. da rezonanslashadi, benzol halqaning *para*-holatiga elektronodonor N,N-dimetilamin guruh kiritilgan benzol halqasi protonlarining signallari esa kuchli maydon sohasiga δ 0,75 m.h. siljiganligini ko‘rsatadi (2-rasm, 1-jadval). Muhokama qilinayatgan tadqiqot natijalari shunday birikmalar sinfi uchun oldinroq olingan natijalarga mos keladi [5-7]. Taxminan shunday o‘zgarishlar xiral markaz va oksipirazolinli geterotsiklning 5-holatidagi assimetrik C* atomi ta’siri ostida AB-sistemani hosil qiluvchi ikkita sterik noekvivalent protonlar signallarining kimyoviy siljishida ham kuzatiladi (1-jadval).



1-rasm. 2,4-dioksopentan kislota etil efiri benzoil gidrazoni (H_2L^1) – (a), 2,4-dioksopentan kislota etil efiri *para*-nitrobenzoilgidrazoni - (H_2L^2) – (b), 2,4-dioksopentan kislota etil efiri *para*-dimetilaminobenzoilgidrazoni-ning(H_2L^3) –(в) $CDCl_3$ eritmasidagi YaMR-^{1}H spektrlari.

1-jadval.

2,4-dioksopentan kislota etil efiri *para*-almashingan benzoilgidrazonlari (H_2L^1–H_2L^3) ning $CDCl_3$ eritmasida olingan YaMR-^{1}H spektrlari parametrlari, δ, m.h.

№	CH_3-CN	CH_3-CH_2O	CH_3-CH_2O	CH_2	OH	C_6H_4-X

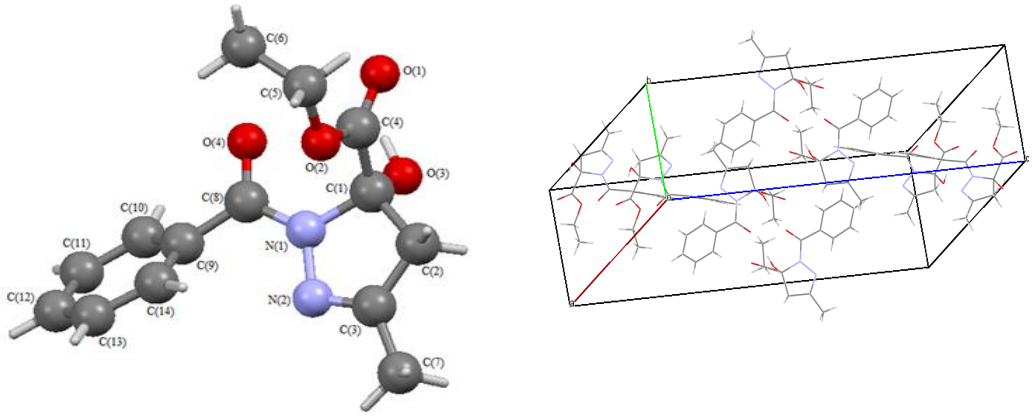
H_2L^2	2,12	1,30	4,36	3,03; 3,28	7,28	8,07; 8,28
H_2L^3	2,12	1,27	4,32	2,98; 3,17	7,28	6,68; 8,00

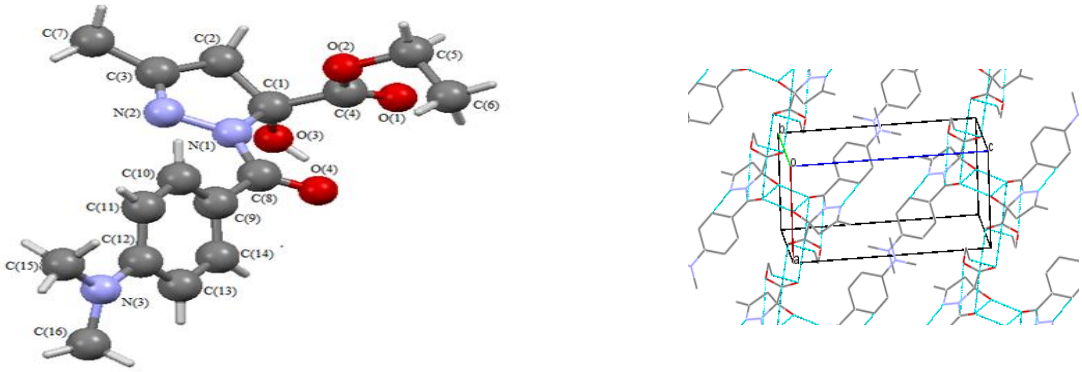
Ketoefirlar 5-gidroksi-2-pirazolin tuzilishida ekanligini IQ- va YaMR-^{1}H spektrlar bo‘yicha olingan halqali strukturasini tasdiqlash maqsadida ikkita H_2L^1 va H_2L^3 ligandlardan o‘stirilgan monokristallar uchun RSA usuli qo‘llanildi. Rentgenostruktur analiz “***Xcalibur, Oxford Diffraction***”avtomatik difraktometrda o‘tkazildi (λ=1,5418 Å, CuKα-nurlanish, grafit monoxromator, ω-skanerlash).

H_2L^1 ligandning $C_{14}H_{16}N_2O_4$ monokristali monoklin hisoblanadi va elementar yacheykaning quyidagi parametrlariga ega bo‘ladi: a=14,1683(5), b=8,28854(18), c=25,5886(9), α=90,0, β=111,457(4), γ=90,0°, V=2796,71(15) Å, Z=2, pr.gr. C2/c.

H_2L^3 ligandning $C_{16}H_{21}N_3O_4$ monokristallari monoklin hisoblanadi va elementar yacheykaning quyidagi parametrlariga ega bo‘ladi: a=7,9240(11), b=8,2192(9), c=13,987(2), α=81,081(12), β=81,939(12), γ=62,199(13)°, V=1715,2(15) Å, Z=2, pr.gr. P-1.



2-rasm. 2,4-dioksopentan kislota etil efiri benzoilgidrazoni (H_2L^1) molekulyar strukturasi va molekulalarning kristall yacheykalarining *as* tekislikdagi proeksiyasi.



3-rasm. 2,4-dioksopentan kislota etil efiri *para*-dimetilaminobenzoilgidrazonining (H_2L^3) molekulyar strukturasi va molekulalarining kristall yacheykalarining *as* tekislikdagi proeksiyasi.

2,3-rasmlarda halqali 5-gidroksi-2-pirazolin (B) shaklga ega bo‘lgan ligandlar molekulasining tuzilish sxemasi ko‘rsatilgan. Har bir ligandning kristall panjarasi-da mustaqil molekulalar bor. C(1)C(2)C(3)N(2)N(1) atomlaridan tashkil topgan besh a’zoli geterotsiklik pirazolin halqalar va molekulaning atsil qismidagi benzol halqalari deyarli yassi bo‘ladi. Geterotsikllar tekisligidan atomlarning

Atom burchaklarning kattaliklari va atomlararo bog‘larning uzunligi Xyukkelning aromatlik qoidasi talablarining bajarilishini ko‘rsatadi. Molekulaning o‘ziga xos xususiyatlaridan biri shundan iboratki, pirazolin halqada joylashgan C(2) uglerod atomi sp^3-gibrid holatda bo‘ladi va shunga muvofiq, C(1)–C(4) va C(3)–C(7) bog‘lar geterotsiklning turli tomonlariga tetraedrik burchaklarga teng kattalikda chetga chiqadi.

H_2L^3 molekulasida benzoilgidrazid qoldiqning fenil halqasi pirazolin halqaga nisbatan fazoda 45,66° ga buralgan bo‘ladi. Molekuladagi β-diketon qismning murakkab efir guruhi va oksipirazolin halqa orasidagi burchak 136,42° ga teng va ular bitta tekislikning chegarasida yotmaydi.

Xulosa. Olingan polifunksional tridentat organik ligandlarning geometrik tuzilishi halqali 5-gidroksi-2-pirazolin tautomer shaklda bo’lishi kuzatildi. Ketoefirlarning *para*-almashingan benzoy kislota gidrazidlari kristall holatda IQ spektrlari tahlili halqali pirazolin tushilishga ega ekanligini ko’rsatadi.

Sintez qilingan tridentat organik ligandlar deteriylangan xloroformdagi ($CDCl_3$) eritmasidan olingan YaMR-^{1}H spektroskopiyasi ma’lumotlarida AB-sistema hosil bo’lishi, halqali 5-gidroksi-2-pirazolin tautomer shaklda ekanligini isbotlaydi.

TOVUQ TUXUMI PO‘STLOG‘INING ANTIOKSIANTLIK XUSUSIYATINI *in vitro* USULIDA O‘RGANISH

Fayziyev Xayrullaxon Omonilloyevich
Andijon Davlat Universiteti mustaqil tadqiqotchisi
E-mail: fayziyevxayrullaxon@gmail.com

Annotatsiya. *Ushbu maqolada tabiiy kalsiy manbai bo‘lgan tuxum po‘stloqlarining tarkibi va shifobaxsh xususiyatlari haqida so‘z boradi. Tuxum po‘stloqlari nafaqat kalsiy manbai, balki antioksidantlik xususiyatiga ham ega bo‘lgan tabiiy birikmadir.*

Kalit so‘zlar*: tuxum po‘stlog‘i, suyak, kalsiy, antioksidantlik, in vitro.*

ИЗУЧЕНИЕ АНТИОКСИДАНТНЫХ СВОЙСТВ СКОРЛУПЫ КУРИНОГО ЯЙЦА МЕТОДОМ in vitro

Аннотация. *В данной статье рассматриваются состав и лечебные свойства яичной скорлупы, являющейся природным источником кальция. Яичная скорлупа является не только источником кальция, но и природным соединением, обладающим антиоксидантными свойствами.*

Ключевые слова: *яичная скорлупа, кость, кальций, антиоксидант, in vitro.*

STUDY OF THE ANTIOXIDANT PROPERTIES OF CHICKEN EGGSHELL BY in vitro METHOD

Abstract. *This article discusses the composition and medicinal properties of eggshells, which are a natural source of calcium. Eggshells are not only a source of calcium, but also natural compounds possessing antioxidant properties.*

Keywords: *eggshell, bone, calcium, antioxidant properties, in vitro.*

Adabiyotlar tahlili

Kalsiy elementi va uning kimyoviy birikmalari inson organizimi uchun eng muhim va zarur tarkibiy qismlardan biridir, chunki u odam skelet tizimining ko‘p qismini (98 %) tashkil qiladi. Kalsiy ionlari jigarda insulin va leptin sezgirligini oshirishi va o‘tkir buyrak shkastlanishini tiklashga yordam beradi. Shu bilan birga, asab to‘qimalarining tiklanishiga ijobiy hissa qo‘shadi va yaralarni davolashda, tashqi stimullarga javob berishda, yallig‘lanishda, hujayra substratining yopishishida, hujayra o‘sishini va to‘qimalarning qayta tuzilishini rag‘batlantirishda muhim rol o‘ynaydi. Organizmning oqsilga bo‘lgan ehtiyojlarini qondirishda tuxum va tuxum mahsulotlarining o‘rni beqiyos [1, 26-30-b; 2, 313-317-b; 3, 497-503-b;].

Tovuq tuxumi oqsilga boy manba bo‘lgani uchun Jahon sog‘liqni saqlash tashkiloti va boshqa barcha sog‘liqni saqlash mutaxassislari odamlarga har kuni tuxum iste’mol qilishni tavsiya qiladilar. Bu esa oziq-ovqat sanoati va kundalik hayotimizda bu mahsulotdan foydalanish darajasi yuqori ekanligi anglatadi. Lekin shu o‘rinda tuxum po‘stloqlarining oziq-ovqat sanoati va kundalik turmushda juda katta miqdorda hosil bo‘ladigan biologik chiqindi ekanligini ham tan olishimiz joiz. Po‘stloqlar kalsiyning qimmatli manbai bo‘lib, tabiiy mahsulot hisoblansa-da ko‘p holatlarda chiqindilar qatorida tabiatga tashlanadi. Atrofda tuxum po‘stloqlarining nazoratsiz va to‘xtovsiz yig‘ilishi tabiatga salbiy ta’sir ko‘rsatadi. Shu bilan birga muhitda mikroorganizmlar rivojlanishi uchun sharoit yaratilishi hamda chiqindilar miqdorining ortishiga sabab bo‘ladi. Adabiyotlardan ma’lum bo‘lishicha, tuxum po‘stlog‘i har yili dunyo bo‘ylab 250 000 tonna chiqindi hosil qiladi. Shuning uchun ham ularni ikkilamchi homashyo sifatida qo‘llab, tabiiy kalsiy manbaasidan to‘g‘ri foydalanish dolzarb masala hisoblanadi. Tuxum po‘stloqlari bilan bog‘liq chiqindi muammolarini minimallashtirish uchun ayrim tadqiqotlar olib borilgan. Kalsiy birikmlariga boyligi va tekin homashyoligi po‘stloqlarning ustida ko‘plab tadqiqotlar olib borilishiga sabab bo‘ladi. Kimyoviy tadqiqotlar natijasida tuxum po‘stlog‘ining tarkibida kalsiy karbonat taxminan 95-97 % ni tashkil qilishi isbotlangan. Stadelmanning ma’lumotlariga ko‘ra bu ko‘rsatkich 94 % ga to‘gri keladi. Ayrim adabiyotlarda bu ko‘rsatkich 98 % dan yuqori ekanligi keltirilgan. Kalsiy birikmalarining yuqori darajada mavjudligi tuxum po‘stlog‘i kukuni kattalar uchun tavsiya etilgan kalsiy iste’molining kunlik miqdorini ta’minlashi mumkin. Po‘stloqlarning yetarli darajada mustahkam bo‘lishi esa tarkibida murakkab birikmalar ham borligidan dalolat beradi. Po‘stloqlarning mineral tarkibida kalsit kristallarining yadrolanish markazlari vazifasini bajaradigan maxsus

organik moddalarga boy bo‘lgan sezilarli miqdorda tiqilib qolgan organik moddalar mavjud. Bu esa tuxum qobig‘ini kichik qalinligi tufayli qattiq materialga aylantiradi [4, 1454-1458-b; 5, 1-5-b; 6, 347-359-b].

So‘nggi yillarda suyak nuqsonlarini davolash uchun autolog suyakka munosib alternativ topish uchun ko‘plab turli usullar va materiallar qo‘llanilmoqda. Autolog suyakdan foydalanish afzal ko‘rilgan augmentatsiya usuli hisoblanadi va shuning uchun ham oltin standart hisoblanadi. Autolog transplantatlarga alternativ sifatida turli xil suyak transplantatlari o‘rnini bosuvchi vositalar qo‘llaniladi. Ideal suyak transplantat materiali biomoslashuvchan, osteoinduktiv, osteo o‘tkazuvchan va qoniqarli mexanik xususiyatlarga ega bo‘lishi kerak. Juda yaxshi yechim suyaklarning to‘liq regeneratsiyasi uchun zarur bo‘lgan barcha xususiyatlarni yaratadigan biomateriallar kompozitini ishlab chiqarish bo‘lishi mumkin. Ilmiy adabiyotlarda keltirilgan ma’lumotlarga ko‘ra, ba’zi in vitro tadqiqot natijalari tuxum qobig‘i zarralari va gialuronan kombinatsiyasining suyak regeneratsiyasi va to‘qima muhandisligi uchun asosiy komponentlar sifatida yuqori salohiyatga ega ekanligini ko‘rsatadi [7, 1-10-b]. Tuxum qobig‘i chiqindilarining afzalliklari tufayli kimyo sanoatida turli xil maqsadlarda, masalan, biokompozitlar, bioshablon, bioqoplama, shisha ko‘piklar, katalizatorlar va boshqalarni tayyorlash uchun adsorbent, matritsa yoki mustahkamlovchi materiallar sifatida ishlatilishi mumkin, bundan tashqari uning tarkibida 70 ga yaqin mikro va makroelementlar identifikatsiya qilingan bo‘lib, bu xususiyat uning foydalanish darajasini va ahamiyatini yanada oshirishga xizmat qiladi [8, 485-494-b; 9, 334-339-b].

Tuxum po‘stloqlari nafaqat kalsiy manbai, balki o‘zida erkin radikallarni neytrallash xususiyatlarini ham namoyon etadi [10, 372-373-b].

Tadqiqot Metodologiyasi

Adrenalinning in vitro sharoitida autooksidlanish metodi bilan preparatlarning antioksidantlik faolligini aniqlashda tadqiq qilinadigan preparatlarning fitokimyoviy tekshiruvlari orqali antioksidantlik faollik aniqlanadi hamda bir nechta usullarni qo‘llash orqali baholanadi.

Preparatlarning antioksidantlik faolligi adrenalinning *in vitro* sharoitida autooksidlanish reaksiyasining ingibitirlanishi bilan aniqlanadi hamda kislorodning erkin shaklini hosil bo‘lishiga to‘sqinlik qiladi. Metod adrenalinning autoksidlanish reaksiyasining ingibirlanishiga asoslangan, preparatlarning *in vitro* sharoitida adrenalinni vaqt davomida KFSh (kislorodning faol shakli) ni hosil bo‘lishi va autooksidlanishi hisobiga (%) foizlarda ifodalanadi.

Buning uchun 0,2 M natriy-karbonat (Na_2CO_3-$NaHCO_3$) pH=10,65 li buferidan 2,0 ml, adrenalin (epinefrin) gidroxloridning 0,18% eritmasidan 56 mkl olinadi, 30 mkl antioksidant preparat solinadi hamda tez aralashtirib 30 soniyadan 10 daqiqa mobaynida 347 nm to‘lqin uzunligida 10 mm kyuvetada Cary 60 UV-Vis Agilet Technologies spektrofotometrida tekshirildi. Tadqiq qilinayotgan (ekstraktning 1 ml dagi konsentratsiyasi 1 mg) miqdori standart sifatida ishlatiladi. Nazorat namuna sifatida 0,2 M 2,0 ml bufer, 0,18% 56 mkl (5,46 мМ) adrenalin ishlatiladi.

Antioksidant faolligini adrenalinning autooksidlanishini ingibrlanishiga ko‘ra foizlarda ifodalandi va quyidagi formula bilan hisoblanadi.

$$AA\% = \frac{(D1-D2)x100}{D1}$$

D_1-buferga qo‘shilgan adrenalin gidroxlorid eritmasining optik zichligi;

D_2-buferga qo‘shilgan tadqiq qilinayotgan ekstraktning va adrenalin gidroxloridning optik zichligi.

Foydalanilgan namunalar:

1. Uy tuxum po‘stlog‘i kukuni
2. Fabrika tuxum po‘stlog‘i kukuni
3. Tuxum po‘stlog‘ining GKMAT bilan kompleksi
4. BFQ

Uy tuxum po‘stlog‘i kukuni, fabrika tuxum po‘stlog‘i kukuni, tuxum po‘stlog‘ining GKMAT bilan kompleksi hamda BFQ ning antioksidantlik faolligi adrenalinning *in vitro* sharoitida oksidlanish jarayonini ingibitsiyalash qobiliyati asosida baholandi. Adrenalinning oksidlanishi natijasida kislorodning erkin shakllari hosil bo‘lib, ular oksidlovchi stress rivojlanishida muhim ahamiyat kasb etadi. Tadqiqot jarayonida foydalanilgan namunalarini ushbu reaktiv kislorod birikmalari hosil bo‘lishini susaytirish xususiyati aniqlandi. Mazkur metod adrenalinning vaqt davomida kechadigan oksidlanish reaksiyasining ingibitsiya darajasini aniqlashga asoslangan bo‘lib, tajribalar preparatlar ishtirokida hamda nazorat namunasi bilan taqqoslangan holda o‘tkazildi. Foydalanilgan namunalarining antioksidantlik faolligi adrenalinning oksidlanish tezligining pasayishi asosida hisoblanib, olingan natijalar foiz (%) ko‘rinishida ifodalandi. Ushbu ko‘rsatkich preparatlarning *in vitro* sharoitida kislorodning erkin shakllari hosil bo‘lishiga qarshi samaradorligini tavsiflaydi.

Namunalarning antioksidantlik miqdori in vitro shakli uchun 1 - jadvalda keltirilgan

1-jadval

Namunalarning antioksidantlik miqdori *in vitro* shakli uchun

Preparat	Eruvchanligi	*In vitro* *mkg/ml*
Uy tuxum po‘stlog‘i kukuni	30 % li spirt va suv	30
Fabrika tuxum po‘stlog‘i kukuni	30 % li spirt va suv	30
Tuxum po‘stlog‘ining GKMAT kompleksi	30 % li spirt va suv	30
BFQ	30 % li spirt va suv	30
Kversetin	30 % li spirt va suv	30
Gliklazid	suv	

Natijalar va ularning tahlil

Namunalarning antioksidantlik faolligi adrenalin *in vitro* autooksidlanish reaksiyasi yordamida aniqlangan. Preparatlar 5 xil konsentratsiyada (100, 250, 500, 750 va 1000 μg/ml) sinovdan o‘tkazilgan va natijalar shuni ko‘rsatdiki, konsentratsiya oshishi bilan antioksidantlik faolligi ham ortadi (100 μg/ml -12,69%, 1000 μg/ml - 24,05%). Namunalarning antioksidant ta’siri kversetin va gliklazid bilan solishtirilganda sezilarli bo‘lib, kislorodning erkin radikallarini hosil bo‘lishiga to‘sqinlik qilishi aniqlangan. Bu natijalar tekshirilgan namunalarning kuchli antioksidant xususiyatga ega ekanini tasdiqladi.

Xulosa

Tekshirilgan namunalar sintetik preparat Gliklazid hamda tabiiy antioksidant Kversetin bilan solishtirilgan bo‘lib, kunlik chiqindi tuxum po‘stloqlari va u asosida olingan turli kompozitsiyalar antioksidantlik xususiyatiga ega ekanligi tasdiqlandi.

ETILEN GLIKOL ASOSIDA BENZIN OKTAN SONINI OSHIRISH

Eshonqulov Nurbek Qaxramon o'g'li
Toshkent kimyo texnologiya instituti
email: Nurik1995.nurbek@gmail.com

Annotatsiya. *Mazkur maqolada etilen glikol va uning hosilalari asosida avtomobil benzinining oktan sonini oshirish imkoniyatlari tahlil etiladi. Oktan soni va detonatsiya hodisasining mohiyati, uni oshirishning asosiy usullari hamda kislorodli qo'shimchalar (oksigenatlar)ning ta'sir mexanizmi yoritiladi. Etilen glikolning tarkibi, fizik-kimyoviy xossalari va oksigenat sifatidagi afzalliklari boshqa oksigenatlar bilan qiyoslangan holda ko'rib chiqiladi; uning suvda yuqori eruvchanlik va past uchuvchanlik kabi cheklovlari hamda bu cheklovlarni efir va atsetal hosilalari orqali bartaraf etish yo'llari asoslanadi. Natijalar grafik, diagramma, reaksiya sxemalari va jadvallar bilan ko'rgazmali izohlangan.*

Kalit so'zlar: *benzin, oktan soni, detonatsiya, antidetonator, oksigenatlar, etilen glikol, glikol efirlari, 1,3-dioksolan, ekologik yoqilg'i.*

ПОВЫШЕНИЕ ОКТАНОВОГО ЧИСЛА БЕНЗИНА С ПОМОЩЬЮ ЭТИЛЕНГЛИКОЛЯ.

Аннотация. *В статье анализируются возможности повышения октанового числа автомобильного бензина на основе этиленгликоля и его производных. Раскрываются сущность октанового числа и детонации, механизм действия оксигенатов, а также преимущества и ограничения этиленгликоля. Результаты проиллюстрированы графиками, схемами реакций и таблицами.*

Ключевые слова: *бензин, октановое число, детонация, антидетонатор, оксигенаты, этиленгликоль, гликолевые эфиры.*

INCREASING GASOLINE OCTANE NUMBER USING ETHYLENE GLYCOL

Annotation. *The article analyses the possibilities of increasing the octane number of automotive gasoline on the basis of ethylene glycol and its derivatives. It explains the essence of the octane number and detonation, the mechanism of action of oxygenates, and the advantages and limitations of ethylene glycol compared with other oxygenates. The high water solubility and low volatility of ethylene glycol and the ways of overcoming these limitations through ether and acetal derivatives are substantiated. The results are illustrated with charts, reaction schemes and tables.*

Keywords: *gasoline, octane number, detonation, antiknock additive, oxygenates, ethylene glycol, glycol ethers, 1,3-dioxolane, environmentally friendly fuel.*

Kirish: Zamonaviy avtomobil dvigatellari uchun yuqori sifatli yonilg'i ishlab chiqarish neft-kimyo sanoatining dolzarb vazifalaridan biridir. Benzinning eng muhim sifat ko'rsatkichlaridan biri — uning oktan soni bo'lib, u yonilg'ining detonatsiyaga, ya'ni dvigatel silindrida o'z-o'zidan portlab yonishga chidamliligini ifodalaydi. Oktan soni qanchalik yuqori bo'lsa, dvigatelni shunchalik yuqori siqilish darajasida ishlatish mumkin bo'lib, bu uning quvvati, samaradorligi va resursini oshiradi.

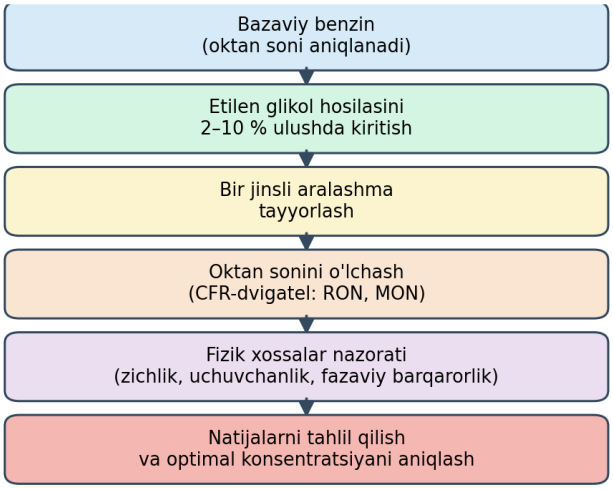
An'anaviy tarzda oktan sonini oshirishda tetraetilqo'rg'oshin (TEQ) kabi antidetonatorlar qo'llanilgan. Biroq ularning yuqori zaharliligi va atrof-muhitga salbiy ta'siri tufayli bunday qo'shimchalar ko'pchilik mamlakatlarda taqiqlangan. Shu sababli ekologik jihatdan xavfsiz, kislorod tutuvchi qo'shimchalar — oksigenatlarni izlash va qo'llash katta ahamiyat kasb etmoqda.

Etilen glikol ($HOCH_2CH_2OH$) — ikki atomli spirt bo'lib, molekulasida ikkita gidroksil guruh va massa bo'yicha taxminan 51,6 % kislorod tutadi. Aynan shu xususiyati uni potensial oksigenat qo'shimcha sifatida qiziqarli qiladi. Mazkur maqolaning maqsadi — etilen glikol va uning hosilalari asosida benzin oktan sonini oshirish imkoniyatlari, ularning afzallik va cheklovlarini ilmiy-nazariy hamda ko'rgazmali tahlil qilishdan iborat.

Mavzuga oid adabiyotlar tahlili va metodologiya. Oktan sonini oshirish va yonilg'i qo'shimchalari masalalari A.M.Danilov, A.A.Gureyev, A.M.Kuliyev hamda K.Owen va T.Coley kabi mutaxassislarning ishlarida atroflicha

yoritilgan. Ushbu manbalarda antidetonatorlar va oksigenatlarning ta’sir mexanizmi, ularning afzallik va kamchiliklari tizimli tahlil qilingan. Oksigenatlar (metanol, etanol, MTBE, ETBE) zamonaviy benzinlarda keng qo‘llaniladi va ularning oktan sonini oshirish samarasi ilmiy adabiyotda tasdiqlangan.

Tadqiqot metodologiyasi sifatida bazaviy benzinga turli ulushda qo‘shimcha kiritib aralashma tayyorlash va uning oktan sonini o‘lchash usuli qabul qilindi. Oktan soni motor usulida (MON; GOST 511 yoki ASTM D2700) va tadqiqot usulida (RON; GOST 8226 yoki ASTM D2699) standart CFR-dvigatelida aniqlanadi; shuningdek, aralashmaning zichligi, uchuvchanligi va fazaviy barqarorligi nazorat qilinadi. Tadqiqot bosqichlari 1-rasmda keltirilgan.

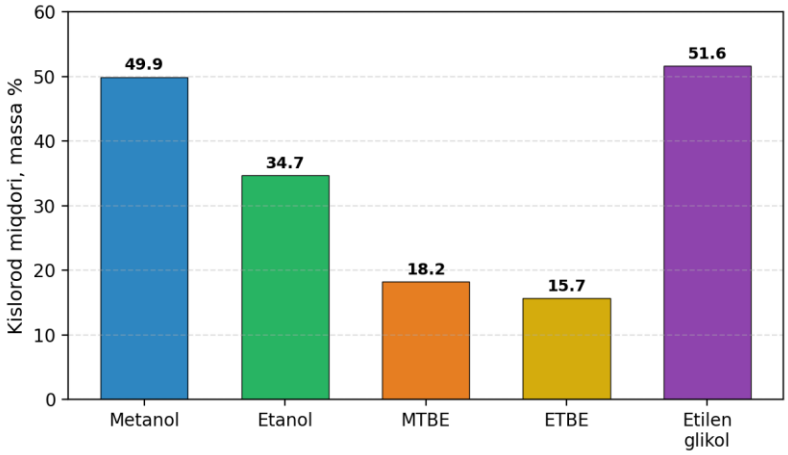


1-rasm. Tadqiqotning uslubiy bosqichlari (blok-sxema).

Tahlil natijalari va muhokama. **Oktan soni va detonatsiya hodisasi.** Detonatsiya — benzin-havo aralashmasining uchqundan oldin o‘z-o‘zidan portlab yonishi bo‘lib, u zarbali to‘lqinlar, ortiqcha qizish va detallarning yemirilishiga olib keladi. Oktan soni yonilg‘ining ana shu hodisaga chidamliligini ko‘rsatadi va etalon aralashma asosida belgilanadi: izooktan (2,2,4-trimetilpentan) oktan soni 100 ga, n-geptanniki esa 0 ga teng deb qabul qilingan.

Oktan sonini oshirishning asosiy usullari. Oktan soni ikki yo‘l bilan oshiriladi: birinchisi — benzin uglevodorod tarkibini yaxshilash (katalitik riforming, izomerlash, alkillash orqali tarmoqlangan va aromatik birikmalar ulushini ko‘paytirish); ikkinchisi — maxsus qo‘shimchalar (antidetonatorlar va oksigenatlar) kiritish. Ikkinchi yo‘l nisbatan sodda va tejamkor bo‘lgani uchun keng qo‘llaniladi.

Oksigenatlar va ularning ta’sir mexanizmi. Oksigenatlar ikki sababga ko‘ra oktan sonini oshiradi: birinchidan, ularning o‘z oktan soni yuqori; ikkinchidan, tarkibidagi kislorod yonishni to‘liqroq amalga oshirib, detonatsiyaga moyillikni va zararli chiqindilarni kamaytiradi. Eng keng tarqalgan oksigenatlarning kislorod miqdori 2-rasmda qiyoslangan; etilen glikol ular orasida eng yuqori kislorod ulushiga ega.



2-rasm. Asosiy oksigenatlarning kislorod miqdori (massa %) bo‘yicha qiyosi.

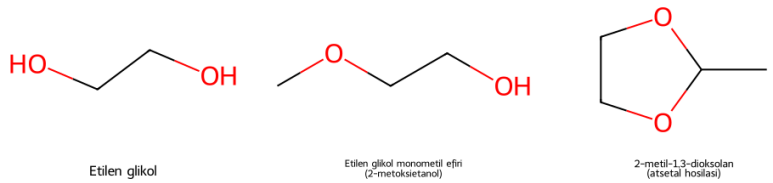
Oksigenatlarning asosiy fizik-kimyoviy ko‘rsatkichlari 1-jadvalda keltirilgan. Jadvaldan ko‘rinadiki, etilen glikol kislorodga eng boy birikma bo‘lsa-da, qaynash harorati boshqalarnikidan ancha yuqori, bu esa uning uchuvchanligini kamaytiradi.

Oksigenat	Formula	Kislorod, %	Qaynash harorati, °C
Metanol	CH_3OH	49,9	64,7

Etanol	C_2H_5OH	34,7	78,4
MTBE	$C_5H_{12}O$	18,2	55,2
ETBE	$C_6H_{14}O$	15,7	72,8
Etilen glikol	$C_2H_6O_2$	51,6	197,6

1-jadval. Ayrim oksigenatlarning fizik-kimyoviy ko‘rsatkichlari (adabiyot ma’lumotlari; qiymatlar manbalar bo‘yicha biroz farq qilishi mumkin).

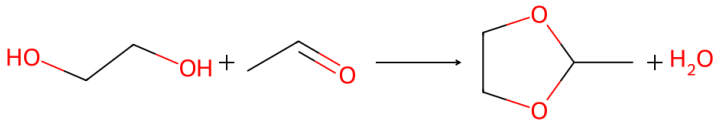
Etilen glikolning xossalari va hosilalari. Etilen glikol rangsiz, yopishqoq, suvda cheksiz eriydigan suyuqlikdir. Yuqori kislorod miqdori uni nazariy jihatdan kuchli oksigenat qiladi, biroq toza holda benzinga qo‘shishda past uchuvchanlik (sovuq holatda ishga tushishni qiyinlashtiradi), gigroskopiklik va suvda yuqori eruvchanlik (fazaviy ajralish xavfi) kabi cheklovlar yuzaga keladi. Shu bois amaliyotda etilen glikolning hosilalari — monoefirlari va atsetallari (1,3-dioksolanlar) ko‘proq istiqbolli hisoblanadi, chunki ular benzin bilan yaxshiroq aralashadi va suvga chidamliroqdir. Mazkur birikmalarning tuzilishi 3-rasmda berilgan.



3-rasm. Etilen glikol va uning yonilg‘i qo‘shimchasi sifatida istiqbolli hosilalarining tuzilish formulalari.

Etilen glikol hosilalarini olishning ikki asosiy yo‘li mavjud. Birinchisi — efirlash (eterifikatsiya): etilen glikolning gidroksil guruhi spirt yoki alken bilan reaksiyaga kirishib glikol efirini hosil qiladi (4-rasm). Ikkinchisi — atsetallash: etilen glikol aldegid bilan kislotali katalizator ishtirokida reaksiyaga kirishib barqaror halqali atsetal — 1,3-dioksolan hosil qiladi (5-rasm). Ikkala usulda ham suvga chidamliroq, benzin bilan yaxshi aralashadigan oksigenat olinadi.

4-rasm. Efirlash reaksiyasi: etilen glikol va metanoldan 2-metoksietanol hosil bo‘lishi.

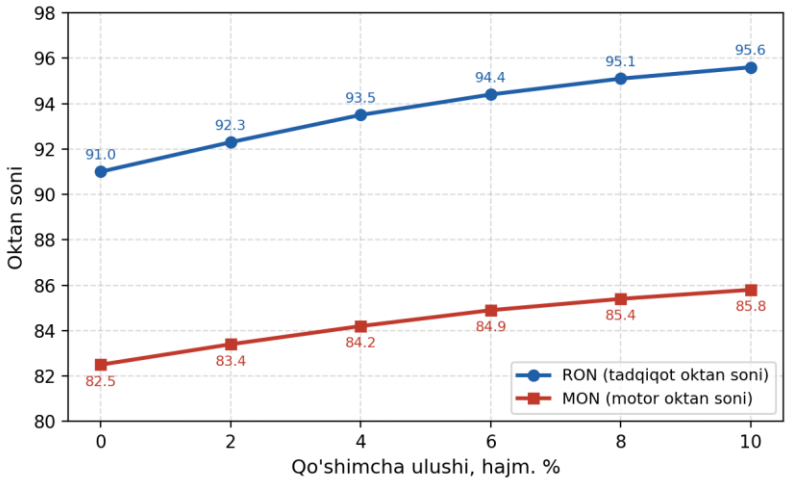


5-rasm. Atsetallash reaksiyasi: etilen glikol va atsetaldegiddan 2-metil-1,3-dioksolan hosil bo‘lishi.

Aralashma tarkibi va oktan sonining o‘zgarishi. Tajribada bazaviy benzinga etilen glikol hosilasidan turli hajmiy ulushda (0–10 %) qo‘shilib, har bir aralashmaning oktan soni o‘lchanadi. Umumiy qonuniyat shundan iboratki, oksigenat ulushi ortishi bilan oktan soni ma’lum chegaragacha o‘sadi, biroq juda yuqori konsentratsiyada aralashmaning energetik qiymati va fazaviy barqarorligi pasayishi mumkin. Natijalarning namunaviy ko‘rinishi 2-jadvalda va 6-rasmdagi grafikda keltirilgan.

Qo‘shimcha ulushi, hajm. %	**RON (tadqiqot oktan soni)**	**MON (motor oktan soni)**
0	91,0	82,5
2	92,3	83,4
4	93,5	84,2
6	94,4	84,9
8	95,1	85,4
10	95,6	85,8

2-jadval. Qo‘shimcha ulushiga bog‘liq holda oktan sonining o‘zgarishi (namunaviy ma’lumotlar; raqamli qiymatlar muallifning tajriba natijalari bilan almashtirilishi shart).



6-rasm. Qo‘shimcha konsentratsiyasiga bog‘liq holda RON va MON o‘zgarishi grafigi (namunaviy ma’lumotlar asosida).

Afzalliklari, cheklovlari va istiqbollari. Etilen glikol asosidagi qo‘shimchalarning afzalliklari: yuqori kislorod miqdori, oktan sonini oshirish va zararli chiqindilarni kamaytirish qobiliyati, zaharli metall asosidagi antidetonatorlarga ekologik muqobil bo‘lishi. Cheklovlari esa suvda yuqori eruvchanlik, gigroskopiklik, past uchuvchanlik va energetik qiymatining benzinnikidan pastligi bilan bog‘liq. Bu kamchiliklarni etilen glikolni efir yoki atsetal hosilalariga aylantirish hamda barqarorlashtiruvchi qo‘shimchalardan foydalanish orqali kamaytirish mumkin. Shu yo‘nalish arzon va ekologik toza oktan oshiruvchi qo‘shimchalar yaratish uchun istiqbolli hisoblanadi.

Xulosa

Tahlil natijalari quyidagi xulosalarga olib keladi. Birinchidan, oktan sonini oshirishda oksigenatlar zaharli antidetonatorlarga ekologik xavfsiz muqobil sifatida muhim o‘rin tutadi. Ikkinchidan, etilen glikol eng yuqori kislorod miqdori tufayli katta nazariy salohiyatga ega, biroq uni toza holda qo‘llashda suvda eruvchanlik, gigroskopiklik va past uchuvchanlik kabi cheklovlar mavjud.

Uchinchidan, etilen glikolning efir va atsetal (1,3-dioksolan) hosilalari benzin bilan yaxshiroq aralashishi va suvga chidamliligi sababli amaliy jihatdan istiqbolliroqdir. To‘rtinchidan, optimal natijaga erishish uchun qo‘shimcha konsentratsiyasini va aralashmaning fizik-kimyoviy barqarorligini eksperimental yo‘l bilan aniqlash zarur. Mavzu istiqbolda turli hosilalarni qiyosiy o‘rganish va aralashmalarning ekspluatatsion ko‘rsatkichlarini baholash orqali chuqurlashtirilishi mumkin.

Abstract; *Coal tar is a complex by-product of coal thermal processing and a significant secondary source of aromatic and heteroatom-containing compounds. Nitrogen-, sulfur- and oxygen-containing heterocycles such as pyridine, quinoline, isoquinoline, indole, carbazole, acridine, benzothiophene and dibenzofuran derivatives are valuable intermediates for pharmaceuticals, dyes, agrochemicals, corrosion inhibitors, functional polymers and specialty carbon materials. However, their recovery from coal tar remains challenging because coal tar contains hundreds of compounds with overlapping boiling ranges, comparable polarity, high aromaticity and strong intermolecular interactions. This review and technological assessment analyzes modern technologies for separating heterocyclic compounds from local coal tar, with emphasis on fractional distillation, acid-base extraction, ionic-liquid-assisted extraction, deep eutectic solvent extraction, adsorption, crystallization and integrated hybrid schemes. The relevance of local coal-tar valorization is supported by the coal resource base of Uzbekistan, where coal production is associated with the Angren lignite field and the Shargun and Boysun underground deposits. The paper proposes a scientifically justified process route that combines raw-tar conditioning, fractionation, selective extraction, adsorption polishing, final purification and instrumental quality control. Because this article is a review and conceptual technological assessment, no original laboratory data are reported. Instead, the contribution lies in synthesizing recent separation literature and translating it into a practical process concept for local coal-tar utilization.*

Keywords: *coal tar; heterocyclic compounds; quinoline; indole; carbazole; ionic liquids; deep eutectic solvents; adsorption; technological assessment; local raw materials*

MAHALLIY ISHLAB CHIQARILGAN KO‘MIR SMOLASIDAN GETEROTSIKLIK BIRIKMALARNI AJRATIB OLISHNING ZAMONAVIY TEXNOLOGIYALARI: SHARH VA TEXNOLOGIK BAHOLASH

Annotatsiya: *Ko’mir smolasi ko’mirni termik qayta ishlashning murakkab qo’shimcha mahsuloti va aromatik va geteroatom o’z ichiga olgan birikmalarning muhim ikkilamchi manbaidir. Piridin, xinolin, izokinolin, indol, karbazol, akridin, benzotiofen va dibenzofuran hosilalari kabi azot, oltingugurt va kislorod o’z ichiga olgan geterosikllar farmatsevtika, bo’yoqlar, agrokimyoviy moddalar, korroziya ingibitorlari, funktsional polimerlar va maxsus uglerod materiallari uchun qimmatli oraliq mahsulotlardir. Biroq, ularni ko’mir smolasidan ajratib olish qiyinligicha qolmoqda, chunki ko’mir smolasi bir-birining ustiga chiqadigan qaynoq diapazonlari, taqqoslanadigan qutblanish, yuqori aromatiklik va kuchli molekulalararo o’zaro ta’sirlarga ega yuzlab birikmalarni o’z ichiga oladi. Ushbu sharh va texnologik baholashda geterosiklik birikmalarni mahalliy ko’mir smolasidan ajratishning zamonaviy texnologiyalari tahlil qilinadi, bunda fraksiyali distillash, kislota-asos ekstraksiya, ion-suyuqlik yordamida ekstraksiya, chuqur evtektik erituvchi ekstraksiya, adsorbsiya, kristallanish va integratsiyalashgan gibrid sxemalarga urg’u beriladi. Mahalliy ko’mir smolasini baholashning dolzarbligi O’zbekistonning ko’mir resurs bazasi bilan tasdiqlanadi, bu yerda ko’mir qazib olish Angren lignit koni va Sharg’un va Boysun yer osti konlari bilan bog’liq. Maqolada xom smolani konditsionerlash, fraksiyalash, selektiv ekstraktsiya, adsorbsiyani abrazivlash, yakuniy tozalash va instrumental sifat nazoratini birlashtirgan ilmiy asoslangan jarayon yo’nalishi taklif qilingan. Ushbu maqola sharh va kontseptual texnologik baholash bo’lgani uchun asl laboratoriya ma’lumotlari keltirilmagan. Buning o’rniga, hissa yaqinda ajratish adabiyotlarini sintez qilish va uni mahalliy ko’mir smolasini utilizatsiya qilish uchun amaliy jarayon kontseptsiyasiga aylantirishdan iborat.*

Kalit so'zlar: *ko'mir smolasi; geterosiklik birikmalar; xinolin; indol; karbazol; ion suyuqliklari; chuqur evtektik erituvchilar; adsorbsiya; texnologik baholash; mahalliy xom ashyo.*

СОВРЕМЕННЫЕ ТЕХНОЛОГИИ ВЫДЕЛЕНИЯ ГЕТЕРОЦИКЛИЧЕСКИХ СОЕДИНЕНИЙ ИЗ КАМЕННОУГОЛЬНОЙ СМОЛЫ МЕСТНОГО ПРОИЗВОДСТВА: ОБЗОР И ТЕХНОЛОГИЧЕСКАЯ ОЦЕНКА

Каменноугольная смола представляет собой сложный побочный продукт термической переработки угля и служит важным вторичным источником ароматических и гетероатомсодержащих соединений. Азот-, серо- и кислородсодержащие гетероциклы — такие как производные пиридина, хинолина, изохинолина, индола, карбазола, акридина, бензотиофена и дибензофурана — являются ценными промежуточными продуктами для производства фармацевтических препаратов, красителей, агрохимикатов, ингибиторов коррозии, функциональных полимеров и специальных углеродных материалов. Однако их выделение из каменноугольной смолы сопряжено с трудностями, поскольку она содержит сотни соединений, характеризующихся перекрывающимися интервалами температур кипения, сопоставимой полярностью, высокой степенью ароматичности и сильными межмолекулярными взаимодействиями. В данном обзоре и технологической оценке анализируются современные методы выделения гетероциклических соединений из каменноугольной смолы местного производства; особое внимание уделяется фракционной перегонке, кислотно-основной экстракции, экстракции с использованием ионных жидкостей и глубоких эвтектических растворителей, адсорбции, кристаллизации, а также комбинированным гибридным схемам. Актуальность оценки свойств местной каменноугольной смолы обусловлена ресурсной базой угля в Узбекистане, где добыча сосредоточена на Ангренском буроугольном разрезе, а также на шахтах «Шаргунь» и «Байсун». В статье предложена научно обоснованная технологическая схема, включающая подготовку сырой смолы, фракционирование, селективную экстракцию, адсорбцию, окончательную очистку и инструментальный контроль качества. Поскольку данная работа носит обзорный и концептуально-оценочный характер, оригинальные лабораторные данные в ней не приводятся; ценность статьи заключается в обобщении актуальных литературных сведений о процессах разделения и их адаптации в практическую технологическую концепцию переработки местной каменноугольной смолы.

Ключевые слова: *каменноугольная смола; гетероциклические соединения; хинолин; индол; карбазол; ионные жидкости; глубокие эвтектические растворители; адсорбция; технологическая оценка; местное сырье.*

Highlights

- Local coal tar is assessed as a secondary source of high-value heterocyclic compounds.
- Basic and neutral nitrogen heterocycles require different separation mechanisms.
- Ionic liquids and deep eutectic solvents provide tunable selectivity beyond conventional acid-base extraction.
- Hybrid fractionation-extraction-adsorption-crystallization is proposed as the most rational process route.
- The study is positioned as a literature-based review and technological assessment without original experimental data.

Introduction

Coal tar is generated during coal carbonization, pyrolysis and related thermal conversion processes. It is not a single substance but a highly complex organic matrix that contains monocyclic and polycyclic aromatic hydrocarbons, phenolic compounds, nitrogen-containing bases, neutral nitrogen compounds, sulfur heterocycles, oxygen heterocycles, resins and pitch-forming components. Historically, coal tar has been used for fuels, binders, preservatives and carbon materials; however, modern coal chemistry increasingly considers it as a valuable secondary feedstock for fine chemicals and functional organic intermediates [3,4].

Heterocyclic compounds represent one of the most important high-value groups in coal tar. Pyridine, quinoline, isoquinoline and acridine are basic nitrogen compounds, whereas indole and carbazole are neutral or weakly basic nitrogen heterocycles. Benzothiophene and dibenzothiophene represent sulfur-containing heterocycles, while benzofuran and dibenzofuran represent oxygen-containing heterocycles. These compounds are widely used or studied as precursors in pharmaceutical synthesis, dye chemistry, agrochemicals, corrosion inhibitors, organic electronics, polymer modification and specialty materials [4-9].

The separation of heterocyclic compounds from coal tar is technologically difficult because coal tar fractions often contain compounds with close boiling points and similar aromatic structures. For example, quinoline, isoquinoline, indole, alkyl-naphthalenes and related aromatics may occur in overlapping wash-oil boiling ranges. In addition, strong pi-pi interactions, hydrogen bonding, acid-base interactions and high viscosity can reduce mass transfer and lower separation selectivity [10-13].

The local relevance of this topic is associated with the coal resource base and coal-processing potential of Uzbekistan. The International Energy Agency reports that Uzbekistan's current coal resource base includes the Angren lignite deposit and the Shargun and Boysun coal deposits [1]. Official information from the Ministry of Mining Industry and Geology

reports that JSC Uzbekcoal produced more than 6.7 million tonnes of coal in 2024, with more than 5.5 million tonnes from the Angren coal deposit [2]. These data indicate that coal and coal-derived secondary products remain strategically relevant for the national raw-material base.

The objective of this article is to provide a review and technological assessment of modern methods for separating heterocyclic compounds from local coal tar and to propose an integrated process concept. The article does not present original experimental results; therefore, its contribution is analytical, conceptual and technological. It aims to support the design of future laboratory and pilot-scale studies.

Methodology of the Review and Technological Assessment

This article was prepared as a literature-based review and technological assessment. The analysis focused on publications related to coal tar fractionation, heterocyclic compound separation, ionic liquids, deep eutectic solvents, adsorption, crystallization and denitrogenation or desulfurization of coal-tar-derived and model aromatic systems. Emphasis was placed on recent studies and review papers published in separation science, fuel processing, chemical engineering and green solvent chemistry.

The technological assessment was performed according to five criteria: (i) selectivity toward basic or neutral heterocycles; (ii) compatibility with real coal-tar fractions; (iii) environmental and corrosion burden; (iv) possibility of solvent or adsorbent regeneration; and (v) scalability for local coal-tar processing. These criteria were used to compare conventional and modern separation technologies and to formulate an integrated process route.

Because no original laboratory experiment was conducted for this manuscript, the paper avoids expressions such as “the experiment showed” or “we obtained.” Instead, it uses terms such as “literature indicates,” “technologically, the method is suitable,” and “the proposed scheme can be evaluated in future experimental work.” This wording is important for ethical and transparent journal submission.

Local Coal Tar as a Potential Source of Heterocyclic Compounds

The term “local coal tar” in this article refers to tar or tar-like liquid products that may be obtained from local coal thermal conversion, semi-coking, carbonization or related industrial processes. Its exact chemical composition depends on coal rank, mineral matter, moisture, pyrolysis temperature, residence time, heating rate and condensation conditions. Lignite-derived tar may differ substantially from high-temperature coke-oven tar; therefore, any proposed separation scheme must be flexible and preceded by detailed compositional analysis.

For Uzbekistan, coal-related production is mainly associated with the Angren brown coal field and the Shargun and Boysun underground deposits [1]. This local raw-material context gives the topic industrial relevance, but it also requires caution: the phrase “coal tar” should be chemically verified for each technological stream. Before selecting the separation method, the tar should be characterized by water content, ash or mechanical impurities, density, viscosity, distillation curve, elemental CHNS composition and chromatographic profile.

From a valorization perspective, the most attractive target fractions are not the entire raw tar but selected distillation cuts enriched with heterocyclic compounds. Light oil may contain pyridine-type bases; middle fractions may contain quinoline and isoquinoline; wash-oil fractions are important sources of indole and quinoline-type compounds; and anthracene-oil fractions may contain carbazole, acridine and heavy nitrogen heterocycles [3-7].

Table 1. Main heterocyclic compounds potentially recoverable from coal-tar fractions.

Heterocycle group	Representative compounds	Typical fraction	Dominant interaction	Separation implication
Basic nitrogen	Pyridine, quinoline, isoquinoline, acridine	Light oil, wash oil, anthracene oil	Acid-base interaction	Suitable for acid extraction or acidic IL/DES extraction
Neutral nitrogen	Indole, carbazole and derivatives	Wash oil, anthracene oil	Hydrogen bonding and pi-pi interaction	Requires ILs, DESs, adsorption or crystallization
Sulfur heterocycles	Thiophene, benzothiophene, dibenzothiophene	Light to middle and heavy aromatic fractions	Pi-pi, CH-pi and polarizability interactions	Difficult by acid extraction; suitable for adsorptive or extractive desulfurization
Oxygen heterocycles	Benzofuran, dibenzofuran	Middle and heavy aromatic fractions	Dipole and hydrogen-bond accepting interactions	May be recovered or removed with IL/DES and adsorption methods

Conventional Separation Technologies

Fractional distillation

Fractional distillation is the first and most necessary step in coal-tar processing. It reduces the complexity of the raw tar by dividing it into boiling-range fractions such as light oil, phenolic oil, naphthalene oil, wash oil, anthracene oil and pitch residue. Distillation does not normally provide pure heterocyclic compounds, but it enriches target compounds into manageable fractions and improves the efficiency of subsequent selective separation.

For local coal tar, fractionation should be performed after dehydration and filtration because water, coke dust and mineral particles can cause foaming, corrosion and fouling. Vacuum distillation is preferable for heavy fractions to avoid thermal decomposition and polymerization reactions. The main limitation of distillation is low selectivity among compounds with similar boiling points; therefore, it is best used as a pre-concentration stage rather than a final purification method.

Acid-base extraction

Acid-base extraction remains one of the most practical conventional methods for separating basic nitrogen heterocycles. Pyridine, quinoline, isoquinoline and acridine can be transferred into the aqueous phase as salts using mineral acids and then regenerated by neutralization. This method is simple, inexpensive and suitable for basic nitrogen bases.

However, acid extraction is poorly selective for neutral compounds such as indole and carbazole, and it can generate acidic wastewater and corrosion problems. Strong acid and alkali processes used for certain wash-oil separations are also environmentally burdensome. Recent indole purification studies note that classical acid polymerization and alkaline fusion may be effective but are expensive, corrosive and polluting [15]. Therefore, conventional acid-base extraction should be integrated with greener and more selective methods rather than used as the only separation route.

Crystallization and solvent re-extraction

Crystallization is a mature purification method for compounds that can be concentrated to a sufficiently high level before cooling or antisolvent treatment. It is especially relevant for indole and carbazole fractions after extraction or re-extraction. The method can provide high product purity, but it is sensitive to impurity profile, solvent selection, supersaturation, cooling rate and solid-liquid separation.

Recent work on indole purification from wash oil shows the importance of combining extraction, re-extraction and crystallization rather than relying on a single operation [15]. This is directly relevant to local coal tar because wash-oil fractions may contain indole together with methyl-naphthalene and quinoline-type compounds.

Modern Separation Technologies

Ionic-liquid-assisted extraction

Ionic liquids are attractive extractants because their structures can be tuned by selecting appropriate cations and anions. Their low vapor pressure, thermal stability and adjustable polarity make them suitable for extracting heteroatom-containing aromatics from coal-tar-derived and model oils. In ionic-liquid-assisted separation, selectivity may arise from acid-base interactions, hydrogen bonding, electrostatic interactions and pi-pi interactions.

For neutral nitrogen compounds, indole and carbazole can interact with ionic liquids through hydrogen bonding and aromatic interactions. Studies on ionic-liquid extraction of neutral nitrogen compounds from coal tar have shown that selected ionic liquids can provide higher extraction efficiency and selectivity for neutral heterocycles than for basic nitrogen compounds [5,6]. Imidazolium-based ionic liquids have also been investigated for the separation of carbazole and derivatives from anthracene oil [17].

The key limitation of ionic liquids is not their selectivity but their process economics. High viscosity, cost, potential product contamination and regeneration requirements may restrict direct application to raw coal tar. Therefore, ionic liquids are most appropriate for enriched fractions rather than whole tar treatment.

Deep eutectic solvents and natural deep eutectic solvents

Deep eutectic solvents are formed by combining hydrogen-bond donors and acceptors to produce a liquid phase with a melting point lower than those of the individual components. They are often presented as lower-cost and potentially greener alternatives to some ionic liquids. DESs can be designed to interact with nitrogen-, sulfur- and oxygen-containing heterocycles through hydrogen bonding, electrostatic attraction and aromatic interactions. A recent kinetic study demonstrated the extraction of pyridine, quinoline and indole from an organic phase using natural deep eutectic solvents based on carboxylic acids, xylitol and water. The study reported rapid equilibration for pyridine and quinoline compared with indole, suggesting that kinetic differences can be exploited for separation design [11]. For coal-tar wash oil, DES systems have been investigated for indole extraction. Literature indicates that DESs can provide strong interactions with indole and may improve separation while reducing reliance on corrosive acid-alkali methods [12]. Acidic DESs have also recently been studied for quinoline and indole extraction from coal tar or coal-tar-like fractions [10,11]. From a process perspective, DESs are especially attractive for local coal-tar valorization because their components may be selected from relatively accessible organic acids, quaternary ammonium salts, alcohols or carbohydrate-derived compounds.

Nevertheless, their viscosity, water sensitivity, phase separation behavior and regeneration must be experimentally validated for each real local tar fraction.

Adsorptive separation

Adsorption is useful as a polishing, enrichment or selective removal stage. Activated carbon, silica gel, alumina, zeolites, ion-exchanged adsorbents and metal-organic frameworks can interact with heterocyclic compounds through acid-base sites, pi-pi interactions, pore confinement and coordination effects. Metal-organic frameworks have attracted attention due to their high surface areas, tunable pore structures and functional active sites. Modified UiO-66-type and other MOF adsorbents have been studied for adsorptive denitrogenation of indole and quinoline from model fuel systems [14]. For coal tar, adsorbents should be applied after pre-fractionation and removal of heavy resinous materials because direct contact with raw tar may rapidly block pores and deactivate active sites. In a local technological scheme, adsorption is best positioned after extraction to remove residual polar aromatics, phenols, sulfur heterocycles and color bodies. Regeneration may be performed using solvent washing, mild heating or sequential desorption, depending on adsorbent type and target fraction.

Hybrid extraction-column chromatography systems

Hybrid systems combine the selectivity of extraction with the purification capacity of adsorption or chromatography. For example, DES extraction can concentrate nitrogen-containing aromatics, while column chromatography can separate compounds according to polarity, aromaticity and adsorption strength. Such systems are not always ideal for large-volume commodity processing, but they are valuable for high-value heterocyclic fractions and for establishing reference-grade products in laboratory studies [8]. For local coal tar, a hybrid system can be used during process development: first to identify which fractions contain the highest-value heterocycles, and later to optimize selective extraction or crystallization routes. Once analytical knowledge is obtained, the process can be simplified for industrial scale.

Table 2. Comparative technological assessment of separation methods for local coal tar.

Method	Best target compounds	Selectivity	Environmental burden	Scalability	Main limitation
Fractional distillation	All fractions by boiling range	Low to medium	Medium energy demand	High	Cannot isolate close-boiling heterocycles
Acid-base extraction	Pyridine, quinoline, acridine	High for basic N compounds	Acidic wastewater and corrosion	High	Weak for neutral heterocycles
Ionic-liquid extraction	Indole, carbazole, quinoline, sulfur heterocycles	High and tunable	Low volatility but regeneration needed	Medium	Cost, viscosity and solvent recovery
DES/NaDES extraction	Indole, quinoline, pyridine and selected S/O heterocycles	Medium to high	Potentially lower than mineral acid routes	Medium	Water sensitivity, viscosity and real-tar validation
Adsorption/MOFs	Residual nitrogen and sulfur heterocycles	Medium to high	Depends on regeneration solvent	Medium	Fouling by resins and heavy aromatics
Crystallization	Indole, carbazole after enrichment	High for concentrated streams	Low to medium	Medium to high	Requires sufficient pre-concentration
Chromatography	Analytical-grade fractions	Very high	Solvent intensive	Low to medium	Limited economic feasibility at bulk scale

Proposed Integrated Process for Local Coal Tar

Based on the literature and technological assessment, the most rational route for local coal tar is not a single operation but an integrated process. The proposed sequence is: raw tar conditioning, fractional distillation, selective extraction of basic nitrogen compounds, DES or ionic-liquid extraction of neutral heterocycles, adsorption polishing, final crystallization or vacuum distillation, and instrumental quality control.

The process begins with heating, settling, filtration and dehydration. These operations reduce viscosity, remove free water and minimize solid contamination. The conditioned tar is then fractionated into light oil, phenolic oil, wash oil, anthracene oil and pitch residue. Each fraction is treated according to its dominant compound class.

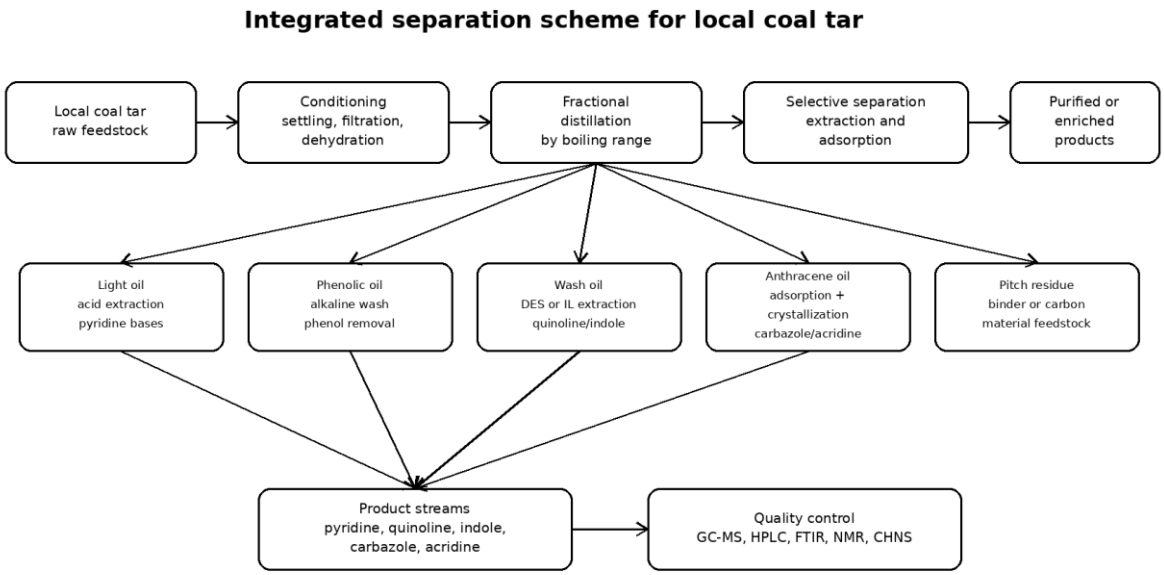

Figure 1. Proposed integrated process scheme for separating heterocyclic compounds from local coal tar.

Table 3. Suggested process windows for future laboratory validation without reporting original results.

Stage	Purpose	Recommended variables to screen	Analytical control	Expected decision output
Conditioning	Remove water and solids	Temperature, settling time, filter grade, drying method	Water content, ash, viscosity	Stable feed for distillation
Fractionation	Concentrate target compounds by boiling range	Pressure, reflux ratio, cut temperature	GC-MS, distillation curve	Identification of target-rich fractions
Acid extraction	Recover basic nitrogen compounds	Acid type, acid concentration, phase ratio, temperature, time	GC-MS, pH, nitrogen content	Pyridine/quinoline-rich extract
DES/IL extraction	Recover neutral and weakly basic heterocycles	DES/IL type, phase ratio, water content, temperature, time	HPLC, GC-MS, FTIR	Indole/carbazole/quinoline enrichment
Adsorption polishing	Remove residual polar and sulfur/oxygen compounds	Adsorbent type, bed height, flow rate, regeneration solvent	GC-MS, UV-Vis, CHNS	Purity improvement and color reduction
Final purification	Obtain product-grade fractions	Crystallization solvent, cooling profile, vacuum distillation pressure	HPLC, NMR, melting point	Purified heterocyclic product or concentrate

Mechanistic Basis of Selective Separation

The success of heterocyclic compound separation depends on the difference between the interaction of the target compound with the tar matrix and its interaction with the extractant or adsorbent. For basic nitrogen compounds, protonation and salt formation provide a strong driving force for transfer into an acidic phase. This explains the continuing industrial relevance of acid extraction for pyridine and quinoline bases. For neutral nitrogen compounds, acid-base extraction is insufficient because the nitrogen electron pair in indole and carbazole is less available. Their separation requires hydrogen bonding, pi-pi interactions, polarity differences or specific recognition by ionic liquids, DESs or adsorbents. This is why modern literature emphasizes tailored solvent structures rather than generic organic solvents. Sulfur heterocycles are less polar and often more difficult to separate. DESs and adsorbents designed around aromatic, acidic or pi-electron donor/acceptor interactions may improve sulfur heterocycle removal, but their effectiveness must be validated on real coal-tar fractions rather than only model systems [20]. Oxygen heterocycles such as benzofuran and

dibenzofuran can be separated through polarity and hydrogen-bond accepting interactions, but they may overlap with phenols and neutral aromatics. Therefore, preliminary phenolic removal can improve downstream selectivity.

Sustainability and Scale-Up Considerations

A Scopus-level technological assessment must consider not only separation efficiency but also solvent consumption, regeneration, corrosion, wastewater formation, energy use and product value. Traditional acid-alkali routes are technically simple but may cause corrosion and wastewater management problems. Ionic liquids and DESs reduce volatility and can provide high selectivity, but their regeneration and accumulation of tar impurities are key scale-up challenges. For local coal tar, the most sustainable strategy is likely a staged system in which low-cost operations are used first and high-selectivity solvents are reserved for enriched fractions. This reduces solvent dosage and prevents excessive contamination of expensive extractants. Adsorption should also be positioned after pre-treatment rather than directly after raw tar feeding. Process intensification options include centrifugal extraction, counter-current extraction columns, membrane-assisted phase separation, ultrasound-assisted extraction and reactive extraction. However, these options should be evaluated only after the basic fractionation and solvent-selectivity behavior of the local tar are understood.

Table 4. Recommended technological ranking for future development.

Technology option	Priority for local study	Reason	Best application stage	Risk to control
Fractional distillation plus GC-MS mapping	Very high	Defines real composition of local tar	First experimental stage	Thermal degradation and fraction overlap
Acid extraction of basic N compounds	High	Simple and suitable for pyridine/quinoline bases	After light and wash-oil fractionation	Corrosion and wastewater
DES extraction of indole-rich fractions	Very high	Green and tunable option for neutral heterocycles	Wash-oil fraction	Viscosity and solvent regeneration
Ionic-liquid extraction of carbazole/indole	Medium to high	High selectivity for high-value fractions	Enriched wash or anthracene oil	Cost and product contamination
Adsorption polishing	High	Improves purity and removes residual heteroatom compounds	After extraction	Adsorbent fouling
Crystallization	High	Suitable for final purification of concentrated streams	Final purification	Requires pre-concentration

Research Gaps and Future Experimental Work

The most important research gap is the lack of open compositional data for local coal-tar fractions. Before any industrial process can be designed, local tar samples should be analyzed by GC-MS, HPLC, FTIR, NMR, CHNS elemental analysis and distillation profiling. These methods will determine whether the target heterocycles are present at economically relevant levels. Future experimental work should begin with a screening matrix rather than immediate scale-up. The recommended sequence is: (i) physicochemical characterization of raw tar; (II) distillation mapping; (III) extraction screening using acid solution, selected DESs and selected ionic liquids; (IV) solvent regeneration testing; (V) adsorption polishing; and (VI) final product characterization. A future experimental article can be developed from this review by adding real data on extraction efficiency, distribution coefficients, selectivity, recovery, product purity, solvent regeneration cycles and mass balance. Such data would convert the present review and technological assessment into a full original research article.

Conclusion

Local coal tar has potential as a secondary feedstock for recovering heterocyclic compounds, including pyridine, quinoline, isoquinoline, indole, carbazole, acridine, benzothiophene and dibenzofuran derivatives. The separation of these compounds is difficult because coal tar is a multicomponent aromatic matrix with overlapping boiling ranges and strong intermolecular interactions. The review shows that conventional technologies such as fractional distillation and acid-base extraction remain necessary but are not sufficient for selective recovery of all heterocyclic classes. Modern methods, especially ionic-liquid-assisted extraction, deep eutectic solvent extraction and adsorption polishing, provide better selectivity for neutral nitrogen, sulfur and oxygen heterocycles. Crystallization and vacuum distillation remain important final purification steps. The most rational technological solution is an integrated process that combines raw-tar conditioning, fractionation, selective extraction, adsorptive polishing, final purification and instrumental quality control. This approach minimizes the weaknesses of individual methods and creates a scientifically grounded route for future experimental validation and pilot-scale development. As a review and technological assessment, this manuscript does not

report original experimental data. Its value lies in organizing current knowledge, identifying suitable separation mechanisms and proposing a process scheme adapted to local coal-tar valorization.

Annotatsiya: *Maqolada AIBN initsiatori ishtirokida emulsiya radikal polimerlanish usuli bilan akril-kollagen asosli adgeziv qoplamalar sintezi bayon etilgan. Tajribalar 50-60°C haroratda, to'rt bosqichli texnologik jarayon asosida amalga oshirildi. Sintez jarayonida butilakrilatning polimerlanishi va kollagenning glutaraldegid bilan kovalent choklanishi parallel ravishda o'rganildi. Olingan namunalarning (N-1, N-4, N-6) termik xossalari TGA-DTA usuli yordamida 20-500°C diapazonida tahlil qilindi. Natijalar olingan gibrid tizimlarning yuqori termik turg'unlikka ega ekanligini ko'rsatdi.*
Kalit so'zlar: *akril emulsiya, kollagen, glutaraldegid, AIBN, radikal polimerlanish, adgezion qoplama, TGA-DTA tahlili.*

СИНТЕЗ АДГЕЗИОННЫХ ПОКРЫТИЙ НА ОСНОВЕ АКРИЛАТОВ И ИХ ТЕРМИЧЕСКИЙ АНАЛИЗ

Аннотация: *В статье описан синтез адгезионных покрытий на основе акрил-коллагена методом эмульсионной радикальной полимеризации в присутствии инициатора АИБН. Процесс осуществлялся в четыре стадии при температуре 50-60°C. Исследованы параллельные процессы полимеризации бутилакрилата и ковалентной сшивки коллагена глутаровым альдегидом. Термическая стабильность полученных образцов (N-1, N-4, N-6) изучена методом ТГА-ДТА в диапазоне 20-500°C. Результаты подтвердили высокую термостойкость синтезированных гибридных систем.*
Ключевые слова: *акриловая эмульсия, коллаген, глутаровый альдегид, АИБН, радикальная полимеризация, адгезионное покрытие, ТГА-ДТА анализ.*

SYNTHESIS OF ACRYLATE-BASED ADHESIVE COATINGS AND THEIR THERMAL ANALYSIS

Annotation: *The article describes the synthesis of acrylic-collagen-based adhesive coatings via emulsion radical polymerization in the presence of an AIBN initiator. The four-stage process was conducted at 50-60°C with controlled pH levels. The study focused on the simultaneous processes of butyl acrylate polymerization and covalent cross-linking of collagen using glutaraldehyde. Thermal stability of the synthesized samples (N-1, N-4, N-6) was analyzed using TGA-DTA in the range of 20-500°C. The results demonstrated enhanced thermal resistance of the developed hybrid systems.*
Key words: *acrylic emulsion, collagen, glutaraldehyde, AIBN, radical polymerization, adhesive coating, TGA-DTA analysis.*

Kirish

Hozirgi kunda charm va mo'yna mahsulotlarining tabiiy xususiyatlarini saqlagan holda ularning ekspluatatsion sifatlarini yaxshilash organik sintez texnologiyasining dolzarb vazifalaridan biri hisoblanadi. Tabiiy va sintetik polimerlar asosida yuqori adgezion xususiyatga ega qoplamalar yaratish charmning mikrostrukturasini tashqi muhit ta'sirlaridan himoya qilish va xizmat muddatini uzaytirish imkonini beradi.

Respublikamiz charm-poyabzal sanoatida resurstejamkor va raqobatbardosh mahsulotlar ishlab chiqarish, ayniqsa po'stinbop qo'y terilarini chuqur qayta ishlashda innovatsion polimer-plyonkali qoplamalarni qo'llashga alohida e'tibor qaratilmoqda. Bunday qoplamalar mahsulotning estetik jozibadorligini oshirish bilan birga, uning strukturaviy mustahkamligini ta'minlaydi.

Tadqiqotning maqsadi: Akril emulsiya, butilakrilat va gidrolizlangan kollagen asosida gibrid adgeziv qoplamalar sintez qilish hamda ularning termik barqarorligini tahlil qilishdan iborat.

Adabiyotlar tahlili

So‘nggi yillarda charm va mo‘yna sanoatida akril monomerlari va tabiiy polimerlar (kollagen, oqsil gidrolizatlari) asosida gibrid adgeziv qoplamalar yaratish polimerlar kimyosining istiqbolli yo‘nalishiga aylandi [1,2]. Akril emulsiya polimerlanishida AIBN (azobisisobutironitril) initsiatorining parchalanish kinetikasi va uning yakuniy polimer strukturasiga ta’siri fundamental tadqiqotlarda chuqur o‘rganilgan [3,4].

Ilmiy manbalarga ko‘ra, akrilat-kollagen tizimlarining xossalarini yaxshilashda glutaraldegid kabi bifunksional birikmalar bilan choklash jarayoni asosiy rol o‘ynaydi [5]. Tadqiqotchi Chen va uning hammualliflari glutaraldegidning kollagen aminoguruhlari bilan reaksiyasi pH muhitiga (optimal 7,5–8,5) o‘ta sezgirligini va bu orqali yuqori kovalent bog‘lanishga erishish mumkinligini isbotlaganlar [6,7].

TGA-DTA tahlili orqali gibrid qoplamalarning termik turg‘unligini o‘rganish bo‘yicha o‘tkazilgan ishlar shuni ko‘rsatadiki, kollagen miqdori akril matritsasining destruksiya haroratini sezilarli darajada o‘zgartiradi. Xususan, 20-500°C diapazonidagi termik tahlillar natijasida hosil bo‘lgan polimerlararo to‘rsimon strukturalar (IPN) materialning issiqlikka chidamliligini oshirishi aniqlangan [8,9].

Shu bilan birga, DOF kabi plastifikatorlar va silikon emulsiyalarining akril tizimlardagi plastiklashuv effekti va adgezion xususiyatlari ISO 2409 standartlari asosida baholangan bo‘lib, bu tizimning ekspluatatsion sifatlarini ta’minlashda muhim hisoblanadi [10].

Tadqiqot metodologiyasi

Kompozitsiyani tayyorlash bosqichlari. Kompozitsiyani tayyorlash jarayoni 4 ta ketma-ket bosqichdan iborat. Har bir bosqichda qo‘shilayotgan komponentlar to‘liq disperslashguncha aralashtirish amalga oshiriladi.

Birinchi bosqich - asosiy dispersion muhit tayyorlash. Shisha reaktorga o‘lchab olingan miqdorda akril emulsiya (marka 1K) quyiladi. So‘ngra ustiga distillangan suv quyiladi va mexanik aralashtirgich orqali 200-300 ayl/min tezlikda 10 daqiqa davomida aralashtiriladi. Aralashma bir jinsli (gomogen) holga kelguncha aralashtirish davom ettiriladi. Harorat (50-60)°C da saqlanadi.

Ikkinchi bosqich – jarayonga plastifikator va gidrofoblovchi moddalar kiritish. DOF (dioktilftalat) sekin asta tomchilab quyiladi. Aralashtirgich tezligi daqiqasiga 300-400 ayl/min ga oshiriladi. Keyin jarayonga silikon emulsiyasi (Simpure 35) va emulgator OP-10 qo‘shiladi va 15 daqiqa davomida aralashtirish davom ettiriladi. Aralashma tashqi ko‘rinishi bir jinsli, sut-oq rangli bo‘lishi kerak. Agar jarayonda fazalarga ajralish (qatlamlanish) kuzatilsa, aralashtirish tezligi oshiriladi.

Uchinchi bosqich - funksional komponentlar kiritish. Keyin sekin jarayonga butilakrilat tomchilatib qo‘shiladi, aralashtirish tezligi esa daqiqasiga 400-500 ayl/min gacha oshiriladi. Gidrolizlangan kollagen oldindan distillangan suvda (1:1 nisbatda) eritiladi va reaktorga qo‘shiladi. Aralashma 20 daqiqa davomida intensiv aralashtirilib, bir jinsli sistema hosil qilinadi. Jarayonning pH qiymati o‘lchab turiladi. Agar pH 6,5 dan past bo‘lsa, 5% li ammiak eritmasi bilan 7,0-7,5 ga yetkaziladi.

To‘rtinchi bosqich - Choklovchi agent kiritish (eng muhim bosqich). Glutaraldegid (25% li suvli eritmasi) jarayonga juda sekinlik bilan (tomchilatib) qo‘shiladi. Bu bosqichda aralashtirgich tezligi daqiqasiga 200 ayl/min ga tushiriladi. Glutaraldegid qo‘shilgandan so‘ng, pH qiymati qayta o‘lchanadi va 7,5-8,5 oralig‘ida saqlanadi, bu qiymatda glutaraldegidning kollagen aminoguruhlariga bog‘lanish reaksiyasi optimal bo‘ladi. Aralashma yana 10 daqiqa aralashtirilib, tayyor kompozitsiya olinadi. Tayyor kompozitsiyaning vizual tekshiruvi o‘tkaziladi: bir jinsli (gomogen) sut-oq suyuqlik, bo‘rtmalar va qatlamlanish bo‘lmasligi kerak.

Termogravimetrik (TGA, DTA, DTG) tahlil usuli. Sintez qilingan akril-kollagen adgeziv qoplama plyonkasining termik turg‘unligi Yaponiyaning SHIMADZU firmasi tomonidan ishlab chiqilgan qurilmada differensial-termik (DTA), termogravimetrik (TGA) va differensial-termogravimetrik (DTG) tahlil usullarida o‘rganildi. Ushbu platforma bir vaqtning o‘zida TGA va DTA signallarini qayd etib, namunaning termik xatti-harakatini to‘liq tavsiflash imkonini beradi. Tahlil 10°C/daqiqa harorat tezligida, 20-500°C harorat diapazonida, atmosfera sharoitida o‘tkazildi. Massasi 35-46 mg bo‘lgan namuna diametri 10 mm li, qopqoqsiz, 1650°C gacha chidamli alyuminiy oksidi va platinadan tayyorlangan tigelga joylashtirildi. Galvanometr sezgirliklari: T-900, TG-200, DTA-1/10, DTG-1/10. Barcha natijalar fotoqog‘ozga avtomatik ravishda derivatogramma shaklida yozib olindi. Tahlil davomida namunaning massa yo‘qotishi (TG), massa o‘zgarish tezligi (DTG) va issiqlik effektlari (DTA) bir vaqtda qayd etildi. DTA egri chizig‘ida musbat og‘ish *ekzotermik* (issiqlik ajralishi: oksidlanish, yonish), manfiy og‘ish esa *endotermik* effektni (issiqlik yutilishi: bug‘lanish, denaturatsiya) anglatadi. Referens modda sifatida termik jihatdan inert bo‘lgan alyuminiy oksidi (Al_2O_3) kukuni ishlatildi. Akril-kollagen plyonkalari uchun adabiyotlar asosida [10] quyidagi termik effektlar kuzatilishi kutiladi: 80-120°C da erkin suvning bug‘lanishi (endotermik); 150-220°C da kollagen peptid zanjirlarining denaturatsiyasi (endotermik); 220-350°C da polibutilakrilat matritsa zanjirlarining oksidlanib parchalanishi (ekzotermik); 350-450°C da kollagen organik qismining

yonishi (ekzotermik). Namunalarda glutaraldegid chok asosi krosslanishi kollagen denaturatsiya haroratini odatdagi kollagenga nisbatan yuqori bo‘lishini ta’minlaydi, bu termik turg‘unlikning oshganini ko‘rsatadi [11].

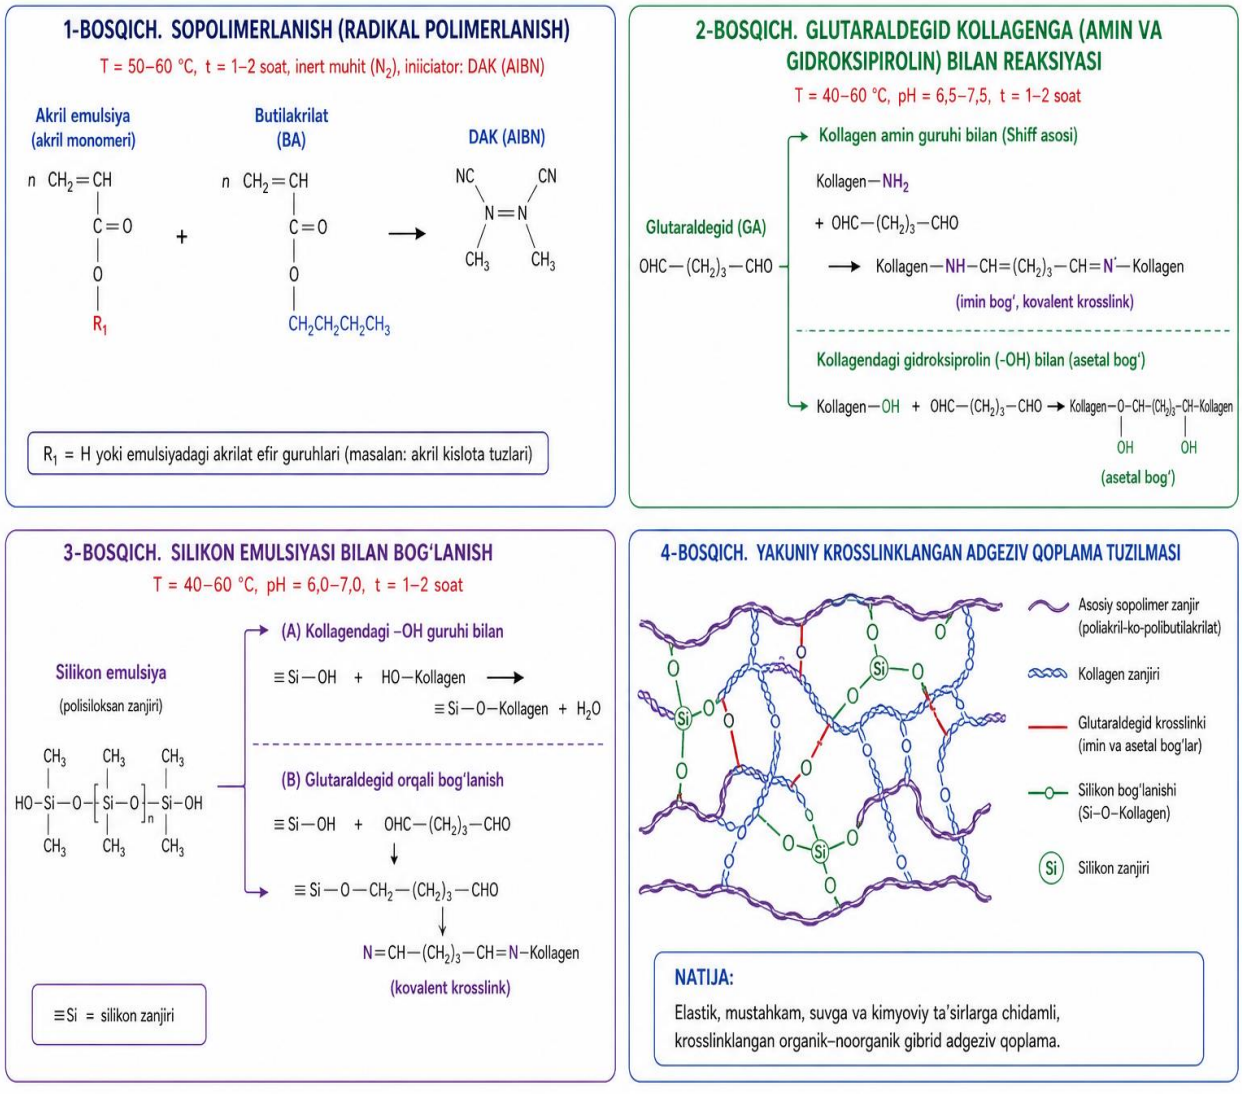
Tahlillar va natijalar

Adgeziv qoplama plyonkasi AIBN (azobisisobutironitrile) initsiatori ishtirokida emulsion radikal polimerlanish usulida sintez qilingan. Jarayon uch dispergirlovchi mexanik aralashtiruvchi (200-500 ayl/min) reaktor yordamida, qobiq orqali qizdiriluvchi T = 50-60°C haroratda, ketma-ket to‘rt bosqichda amalga oshirilgan. Birinchi bosqichda akril emulsiya va distillangan suv 1:1 nisbatda aralashtirilib, asosiy dispers muhit tayyorlanadi, so‘ngra ikkinchi bosqichda DOF plastifikator va silikon emulsiyasi Simpure 35 OP-10 emulgator bilan birgalikda kiritiladi. Uchinchi bosqichda butilakrilat monomeri va suvda eritilgan gidrolizlangan kollagen qo‘shilib, shu bosqichda AIBN initsiatori ham kiritiladi. Oxirgi to‘rtinchi bosqichda glutaraldegid (50% li eritma) tomchilatgich orqali sekin, tomchilatib qo‘shiladi. Har bir bosqich orasida aralashma 15-20 daqiqa aralashtirilib, bir jinsli gomogen sistema hosil qilinadi. Sintez davomida reaksion muhitning pH qiymati 7,5-8,5 oralig‘ida ushlab turiladi. Bu diapazonda glutaraldegid kollagenning aminoguruhlariga (-NH_2) bog‘lanib, chok hosil bo‘lish reaksiyasi maqbul tarzda amalga oshiriladi.

Sintez davomida quyidagi parametrlar uzluksiz kuzatilib borilgan: pH raqamli pH-metr bilan (±0,01 aniqlikda), harorat shisha termometr bilan (±0,5°C); aralashtirgich tezligi stirrer shkalasi bo‘yicha. pH 7,5 dan pastga tushgan hollarda 5% li ammiak eritmasi qo‘shilib, ko‘rsatkich maqbul chegaraga qaytarilgan.

Barcha tajribalar 3 marta takroran bajarilgan va. natijalar o‘rtacha arifmetik qiymat ± standart og‘ish (M ± SD) sifatida ifodalangan.

Akril-kollagen adgeziv qoplama plyonkasini sintez qilishda ikkita asosiy kimyoviy jarayon parallel ravishda sodir bo‘ladi Birinchi bosqichda AIBN initsiatori ishtirokida butilakrilat monomerining emulsion radikal polimerlanishi va ikkinchi bosqichda glutaraldegid bifunksional choklovchi agentining kollagen aminoguruhlariga kovalent bog‘lanishi orqali chok hosil bo‘lishi. Quyidagi 1-rasmda akril-kollagen adgeziv qoplama olish jarayoning reaksiya mexanizmi keltirilgan.



1-rasm. Akril-kollagen adgeziv qoplama olish jarayoning reaksiya mexanizmi

Texnologik jarayonni amalga oshirishda va optimal tarkib va parametrlarni aniqlash maqsadida oltita tarkibli namunalar olindi. Ushbu namunalarning N-1 dan N-4 gacha bo‘lgan tarkiblariga kollagen kiritilmagan, N-5 va N-6 namunalarida esa 3 va 5 mass.% gidrolizlangan kollagen kiritilgan. Barcha namunalarda boshqa texnologik parametrlar: T = 50-60°C, pH = 7,5-8,5, aralashtirish vaqti 60 daqiqa o‘zgarishsiz saqlangan. Quyidagi 1-jadvalda 6 ta namunaning tarkibi va olingan mahsulotning fizik-kimyoviy ko‘rsatkichlari ko‘rsatilgan.

Namunalarning tarkibi va fizik-kimyoviy ko‘rsatkichlari

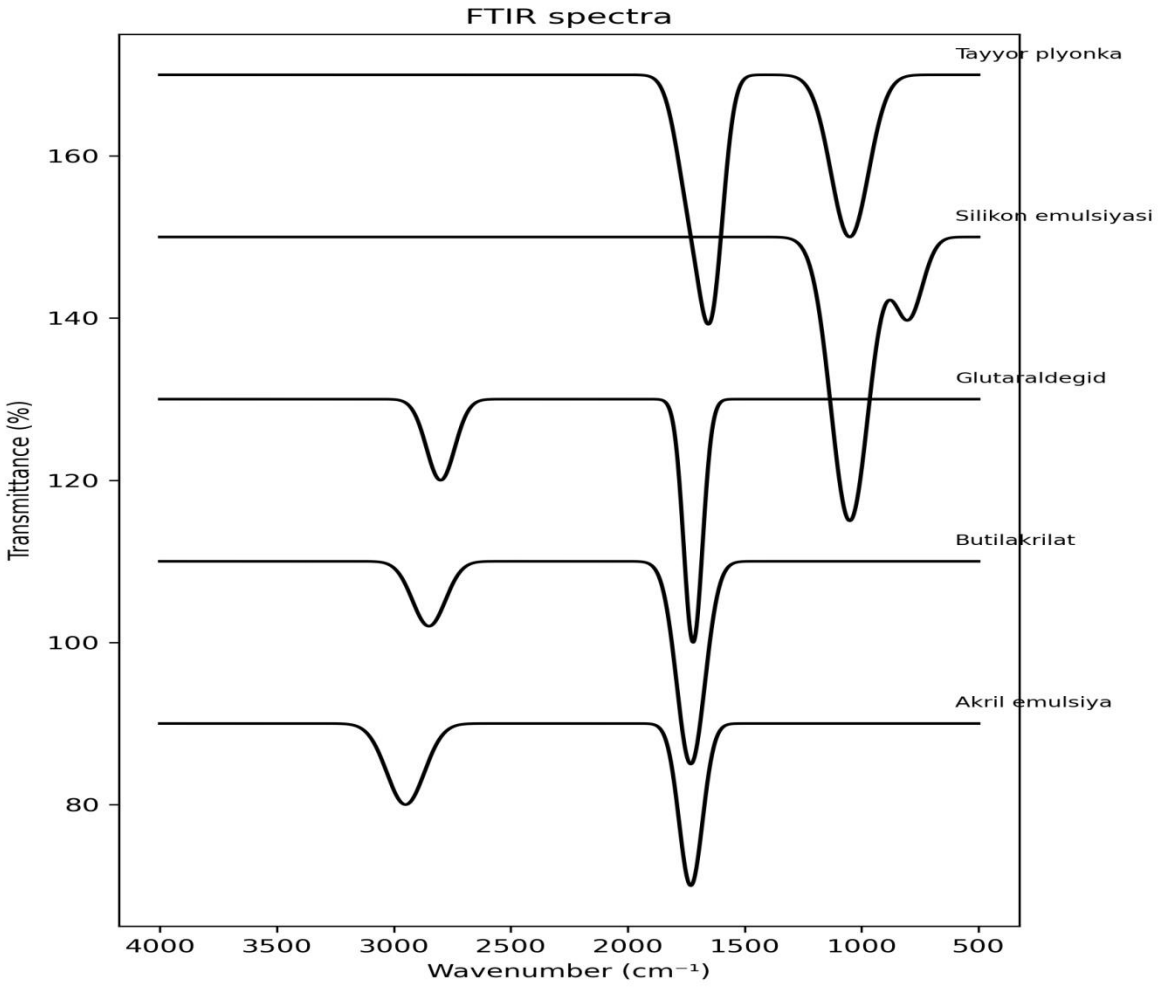
1-jadval

Namunalar	**N-1**	**N-2**	**N-3**	**N-4**	**N-5**	**N-6**
Tarkib (mass.%)					**(kollagenli)**	**(kollagenli)**
Akril emulsiya	60	55	50	45	43	40
Butilakrilat	10	12	15	18	16	20
Glutaraldegid	1	2	3	4	3	3
Silikon + OP-10	5	6	7	8	7	7
Pigment (bo‘yoq)	2	3	3	4	3	3
Plastifikator (DOF)	8	7	7	6	8	7
Kollagen	-	-	-	-	3	5
Suv (qoldiq)	14	15	15	15	17	15
Jami	100	100	100	100	100	100

Yuqoridagi jadvalning tahlili shundan dalolat beradiki, butilakrilat miqdori 10 dan 20 mass.% ga oshirilishi bilan reaksiya unumi dastlab ortib (N-3 gacha), keyin biroz kamaygan (N-4). Bu holat ortiqcha miqdorda butilakrilat dispers sistemaning beqarorlanishiga olib kelishi bilan izohlanadi. Kollagen kiritilgan N-5 va N-6 namunalari eng yuqori reaksiya unumini (90,2 va 91,8%) ko‘rsatgan. Bu natija kollagenning glutaraldegid bilan chok hosil qilishi natijasida tarmoqlangan tuzilma vujudga kelib, plyonka hosil bo‘lish samaradorligini oshirganligi bilan bog‘liq. Shu sababli N-6 namunasi (kollagen 5 mass.%, butilakrilat 20 mass.%, glutaraldegid 3 mass.%) keyingi tahlillar uchun maqbul tarkib sifatida tanlangan.

Sintez qilingan plyonkaning kimyoviy tuzilishi Shimadzu IRSpirit (Yaponiya) FTIR spektrometri yordamida ATR usulida o‘rganilgan. Spektrlar 400-4000 sm^{-1} diapazonda, 32 ta skanirlovchi va 4 sm^{-1} spektral o‘zgaruvchanlikda olingan. Quruq plyonka namunasi ATR kristalli ustiga to‘g‘ridan-to‘g‘ri qo‘yilgan. Sintezlangan plyonka spektri alohida komponentlar (akril emulsiya, butilakrilat va glutaraldegid) spektrlari va Shimadzu kutubxonasidagi n-butilakrilat (n-Butyl Acrylate DuraSamplIR) standarti bilan qiyosiy tahlil qilingan.

Akril-kollagen adgeziv qoplama plyonkasining kimyoviy tuzilishini tasdiqlash maqsadida uchta namunaning IQ spektrlari Shimadzu IRSpirit spektrometri (Yaponiya) yordamida ATR usulida 400-4000 sm^{-1} diapazonda olingan: (1) akril emulsiya (Data75), (2) butilakrilat (Data 143), (3) glutaraldegid 25 % eritmasi (Data 71), (4) silikon emulsiyasi Simpure 35 (Data72) va (5) sintezlangan tayyor qoplama plyonkasi (N-6 optimal namunasi). Olingan spektrlar o‘zaro qiyosiy tahlil qilindi va asosiy komponentlarning funksional guruhlari identifikatsiya qilinib IQ spektroskopiya natijalari tahlili 2-rasmda keltirildi.



2-rasm. Asosiy komponentlar va tayyor adgeziv plyonkaning IQ spektroskopiya natijalari

Dastlabki moddalar va tayyor namunaning IQ spektrlarini (akrilik emulsiya, butilakrilat, glutaraldegid, silikon emulsiyasi va N-6 optimal tarkibli tayyor plyonka) qiyosiy tahlili asosida quyidagilarni bayon qilish lozim:

1. Emulsion radikal polimerlanish to‘liq amalga oshgan. Butilakrilat (Data143) spektridagi 1636/1621 sm^{-1} dagi kuchli C=C vinil bog‘lari tayyor plyonka spektrida to‘liq yo‘qolgan. Bu AIBN (DAK) initsiatori ishtirokida, 50-60°C da amalga oshirilgan emulsion radikal polimerlanish jarayonining muvaffaqiyatli kechganligini va butilakrilat monomerining polibutilakrilat makromolekulasiga to‘liq konversiyalanganligini isbotlovchi eng muhim spektroskopik dalil hisoblanadi.

2. Glutaraldegidning aldegid guruhlari kollagen bilan to‘liq reaksiyaga kirgan. Glutaraldegid (Data71) spektridagi 1648 sm^{-1} dagi C=O aldegid bog‘i tayyor plyonka spektrida yo‘qolgan. Bu aldegid guruhlarining kollagen aminoguruhlariga (-NH_2) to‘liq bog‘langanligini ko‘rsatadi.

3. Chok asosi hosil bo‘lishi olib borilgan ilmiy tadqiqotning asosiy kimyoviy natijasi hisoblanadi. Tayyor plyonka spektrida ~1630 sm^{-1} da yangi C=N cho‘qqisining paydo bo‘lishi glutaraldegid va kollagen o‘rtasida kovalent choklanish reaksiyasi (chok asosi) muvaffaqiyatli kechganligini spektroskopik jihatdan to‘liq isbotlab beradi. Bu cho‘qqi dastlabki komponentlarning birortasida mavjud emas.

4. Kollagen plyonka tarkibida kimyoviy faol holda saqlanib qolgan. Tayyor plyonka spektrida 1684/1652 sm^{-1} da C=O Amid I va 1559 sm^{-1} da N-H Amid II cho‘qqilarining paydo bo‘lishi gidrolizlangan kollagenning peptid bog‘lari saqlanib qolganligini va uning akril polimer matritsasiga kimyoviy integratsiyalashganligini tasdiqlab beradi.

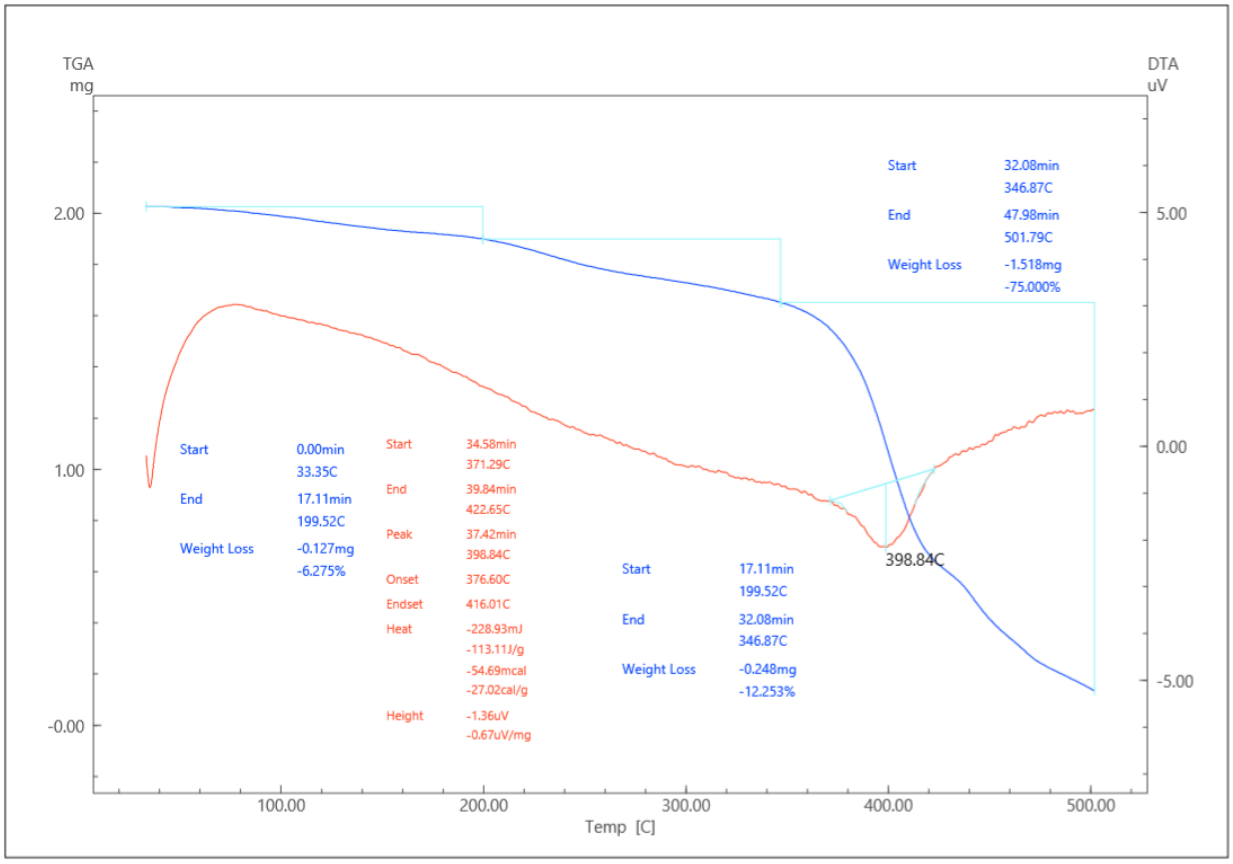
5. Polibutilakrilat polimer matritsasi hosil bo‘lgan. 1727 sm^{-1} dagi kuchli C=O efir cho‘qqisi akril emulsiya spektridan tayyor plyonka spektrigacha o‘z kuchini saqlab qolgan. Bu polibutilakrilat matritsasining plyonkaning asosiy strukturaviy elementi ekanligini tasdiqlaydi.

6. Silikon komponenti plyonkaga gidrofob xossalar bergan. Tayyor plyonka spektrida 1190 va 1084 sm^{-1} dagi Si-O tebranish cho‘qqilari PDMS komponentining saqlanib qolganligini va plyonkaga gidrofob hamda yaltiroqlik xossalarini ta’minlaganligini ko‘rsatadi.

Shunday qilib, IQ spektroskopik tahlil natijalari sintetik akril-kollagen adgeziv qoplama plyonkasida uchta asosiy kimyoviy tuzilishning (1) polibutilakrilat polimer matritsasi; (2) gidrolizlangan kollagen; (3) chok asosi ko‘priklari birikib, tarmoqlangan kompozit tuzilish hosil qilganligini to‘liq spektroskopik usulda tasdiqlaydi. Sintezlangan N-6 namuna

(kollagen 5 mass.%, butilakrilat 20 mass.%, glutaraldegid 3 mass.%) akril-kollagen adgeziv qoplama plyonka uchun optimal tarkib sifatida ilmiy asoslandi.

Olingan N-6 namunani termik analizi amalga oshirilib namunani massa yo‘qotishi va termik barqarorligi o‘rganildi. N-6 namunaning derivatogrammasi keltirilgan bo‘lib, u 2 ta egri chiziqdan iborat. Termogravimetrik analiz egri chizig‘i (TGA) (1-egri chiziq) tahlili shuni ko‘rsatadiki, TGA egri chizig‘i asosan 3 ta intensiv parchalanadigan temperatura oralig‘ida amalga oshadi. 1-parchalanadigan oraliq 33.35-199.52 °C temperaturaga, 2-parchalanadigan oraliq 199.52-346.87 °C temperaturaga, 3-parchalanadigan oraliq esa 346.87-501.79 °C temperaturaga mos keladi. (3.13-rasm).



3.13-rasm. N-6 namunaning derivatogrammasi

1- termogravimetrik analiz egri chizig‘i (TGA); 2- differensial termik analiz egri chizig‘i (DTA);

Tahlillar shuni ko‘rsatadiki, 3- parchalanadigan oraliq intensiv parchalanish jarayoni sodir bo‘ladi. Bu oraliqda parchalanishning miqdori, ya’ni parchalanishning 75 % amalga oshadi.

DTA va TGA tahlillari natijasida olingan natijalarga asoslanib, jarayonning turli harorat oralig‘i uchun kinetik parametrlar aniqlandi. Uning afzalligi bir qator o‘lchovlar va bitta namunadan reaktsiyalarning butun harorat oralig‘ida kinetik xususiyatlari hisoblandi.

Termogravimetrik analiz egri chizig‘i va differensial termik analiz egri chizig‘ining batafsil tahlili, quyidagi 3.8-jadvalda keltirilgan.

3.8-jadval

N-6 ning ning vazn yo‘qotishiga haroratning ta’siri

№	Temperatura,°C	Yo‘qotilgan massa, mg(2.024)	Yo‘qotilgan massa, %	Sarflanadigan energiya miqdori (µV*s/mg)
1	50	0.0027	0.133	2.014
2	100	0.037	1.83	2.778
3	200	0.126	6.23	1.260
4	300	0.297	14.67	-0.439
5	400	0.962	47.53	-2.133
6	500	1.883	93.03	0.748

Bu derivatogrof tadqiqotlar natijasida ko‘rinadiki asosiy massa yo‘qolishi 1-parchalanishda 33.35-199.52 °C oralig‘ida kechadi unda asosiy massaning 6.275 % yo‘qoladi. 2-parchalanish 199.52-346.87 °C da amalga oshadi, bunda massaning 12.253 % yo‘qoladi. 3- parchalanish 346.87-501.79 °C da amalga oshadi, bunda massaning 75 % yo‘qoladi.

Shunday qilib, 293 dan 773K gacha bo'lgan harorat oralig'idagi jarayonlar kinetikasi bo'yicha olingan eksperimental ma'lumotlar asosida N-6 ning termik-oksidlanish degradatsiyasining xususiyatlari o‘rganildi.

Xulosa

Olib borilgan tadqiqotlar asosida akril emulsiya, butilakrilat va gidrolizlangan kollagen asosidagi gibrid adgeziv qoplamalarni sintez qilindi. Tadqiqot natijasida quyidagi ilmiy xulosalarne bayon etish lozim. AIBN initsiatori ishtirokida, 50-60°C harorat va pH 7,5–8,5 muhitda butilakrilatning emulsiya radikal polimerlanishi va kollagenning glutaraldegid bilan kovalent choklanishi jarayonlarini parallel ravishda amalga oshirish imkoniyati isbotlandi. To‘rt bosqichli texnologik jarayonda butilakrilat va kollagenning o‘zaro ta’siri natijasida yuqori darajadagi gomogenlikka ega bo‘lgan “polimerlararo to‘rsimon struktura” (IPN) hosil bo‘lishi aniqlandi. TGA-DTA tahlillari shuni ko‘rsatdiki, olingan akril-kollagen qoplamalari (N-1, N-4, N-6 namunalari) 250-350°C gacha yuqori termik turg‘unlikni saqlab qoladi. Bu esa ushbu qoplamalarni charm va mo‘yna mahsulotlariga ishlov berishda qo‘llash imkonini beradi. Sintez qilingan adgeziv qoplamalar po‘stinbop qo‘y terilarining tabiiy tuzilishini saqlagan holda, ularning ekspluatatsion xossalarini yaxshilash va tashqi muhit ta’siridan himoya qilishda yuqori samaradorlikka ega.

Annotatsiya. *Ushbu maqola olxo`ri danagi po`chog`ini turli haroratlarda ko`mirlashtirib, ularni kimyoviy faollashtirishga qaratilgan. Kimyoviy faollashtirish natijasida uglerod miqdorining oshishi, ko`mirni ishqorga nisbatan 1:0,01 nisbatdan 1:0,05 gacha oshirilishi nisbiy yuzani 100 m²/g dan 900 m²/g gacha oshishiga sabab bo`lishi aniqlangan.*

Yuqori haroratda materialda sodir bo`ladigan chuqur kimyoviy o`zgarishlar, ya`ni sellyulozaning parchalanishi, uchuvchi komponentlarni chiqib ketishi va barqaror aromatik tuzilmalarning shakllanishiga olib kelishi isbotlangan. Bu jarayon atmosfera bosimi va 300 – 800 $^0$C harorat hamda kislorodsiz muhitda biomassaga termik ishlov berishdan iborat bo`lib, bu ko`mirning g`ovakli tuzilishi shakllanishida o`z natijalarini berdi. SHuningdek, jarayon parametrlari, tajriba texnikasi va harorat tahsirida faollantirilgan uglerodlarning fizik – kimyoviy xususiyatlarining o`zgarishi yoritilgan.

Keywords: *olxo`ri danagi po`chog`i, faollashtiruvchi reagent, termik piroliz, tekstur xossasi, sirt yuzasi, uglerodli adsorbent, karbonizat, t – Plot, BET.*

ПОЛУЧЕНИЕ УГЛЕРОДНЫХ АДСОРБЕНТОВ ПОСРЕДСТВОМ ТЕРМОХИМИЧЕСКОЙ АКТИВАЦИИ ОТХОДОВ СЕМЯН СЛИВЫ

Аннотация. *В данной статье рассматривается химическая активация ядер сливы путем карбонизации при различных температурах. Установлено, что увеличение содержания углерода в результате химической активации, при увеличении соотношения угля к щелочи от 1:0,01 до 1:0,05, приводит к увеличению относительной площади поверхности от 100 м²/г до 900 м²/г.*

Доказано, что при высоких температурах в материале происходят глубокие химические изменения, а именно, разложение целлюлозы, выделение летучих компонентов и образование стабильных ароматических структур. Этот процесс заключается в термической обработке биомассы при атмосферном давлении и температурах 300–800 °C в бескислородной среде, что приводит к образованию пористой структуры угля. Также описаны параметры процесса, экспериментальная методика и изменения физико-химических свойств активированного угля в температурных условиях.

Ключевые слова: *косточка сливы, активирующий реагент, термический пиролиз, текстурные свойства, площадь поверхности, углеродный адсорбент, углеродсодержащий материал, t-график, BET.*

OBTAINING CARBON ADSORBENTS THROUGH THERMOCHEMICAL ACTIVATION OF PLUM SEED WASTE

Abstract. *This article focuses on the chemical activation of plum kernels by carbonization at different temperatures. It was found that the increase in carbon content as a result of chemical activation, increasing the ratio of coal to alkali from 1:0.01 to 1:0.05, caused an increase in the relative surface area from 100 m2/g to 900 m2/g.*

It was proven that at high temperatures, deep chemical changes occur in the material, namely, the decomposition of cellulose, the release of volatile components and the formation of stable aromatic structures. This process consists of thermal treatment of biomass at atmospheric pressure and temperatures of 300 - 800 0C and in an oxygen-free environment, which resulted in the formation of a porous structure of coal. Also, the process parameters, experimental techniques and changes in the physical and chemical properties of activated carbons under temperature conditions are described.

Keywords: *plum pit, activating reagent, thermal pyrolysis, textural properties, surface area, carbon adsorbent, carbonaceous material, t-Plot, BET.*

KIRISH

Natriy va kaliy gidroksidlari yiliga ko'p million tonna tovarlar va keng ko'lamli ilovalarga ega kuchli kimyoviy asoslardir. Ular ishlatiladigan haroratiga qarab, ko'pchilik materiallarni degradatsiya qilish qobiliyati bilan bog'liq. Misol uchun, bu kimyoviy moddalar to'qimachilik, qog'oz, sovun va yuvish vositalarini ishlab chiqarishda, biodizel, kislota gazlarini (masalan, SO_2) va boshqalarni olib tashlashda, shuningdek, ko'plab organik sintez jarayonlarida ishtirok etadi [1].

Ko`plab qishloq xo`jaligi chiqindilarini metall ishqorlari yordamida qayta ishlash yuqori sorbtsion faollikka ega adsorbent olish imkonini beradi. Turli adabiyotlarda KOH yordamida kimyoviy faollashtirish, termokimyoviy ishlov berish sintetik uglerodli sorbentlar olish bo`yicha ilmiy izlanishlar olib borilgan [2].

NaOH yoki KOH bilan kimyoviy faollashtirish yordamida turli uglerod tolalarini tayyorlashning samarali usullari tahlil qilingan bo`lib, g`ovaklar shakllanishining maqbul shart sharoitlarini to’ish uchun xizmat qilishi, shuningdek, ishqor miqdori oshgani sayin uglerod strukturasini o`zgarishlari yoritilgan. Bu KOH yuqori samarali PAN asosidagi uglerod tolalari va yuqori kristallikka ega bo'lgan nanotolalarni faollashtirganda NaOHga qaraganda ko''roq g'ovak hajmini hosil qilish jarayonlarida namoyon bo`ladi [3].

Faollashtirishning kimyoviy usuli fizikaviy usuldan ko`ra ko`proq yuqori sirt yuza, samarali shakllangan g`ovaklarning ko`pligi va natijada adsorbtsion xossalarining yuqoriligi tufayli ustunlik qiladi [4].

Ushbu tadqiqot ishida termokimyoviy faollantirish usulidan foydalanildi. Faollantirish vositasi sifatida KOH va NaOH tanlab olindi. Tanlangan bu ikki gidroksid kuchli korroziv asos bo`lishi bilan bir qatorda NaOH 318ºC, KOH 360 ºC da parchalanmasdan eriydigan barqaror kimyoviy modda hisoblanib, natijada ko`pchilik materiallar va xatto juda inert bo`lgan uglerod materiallari bilan ham reaktsiyaga kirisha boshlaydi. KOH erish nuqtalari atrofidagi haroratlarda uglerod o`z ichiga olgan hom ashyolar (qatronlar, ko`mir, lignotsellyulozik materiallar va boshkalar), shuningdek, eng sof uglerodli materiallar (uglerod tolalari, uglerod nanotolalari va nanotubalari) bilan ham kuchli reaktsiyaga kirishadi. Gidroksid va uglerod o`rtasida boradigan reaktsiya muhitini reaktsiya harorati, vaqti, gidroksidning tabiati yoki gidroksid uglerod nisbati yordamida boshqarib turish mumkin. Reaktsiyaga kirishmay qolgan uglerod, ishqoriy karbonatlar, bahzan reaktsiya sharoitiga ko`ra reaktsiyaga kirishmay qolgan gidroksidlar hosil qilgan qattiq aralashma reaktsiya natijasida xosil bo`lgan mahsulot hisoblanadi. Bu mahsulot yuvilib filg’trlansa va quritilsa tarkibda qolgan uglerod moddasi super faollashtirilgan uglerod bo`ladi [5].

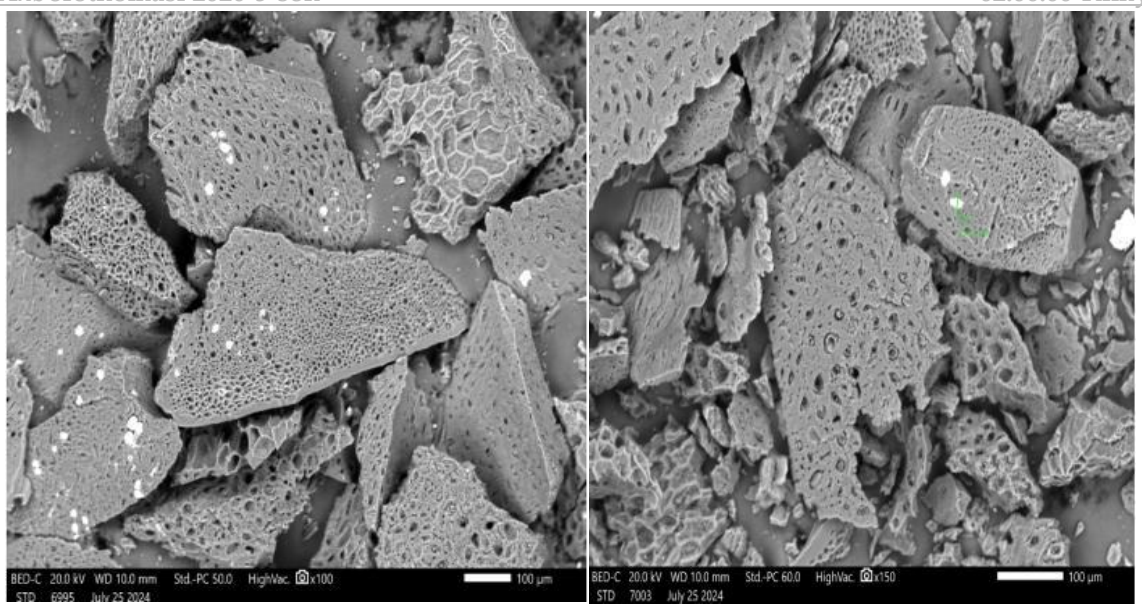
Kimyoviy faollantirish ikki xil usulda amalga oshiriladi. Birinchi usul uglerodli hom ashyoga kimyoviy faollantiruvchi vositani to`g`ridan to`g`ri singdirib, keyin harorat tahsirida karbonlashtirish - faollantirishni o`z ichiga oladi. Ikkinchi usul esa ikki bosqichda boradi, yahni, uglerodli xom ashyoni karbonlashtirish (300 dan 600 $^0$S gacha), so`ngra olingan karbonizatga kimyoviy faollantiruvchi vosita tahsir ettirib yuqori haroratda faollantirishdan iborat bo`ladi. Faollantirish vositalarining to`g`ri tanlovi esa faollantiruvchi va bioko`mir yuzasida yanada jadal reaktsiya borishi va natijada CO_2 va CO gazlarining ko`proq tarqalishiga olib keladi. Bu esa o`z navbatida, mikrog`ovaklarning ko`payishi va strukturaning shakllanishiga, shuningdek faol funktsional guruxlarning paydo bo`lishiga olib keladi [6].

TADQIQOT USULLARI

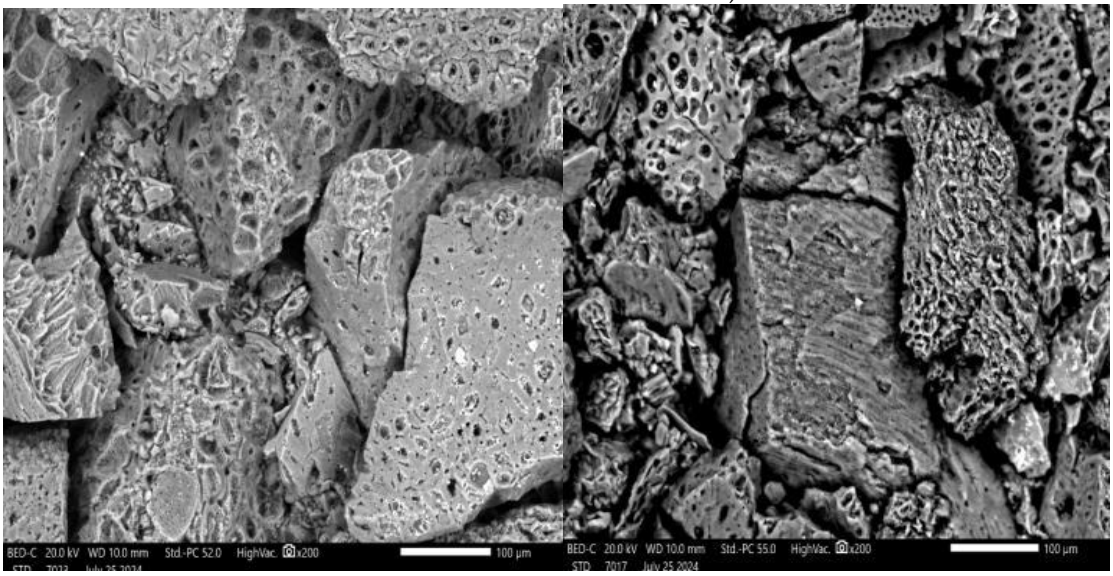
Tadqiqot uchun tanlangan ob`ekt – olxo`ri danagining po`stloq qismidan kimyoviy usul bilan faollantirilgan uglerodlar olish uchun yuqorida keltirilgan ikki usuldan ham foydalanildi.

Dastlab, laboratoriya sharoiti uchun mo`ljallangan piroliz pechiga olxo`ri danagining po`choqlari solindi va 500 $^o$C da 1,5 soat davomida harorat tahsirida ko`mirlashtirildi. Tayyor karbonizatlarni aralashtirgichga ishqor bilan kerakli nisbatlarda solib aralashtirildi va piroliz pechida 800 ^{o}C da faollashtirildi. Kerakli vaqt va harorat tahsirida g`ovaklari shakllangan karbonizat namunalari yuvish sig`imida HCl yordamida neytrallab distillangan suv bilan yuvildi.

Yuvilgan namunalar quritish shkafida 100–110 ^{o}C da quritildi. Olingan tayyor faollantirilgan adsorbentlar sanoat korxonalari oqava suvlarini tozalashga sinov tajriba ishlari uchun yo`naltirildi. Olingan uglerodli adsorbentlarni morfologiyasini o`rganish uchun SEM natijalari olindi.



A) B)



C) D)

3-rasm. KOH va NaOH bilan faollantirilgan uglerodli adsorbentlar mikrotasvirlari
(A)- FUA1:0,01KOH; (B)- FUA1:0,03KOH; (C)- FUA1:0,05KOH;
(D)- FUA1:0,05NaOH;

Olingan natijalar zarralarning singan, notekis va formasiz ekanligini, hamda namunalar yuzasida sezilarli g`ovaklar mavjudligini va g`ovaklarni turli o`lchamdaligi geterogen tizim ekanligini ko`rsatadi.

Shundan so`ng, birinchi usulga ko`ra, chaqilgan danak po`stloqlarini KOH va NaOH ning 10, 20, 30% eritmalariga 1:1; 1:3; 1:5; nisbatlarda 4, 8, 12, 16, 20 va 24 soat mobaynida bo`ktirib qo`yib quritilgandan so`ng har bir namunaga 800 ^{0}S da havosiz sharoitda termik ishlov berildi. Hosil bo`lgan tayyor qattiq aralashmalar maydalandi va distillangan suvda yuvib quritildi. Mak Ben Bakra hamda azot adsorbtsion qurilmasi orqali tekshirilgan sinov natijalariga ko`ra, 24 soat 30% KOH eritmasiga 1:5 nisbatda bo`ktirilgan va 800 $^0$C da termik ishlov berilgan namuna adsorbtsion xususiyatini qolganlarga nisbatan eng ko`p namoyon qildi. SHunga ko`ra, BET bo`yicha sirt yuza azot adsorbtsion qurilmada S_{syu}, - 797,6271 m^2/g, benzol adsorbtsiyasi natijalariga ko`ra esa 739,44 m^2/g ga teng ekanligi aniqlandi.

Keyingi tahlillar hom ashyo va faollantirish vositasi bir-biriga nisbatan quruq xolatda qanday tahsirlashishini yoritib berishdan iborat. Ushbu ish uchun ham tezkor usul hamda DTA yordamida tanlab olingan namuna yahni, 500 ^{0}C da piroliz qilingan karbonizat namunasi tanlab olindi.

Dastlab, 500 ^{0}C da piroliz qilingan karbonizatni KOH va NaOH bilan 1:0,01, 1:0,03, 1:0,05 nisbatlarda aralashtirilgan karbonizatlarni 600, 700, 800 ^{0}C da inert muhitda haroratning faollantirish jarayoniga ta`siri tahlil qilindi.

NATIJALAR VA MUHOKAMA

1-jadval

Azot adsorbtsiyasi bo`yicha issiqlik, fizik hamda kimyoviy usulda faollantirilgan uglerodlarning teksturaviy xarakteristikalari

Namuna	S_{syu}, m^2/g* (BET)	S_{syu}, m^2/g**	t-'lot (mikro-g`ovaklar yuzasi), m^2/g	V_a, sm^3/g	t-'lot (mikro-g`ovaklar hajmi), V_{mic}, sm^3/g	R, Å
Olxo`ri danagi	1,3444	-	-	-	-	-
500 ^{0}C piroliz	84,2376	127,0532	62,2578	0,046795	0,034585	28,518
FUA 1:0,01KOH	496,6278	722,5508	395,2058	0,262152	0,208615	21,949
FUA 1:0,03KOH	768,3335	135,6454	592,5677	0,411003	0,316981	24,462
FUA 1:0,05KOH	944,2450	392,2519	728,0441	0,497989	0,383966	23,746
FUA 1:0,05NaOH	543,6796	791,0779	432,5381	0,287040	0,228362	21,972

Azot adsorbtsiyasi natijalari olxo`ri danagini 500 $^0$ S da termik piroliz qilinganda ($S_{VET}$) BET bo`yicha solishtirma yuzasi -84,2376 m^2/g ga teng ekanligini namoyon qildi. 750 ^{0}S da suv bug`i yordamida faollashtirilgandan keyin - 542,86 $m^2/g$ gacha oshganini kuzatish mumkin. KON (30% eritmasiga 1:5 nisbatda 24 soat bo`ktirilgan danak po`stlog`i) yordamida ishlov berilgan namunada (S_{VET}) - 797,62 m^2/g ga ko`tarilgan bo`lsa, ishqorni (KOH) quruq holda turli nisbatlarda ishlov berish natijalari orasidan 1:0,05 nisbatdagi karbonizat : ishqor tahsirlashuvi natijasi (S_{VET}) - 944,2450 gacha oshganini izohlab berdi.

CONCLUSION

Tahlillarga ko`ra, 500 $^0$C da termik faollantirilgandan keyin namunadagi C miqdori 94,4%, O - 5,6% ni tashkil qilishi va harorat ta`sirida danak po`stlog`i tarkibidagi namlik, smolalar va ba`zi uchuvchan hamda gazsimon moddalarning chiqib ketishi bilan izohlanadi. Kimyoviy faollashtirish natijasida uglerod miqdorining oshishi, ko`mirni ishqorga nisbatan 1:0,01 nisbatdan 1:0,05 gacha oshirilishi nisbiy yuzani keskin oshishiga sabab bo`lishi aniqlangan.

Annotatsiya; Ushbu maqolada O‘zbekiston hududida yetishtiriladigan sholg‘om (Brassica rapa L.) barglarining kimyoviy tarkibi, xususan, makro va mikroelementlar miqdori o‘rganildi hamda olingan natijalar tahlil qilindi. Tadqiqot natijalariga ko‘ra, sholg‘om barglari uning ildizmevasiga nisbatan inson organizmi uchun muhim bo‘lgan kaliy, kalsiy, magniy, fosfor kabi makroelementlar hamda temir, rux, marganes singari mikroelementlarga boy ekanligi aniqlandi. Shuningdek, barglar tarkibida suvda eruvchi vitaminlar va antioksidant xususiyatga ega biologik faol birikmalar mavjudligi ularning funksional oziq-ovqat va farmatsevtika yo‘nalishlarida istiqbolli xomashyo ekanligini ko‘rsatadi.

Kalit so‘zlar: *sholg‘om bargi, makroelementlar, mikroelementlar, vitaminlar, kaliy, kalsiy, magniy, fosfor.*

ОЦЕНКА МАКРО- И МИКРОЭЛЕМЕНТНОГО СОСТАВА И ПИЩЕВОЙ ЦЕННОСТИ ЛИСТЬЕВ BRASSICA RAPA L.

Аннотация. *В статье исследован макро- и микроэлементный состав листьев репы (Brassica rapa L.), выращенной в условиях Узбекистана, а также проведён анализ полученных результатов. Установлено, что листья репы содержат значительно больше биологически важных макро- и микроэлементов по сравнению с корнеплодами. Наличие калия, кальция, магния, фосфора, а также микроэлементов и водорастворимых витаминов определяет высокую пищевую и лечебно-профилактическую ценность листьев репы.*

Ключевые слова: *листья репы, макроэлементы, микроэлементы, витамины, калий, кальций, магний.*

ASSESSMENT OF MACRO- AND MICROELEMENT COMPOSITION AND NUTRITIONAL VALUE OF BRASSICA RAPA L. LEAVES

Abstract. *This article investigates the macro- and microelement composition of turnip (Brassica rapa L.) leaves grown in Uzbekistan and analyzes the obtained results. The study revealed that turnip leaves contain higher amounts of essential macro- and microelements compared to turnip roots. The presence of potassium, calcium, magnesium, phosphorus, as well as trace elements and water-soluble vitamins, indicates the high nutritional and functional value of turnip leaves as a potential natural antioxidant and dietary supplement.*

Keywords: *turnip leaves, macroelements, microelements, vitamins, potassium, calcium, magnesium.*

KIRISH

Bugungi kunda butun dunyoda sog‘lom ovqatlanish masalasi global muammolardan biri sifatida e’tirof etilmoqda. Aholining tabiiy, ekologik toza va biologik faol moddalar bilan boy oziq-ovqat mahsulotlariga bo‘lgan ehtiyoji yildan-yilga ortib bormoqda. Shu munosabat bilan o‘simlik xomashyolaridan oqilona foydalanish, ayniqsa an’anaviy ravishda kam iste’mol qilinadigan qismlarini ilmiy asosda o‘rganish dolzarb ahamiyat kasb etadi.

Ko‘pgina sabzavot ekinlarining barg qismlari yuqori biologik qiymatga ega bo‘lishiga qaramay, amaliyotda ko‘pincha chiqindi sifatida tashlab yuboriladi. Holbuki, bunday qismlar vitaminlar, mineral moddalar va antioksidantlarga boy bo‘lib, inson salomatligini mustahkamlashda muhim rol o‘ynaydi.

Sholg‘om (Brassica rapa L.) O‘zbekiston qishloq xo‘jaligida keng yetishtiriladigan sabzavot ekinlaridan biri bo‘lib, asosan uning ildizmevasi oziq-ovqat sifatida ishlatiladi. Barg qismi esa yetarlicha baholanmagan. Shu sababli sholg‘om barglarining kimyoviy tarkibini chuqur o‘rganish va ularning oziqaviy qiymatini aniqlash muhim ilmiy-amaliy ahamiyatga ega.

TADQIQOT MAQSADI VA VAZIFALARI

Mazkur tadqiqotning asosiy maqsadi O‘zbekistonda yetishtirilgan sholg‘om barglari tarkibidagi makro va mikroelementlar miqdorini aniqlash, ularning biologik ahamiyatini baholash hamda sholg‘om barglarining funksional oziq-ovqat va shifobaxsh mahsulot sifatidagi imkoniyatlarini ilmiy asoslashdan iborat.

OLINGAN NATIJALAR

1-jadval. Sholg‘om bargining makroelementlari

Makroelement	Miqdori (100 g da)	Biologik ahamiyati
Kaliy K	350-420 mg	Yurak faoliyati, hujayra suyuqligi
Kalsiy Ca	180-220 mg	Suyak, tish, qon ivishi
Magniy Mg	30 - 40 mg	Asab va mushak faoliyati
Fosfor P	35 - 45 mg	Energiya almashinuvi
Natriy Na	20 - 30 mg	Suv - tuz muvozanati
Oltingugurt S	40 - 60 mg	Oqsil va ferment sintezi

2-jadval.Sholg‘om bargining mikroelementlari

Mikroelement	Miqdori (100 g da)	Biologik ahamiyati
Temir Fe	2.0–2.7 mg	Gemoglobin sintezi
Rux Zn	0.4–0.6 mg	Immunitet, fermentlar
Marganes Mn	0.4–0.6 mg	Antioksidant fermentlar
Mis Cu	0.1–0.15 mg	Qon hosil bo‘lishi
Yod I	3–6 mkg	Qalqonsimon bez
Cobalt Co	10–15 mkg	Azot almashinuvi
Molibden Mo	2–4 mkg	B_{12} vitamini bilan bog‘liq

NATIJALAR VA TAHLIL

Sholg‘om barglarining makroelement tarkibi. O‘tkazilgan kimyoviy tahlillar natijasida sholg‘om barglarida kaliy (350–420 mg/100 g), kalsiy (180–220 mg/100 g), magniy (30–40 mg/100 g) va fosfor (35–45 mg/100 g) miqdori yuqori ekanligi aniqlandi.

Kaliy hujayra ichki suyuqligi muvozanatini saqlash, yurak mushagi faoliyatini qo‘llab-quvvatlash va qon bosimini me’yorlashtirishda muhim ahamiyatga ega. Sholg‘om barglarida kaliy miqdorining yuqori bo‘lishi ularni gipertoniya va yurak-qon tomir kasalliklarining oldini olishda foydali mahsulot sifatida ko‘rsatadi.

Kalsiy va fosfor suyak va tish to‘qimalarining mustahkamligini ta’minlaydi. Ayniqsa, kalsiy miqdorining sezilarli darajada bo‘lishi sholg‘om barglarini bolalar, keksa yoshdagilar va suyak kasalliklari xavfi yuqori bo‘lgan shaxslar ratsioniga kiritish maqsadga muvofiqligini ko‘rsatadi.

Sholg‘om barglarining mikroelement tarkibi

Tadqiqot natijalari shuni ko‘rsatdiki, sholg‘om barglari temir (2,0–2,7 mg/100 g), rux (0,4–0,6 mg/100 g), marganes (0,4–0,6 mg/100 g) kabi muhim mikroelementlarga boydir.

Temir gemoglobin sintezida ishtirok etib, kamqonlikning oldini olishda muhim rol o‘ynaydi. Rux va marganes esa immun tizimi faoliyatini kuchaytiradi hamda antioksidant fermentlar tarkibiga kiradi. Shuningdek, barglar tarkibida yod va kobalt kabi kam miqdorda bo‘lsa-da, organizm uchun zarur bo‘lgan elementlarning mavjudligi ularning biologik qiymatini yanada oshiradi.

MUHOKAMA

Olingan natijalar shuni ko‘rsatadiki, sholg‘om barglari ko‘pincha chiqindi sifatida qaralishiga qaramay, o‘zining boy mineral tarkibi bilan ko‘plab an’anaviy sabzavotlardan kam emas. Aksincha, ayrim hollarda ular ildizmevaga nisbatan ko‘proq biologik faol moddalarni saqlaydi.

Sholg‘om barglarining ratsionga kiritilishi organizmda mineral moddalarning yetishmovchiligini kamaytirishi, antioksidant himoyani kuchaytirishi va umumiy metabolik jarayonlarni yaxshilashi mumkin. Bu esa ularni nafaqat oziq-ovqat mahsuloti, balki funksional oziq-ovqat qo‘shimchalari va farmatsevtik preparatlar ishlab chiqarishda istiqbolli xomashyo sifatida ko‘rsatadi.

XULOSA:

Xulosa o’rnida shuni ta’kidlashimiz joizki, bugungi kunda oziq-ovqat sifatida o'simliklar qismlarining iste'moli tufayli, ayniqsa sholg’om bargining tarkibida tabiiy inson salomatligi uchun foydali bo’lgan vitamin va minerallar, shu qatorda yuqori miqdorda kaliy, kalsiy, magniy, fosfor kabi biologik faol elementlar mavjud. Yuqoridagi tahlillar shuni ko’rsatadiki, sholg’om bargi kaliyga eng ko’p boy bo’lganligi uchun qon bosimni meyorlashtiradi va yurak faoliyatini qo’llab quvvatlaydi, kalsiyni ko’pliga esa suyaklar va tish uchun muhim ahamiyat kasb etadi. Bu esa sholg’om bargidan

kelajakda funksional oziq – ovqat qo'shimchalari va farmatsevtik xomashyo sifatida yuqori istiqbolli xomashyo hisoblanadi.

Anotatsiya: *Karadarya Andizhan Uzbekistan and the Kyrgyz republic is located in the region of the river came from. This river is the main osce is one Syrdarya, in the middle of Asia's second largest river. One of the Fergana valley of Uzbekistan, located in a dense population area Karadarya will be. The river is mainly used for agricultural irrigation throughout the fergana valley and the largest city not only drinking water but also is used to provide water for industrial purposes. Water from ditches the largest city in the territory of the republic of uzbekistan, as well as drainage ditches and worsens the water quality of the river water Karadarya this biotik abiotik and has a serious impact on his environment. The purpose of the project-the water physical-chemical parameters and determine the level of pollution of the river using bioassaylardan qoradaryo. Karadaryapoll-toxic and evaluate the validity and usefulness of the test to monitor the pollution of the river Karadarya this bioassaylarni apply. Here we comparison the validity of the results obtained from the tests most likely bioassayni various toxic to monitor the pollution of water by a quick, responsive and economical ekotoksikologik means the description appreciate.*

Key words: *water quality, physical-chemical parameters, utilities, monitoring, ekotoksikologik of water systems, water pollution, toxic tests.*

QORADARYO DARYOSINING IFLOSLANISHINI BAHOLASH: SUVNING FIZIK-KIMYOVIY KO'RSATKICHLARI HAMDA TURLI TROFIK DARAJALARDAGI INDIKATOR ORGANIZMLAR YORDAMIDA TOKSIKLIK SINOVLARI ASOSIDA

Annotatsiya: *Qoradaryo O'zbekiston (Andijon viloyati) va Qirg'iziston Respublikasi hududidan oqib o'tuvchi daryodir. Ushbu daryo Markaziy Osiyodagi ikkinchi eng yirik daryo bo'lgan Sirdaryoning asosiy irmoqlaridan biri hisoblanadi. Qoradaryo O'zbekistonning zich aholi yashaydigan hududi — Farg'ona vodiysidan oqib o'tadi. Daryo suvidan asosan Farg'ona vodiysida qishloq xo'jaligi ekinlarini sug'orishda, shuningdek, yirik shaharlarni ichimlik va sanoat ehtiyojlari uchun suv bilan ta'minlashda foydalaniladi. Respublikadagi yirik shaharlardan keladigan oqava va drenaj suvlari Qoradaryo suvining sifatini yomonlashtiradi, bu esa daryoning biotik va abiotik muhitiga jiddiy ta'sir ko'rsatadi. Loyihaning maqsadi — bioanaliz (bioassay) usullari yordamida Qoradaryo suvining fizik-kimyoviy ko'rsatkichlarini va ifloslanish darajasini aniqlashdir. Shuningdek, daryo ifloslanishini monitoring qilishda ushbu bioanaliz usullarining samaradorligi va yaroqliligini baholash ko'zda tutilgan. Tadqiqot davomida turli toksik moddalar ta'sirida olingan natijalar taqqoslanadi hamda suv ifloslanishini tezkor, sezgir va iqtisodiy jihatdan samarali ekotoksikologik usulda kuzatish imkonini beruvchi eng maqbul bioanaliz usuli baholanadi.*

Kalit so'zlar: *suv sifati, fizik-kimyoviy ko'rsatkichlar, kommunal xo'jalik, monitoring, suv tizimlarining ekotoksikologiyasi, suv ifloslanishi, toksikologik testlar.*

ОЦЕНКА ЗАГРЯЗНЕНИЯ РЕКИ КАРАДАРЬЯ С ИСПОЛЬЗОВАНИЕМ ФИЗИКО-ХИМИЧЕСКИХ ПОКАЗАТЕЛЕЙ ВОДЫ И ТЕСТОВ ТОКСИЧНОСТИ С ИНДИКАТОРНЫМИ ОРГАНИЗМАМИ РАЗЛИЧНЫХ ТРОФИЧЕСКИХ УРОВНЕЙ

Аннотация: *Карадарья — река, протекающая по территории Узбекистана (Андижанская область) и Кыргызской Республики. Она является одним из основных притоков Сырдарьи — второй по величине реки Центральной Азии. Карадарья протекает через Ферганскую долину — густонаселенный регион Узбекистана. Воды реки используются преимущественно для орошения сельскохозяйственных культур в Ферганской долине, а также для обеспечения крупных*

городов питьевой и технической водой. Сбросы сточных и дренажных вод из крупных городов региона ухудшают качество воды в Карадарье, оказывая существенное влияние на биотические и абиотические компоненты речной экосистемы. Цель данного проекта — определение физико-химических показателей и уровня загрязнения воды реки Карадарья с использованием методов биотестирования. Также оценивается эффективность и пригодность этих методов для мониторинга загрязнения реки. Исследование включает сравнение результатов, полученных при воздействии различных токсичных веществ, и выбор наиболее оптимального метода биотестирования, обеспечивающего быстрый, чувствительный и экономически эффективный экотоксикологический контроль загрязнения воды.

Ключевые слова: *качество воды, физико-химические показатели, коммунальное хозяйство, мониторинг, экотоксикология водных систем, загрязнение воды, токсикологические тесты.*

Karadarya at Andizhan region, a river is, with its source in Kyrgyzstan is, Kazakhstan's main osce is one. The tar river, together with the length of his 318 km, basin area 28,6 thousand km². It Karagulja Fergana ridge to the south-east side people centuries and get a ridge of tar and centuries came from the north side of the river is formed from the joining of qoragulja. The river has two major osce-Dm and Kur-Shab river is added to. The river is fed by snow and ice the water. Karadarya basin of uzbekistan the central part of the island is located in the largest river system that flows into the sea. This basin is one of the country's most important water sources, big agriculture, fisheries, farming and industrial activities, it is very important. The river and its surrounding ecosystem plays an important role in maintaining the biological diversity of the osce. Ivanov (2020) by out go and research Karadarya basin clams ecology and their water ecosystem gives you detailed information about the role. Karadarya basin plant and animal species, the including clams of the water chemical composition and environmental stability will take an active part in. Also, in the pool, which play an important role in maintaining the ecological balance and mutually influencing each other, there are various countries[1.2].

Water samples of the river until the first year of the project to take place on a seasonal basis is taken from qoradaryo 6 samples. Physical-chemical parameters were measured and water samples were analyzed using standard analytical methods. Karadarya of the river, the physical-chemical parameters of the water pollution index (vp) and have makroinvertenlarga based bentu biotik the index will be translated. Water samples for heavy metals, pesticides, pollutants and type, respectively, with the presence of potential spektroskopik like mikroplastmassalar main methods are analyzed. Microtox test, Le sp like the toxic test. Growth inhibition test, the funeral sp. Sharp test of the embryo and the frog immobilizasiya Teratogenez analysis: Xenopus, FETAX for each test is carried out in accordance with standard procedures based on the description. Sensor body as fluorescent bacteria Vibrio fischeri, Crustacean Daphnia be substituted, the water is fresh water of the plant Le minor and amphibians Xenopus laevis is used. Of death out come and effective Azerbaijanis agree to these values (LCs and the ec) and Teratogenic index (the oldest and largest) is calculated for the test toxic and toxic profile of the curved lines are drawn [3].

Field work and to take samples of the forms of implementation of the project until the first year after the date on a seasonal basis, the physical-chemical parameters are also measured and analyzed. The river and its water quality and of the class of animals on the basis of indicators have bentu makroinvert biotik is determined by the vp. In addition, water samples for heavy metals, pesticides and also the presence and types of pollutants mikroplastmassalar of those years as the main potential analysis. bioassays will be held in the second year of the project and the statistical analysis is conducted. [1]

Karadaryapoll-test on different trophic levels of the toxic bioindikatorlar with fresh water ecosystem on the first use of a comprehensive project; as well as in environmental samples derived from qoradaryo not only affect the physical-chemical parameters, but also pesticides, heavy metals and also mikroplastikalarni analysis. To get a reliable data base for research on Karadaryapoll new water protection and cleaning guide.

The river is the largest river in the south of Kyrgyzstan and eastern Uzbekistan Karadarya. This river is one of the main osce sir-darya, central asia's second largest river. The length of 177 km and its basin area qoradaryo 30.100 km² (1-picture)

The form 1. Reading area

Physical-chemical parameters and identify pollutants. Water quality parameters measured and analyzed per year on a seasonal basis. Saline, ph, ec, TD, T, do, and Sat as physical-chemical parameters. O_2 is measured in meters, portable place. Night water samples +4 is stored at SE. Other physical-chemical parameters, heavy metals and pesticides analysis carried out using standard analytical methods (APHA, 2005) (table 1).

Table 1. Parameters measured and analyzed.

Bentu mp particles and have makroinvertezlar with work. The land is taken up by a plastic bucket to get water samples from six samples with the place. MP separation was carried out according to the steps and the other coppock. (2017) the method of (2-picture). MP classification Hidalgo-Ruz and other., (2012) and Virikkek and other., (2016) using stereomikroskop. Each filter from the plastic particles of series type, and color into account is taken.

Animals have makroinverturali sample from bentu will car out to get Aq consortium (50) (30-picture) and on the size of 250 2002) 2002 classic cm in size on the bottom of the shock is carried out on a seasonal basis using the network of.

Mikrotoks the test with qoradaryo from the taken water samples whether toxic determineMicrotox. Mikrotox, the environment at toksikologik mikroskale as a tool for biomonitoring of environmental samples is used to determine toxic pollutants from the river. The analysis in accordance with the protocol specified by the manufacturer main trial is held in the original sample is diluted in a series of five (Microbics Corporation, 1992). Referral toxicants, phenol (organic) and zinc sulfate (zns the$_4$·7h$_2$O, inorganic) used as a positive control. *Microtox*, *Reagents bacteria, Vibrio fischeri* curl nr b-11177 's selected strains of fluorescent appropriate to bacteria is used as the test organism. Luminescence (Ec) is considered as the effective concentration to inhibit the last point. [1]

A water sample was taken from the river to determine its toxicity using Lemna sp. The growth of *Lemna sp.* was used as a test parameter. Freshwater samples associated with macrophytes were tested using Lemna minor, following the guidelines of the European Commission (EC, 1999).

The *L. minor* test for detecting the effects of pollution on vegetative growth was conducted as a 7-day static assay. Water samples at different concentrations were tested by allowing monocultures to grow under controlled conditions.

Test conditions included a light intensity of 4000–4500 lux and a temperature of 25 ± 2°C. Each test solution (approximately 450 ml) was maintained to ensure proper root development. At least three replicates were prepared for each treatment, each containing two plants with three fronds.

At the end of the test period, the increase in frond number and dry weight was measured. The growth rate (EC) and percentage inhibition were calculated, and the effective concentration (EC value) was determined as the endpoint.

The toxicity of water samples from the Karadarya River was determined using Daphnia sp. The *Daphnia sp.* acute immobilization test was conducted to support environmental monitoring and to assess freshwater pollution, following OECD guidelines (OECD, 2004).

Neonates (less than 24 hours old) were exposed to the test solutions under controlled conditions. The experiment included five different concentrations and a control group. Each treatment was replicated, with 10 organisms per replicate and two replicates per concentration, over a 48-hour exposure period. The test was performed under static conditions at a temperature of 20 ± 2°C, with a photoperiod of 16 hours light and 8 hours dark. [6.8]

At the end of the test, immobilization was recorded, and the median lethal concentration (LC_{50}) and effective concentration (EC_{50}) values were determined as endpoints. The toxicity of water samples from the Karadarya river was determined using the FETAX test. This internationally recognized assay uses embryos of Xenopus laevis as a model organism to evaluate developmental toxicity.

The test was conducted in accordance with the guidelines of the American Society for Testing and Materials (ASTM, 2004). Adult male and female *X. laevis* were maintained under laboratory conditions. Breeding was induced by intralymphatic injection of gonadotropin hormones. After induction, pairs were transferred to aquaria for spawning and egg laying.

Embryos were collected and exposed to different concentrations of water samples under controlled conditions. During the exposure period, endpoints such as mortality, malformation, and growth inhibition were recorded. Malformations were identified according to a standard abnormality atlas (e.g., Bantle et al., 1998).

At the end of the test, the median lethal concentration (LC_{50}) and effective concentration (EC_{50}) were calculated based on dose–response curves. In addition, the teratogenic index (TI) was determined to assess embryotoxic effects.

The obtained data were subjected to statistical analysis and interpretation. The physicochemical water quality of the Karadarya river was classified according to relevant water quality standards. Polymer types of plastic samples were analyzed using FTIR spectroscopy with an ATR accessory (PerkinElmer Spectrum Two FTIR spectrometer). The elemental composition of the samples was determined by Energy Dispersive Spectroscopy.

Biotic indices and diversity indices of benthic macroinvertebrates were calculated using ASTERICS (version 4.04). Similarity between sampling stations based on benthic macroinvertebrate composition was assessed using the Bray–Curtis similarity index (Somerfield, 2008; Young, 2008).

Cluster analysis was performed using the UPGMA (Unweighted Pair Group Method with Arithmetic Mean) algorithm to illustrate relationships among samples. Correlation analysis was conducted using Pearson's biotic index with SPSS version 20.0.

The relationships between benthic macroinvertebrates and physicochemical variables were analyzed using redundancy analysis (RDA) in CANOCO version 4.5. The suitability of RDA was verified using detrended correspondence analysis (DCA) (ter Braak, 1988).

Toxicity parameters (LC_{50} and EC_{50}) obtained from bioassays were calculated using probit analysis in SPSS 20.0. One-way analysis of variance (ANOVA) was used to compare control and treatment groups.

Scientific novelty (corrected version):

The scientific novelty of the research lies in addressing the defined objectives and providing new insights into the ecological status and toxicity assessment of the Qoradaryo River, with the potential to obtain reliable and scientifically grounded results.

The Fergana Valley can be considered a microcosm of Central Asia. Its geographical location, historical development, and ecological and economic significance increase the importance of studies focused on its environmental protection.

The valley is distinguished by its rich biodiversity, including a wide variety of plant and animal species. This biological richness is largely explained by its unique geographical setting, as the valley is surrounded by mountain ranges that create diverse ecological conditions.

In addition, the Fergana Valley is rich in freshwater resources. The hydrological characteristics of its river systems play a crucial role in supporting agricultural activities and sustaining the regional economy.

However, water pollution has become a major environmental concern in the valley's ecosystem. Within the territory of Uzbekistan, large amounts of agricultural, domestic, and industrial waste are discharged directly or indirectly into rivers such as the Karadarya river. This pollution has significant negative impacts on both biotic and abiotic components of the environment.

The main objective of this study is to determine the level of pollution in the Karadarya river by analyzing its physicochemical water parameters and by applying bioassays. Water quality is traditionally assessed based on physicochemical parameters; however, in many cases, these parameters alone are insufficient to evaluate the actual effects of pollutants on living organisms. [10]

Bioassays provide an integrated assessment of environmental toxicity by considering the combined effects of all components present in a sample. In this context, biological testing serves as a complementary approach to physicochemical analysis, allowing for a more direct evaluation of toxic impacts (Hernando et al., 2005).

This project primarily aims to compare physicochemical water quality parameters with the results obtained from bioassays. It also seeks to evaluate the applicability, validity, and usefulness of bioassay methods as effective tools for monitoring pollution in the Karadarya river. In collaboration with international partners, this study introduces bioassays as a relatively new research approach in this region.

Different toxicity tests conducted in the Karadarya river are compared to identify the most reliable, rapid, sensitive, and cost-effective bioassay methods for ecotoxicological assessment. The ultimate goal is to determine which bioassays are most suitable for detecting environmental toxicity in freshwater ecosystems.

To the best of our knowledge, this study represents one of the first comprehensive applications of bioindicators across different trophic levels in the freshwater ecosystem of the Fergana Valley. In addition to physicochemical parameters, the study considers the potential effects of pollutants such as pesticides and heavy metals present in water samples.

Thus, this research aims to fill an existing gap in the literature by integrating multiple assessment approaches for evaluating pollution in the Karadarya river. The findings are expected to support the development of a rapid, sensitive, and cost-effective ecotoxicological monitoring system, contributing to improved water quality management in the freshwater ecosystems of the Fergana Valley.

The research problem of this study is defined through an analysis of global scientific developments and competitive research trends in the field of freshwater ecology and pollution assessment.

Freshwater resources cover less than 1% of the Earth's surface; however, they are essential for sustaining life. Due to increasing anthropogenic pressures, both the quantity and quality of freshwater resources are continuously declining worldwide. Environmental contamination by agrochemicals, heavy metals, and other toxic substances has become a major global concern, posing significant risks to ecosystems and human health (Nicolopoulou-Stamati et al., 2016; FAO, 2019; Gan et al., 2023; Chen et al., 2023).

Water is particularly vulnerable to pollution because it acts as a universal solvent, capable of dissolving more substances than any other liquid on Earth. Both point-source and non-point-source pollutants enter aquatic systems from various pathways, contributing to the degradation of water quality (Karthik et al., 2018; Pandey et al., 2023).

Pollution of water bodies leads to the contamination of aquatic ecosystems and groundwater, resulting in toxic effects on wildlife and posing serious threats to human health. These pollutants negatively affect the growth, survival, and reproduction of aquatic organisms (van den Brink, 2011; Pathiratne & Kroon, 2016).

Freshwater habitats, which support a wide range of biodiversity, are being lost at an alarming rate. According to the WHO/UNICEF Joint Monitoring Programme (2019), more than 2 billion people lack access to safely managed drinking water, and over 1 billion people do not have adequate sanitation services.

All these pressures contribute to the disruption of ecological balance and the degradation of water resources. Consequently, freshwater ecosystem pollution is considered one of the most critical environmental challenges of the 21st century.

The environmental effects of pollutants are diverse and often interrelated. In natural ecosystems, the impact of pollutants on living organisms—particularly their early warning signals for human health risks—is commonly assessed using bioindicators (WWAP, 2013; 2015).

Pollutants can cause a wide range of adverse effects, including mortality, cancer, tumor formation, physical injuries, reduced reproductive success, growth inhibition, immune suppression, endocrine disruption, and damage to cells and DNA. In addition, they may induce teratogenic effects during development. The complexity and diversity of these impacts make them difficult to assess comprehensively. Importantly, many of these effects are chronic and not immediately visible, yet they can have long-term consequences across entire food chains (WHO, 2012). Aquatic pollutants affect all biological groups in ecosystems, from primary producers to higher trophic levels.

Due to fertile soils and abundant water resources, the Fergana Valley has a highly developed agricultural sector. Today, a large proportion of agricultural production in the region relies on pesticide use. Approximately 72 active chemical substances are permitted for agricultural use in Uzbekistan; however, more than 60% of these are not allowed in the European Union.

Given the intensive use of land and water resources in the valley, the environmental situation has become increasingly complex. Rivers such as the Syrdarya River and Karadarya river are heavily utilized for irrigation, domestic, and industrial purposes. As a result, they are exposed to significant pollution from agricultural runoff (pesticides and fertilizers), industrial waste, and other contaminants (Taltakov, 2015). Long-term monitoring indicates increasing salinity levels in river waters over the past 40 years, largely due to drainage return flows carrying salts and agrochemicals. In addition to agricultural pollution, urban wastewater and industrial discharges also contribute significantly to water contamination, particularly in densely populated areas (Wegerich et al., 2015).

In response to environmental challenges, the Government of Uzbekistan established the State Committee for Environmental Protection in 1992. In parallel, non-governmental organizations (NGOs) have played an important role in promoting regional initiatives for water resource conservation and environmental protection.

Freshwater is essential for all living organisms, and its sustainable management is critical. Assessing water quality and identifying pollution sources are fundamental steps in developing effective environmental protection strategies. The

Water Framework Directive (WFD, 2000) emphasizes achieving good ecological and chemical status of water bodies and preventing further environmental degradation.

An integrated approach combining physical, chemical, and biological assessments is essential for accurately evaluating water pollution (Nai et al., 2023). In this context, bioassays represent rapid, sensitive, and cost-effective tools for monitoring environmental toxicity.

The KaradaryaPoll project is a comprehensive study that integrates physicochemical analysis, assessment of pesticides, heavy metals, and microplastics (MPs), along with bioassays using bioindicators from different trophic levels. This represents one of the first such integrated approaches applied to freshwater ecosystems in the Fergana Valley.

The project aims to establish a reliable scientific database to support water protection and remediation strategies for the Karadarya river. Through international collaboration, it seeks to develop innovative ecotoxicological assessment approaches to address freshwater pollution—one of the most pressing global environmental challenges—and to generate new scientific knowledge and interpretations.

SYNTHESIS, SINGLE-CRYSTAL STRUCTURE AND EPR CHARACTERIZATION OF A BENZOYLACETONE-DERIVED SCHIFF BASE AND ITS CU(II) COMPLEX

Abstract: *A new benzoylacetone-derived Schiff base ligand, bis(benzoylacetone) propylene diimine (BBP), and its Cu(II) complex were synthesized and characterized. The crystal structure of the BBP ligand was determined by single-crystal X-ray diffraction analysis, which revealed that the compound crystallizes in the orthorhombic crystal system with the Pbcn space group. The crystallographic refinement parameters confirmed the good quality and reliability of the obtained structure. The Cu(II) complex was obtained in polycrystalline form and investigated by X-band electron paramagnetic resonance (EPR) spectroscopy. The EPR spectrum exhibited a characteristic broad signal with a g value of 2.0646, confirming the coordination of Cu(II) ions within the Schiff base environment. The obtained spectral data suggest a distorted square-planar geometry around the copper center. The synthesized compounds may be considered promising systems for further coordination and spectroscopic investigations.*

Keywords: *Schiff base, benzoylacetone, Cu(II) complex, single-crystal structure, EPR spectroscopy, polycrystalline complex.*

СИНТЕЗ, МОНОКРИСТАЛЛИЧЕСКАЯ СТРУКТУРА И ЭПР-ХАРАКТЕРИСТИКА ШИФФОВА ОСНОВАНИЯ НА ОСНОВЕ БЕНЗОИЛАЦЕТОНА И ЕГО КОМПЛЕКСА CU(II)

Аннотация: *Синтезированы новое шиффово основание на основе бензоилацетона бис(бензоилацетон) пропилендиимин (BBP), а также его комплекс Cu(II). Кристаллическая структура лиганда BBP была исследована методом монокристального рентгеноструктурного анализа, который показал, что соединение кристаллизуется в орторомбической сингонии с пространственной группой Pbcn. Параметры структурного уточнения подтвердили хорошее качество и надёжность полученной структуры. Комплекс Cu(II) был получен в поликристаллической форме и исследован методом ЭПР-спектроскопии X-диапазона. ЭПР-спектр характеризуется широким сигналом с g-фактором 2.0646, что подтверждает координацию ионов Cu(II) в окружении шиффова основания. Полученные спектральные данные указывают на искажённую квадратно-плоскую геометрию вокруг центра меди. Синтезированные соединения могут представлять интерес для дальнейших координационных и спектроскопических исследований.*

Ключевые слова: *шиффово основание, бензоилацетон, комплекс Cu(II), монокристаллическая структура, ЭПР-спектроскопия, поликристаллический комплекс.*

1. Introduction

Schiff base ligands are widely studied in coordination chemistry because of their simple synthesis and effective coordination ability toward transition metal ions [1–4]. These compounds are formed through condensation reactions between primary amines and carbonyl compounds, resulting in azomethine (C=N) groups that play an important role in metal coordination [5,6]. Schiff bases containing nitrogen and oxygen donor atoms readily form stable complexes with transition metal ions such as Cu(II), Ni(II), and Co(II) [7–9]. Among transition metal complexes, Cu(II)-based Schiff base systems attract particular interest due to their magnetic and spectroscopic properties.In this study, a new benzoylacetone-derived Schiff base ligand, bis(benzoylacetone) propylene diimine (BBP), was synthesized and characterized by single-crystal X-ray diffraction analysis. Furthermore, the corresponding Cu(II) complex was investigated by X-band EPR spectroscopy to evaluate its structural and spectroscopic properties.

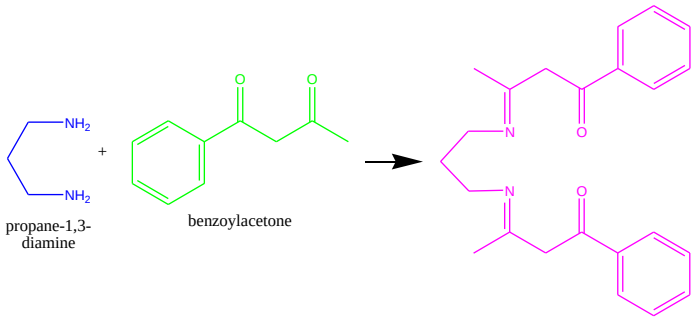
2. Materials and Methods

2.1. Materials and physical measurements

All chemicals and solvents were purchased from Sigma-Aldrich and used without further purification. Electron paramagnetic resonance (EPR) spectra were measured in the X-band region using a Varian E-Line Century Series EPR spectrometer on polycrystalline samples at room temperature.Single-crystal X-ray diffraction data for the BBP ligand were collected using MoKα radiation (λ = 0.71073 Å). The crystal structure was solved and refined using the Olex2 crystallographic package.

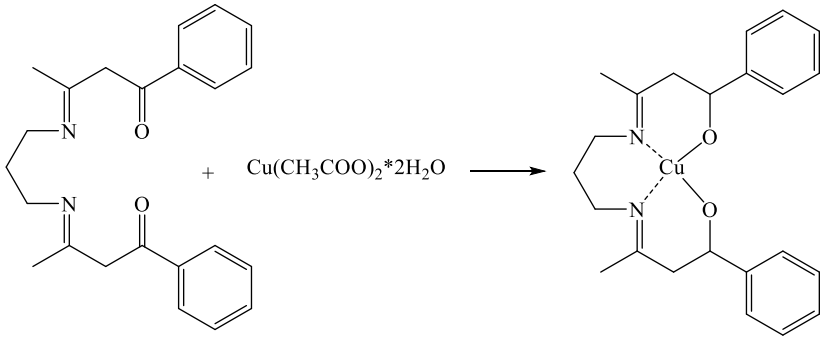
2.2. Synthesis of Schiff base ligand [Bis(Benzoylacetone) Propylene Diimine] (BBP)

The Schiff base ligand was synthesized according to a modified literature procedure [10]. Briefly, 2 mmol of 1,3-propanediamine dissolved in 20 mL of ethanol was added dropwise to a solution containing 4 mmol of benzoylacetone in 50 mL of ethanol under continuous stirring at room temperature. The reaction mixture was stirred for 5 h, during which a white precipitate was formed. The resulting product was further stirred for an additional hour, filtered, washed several times with ethanol, and recrystallized from ethanol. The obtained BBP crystals were dried under vacuum at 60 °C for 2 h. The synthesis of BBP is shown in Scheme



2.3. Synthesis of Cu(II) complex

1 mmol of the BBP Schiff base ligand was dissolved in 20 mL of ethanol and added to a solution of $Cu(CH_3COO)_2{\cdot}2H_2O$ (0.2 g) dissolved in 20 mL aqueous ammonia solution under constant stirring. The resulting mixture was heated at 60–70 °C for several hours. After several days, green Cu(II) polycrystals were formed, separated by filtration, washed with ethanol, and dried at room temperature. The synthesis is shown in Scheme 2.



Scheme 2

3. Results and Discussion

Single-crystal X-ray diffraction analysis of BBP ligand The molecular structure of the BBP Schiff base ligand was determined by single-crystal X-ray diffraction analysis. The crystallographic investigation revealed that the ligand crystallizes in the orthorhombic crystal system with the Pbcn space group. The asymmetric unit contains one

crystallographically independent molecule of the BBP ligand. The refined unit-cell parameters were determined as a = 24.846(2) Å, b = 9.6516(9) Å, and c = 9.1786(8) Å, with a unit-cell volume of 2201.0(3) Å³ and Z = 4. The molecular structure confirms the successful formation of the Schiff base ligand through condensation of benzoylacetone with 1,3-propanediamine, resulting in the formation of azomethine (C=N) groups. The ligand contains nitrogen and oxygen donor atoms capable of participating in coordination with transition metal ions. The crystal packing is stabilized mainly through intermolecular interactions and van der Waals forces.The crystallographic refinement converged satisfactorily with final values of R1 = 0.0605 and wR2 = 0.1469 for observed reflections [$I \geq 2\sigma(I)$], while the goodness-of-fit on F^2 was 1.061. The residual electron density values (0.17 and −0.27 e Å⁻³) indicate good structural refinement quality. Furthermore, cumulative intensity distribution and checkCIF analyses revealed no significant evidence of crystal twinning, confirming the reliability of the obtained crystal structure.The molecular structure of the BBP ligand obtained from single-crystal X-ray diffraction analysis is shown in Figure 1. The crystal packing arrangement presented in Figure 2 demonstrates the intermolecular organization of the molecules within the crystal lattice. The crystallographic data and refinement parameters are summarized in Table 1, and the selected atomic coordinates together with equivalent isotropic displacement parameters are listed in Table 2.

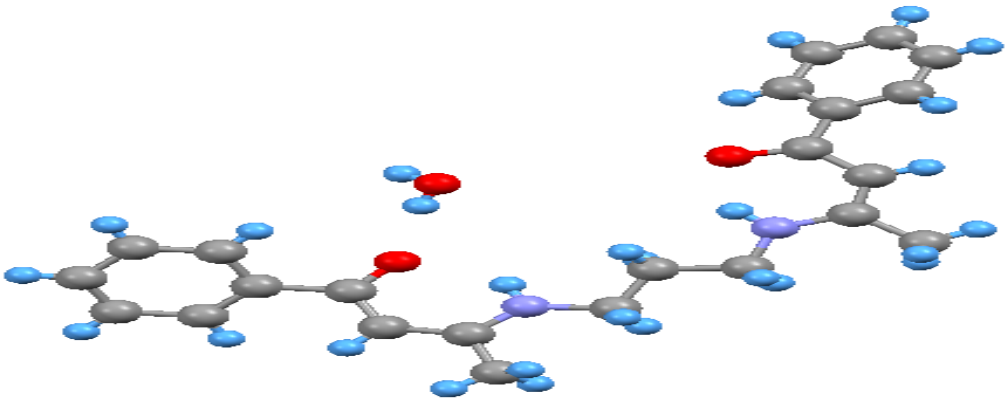

Figure 1 Crystal packing of the BBP ligand showing intermolecular interactions within the crystal lattice

EPR spectral analysis of Cu(II) complex The EPR spectrum of the synthesized Cu(II) complex was recorded at room temperature in the X-band region (ν = 9.455 GHz). The spectrum exhibited a broad resonance signal centered at approximately 327 mT with a calculated g-factor value of 2.0646. The observed g value is significantly higher than the free electron value (g = 2.0023), confirming the presence of Cu(II) ions in the coordination environment of the Schiff base ligand.The broad resonance line and linewidth value of 10.01 mT indicate considerable spin–orbit coupling and exchange interactions around the copper center. The absence of resolved hyperfine splitting may be attributed to dipolar broadening and intermolecular magnetic interactions commonly observed in polycrystalline Cu(II) Schiff base complexes. Similar EPR behavior has been reported previously for Cu(II) complexes containing nitrogen and oxygen donor ligands.The obtained EPR parameters suggest a distorted square-planar coordination geometry around the Cu(II) ion. These spectral results confirm the successful coordination of the BBP Schiff base ligand with the Cu(II) center.The X-band EPR spectrum of the synthesized Cu(II) polycrystalline complex recorded at room temperature is presented in Figure 3. EPR parameters: g = 2.0646; linewidth = 10.01 mT; microwave frequency = 9.455 GHz; modulation frequency = 100 kHz; temperature = 23.6 °C.The X-band EPR spectrum of the synthesized Cu(II) complex in solution exhibited an intense resonance signal in the 320–335 mT region, characteristic for Cu(II)-based Schiff base complexes. The observed broad signal confirms the coordination of Cu(II) ions with the ligand donor atoms. The spectral pattern indicates a distorted square-planar geometry around the copper center. Line broadening may be associated with spin–orbit coupling and solvent effects in solution medium.

4. Conclusion. A new benzoylacetone-derived Schiff base ligand, bis(benzoylacetone) propylene diimine (BBP), and its Cu(II) complex were successfully synthesized. Single-crystal X-ray diffraction analysis revealed that the BBP ligand crystallizes in the orthorhombic crystal system with the Pbcn space group. The Cu(II) complex was further characterized by X-band EPR spectroscopy, where the observed broad resonance signal (g = 2.0646) confirmed the coordination of Cu(II) ions within the Schiff base environment. The EPR results indicated a distorted square-planar geometry around the copper center. Overall, the structural and spectroscopic investigations verified the successful formation of the synthesized compounds and demonstrated their potential significance for further coordination and spectroscopic studies.

Determination of heavy metal ions in environmental objects by sorption-spectroscopic methods

M.N.Mamedova
Tashkent State Agrarian University, d.f.ch. PhD
Z.A.Smanova
National University of Uzbekistan, professor, doctor of chemistry

Abstract. *In the study, soil samples taken from the industrial area of Ahangaran factories were studied using mass spectrometric (ICP-MS) analysis methods. The results of the analysis of heavy metals in the analyzed soil are presented: V, Cr, Mn, As, Sr, Mo, Cd, Sn, Sb, Pb ions. As a result of monitoring, Cr ions were found to be above the permissible limit and exceeded the RPL.*

Keywords: *Heavy metals, soil, mass spectrometry, inductively coupled plasma (ISP), mass spectrometry (MS), MPS, monitoring, Tashkent region, Ahangaran industrial zone, sorption spectroscopy.*

ОПРЕДЕЛЕНИЕ ИОНОВ ТЯЖЕЛЫХ МЕТАЛЛОВ В ОБЪЕКТАХ ОКРУЖАЮЩЕЙ СРЕДЫ СОРБЦИОННО-СПЕКТРОСКОПИЧЕСКИМИ МЕТОДАМИ

Аннотация. *В ходе исследования были изучены пробы почвы, отобранные на территории промышленной зоны Ахангаранского завода, с использованием масс-спектрометрического (ИСП-МС) анализа. Представлены результаты анализа ионов V, Cr, Mn, As, Sr, Mo, Cd, Sn, Sb, Pb в исследуемой почве. В результате мониторинга установлено превышение допустимых концентраций ионов Cr в пределах ПДК и ПДК.*

Introduction. Nowadays, the state of the environment is the most important factor determining the vital activity and development of man and society as a whole. One of the most common chemical pollutants is pollution by heavy metals. The high content of many chemical elements and their compounds is associated with natural and man-made processes occurring in the world around us. Heavy metals are found in all natural environments - the atmosphere, soil, water, plants, and animals. In terms of toxicity, they occupy the second place in environmental pollution and constitute the most dangerous group of pollutants of the biosphere.[1].

Factories, ore mines, and waste dumps are chromium concentrators. Anthropogenic pollution of soil and atmospheric air with chromium ions leads to increased environmental pollution, as well as an increase in the amount of chromium ions in plants growing in areas contaminated with chromium ions, especially in the leaves of plants. In the conditions of the industrial zone of a metallurgical plant, the accumulation coefficient of the element in leaves ranges from 2.38 to 6.68. [2].

Taking into account the high toxicity of heavy metals and their ability to accumulate in soil, plants, animals, and humans, they are included in the list of the most dangerous chemical pollutants, it is necessary to study the levels of soil pollution and ensure that they do not exceed the established standards.

Chromium is an inert element in most natural conditions. It is present in the soil mainly as Cr^{3+}, and the presence of organic matter contributes to its accumulation in the soil system. As an element with a small electron radius, it also binds to moist soils, and this situation increases with increasing pH. Wetting the soil profile has a significant effect on the mobility and accumulation of chromium in plants, and chromium uptake in moist soil can increase by up to 5 times. In addition, chromium also binds to organic matter in the soil. [3].

Heavy metals and their compounds have a strong negative impact on human health and constitute an important group of pollutants. The main group of environmental pollutants is heavy metals. These metals are the most commonly used metals in industrial facilities. In environmental monitoring and environmental pollution studies, metals with a density of 5 g/sm^3 and above are mainly included. These heavy metals pose a serious threat not only to humans, but also to all organisms on Earth. These mainly include Cr, Pb, Co, Zn, Cu, Sn, Mo, As, V, Hg, Cd, Bi, Ni, Sb, Mn. The chromium ion studied in our research work belongs to class II in terms of hazard level.

Depending on the level of toxicological impact, according to StateS (GOST) 17.4.1.0283, chemicals are divided into three classes:

Class I (highly hazardous) - As, Cd, Hg, Be, Se, Pb, Zn;

Class II (moderately hazardous) - B, Co, Ni, Mo, Cu, Sb, Cr;

Class III (low hazardous) - Ba, V, W, Mn, Sr. [4].

It is located in the Ahangaran district of Tashkent region, 50 km from Tashkent. Ahangaran district has a large industrial area, where about ten different production and processing plants are located. In particular, the “Ahangaran Cement” joint-stock company is one of the largest cement manufacturers in the republic, and “Ahangaranshifer” JSC and various other plants are located in the industrial zone.[5].

Although the factories located in the Ahangaran industrial zone play an important role in the development of the economy of Uzbekistan, they have a serious impact on the environment and the health of the population. Cement, metal, fittings, industrial waste are associated with the ecological state of the Ahangaran district, and pollution of water, soil and atmosphere has a negative impact on plants and animals. [6].

Experimental part. In order to determine the important components of the soil and study some of its properties, it was prepared for analysis according to SS (GOST).[7]. The soil was spread on clean paper and dried at room temperature. After the soil dried, the large components in it were crushed. In order to obtain an average soil sample for laboratory analysis, it was divided into several cells using the envelope method, soil was taken from each and weighed on an analytical balance to a mass of 10 g. This prepared soil was ground in a special mortar and passed through special 1 mm sieves. Each of the soil samples taken from the industrial zone areas was prepared for analysis using the above method.

10 g of soil samples were taken from the areas. The samples were dissolved in a 1:1 ratio, i.e., 20 ml of concentrated HCl acid and 20 ml of distilled water. The solution was heated to boiling in a water bath for 1 hour. The solution was cooled and heated in a water bath twice in succession. After a day, the solution was heated again and precipitated. The color changed due to the presence of various metal ions in the composition. The solution was filtered into 250 ml volumetric flasks and the precipitate was separated. [8].

To concentrate chromium ions from the soil solution, a polymer sorbent immobilized with an organic reagent was used. Polymer sorbents were used from natural silk fibroin fiber, a waste fiber of the “Urgench teks” LLC factory. Sulforsazen, eriochrome black, thoron, arsenazo (III), sulfosalicylic acids were used from organic reagents, and the results showed good results with black eriochrome, i.e. GNGS organic reagent. An aliquot of the soil solution was placed in a 50 ml beaker from the sample to be analyzed, and 5 μg of Cr ion solutions and 5 ml of a covering agent, 0.2 g of an organic reagent immobilized on silk fibroin fiber were added to 5 ml of a universal buffer solution pH=7-8 and sorption was carried out for 10-15 minutes.

The results obtained and their discussion. In the study, heavy metals in soil samples taken from the Ahangaran industrial zone and adjacent areas were analyzed using the mass spectrometric (ICP-MS) instrument "UzOU 0677:2015 (МВИ №499-АЭМ/МС)". Soil samples from the industrial zone were taken from distances of 1 km, 5 km, 10 km from the area and monitored. The presence of 61 elements in the soil sample was determined. The amount of some metals present in the data (ppm, mg/g, g/t) is presented in table-1 below.

table-1. The composition of elements in soil samples according to ICP-MS data, mkg / g

№	Metal name	From the zone 1 km	From the zone 5 km	From the zone 10 km
1	**V**	150	110	100
2	**Cr**	120	81,0	65,0
3	**Mn**	1300	1100	910

4	**As**	29,0	23,0	21,0
5	**Sr**	250	220	190
6	**Mo**	4,40	4,00	3,50
7	**Cd**	0,170	0,280	0,094
8	**Sn**	3,90	2,90	3,40
9	**Sb**	2,00	2,70	2,70
10	**Pb**	41,0	46,0	37,0

The distribution of Cr ions in soil samples from the Ahangaron industrial area is presented in Table 2 and Diagram 1. When analyzing the results, it was observed that the amount of chromium metal in the soil composition decreases with distance from the industrial area.

table-2. ICP-MS analysis of Cr ions in soil samples from the Akhangaran industrial zone, mkg/g

№	Metal name	From the zone 1 km	From the zone 5 km	From the zone 10 km
1	**Cr**	120	81,0	65,0

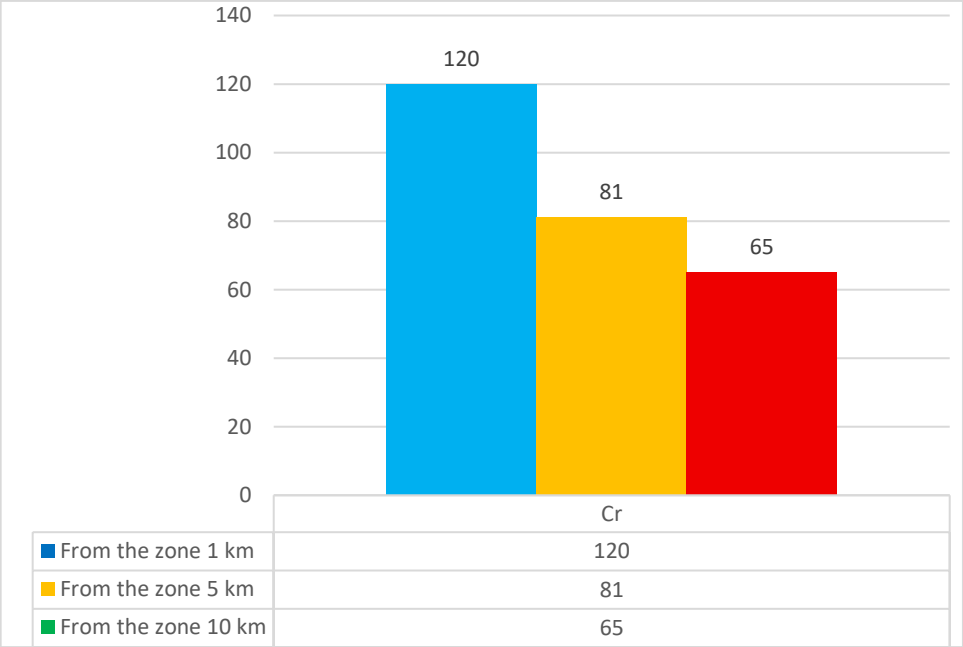

Diagram 1. Distribution diagram of chromium metal

A sorption-spectroscopic method for the determination of chromium ions in environmental objects has been developed. The method involves concentrating metals from a sample using a polymer sorbent immobilized with organic reagents.

The immobilization process of solutions of organic reagents used in the study on sorbents is carried out using the following methods: fiber samples with a diameter of 2 cm and a mass of 0.2 g are placed in a beaker with a 0.1 M HCl solution (50 cm3). In this case, the initial sorbent is converted to the Cl- form. Then the carrier fibrous sorbent is washed several times with distilled water, and the organic reagent obtained for immobilization is measured in a volume of 10 ml and placed in a 50 ml measuring glass beaker. Then, the immobilization process is carried out by placing the fiber activated in HCl acid in the beaker, the process time is continued from 5 minutes to 24 hours. After that, the fiber is washed with distilled water, and the immobilized fiber is washed with distilled water 2 times with 50 cm3, while holding the immobilized fiber with a glass rod. In a wet state, the fiber is placed in a Petri dish. The organic reagent remaining in the beaker was determined using an absorption spectrometer, while the portion immobilized on the fiber was determined using a reflectance spectrophotometer [9].

The complexation process with organic reagents immobilized on polymer fibers is mainly carried out by passing metal solutions from 10 ml to 200 ml at room temperature through a microcolumn containing 0.2 g of sorbent at a rate of 1-

10 ml/min for sorption concentration. The sorbent is initially concentrated by passing the solution at pH values that concentrate metal ions. The sorption concentration and spectroscopic determination of these metals helps to solve environmental problems.

Conclusion. As can be seen from the table, if we compare the depletion of metals, the metals are arranged in decreasing order from Figure 1 to Figure 4. Among the metals, the highest amount of Mn is 1300-910 μg/g. It can be observed that Sr is 250-190 μg/g; V is 150-100 μg/g; Cr is 120-81 μg/g; Pb is 41-37 μg/g; As is 29-21 μg/g; Mo is 4.4-3.5 μg/g; Sn is 3.9-3.7 μg/g; Sb is 2-2.7 μg/g; Bi is 0.51-0.46 μg/g; Cd is 0.17-0.094 μg/g. The main factor that causes the concentration of heavy metals to exceed the TLV is the emission of waste from metallurgical plants and other plants in the industrial area.

Annotattsiya. *Ushbu maqolada O‘zbekiston florasining noyob va yo‘qolib borayotgan kauchukli endemik turi - Taxtajanantha tau-saghyz (Lipsch. & G.G.Bosse) Zaika, Suxor. & N.Kilian turining O‘zbekiston florasida tarqalgan taksoni tabiiy populyatsiyasini tiklash va urug‘larining unuvchanligini oshirish bo‘yicha tadqiqot natijalari keltirilgan. Tadqiqotning asosiy maqsadi turning urug‘larini stratifikatsiya va prayming orqali o‘sish darajasini yaxshilash, sog‘lom ko‘chatlar olish hamda kelgusida sanoat miqyosida kauchuk ishlab chiqarish uchun moddiy baza yaratishdan iborat. Tajribalar davomida urug‘larga past ijobiy haroratda (+5–+7°C) 26330 kun stratifikatsiya, shuningdek 50–100 mg/l kontsentratsiyada askorbin kislotasi va biogumusli eritmalar bilan prayming usullari qo‘llanildi. Natijada urug‘larning unuvchanlik darajasi 94% gacha oshdi, kontaminatsiya darajasi esa sezilarli kamaydi. Shu bilan birga, 10% li nistatin eritmasi qo‘llanilishi zamburug‘lar bilan kasallanishni oldini olishda samarali bo‘ldi. Tadqiqot natijalari Taxtajanantha tau-saghyz turini saqlash, ko‘paytirish va kauchukli xom ashyo sifatida ishlab chiqarishni yo‘lga qo‘yishda muhim ahamiyat kasb etadi.*

ВОССТАНОВЛЕНИЕ ЕСТЕСТВЕННЫХ ПОПУЛЯЦИЙ ЭНДЕМИЧНОГО ДЛЯ УЗБЕКИСТАНА КАУЧУКОВОГО РАСТЕНИЯ TAXHAJANANTHA TAU-SAGHYZ (LIPSCH. & G.G.BOSSE) ZAIKA, SUKHOR. & N. KILIAN

Аннотация. *В данной статье представлены результаты исследования по восстановлению естественной популяции уникального и находящегося под угрозой исчезновения эндемичного для флоры Узбекистана вида каучукового дерева - Taxhajanantha tau-saghyz (Lipsch. & G.G.Bosse) Zaika, Sukhor. & N. Kilian, таксона, распространенного во флоре Узбекистана, и по повышению всхожести его семян. Главная цель исследования - улучшение всхожести семян вида путем стратификации и предпосевной обработки, получение здоровых саженцев и создание материальной базы для будущего промышленного производства каучука. В ходе экспериментов семена подвергались стратификации в течение 26330 дней при низких положительных температурах (+5-+7°C), а также предпосевной обработке растворами аскорбиновой кислоты и биогумуса в концентрации 50–100 мг/л. В результате всхожесть семян увеличилась до 94%, а уровень заражения значительно снизился. При этом использование 10% раствора нистатина оказалось эффективным в предотвращении грибковых инфекций. Результаты исследования имеют большое значение для сохранения, размножения и производства вида Taxhajanantha tau-saghyz в качестве сырья для производства каучука.*

Ключевые слова: *Taxhajanantha tau-saghyz, эндемичный вид, каучуковое растение, стратификация, предпосевная обработка, аскорбиновая кислота, биогумус, нистатин, прорастание семян, восстановление популяции, натуральный каучук.*

RESTORATION OF NATURAL POPULATIONS OF THE RUBBER ENDEMIC OF UZBEKISTAN TAXTAJANANTHA TAU-SAGHYZ (LIPSCH. & G.G.BOSSE) ZAIKA , SUKHOR. & N. KILIAN

Annotation. *This article presents the results of a study on the restoration of the natural population of the unique and endangered rubber endemic species of the flora of Uzbekistan - Taxhajanantha tau-saghyz (Lipsch. & G.G.Bosse) Zaika, Sukhor. & N. Kilian, a taxon distributed in the flora of Uzbekistan, and on increasing the germination of its seeds. The main goal of the study is to improve the germination rate of the seeds of the species through stratification and priming, obtain healthy seedlings, and create a*

material base for future industrial-scale rubber production. During the experiments, the seeds were stratified for 26330 days at low positive temperatures (+5-+7°C), as well as priming with ascorbic acid and biohumus solutions at a concentration of 50–100 mg/l. As a result, the germination rate of seeds increased to 94%, and the contamination rate decreased significantly. At the same time, the use of a 10% nystatin solution was effective in preventing fungal infections. The results of the study are of great importance in the conservation, propagation and production of the Taxhajanantha tau-saghyz species as a rubber raw material.

Keywords. *Taxhajanantha tau-saghyz, endemic species, rubber plant, stratification, priming, ascorbic acid, biohumus, nystatin, seed germination, population restoration, natural rubber.*

Kirish. *Taxtajanantha tau-saghyz* o‘simligi O‘zbekiston florasining kam uchraydigan endemik turi hisoblanadi. Bu tur strategik jihatdan qimmatli xom ashyo turi hisoblanadi, chunki uning ildizlarining qobig‘ida kauchuk mavjud (1950). O‘simlik birinchi marta XX asrning o‘rtalarida (1950) Markaziy Osiyo florasini o‘rgangan rus botaniklari - S.Yu. Chevrenidi va M.M. Bondarenko tomonidan aniqlangan, ilmiy tavsifi berilgan va mustaqil tur sifatida *Scorzonera uzbekistanica (Czevr. & Bondarenko)* nomi bilan atalgan (TASH003153) [1]. 1986 yilda I.U.Tagaev va R.A.Kamelinlar tomonidan qayta o‘rganilib, ushbu tur alohida emas, balki Qozog‘istonning G‘arbiy Tyan-Shan (Qaratau) tog‘larida tarqalgan *Scorzonera tau-saghyz (Lipsch et Bosse)* turining kenja turi sifatida baholangan va *Scorzonera tau-saghyz Lipsch et Bosse, subsp. uzbekistanica (Czevr. et Bondarenko), Tagayev* nomiga o‘zgartirilgan [2]. 2020 yilda Zaika, Suxor va N.Kilianlar tomonidan ushbu o‘simlik *Taxtajanantha tau-saghyz* (Lipsch. & G.G.Bosse) *Zaika, Suxor. & N. Kilian* nomi bilan qayta tavsiflangan [3].

Ushbu tur O‘zbekiston Respublikasi Namangan viloyatining shimoliy-sharqiy tomonida Qirg‘iziston Respublikasi bilan chegara xududlarida, Tyan-Shan tog‘ tizimining g‘arbiy qismida Chotqol tizmasining Jiydali-soy, Mayli-soy va Archa-soy tog‘ yon bag‘rlaridagi adirlik qiyaliklarida tarqalgan [2].

O‘simlik urug‘lar orqali va vegetativ usulda, yahni poya va ildiz ko‘paytmalari yordamida ko‘payadi. Tur mezofit o‘simlik bo‘lib, sovuqqa va issiqqa chidamli, keng ekologik spektrga ega. Yovvoyi shakllari quritilgan ildizlarda 28-40% gacha kauchuk sintez qila oladi va to‘playdi (Bondarenko). Kauchuk sutshirali naysimon to‘qimalarda (lateks chiqaruvchi xujayralar) mavjud bo‘lib, ular faqat ildizlarda emas, balki o‘simlikning kaudekslari va barglariga ham tarqaladi [5]. Ko‘p yillar davomida xududdagi mavsumiy iqlim o‘zgarishlari, atropogen omillarning tahsiri natijasida o‘simlik populyatsiyasi tarqalish maydoni qisqarib ketgan. Hozirgi kunda bu ko‘rsatkich taxminan 1-3 km ni tashkil etadi xolos [7].

Tabiiy holda uning zaxiralarini tiklash juda sekin kechadi, chunki o‘simlikning urug‘lari 2–3-yildagina shakllanadi va yosh nihollari ko‘pincha halok bo‘ladi. *T.tau-saghyz* ni keng miqyosda yetishtirishdagi muammolardan biri - urug‘larning unuvchanligi va o‘sib chiqish darajasining pastligi hisoblanadi. Bunga turli infektsiyalar bilan urug‘larning zararlanishi, zararli hasharotlar tomonidan yeyilishi va fiziologik past o‘sish energiyasi sabab bo‘ladi.

Ushbu tadqiqotning asosiy maqsadi - tabiiy sharoitda o‘suvchi *T.tau-saghyz* urug‘larining turli stratifikatsiya va prayming jarayonlarini o‘rganish, urug‘larning unish va unib chiqish darajasini oshirish hamda ularni ko‘paytirish orqali kauchukli endemik o‘simlikning populyatsiya sonini tiklashdir.

Tabiiy kauchuk juda ko‘p turdagi o‘simliklarda uchraydi va ular aniq bir botanik oilaga kirmaydi. Kauchuk qaysi to‘qimada to‘planishiga qarab, kauchukli o‘simliklar quyidagicha bo‘ladi: Parenximali - kauchuk ildiz va poyalarda to‘planadi; Xlorenximali - kauchuk barglarda va yosh novdalarning yashil to‘qimalarida paydo bo‘ladi; Lateksli – kauchuk o‘simlikning mlechnik suyuqligida mavjud [8,9,10].

T. tau-saghyz ni sanoat miqyosida yetishtirish uchun, avvalo, toza tur urug‘lari yetarli miqdorda bo‘lishi lozim. Urug‘lari past o‘sish ko‘rsatgichiga ega, [5].

T.tau-saghyz urug‘larining tinim davri uzoq, chunki ular havo quruqligigacha uzoq vaqt chiqa oladi. Urug‘lar qiyin so‘rib olinuvchi qattiq qobiqlarga ega (qattiq urug‘lar), bu esa suvning sekin so‘rilishini tahminlaydi. Suv o‘tkazmaydigan urug‘ qobiqlari har bir murtakni alohida izolyatsiyalab, murtaklarda doimiy past suv miqdorini saqlaydi, bu esa urug‘larning tabiiy sharoitda uzoq muddatli muvaffaqiyatli saqlanishida muhim ahamiyatga ega.

Qattiq urug‘larning unib chiqishi uchun quyidagi zarur shartlar mavjud: optimal harorat, kislorod va namlik. SHu sababli, qattiq urug‘ qobiqlariga ega urug‘lar uchun fizik yoki kimyoviy tabiatli maxsus stimulyatorlar talab etiladi (fitogormonlar, yorug‘lik, harorat va h.k.). Bunday hollarda o‘sish stimulyatsiyaga berilgan javob reaktsiyasi sifatida qaraladi va olimlar urug‘ning to‘g‘ridan-to‘g‘ri reaktsiya beruvchi stimulyatorlarini aniqlashga harakat qiladilar [11, 12].

Hozirgi vaqtda olib borilayotgan tadqiqotlar kam uchraydigan, yo‘qolib borayotgan ildizlarida tabbiy kauchuk saqlovchi endemik o‘simlik – *T.tau-saghyz* populyatsiyasini tiklash muammosiga bag‘ishlangan.

T.tau-saghyz ni yetishtirish uchun materiallarining cheklanganligi va O‘zbekistonda ularni ishlab chiqaruvchi pitomniklarning deyarli yo‘qligi tufayli, o‘simliklarni tezkor ko‘paytirish va ommaviy ravishda olish texnologiyasini

ishlab chiqish va takomillashtirish masalasi dolzarb hisoblanadi. Bu o‘simlik - tabiiy yuqori sifatli kauchukning alternativ manbai hisoblanadi.

Tadqiqot materiallari va medotlari: Tadqiqotda asosiy o‘simlik materiali - *Taxtajanantha tau-saghyz* yovvoyi o‘simliklari namunalari bo‘ldi. *T.tau-saghyz* ning yovvoyi urug‘larini to‘plash maqsadida Namangan O‘zbekiston Respublikasi Namangan viloyatining shimoliy - sharqiy tomonida Qirg‘iziston respublikasi bilan chegara xududlarida, Tyan-Shan tog‘ tizimining g‘arbiy qismidagi Chotqol tizmasi adirliklariga ekspeditsiya tashkil etildi. Ekspeditsiya davomida Jiyda-soy, Mayli-soy va Archa-soy tog‘ yon bag‘rlaridagi adirliklari o‘rganilib, o‘simliklar urug‘lari yig‘ib olindi (1-rasm).

1-rasm. A) Mayli-soy tog‘ oldi adirliklari; B, S) *Taxtajanantha tau-saghyz* ning gullashdan oldin va urug‘lari yetilgan davri.

O‘simlikning yovvoyi urug‘lari o‘sish darajasi juda past, ko‘pchiligi noto‘liq rivojlangan va turli zamburug‘ kasalliklariga chalingan (2-rasm). Shu sababli, sog‘lom ko‘chatlar olish va urug‘lar o‘sishini yaxshilash uchun ularni **stratifikatsiya qilish** talab qilinadi. Shu sababdan *T. tau-saghyz* urug‘lari past haroratda saqlanib, ulardagi tinim davridagi murtaklar hosil yig‘imidan keyin to‘liq rivojlanishi ta’minlandi. Urug‘larni past haroratda ushlash davri bir necha kundan bir necha oygacha o‘zgarishi mumkin [20]. Past haroratda stratifikatsiya urug‘larning tabiiy hosil yig‘imidan keyin rivojlanish shartlarini qayta yaratadi.

T. tau-saghyz urug‘larining unuvchanligi juda past bo‘lganligi uchun dastlab unuvchanligini oshirish maqsadida stratifikatsiya qilish zarur (2-rasm). Stratifikatsiya jarayoni quyidagicha amalga oshirildi: tabiiy muhitdan terib kelib quritilgan urug‘lar maxsus muzlatgich kamerada +5-+7^{0}C haroratda 26-30 kun davomida saqlanadi. Nazorat sifatida stratifikatsiya qilinmagan urug‘lar olindi. Keyin urug‘lar Petri idishlarida nam filtr qog‘ozi ustida, 25±2°C haroratda, 16/8 soatlik yorug‘ muhitda o‘stirildi. 22-36 kundan so‘ng urug‘larning o‘sish foizi baholandi.

2-rasm. *Taxtajanantha tau-saghyz* urug‘lari

Natijalar va ularning muhokamasi. *T. tau-saghyz* urug‘lari unuvchanligini oshirish maqsadida ularni askorbin kislotasi (antioksidant, metabolizmni faollashtiradi) 50–100 mg/l kontsentratsiyada va biogumusli eritmalar bilan prayming qilindi.

1. Urug‘lar 45 va 60 daqiqa davomida askorbin kislota eritmasiga solindi.
2. Urug‘lar suvli biogumus eritmasida 6-10 soat davomida saqlandi.

Nazorat sifatida xech qanday ishlov berilmagan urug‘lar olindi.

So‘ngra, urug‘lar Petri idishlariga nam filtr qog‘ozi ustiga qo‘yildi va 25±3°C haroratda, 16/8 soatlik yorug‘ muhitda o‘stirildi. 22-45 kun davomida urug‘larning o‘sish jarayoni kuzatildi va ularning o‘sish foizi hisoblandi. Tajriba

davomida xar 5-7 kun oralig‘ida urug‘larni (zamburug‘ tushishi oldini olish uchun) nistatin moddasining 10 % li eritmasidan purkab turildi

Tadqiqot natijalari shundan dalolat berdiki: 2 hafta stratifikatsiya qilingan urug‘larda va nazoratda o‘sish kuzatilmagan. Stratifikatsiya muddati 4 haftaga uzaytilganda, o‘sish foizi 94% ga yetdi, infektsiyalangan urug‘lar esa faqat 3% ni tashkil qildi (1-jadval). Nazoratda esa kontaminatsiyalangan urug‘lar o‘suvchi urug‘larning 1/5 qismini tashkil qilgan.

Bu natijalar past ijobiy haroratda stratifikatsiya patogenlar rivojlanishini ingibitorlashini ko‘rsatadi. Tadqiqotlar shuningdek, **yorug‘lik ham urug‘ o‘sishiga ta’sir qilishi**ni ko‘rsatdi: stratifikatsiyadan keyin o‘simlikning urug‘lari yorug‘likda yaxshi o‘sishda davom etdi.

Urug‘larning unuvchanligi, %	0	94±4,7	0	79,9±7,4	70,0±3,9	38,0±7,3	14,5±7,2	40,0±12,0
Kontaminatsiyalangan urug‘lar %	0	6,0±5,8	0	17,0±6,8	33,3±9,6	13,0±3,35	86,0±7,38	14,1±6,01

1-jadval ma’lumotlariga ko‘ra, quruq stratifikatsiyadan o‘tgan urug‘lar askorbin kislota eritmasi bilan ishlov berilgan urug‘larga nisbatan 1,4 marta ko‘proq o‘sadi. Shu bilan birga infektsiyalangan urug‘lar soni ko‘paydi. Bu holat prayming vaqtida namlik foizi oshishi natijasida patogen sporlarining o‘sishi bilan bog‘liq deb hisobladik. Nazorat variantida kontaminatsiyalangan urug‘lar soni esa 3 marta kamroq.

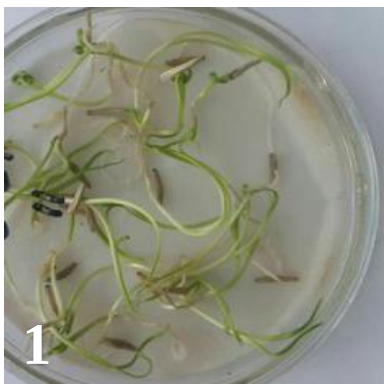
2-jadval ma’lumotlariga ko‘ra, eng yuqori unuvchanlik foizi 50–100 mg/l kontsentratsiyada askorbin kislota eritmasida 50 daqiqa va 1% biogumus eritmasida 8 soat muddatda ishlov berilgan urug‘larda kuzatildi. Askorbin kislota va nistatinning 10 % li eritmasi fungitsid va bakteritsid xususiyatlarga ega bo‘lib, urug‘lardagi patogen mikroflorani deyarli to‘liq yo‘q qiladi.

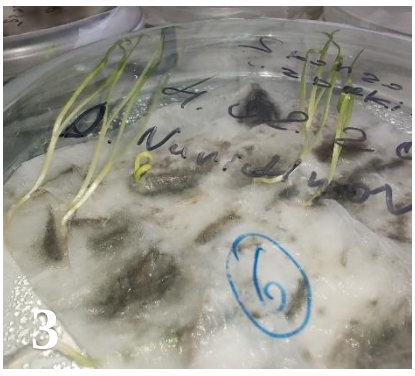
2-jadval

Taxtajanantha tau-saghyz urug‘lari praymingi

Ko‘rsatkichlar	Askorbin kislotali prayming				Biogumusli prayming		Nazorat
	10 daq	15 daq	30 daq	1 soat	4 soat	8 soat	
Urug‘larning unuvchanligi, %	21,0±4,2	30,5±1,6	48,2±3,7	74,3±3,9	49,1±4,2	58,0±5,01	55,0±2,65
Kontaminatsiyalan-gan urug‘lar %	0	0	6,01±2,2	4,81±2,01	12,01±3,1	7,8±2,65	30,0+4,63

Biogumus bilan ishlov berilgan urug‘larda ham o‘sish foizi yuqori bo‘ldi (60% gacha), lekin infektsiyalangan urug‘lar soni askorbin kislota bilan ishlov berilganlarga nisbatan ko‘proq (12%). Biogumusda zarur mikroelementlar, vitaminlar va o‘sish gormonlari mavjud bo‘lib, ular *T.tau-saghyz* urug‘larining to‘liq unib chiqishini rag‘batlantiradi. Biroq, biogumusdagi organik moddalar fitopatogen organizmlar (o‘simlik kasalliklari qo‘zg‘atuvchi bakteriyalar, zamburug‘lar) sporlarini ham o‘sishini qo‘zg‘atadi. Bu esa nixollarning o‘sish va rivojlanishi ingibitorlaydi (3-rasm).

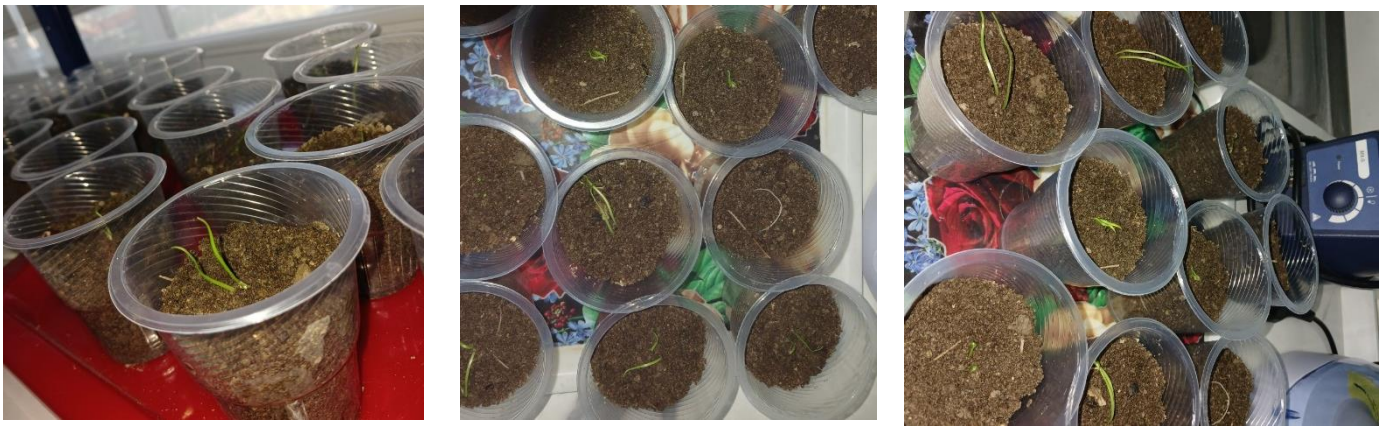




3-rasm - *Taxtajanantha tau-saghyz* o‘simligining urug‘ nihollari.
1) 25±2°C haroratda yetishtirilgan nihollar (nazorat); 2) muzlatgich kamerasida +7°C haroratda, qorong‘ilik sharoitida 4 hafta stratifikatsiya qilingan nihollar; 3) biogumus bilan ishlov berilgan va 25±2°C haroratda yetishtirilgan nihollar.

O‘tkazilgan tajribaga asoslangan holda optimal usullar *T.tau-saghyz* **urug‘larining o‘sishini oshirishda: Stratifikatsiya:** 26-30 kun, past ijobiy harorat (+5-+7^{0}C) - unuvchanlik foizini maksimal darajaga chiqaradi. **Prayming askorbin kislota (xar 3-5 kun oralig‘ida nistatinning 10% li eritmasini purkash bilan birga) bilan:** 1 soatlik muddat – sog‘lom va to‘liq o‘sgan urug‘lar rivojlanishini rag‘batlantishi aniqlandi.

Tajriba yakunida Petri idishida o‘stirilgan o‘simlik nihollari biogumusning tuproq bilan 1/4 nisbatda aralashtirilgan tuproq bilan to‘ldirilgan yelim idishli stakanlarga o‘tkazildi (4-rasm). Yangi o‘simlik nihollari tuproq muhitiga moslanishi juda qiyin kechishi aniqlandi.



4-rasm. *Taxtajanantha tau-saghyz* tuproq muhitidagi nihollari.

Xulosa. *T. tau-saghyz* juda kam uchraydigan va yo‘qolib borayotgan kauchukli o‘simlik turi hisoblanadi. Ushbu turni o‘sish areallarida saqlab qolish hamda uni ko‘paytirish bo‘yicha olib borilayotgan chora-tadbirlarga qaramay, yovvoyi, ildizida kauchuk saqlovchi Turning urug‘larida o‘sish va unib chiqish darajasi pastligi aniqlangan.

Tadqiqotlar natijasida mahlum bo‘ldiki, urug‘larning quritilgan holda +7°C haroratda 26-30 kun davomida stratifikatsiya qilinishidan so‘ng, unuvchanlik foizi oshadi.

Dala tadqiqotlaridagi kuzatuv jarayonlarida aniqlanishicha, *T.tau-saghyz* urug‘larining tabiiy sharoitdagi unib chiqish qobiliyati juda past bo‘lib, qishloq xo‘jaligi yerlarida ular chorva mollari va qushlar tomonidan yeyilib ketadi. Bu esa mazkur noyob turning tabiiy populyatsiyasini tiklashni qiyinlashtiradi.

Tabiiy populyatsiyalarda *T. tau-saghyz* sonini ko‘paytirish maqsadida maxsus ilmiy tadqiqotlar amalga oshirildi. Urug‘larni 50–100 mg/l kontsentratsiyada askorbin kislotasi eritmasida 55-60 daqiqa davomida oldindan prayming qilish va uni stratifikatsiya bilan uyg‘unlashtirish, unish darajasi past bo‘lgan urug‘larning unib chiqish qobiliyatiga ijobiy tahsir ko‘rsatdi.

Shuningdek, urug‘larni 10 % li nistatin eritmasi bilan ishlov berish natijasida zamburug‘lar bilan kasallanish darajasi pasaydi va bu urug‘larning unib chiqish koeffitsenti samaradorligini kuchaytirdi. Bu esa keyinchalik in vitro kulturasiga kiritiladigan aseptik nihollarni olish imkonini berdi.

Olingan mahlumotlar kelajakda *Taxtajanantha tau-saghyz* (Lipsch. & G.G.Bosse) *Zaika , Suxor. & N. Kilian* turini aynan O‘zbekiston hududida uchrovchi endemic vakilini samarali ko‘paytirish va uning ildizlaridan sanoat miqyosida tabiiy kauchuk ishlab chiqarish texnologiyalarini ishlab chiqishda muhim ahamiyat kasb etadi.

Annotatsiya. *Ushbu maqolada Philadelphus L. turkumiga mansub o‘simliklarning in vitro sharoitida olingan regenerantlarini grunt sharoitiga moslashtirish muammolari va ularning samarali yechimlari o‘rganildi. Tadqiqotlarda eksplantlarning fiziologik holati, stomatik faoliyati, ildiz tizimi rivojlanishi va antioksidant tizimi ko‘rsatkichlari tahlil qilindi. Adaptatsiya jarayonida namlik, yorug‘lik va substrat omillarining bosqichma-bosqich boshqarilishi o‘simliklarning yashovchanligini 85–90% gacha oshirishi aniqlangan. Mikoriza qo‘llanilishi, auksinlar bilan ishlov berish va antioksidantlar yordamida stressni kamaytirish asosiy samarali usullar sifatida tavsiya etildi.*

Kalit so‘zlar: *Philadelphus L., in vitro, adaptatsiya, mikroklonal ko‘paytirish, grunt, mikoriza, stress,*

ПРОБЛЕМЫ АДАПТАЦИИ В ГРУНТЕ ВИДОВ РОДА *PHILADELPHUS* L., ПОЛУЧЕННЫХ В УСЛОВИЯХ *IN VITRO*

Аннотация. *В данной статье изучены проблемы адаптации регенерантов растений рода Philadelphus L., полученных в условиях in vitro, к грунтовым условиям, а также предложены эффективные пути их решения. В ходе исследований были проанализированы физиологическое состояние эксплантов, активность устьиц, развитие корневой системы и показатели антиоксидантной системы. Установлено, что поэтапное регулирование факторов влажности, освещённости и субстрата в процессе адаптации позволяет повысить выживаемость растений до 85–90%. В качестве основных эффективных методов рекомендованы использование микоризы, обработка ауксинами и снижение стрессовых факторов с помощью антиоксидантов.*

Ключевые слова: *Philadelphus L., in vitro, адаптация, микроклональное размножение, грунт, микориза, стресс.*

PROBLEMS OF SOIL ADAPTATION: *PHILADELPHUS* L.

Abstract. *This article examines the problems of adapting regenerants of plants of the genus Philadelphus L., obtained under in vitro conditions, to soil environments, and proposes effective solutions. The study analyzed the physiological state of explants, stomatal activity, root system development, and indicators of the antioxidant system. It was established that the gradual regulation of humidity, light, and substrate factors during the adaptation process can increase plant survival up to 85–90%. The use of mycorrhiza, auxin treatment, and reduction of stress factors through antioxidants are recommended as the most effective approaches.*

Keywords: *Philadelphus L., in vitro, adaptation, microclonal propagation, soil, mycorrhiza, stress.*

Kirish

Zamonaviy o‘simlik biotexnologiyasida *in vitro* mikroklonal ko‘paytirish usullari botanika bog‘lari va ilmiy markazlarda keng qo‘llanilmoqda. Bu usul orqali qisqa vaqt ichida ko‘p miqdorda sog‘lom va genetik jihatdan barqaror o‘simlik materiallarini olish mumkin. Ayniqsa, noyob va introduksiya qilingan turlarni saqlashda bu texnologiyaning ahamiyati beqiyosdir.

Biroq *in vitro* sharoitida yetishtirilgan o‘simliklarni grunt sharoitiga o‘tkazish murakkab biologik va fiziologik jarayon hisoblanadi. Mazkur tadqiqotning maqsadi - *Philadelphus* L. turkumiga mansub o‘simliklarda gruntga adaptatsiya jarayonida yuzaga keladigan asosiy muammolarni aniqlash va ularni bartaraf etishning ilmiy asoslangan usullarini ishlab chiqishdir.

Materiallar va metodlar

Tadqiqot obyeklari.

***Philadelphus* L. turlarining tavsifi (Hydrangeaceae Dumort.)**

Philadelphus L. turkumiga mansub *Philadelphus laxus* Schrad., *Philadelphus lavallei*, *Philadelphus lemoinei* Lemoine, *Philadelphus lewisii* Pursh., *Philadelphus nivalis* Jacques va *Philadelphus pubescens* Loisel turlari Hydrangeaceae Dumort. oilasiga kiruvchi barg to‘kuvchi manzarali butalardir. Ushbu turlar tabiiy sharoitda Yevropa, Sharqiy Osiyo va Shimoliy Amerika hududlarida keng tarqalgan bo‘lib, asosan o‘rmon chekkalari, tog‘ yonbag‘irlari va daryo vodiylarida uchraydi. Biologik faol moddalar — kumarinlar (umbelliferon, skopolin), flavonoidlar, triterpenlar (uvaol) va sterol birikmalar, jumladan stigmasteril–3–β–D–glikozid mavjud. Ushbu moddalar o‘simliklarning antioksidant va himoya xususiyatlarini belgilaydi.

Usullar

Tadqiqotlar Butenko [1, 2], Kalinin [3, 4] va Batygina [5, 6] tomonidan tavsiflangan o‘simlik to‘qimalari va organlarini yetishtirishning standart usullariga asoslandi.

Ozuqa muhitlari

Driver va Kuniyuki Walnut (DKW) [7], Murashige va Skoog (MS) [8], Woody Plant Medium (WPM) [9], N6 [10, 11] va Gamborg B5 [12] muhitlari ishlatilgan.

Tadqiqot natijalari har bir muhitning eksplantlarning morfogen faolligiga ta’siri, ildizlanish va regeneratsiya darajasi, shuningdek yosh novdalar o‘sish dinamikasi bo‘yicha taqqoslama tahlil qilish imkonini berdi. Olingan ma’lumotlar turli muhitlar o‘rtasidagi samaradorlik farqlarini baholash va kelgusida muayyan turlar uchun individual muhit formulalarini ishlab chiqish uchun asos bo‘lib xizmat qiladi.

Eksplantlarni tanlash

Eksplant sifatida bir yillik novdalardagi **apikal (uch) va lateral (yondosh) kurtaklar**, shuningdek **nekroz belgilari kuzatilmagan sog‘lom barg plastinkalari** tanlandi. Apikal kurtaklar 0,5–1,0 sm uzunlikdagi bo‘laklar holatida olindi. Barg eksplantlari yosh, morfologik jihatdan sog‘lom va hech qanday mexanik yoki fiziologik shikastlanishsiz bo‘lishiga e’tibor berildi. Materiallar yil davomida, **fevraldan oktyabrgacha bo‘lgan davrda,** turli mavsumlarda o‘rganildi.

Sterilizatsiya protokoli

Aseptik sharoitni ta’minlash maqsadida bir nechta sterilizatsiya sxemalari sinovdan o‘tkazildi:

• 1-protokol (ko‘p komponentli): $KMnO_4$, sovun eritmasi, natriy gipoxlorit (“Belizna”) + Tween 20, $AgNO_3$ va etanol

• 2-protokol (soddalashtirilgan): sovun, natriy gipoxlorit + Tween 20 va etanol

• 3-protokol (fungitsidli): sovun, natriy gipoxlorit, propikonazol va etanol

Sterilizatsiya samaradorligi kontaminatsiya darajasi va eksplant yashovchanligi asosida baholandi.Kulturaga kiritish va o‘sish regulyatorlarning konsentratsiya va kombinatsiyalarini optimallashtirish.

Fitogarmonlar tanlash

Optimal fitogarmonlar kombinatsiyasini aniqlash maqsadida auksinlar: 2,4-D, indol-3-sirka kislotasi (IAA), α-naftiluksus kislotasi (NAA), indol-3-moy kislotasi (IBA); sitokininlar: 6-benzilaminopurin (BAP), zeatin, kinetin, tidiazuron (TDZ) qo‘llanildi. Fitogormonlarning zaxira eritmalari standart usullarga muvofiq tayyorlandi [3,4]. Turli konsentratsiyalarda ko‘plab kombinatsiyalar sinovdan o‘tkazilib, optimal variantlar aniqlashtirildi. Muhit tarkibiga 10–35 g/l saxaroza qo‘shildi.

Tuproqqa moslashish: Regeneratsiya qilingan novdalar (≥2 sm) ildizlantirish muhiti (IMK 0,5 mg/l yoki ½ MS gormonsiz konsentratsiya) ga ko‘chirildi. Moslashtirish bosqichi steril substratlarda amalga oshirildi: tuproq: qum: vermikulit (1:1:1) yoki tuproq : qum : vermikulit : perlit (1:1:1:1). Yashovchanlikni oshirish uchun namlik bosqichma-bosqich kamaytirildi, bu mikroko‘paytirilgan o‘simliklarning *ex vitro* sharoitga moslashishida muhim omil hisoblanadi [1, 2]. Moslashgan o‘simliklar issiqxona sharoitida ochiq tuproqqa o‘tkazildi.

Natijalar va ularning muhokamasi

***In vitro* mikroklonal ko‘paytirish usuli** orqali steril sharoitda ko‘p sonli o‘simlik materiallarini olish mumkin bo‘ladi, biroq laboratoriya sharoitida o‘sgan eksplantlarning **grunt muhitiga moslashishi** ko‘pincha murakkab jarayon hisoblanadi. Gruntga adaptatsiya qilishdagi asosiy muammolar: **Kutikula yetishmasligi** – suv yo‘qotishni kuchaytiradi, **stoma funksiyaning zaifligi** – gaz almashinuv muvozanatini buzadi, **fotosintetik pigmentlar tanqisligi** – xlorofill konsentratsiyasi past bo‘ladi, **ildiz tizimining sterilligi** – mikoriza va rizosfera bakteriyalari yo‘q. *Philadelphus* L. turkumi turlarida ildiz tizimi asosan chuqur bo‘lib, ozuqa moddalarini tez so‘radi, biroq suv tanqisligiga sezgir. Shuning uchun

ko‘chatlarni gruntga ko‘chirishda **torf:perlit:qum (1:1:1)** yoki torf:qum (1:1) aralashmasidan foydalanish tavsiya etiladi. Bu substrat havo aylanishini ta’minlaydi va ildizlarning nafas olishini yengillashtiradi.

In vitro sharoitida yetishtirilgan daraxtsimon va bo‘tasimon turlarning grunt muhitiga moslashishi ko‘p bosqichli, fiziologik va ekologik jihatdan nozik jarayondir. Asosiy muammolar – suv yo‘qotish, ildiz sterilligi, fotosintetik stress va oksidlanish jarayonlaridir. Ularni hal etish uchun namlik, yorug‘lik, harorat va mikoriza omillarini to‘g‘ri boshqarish talab qilinadi.

Xulosa

O‘tkazilgan tadqiqotlar natijasida *Philadelphus* L. turkumiga mansub o‘simliklarning *in vitro* sharoitida olingan regenerantlarini grunt sharoitiga moslashtirish murakkab, ko‘p omilli va fiziologik stress bilan kechadigan jarayon ekanligi aniqlandi.

1.Adaptatsiya jarayonidagi asosiy cheklovchi omillar sifatida stomalarning doim ochiq holatda bo‘lishi natijasida kuchli transpiratsiya, kutikulaning yetarli rivojlanmaganligi, fotosintetik tizimning sustligi, ildiz zonasining sterilligi va oksidlanish stressining kuchayishi aniqlangan.

2.Maxsus agrotexnik choralar qo‘llanilmagan holatda moslashish bosqichida o‘simliklarning yashovchanligi 30–40% gacha kamayishi mumkinligi tasdiqlandi.

3.Namlikni bosqichma-bosqich kamaytirish (90% dan 60–70% gacha) va yorug‘likni asta-sekin oshirish (1300 lyuksdan 10 000 lyuksgacha) muvaffaqiyatli adaptatsiyaning asosiy shartlari ekanligi isbotlandi.

4.Ko‘chatlarni gruntga ko‘chirishda torf–perlit–qum kabi havo o‘tkazuvchan substratlar ildiz tizimining normal faoliyatini ta’minlashi aniqlandi.

5.Auksinlar, xususan IMK (0,5 mg/l) qo‘llanilishi ildiz hosil bo‘lishini faollashtirib, o‘simliklarning stressga chidamliligini oshiradi.

6.Mikoriza qo‘llanilishi natijasida o‘simliklarning yashovchanligi o‘rtacha 20–30% ga oshishi, ildiz tizimi rivojlanishi va mineral moddalar o‘zlashtirilishi yaxshilanishi kuzatildi.

7.Antioksidantlar va biostimulyatorlar qo‘llanilishi oksidlanish stressini kamaytirib, fiziologik jarayonlarning barqarorlashuviga xizmat qiladi.

8.Yuqoridagi omillarni kompleks qo‘llash natijasida o‘simliklarning yashovchanligini 85–90% gacha oshirish mumkinligi aniqlandi.

Shunday qilib, ishlab chiqilgan adaptatsiya usuli *Philadelphus* L. turlarini botanika bog‘lari va biotexnologik laboratoriyalarda samarali saqlash hamda ko‘paytirishda muhim amaliy ahamiyatga ega.

Minnatdorchilik

Ushbu tadqiqot O‘zbekiston Respublikasi Fanlar akademiyasi Botanika instituti huzuridagi akademik F.N. Rusanov nomidagi Toshkent Botanika bog‘ining Biotexnologiya laboratoriyasida amalga oshirildi. Tadqiqotlar 2025–2029 yillarga mo‘ljallangan “Botanika bog‘i kolleksiyalarini saqlash, istiqbolli turlarni introduksiya qilish hamda ularni Respublikaning turli sohalariga tavsiya etish” mavzusidagi Davlat dasturi doirasida, xususan, Biotexnologiya laboratoriyasida bajarilayotgan “Innovatsion biotexnologiya usullaridan foydalanilgan holda Toshkent Botanika bog‘ida *in vitro* kolleksiyasini yaratish va uni raqamli hujjatlashtirish” nomli dasturi asosida amalga oshirildi.

Uskunalar O‘zbekiston Respublikasi Prezidentining 2017-yil 17-sentabrdagi PQ–3365-sonli “Ilmiy-tadqiqot muassasalarining moddiy-texnik bazasini yanada mustahkamlash va ularning faoliyat samaradorligini oshirish chora-tadbirlari to‘g‘risida”gi qaroriga muvofiq xarid qilingan. Mazkur qaror doirasida ilmiy-tadqiqot faoliyatini rivojlantirish, laboratoriya bazasini zamonaviy texnologiyalar bilan jihozlash hamda ilmiy ishlanmalar samaradorligini oshirish maqsadida zarur bo‘lgan asbob-uskunalar bilan ta’minlash amalga oshirildi. Ushbu uskunalar tadqiqotlarning sifatli va ishonchli natijalarini olish, zamonaviy ilmiy metodlarni qo‘llash hamda biotexnologik jarayonlarni samarali tashkil etish imkonini beradi.

Philadelphus L. turkumiga mansub bo'lgan turlarini in vitro kulturasiэa kiritish bosqichlari: 1). Sterilizatsiya bosqichi. 2). 24±2°C va Rh 40% kulturalxonasi sharoitida in vitro kulturasiэa kiritish, prolongatsiya (proliferatsiya) va rizogenez bosqichi. 3). Issiqxona sharoitida gruntga

Annotatsiya: *Ushbu maqolada kuzgi bug‘doy (Triticum aestivum L.) ning tuplanish fazasida barglarda kechadigan suv almashinuvi jarayonlariga resurs tejamkor sug‘orish texnologiyalarining ta’siri o‘rganilgan. Tadqiqot natijalariga ko‘ra, turli hududlarda o‘simliklarning suv rejimi ko‘rsatkichlari — umumiy suv miqdori, suv taqchilligi, suv saqlash qobiliyati hamda nisbiy turgor darajasi sezilarli farq qilishi aniqlangan. Suv bilan yaxshi ta’minlangan sharoitda o‘simliklarda fiziologik jarayonlar barqaror kechishi, suv taqchilligi ortishi bilan esa turgor pasayib, suv saqlash qobiliyati kamayishi kuzatilgan. Shu bilan birga, ayrim sharoitlarda o‘simliklarning moslashuv mexanizmlari hisobiga suv rejimi ko‘rsatkichlarining qisman tiklanishi aniqlangan. Olingan natijalar resurs tejamkor texnologiyalarni qo‘llash orqali kuzgi bug‘doyda suvdan foydalanish samaradorligini oshirish mumkinligini ko‘rsatadi.*

Tayanch so‘zlar: *Kuzgi bug‘doy (Triticum aestivum L.), resurs tejamkor texnologiyalar, suv almashinuvi, transpiratsiya jadalligi, barglardagi umumiy suv miqdori, suv taqchilligi, suvni saqlash qobiliyati, nisbiy turgor, nisbiy turgor tanqisligi.*

ВЛИЯНИЕ РЕСУРСОСБЕРЕГАЮЩИХ ТЕХНОЛОГИЙ НА ПРОЦЕССЫ ВОДООБМЕНА У ОЗИМОЙ ПШЕНИЦЫ (TRITICUM AESTIVUM L.) В ФАЗЕ КУЩЕНИЯ

Аннотация: *В данной статье изучено влияние ресурсосберегающих технологий орошения на процессы водообмена в листьях озимой пшеницы (Triticum aestivum L.) в фазе кущения. По результатам исследования установлено, что показатели водного режима растений, такие как общее содержание воды, дефицит воды, водоудерживающая способность и относительный тургор, существенно различаются в зависимости от условий выращивания. В условиях достаточного водообеспечения физиологические процессы протекают более стабильно, тогда как при увеличении дефицита влаги наблюдается снижение относительного тургора и водоудерживающей способности. Вместе с тем выявлено, что в отдельных вариантах за счёт адаптационных механизмов происходит частичное восстановление водного режима растений. Полученные результаты свидетельствуют о возможности повышения эффективности использования водных ресурсов при применении ресурсосберегающих технологий.*

Ключевые слова: *Озимая пшеница (Triticum aestivum L.), ресурсосберегающие технологии, водообмен, интенсивность транспирации, общее содержание воды в листьях, дефицит воды, водоудерживающая способность, относительный тургор, дефицит относительного тургора.*

THE EFFECT OF RESOURCE-SAVING TECHNOLOGIES ON WATER EXCHANGE PROCESSES IN WINTER WHEAT (TRITICUM AESTIVUM L.) AT THE TILLERING STAGE

Annotation: *This article examines the effect of resource-saving irrigation technologies on water exchange processes in the leaves of winter wheat (Triticum aestivum L.) during the tillering stage. The results showed that plant water regime indicators, including total water content, water deficit, water retention capacity, and relative turgor, vary significantly depending on growing conditions. Under sufficient water supply, physiological processes proceed more stably, whereas an increase in water deficit leads to a decrease in relative turgor and water retention capacity. At the same time, partial recovery of the plant water regime due to adaptive mechanisms was observed in certain conditions. The obtained results indicate that the use of resource-saving technologies can improve water use efficiency in winter wheat cultivation.*

Key words: *winter wheat (Triticum aestivum L.), resource-saving technologies, water exchange, transpiration intensity, total water content in leaves, water deficit, water retention capacity, relative turgor, relative turgor deficit.*

Kirish. Hozirgi kunda qishloq xo‘jaligida suv resurslaridan samarali foydalanish muammosi tobora dolzarb ahamiyat kasb etmoqda. Bizning fikrimizcha, suvdan oqilona foydalanish nafaqat hosildorlikni oshirish, balki o‘simliklarning fiziologik barqarorligini ta’minlashda ham muhim omil hisoblanadi.

O‘simliklarning suv almashinuvi jarayonlari ularning o‘sishi, rivojlanishi, hosildorligi hamda hosil sifatini belgilovchi muhim fiziologik ko‘rsatkichlardan biri hisoblanadi [15]. Suv rejimining optimal darajada ta’minlanishi o‘simlik organizmida kechadigan metabolik jarayonlarning barqarorligini ta’minlab, fotosintez, oziqa moddalar almashinuvi va biomassa to‘planishiga ijobiy ta’sir ko‘rsatadi.

Shu bilan birga, qishloq xo‘jaligida to‘g‘ri tanlangan sug‘orish va o‘g‘itlash choralari suv hamda o‘g‘it resurslaridan samarali foydalanishni ta’minlaydi. Ushbu agrotexnik tadbirlar suv va o‘g‘it yo‘qotilishini kamaytirib, ularning o‘zlashtirilish darajasini oshiradi hamda ekinlarning hosildorligini barqarorlashtirishda muhim ahamiyat kasb etadi [3].

Tomchilatib va yomg‘irlatib sug‘orish (o‘g‘itlash) texnologiyalari suv va o‘g‘itlarni o‘simlik ildiz zonasi yaqiniga aniq va me’yorida yetkazib berishga imkon yaratadi. Natijada ekinlarning don hosildorligi hamda suvdan foydalanish samaradorligi oshadi, shu bilan birga o‘g‘itlarning yuvilib ketishi kamayib, ularning o‘zlashtirilish darajasi ortadi [10]. Ushbu texnologiyalar resurslardan samarali foydalanish nuqtayi nazaridan zamonaviy agrotexnologiyalarning muhim yo‘nalishlaridan biri hisoblanadi.

Hozirgi kunda tomchilatib va yomg‘irlatib sug‘orish texnologiyalari bo‘yicha olib borilayotgan tadqiqotlar asosan paxta, meva va sabzavot kabi tijorat ekinlariga qaratilgan bo‘lib, kuzgi bug‘doyda ushbu texnologiyalarning qo‘llanilishi yetarli darajada o‘rganilmagan. Shu sababli, kuzgi bug‘doy yetishtirishda mazkur sug‘orish usullarining samaradorligini aniqlash dolzarb ilmiy masalalardan biri hisoblanadi.

Ildiz tizimi o‘simlikning suv va oziqa moddalardan foydalanishida hal qiluvchi rol o‘ynaydi. U tuproqdan suv va mineral elementlarni o‘zlashtirish bilan birga, fotosintez mahsulotlarining asosiy iste’mol qiluvchi organi hisoblanadi. Tomchilatib va yomg‘irlatib sug‘orish texnologiyalari tuproqda suv va o‘g‘itning optimal taqsimlanishini ta’minlab, ildiz tizimining rivojlanishiga ijobiy ta’sir ko‘rsatadi. Natijada ildizning tarqalish sohasi kengayadi [11] hamda uning fiziologik faolligi ortadi [7], bu esa o‘simlik yer ustki qismining o‘sishi va rivojlanishini jadallashtiradi.

Mavjud baholashlarga ko‘ra, dunyo oziq-ovqat mahsulotlarining qariyb 40 foizi sug‘oriladigan qishloq xo‘jaligi hisobiga ishlab chiqariladi, bu esa sug‘orish tizimlarini Yer yuzidagi eng yirik suv iste’molchilaridan biriga aylantiradi [1]. Aholi sonining ortib borishi, sanoat va shahar infratuzilmasining kengayishi natijasida suv resurslariga bo‘lgan talab keskin oshib, sug‘orish suvi tanqisligi global muammoga aylanmoqda. Bu holat o‘z navbatida oziq-ovqat xavfsizligiga jiddiy tahdid soladi.

Shu munosabat bilan sug‘orish tizimlarini takomillashtirish, suv sarfini samarali boshqarish hamda mavjud resurslardan oqilona foydalanish muhim ilmiy va amaliy ahamiyat kasb etadi. Zamonaviy sug‘orish texnologiyalarini joriy etish orqali suvdan foydalanish samaradorligini oshirish bilan birga, qishloq xo‘jaligi ekinlarining hosildorligini saqlab qolish yoki oshirish imkoniyati yaratiladi [5].

Tuproqda mavjud suv zaxiralaridan samarali foydalanish va o‘simlik tomonidan o‘zlashtiriladigan tuproq suvining ulushini oshirish hosildorlikni ta’minlovchi muhim omillardan biri hisoblanadi. Bu jarayon o‘simlik barglarining suv holatini yaxshilash hamda transpiratsiya jadalligini (Tr) optimal darajada saqlash orqali amalga oshadi [13]. Shu bois, o‘simliklarning suv rejimini boshqarishda tuproq namligining vertikal va gorizontal taqsimlanishi muhim ahamiyat kasb etadi.

Mikro-sug‘orish texnologiyalari, xususan tomchilatib va mikro purkash sug‘orish usullari, tuproqning chuqur qatlamlarida ildiz tizimining rivojlanishini faollashtiradi. Tadqiqotlar shuni ko‘rsatadiki, ushbu usullar ildiz uzunligi zichligini 80 sm dan chuqur qatlamlarda oshirib, chuqur tuproqdan suv o‘zlashtirilishini kuchaytiradi. Natijada an’anaviy bostirib sug‘orishga nisbatan hosildorlik 9,8–14,2 % ga, suvdan foydalanish samaradorligi esa 12,3–17,7 % ga ortadi [6].

Ildiz tizimining chuqur qatlamlarga kirib borishini rag‘batlantirish suv resurslaridan oqilona foydalanishning muhim yo‘nalishlaridan biri hisoblanadi. Suv sharoitlari ildiz uchlarining o‘sish yo‘nalishiga bevosita ta’sir ko‘rsatib, bu hodisa ildizlarning gidrotropizmi bilan izohlanadi [4]. Shuning uchun zamonaviy sug‘orish texnologiyalari yordamida tuproq namligini optimal taqsimlash ildiz tizimining rivojlanishini boshqarishda muhim omil bo‘lib xizmat qiladi.

Tomchilatib sug‘orish tizimida, xususan tomchilatkich quvurlarini haydalma qatlam ostiga joylashtirish natijasida tuproqning pastki qatlamlarida yuqori namlik zonasi shakllanadi, bu esa ildizlarning chuqurroq rivojlanishini rag‘batlantiradi [2]. Romero va boshqalar (2004) tomonidan o‘tkazilgan tadqiqotlarda ham cheklangan suv sharoitida ildizlarning gorizontal va vertikal tarqalishi kengayib, yuzaki sug‘orish usullariga nisbatan chuqurroq ildiz tizimi shakllanishi aniqlangan [9].

Bug‘doy navlarining suv almashinuvi xususiyatlari ularning qurg‘oqchilikka chidamliligini belgilovchi muhim fiziologik ko‘rsatkichlardan biri hisoblanadi. Tadqiqotlar natijalariga ko‘ra, turli navlar o‘rtasida barglardagi umumiy suv

miqdori va transpiratsiya jadalligi bo‘yicha sezilarli farqlar kuzatiladi. Xususan, Tanya bug‘doy navining barglaridagi umumiy suv miqdori 84,4 % ni tashkil etib, Andijon-1 naviga (75,6 %) nisbatan yuqori ekanligi aniqlangan. Shu bilan birga, transpiratsiya jadalligi Tanya navida Andijon-1 naviga nisbatan 14,5 g ga kam bo‘lib, bu uning suvni tejab sarflash xususiyatiga ega ekanligini hamda yuqori darajada qurg‘oqchilikka chidamli ekanligini ko‘rsatadi [8].

O‘simliklarning suv balansini tavsiflovchi asosiy ko‘rsatkichlardan biri barglardagi umumiy suv miqdori hisoblanadi [14]. Shu bilan birga, suv almashinuvida transpiratsiya jarayoni alohida o‘rin tutadi. Transpiratsiya o‘simliklarda suvning bug‘lanishi orqali ularni ortiqcha qizib ketishdan himoya qiladi, suv va unda erigan moddalarning o‘simlik tanasi bo‘ylab harakatlanishini ta’minlaydi hamda gaz almashinuvida muhim rol o‘ynaydi [18].

Demak, bug‘doy o‘simligida suv almashinuvi jarayonlari, xususan barglardagi suv miqdori va transpiratsiya jadalligi, uning fiziologik barqarorligi va qurg‘oqchilikka chidamliligini belgilovchi asosiy omillar hisoblanadi.

Tadqiqot obyekti va uslublari. Tadqiqot Ingichka tolali paxtachilik ilmiy-tadqiqot instituti tajriba dalasida amalga oshirildi. Tadqiqot obyekti sifatida bug‘doyning “Turon” navidan foydalanildi. Eksperimental uchastkalarni joylashtirish B.A.Dospexov metodikasi bo‘yicha olib borildi[16].

Bug‘doy o‘simligi barglarining suv saqlash xususiyati A.A. Nichiporovich [19], Barglardagi to‘liq to‘yinishga nisbatan suv tanqisligi Chatskiy [20], Barglarning turgosentlik darajasi – Uizerli metodi [12] orqali metodi bilan o‘rganildi. Bundan tashqari barglarning suvni saqlash darajasi ham aniqlandi [17].

Tadqiqot natijalari va uning muhokamasi.

Mazkur tadqiqotda kuzgi bug‘doy (Triticum aestivum L.) ning tuplanish fazasida barglarda suv almashinuvi ko‘rsatkichlari turli hududlar kesimida o‘rganildi. Olingan natijalar o‘simliklarning suv rejimi, fiziologik holati va ekologik sharoitlarga moslashuv darajasini baholash imkonini berdi(1-jadval)

1-jadval

Kuzgi bug‘doy (*Triticum aestivum* L.) tuplanish fazasida barglarda suv almashinuvi ko‘rsatkichlari (2026-yil)

Hududlar	Barglarda				
	Umumiy suv miqdori %	Suv taqchilligi %	Suv saqlash qobiliyati %	Nisbiy turgotsentlik %	Nisbiy turgotsentlik tanqisligi %
1-Hudud	96,88	5,3	67,03	94,7	5,3
2-Hudud	96,32	15,2	62,04	84,8	15,2
2-Hudud	95,66	6,03	60,99	93,97	6,03

Tadqiqot natijalariga ko‘ra, barglardagi umumiy suv miqdori barcha variantlarda nisbatan yuqori bo‘lib, 95,66–96,88 % oralig‘ida o‘zgarib turdi. Eng yuqori ko‘rsatkich 1-hududda (96,88 %) qayd etildi. Bu holat ushbu hududda o‘simliklarning suv bilan ta’minlanish darajasi nisbatan yaxshi ekanligini ko‘rsatadi. Shu bilan birga, 2-hudud variantlarida umumiy suv miqdorining biroz pasayishi (96,32 % va 95,66 %) ekologik omillar, xususan, tuproq namligi yoki atmosfera sharoitlari bilan bog‘liq bo‘lishi mumkin.

Suv taqchilligi ko‘rsatkichi variantlar bo‘yicha sezilarli darajada farq qildi. Eng past qiymat 1-hududda (5,3 %) kuzatilib, bu o‘simliklarda suv yetishmovchiligi deyarli sezilmasligini bildiradi. Aksincha, 2-hududda suv taqchilligi 15,2 % ga yetib, bu o‘simliklar ma’lum darajada stress holatiga tushganini ko‘rsatadi. Uchinchi variantda (2-hudud, 6,03 %) esa suv taqchilligi o‘rtacha darajada bo‘lib, bu sharoitda o‘simliklarning moslashuv mexanizmlari ishga tushganligini taxmin qilish mumkin.

Suv saqlash qobiliyati (water holding capacity) o‘simliklarning suvni ushlab turish va undan samarali foydalanish qobiliyatini ifodalaydi. Ushbu ko‘rsatkich 1-hududda 67,03 % ni tashkil etib, eng yuqori natija qayd etildi. Bu esa o‘simliklarning suvni saqlab qolish xususiyati yaxshi rivojlanganligini bildiradi. 2-hudud variantlarida esa ushbu ko‘rsatkich 62,04 % va 60,99 % ga teng bo‘lib, bu suv taqchilligi ortishi bilan suvni saqlash qobiliyati pasayishini ko‘rsatadi.

Nisbiy turgor o‘simlik hujayralarining suv bilan to‘yinganlik darajasini aks ettiradi va fiziologik barqarorlikning muhim ko‘rsatkichi hisoblanadi. Tadqiqot natijalariga ko‘ra, 1-hududda bu ko‘rsatkich 94,7 % bo‘lib, eng yuqori qiymatni tashkil etdi. Bu o‘simliklarning optimal suv rejimida rivojlanayotganini ko‘rsatadi. 2-hududda esa nisbiy turgor 84,8 % gacha pasaygan bo‘lib, bu suv stressining kuchayganidan dalolat beradi. Uchinchi variantda (93,97 %) nisbiy turgor deyarli tiklangan bo‘lib, bu o‘simliklarning kompensator mexanizmlari (stomatal boshqaruv, osmotik moslashuv) ishga tushganligini ko‘rsatadi.

Nisbiy turgor tanqisligi ko‘rsatkichlari suv taqchilligi bilan to‘g‘ridan-to‘g‘ri bog‘liq bo‘lib, mos ravishda 5,3 %, 15,2 % va 6,03 % ni tashkil etdi. Bu natijalar suv rejimi buzilganda hujayralarda suv yetishmovchiligi kuchayishini aniq ifodalaydi.

Xulosa. Olingan natijalarga ko‘ra, kuzgi bug‘doyning tuplanish fazasida suv almashinuvi ko‘rsatkichlari hududlar kesimida sezilarli farq qildi. Suv ta’minoti yaxshi bo‘lgan sharoitda (1-hudud) o‘simliklarda umumiy suv miqdori, suv

saqlash qobiliyati va nisbiy turgor yuqori darajada saqlanib, fiziologik jarayonlar barqaror kechdi. Suv taqchilligi ortgan variantda (2-hudud, 15,2 %) esa nisbiy turgor pasayib, suv saqlash qobiliyati kamaygani kuzatildi, bu esa o‘simliklarda stress holati yuzaga kelganini ko‘rsatadi. Shu bilan birga, suv taqchilligi o‘rtacha bo‘lgan sharoitda ayrim moslashuv mexanizmlari hisobiga o‘simliklarning nisbiy turgori qisman tiklandi.

Umuman olganda, suv ta’minoti darajasi kuzgi bug‘doyning suv rejimi va fiziologik holatini belgilovchi asosiy omil bo‘lib, resurs tejamkor texnologiyalarni qo‘llash o‘simliklarning suvdan samarali foydalanishini ta’minlaydi.

Annotatsiya. *Ushbu tadqiqotda Aralo-Kaspiy havzasiga mansub relikt tur hisoblangan Turkogammarus aralensis ning morfologik va molekulyar tavsifi integrativ yondashuv asosida o‘rganildi. Mazkur turning nisbatan keng tarqalganligiga qaramay, uning taksonomik maqomi uzoq vaqt davomida noaniq bo‘lib kelgan bo‘lib, bu holat tarixiy tavsiflarning yetarlicha mukammal emasligi, morfologik o‘zgaruvchanlikning yuqoriligi hamda turli avlodlarga noto‘g‘ri kiritish holatlari bilan izohlanadi. Tadqiqot materiali O‘zbekiston hududidagi Sariqamish ko‘lidan yig‘ilgan namunalar asosida shakllantirildi. Molekulyar tahlil ribosomal 18S rDNK markeri asosida olib borildi. Shu bilan birga, turli geografik populyatsiyalar o‘rtasida kuzatilgan genetik farqlanishlar turning ichki tuzilmasida muayyan differensiasiya jarayonlari mavjudligini ko‘rsatadi.*

Kalit so‘zlar: *Turkogammarus aralensis, amfipodalar, morfologiya, molekulyar filogeniya, 18S rDNK, integrativ taksonomiya, Sariqamish ko‘li, bioxilma-xillik, DNK barkodlash, filogeniya, Orolbo‘yi hududi.*

МОРФОЛОГИЧЕСКАЯ И МОЛЕКУЛЯРНАЯ ХАРАКТЕРИСТИКА ОРОЛЬСКОГО БОКОПЛАВА (*TURKOGAMMARUS ARALENSIS*)

Аннотация. *В данном исследовании представлена морфологическая и молекулярная характеристика реликтового вида Арало-Каспийского бассейна — Turkogammarus aralensis, выполненная на основе интегративного подхода. Несмотря на относительно широкое распространение данного вида, его таксономический статус длительное время оставался неопределённым, что обусловлено недостаточной полнотой исторических описаний, высокой морфологической изменчивостью, а также случаями ошибочного отнесения к различным родам. Материал для исследования был собран на территории Узбекистана из озера Сарыкамыш. Молекулярный анализ проведён на основе маркера рибосомальной ДНК 18S. В то же время выявленные генетические различия между географически разобщёнными популяциями свидетельствуют о наличии процессов внутривидовой дифференциации.*

Ключевые слова: *Turkogammarus aralensis, амфиподы, морфология, молекулярная филогения, 18S рДНК, интегративная таксономия, озеро Сарыкамыш, биоразнообразие, ДНК-баркодирование, филогения, Приаралье*

MORPHOLOGICAL AND MOLECULAR CHARACTERIZATION OF THE ARAL AMPHIPOD (*TURKOGAMMARUS ARALENSIS*

Abstract.*This study presents a morphological and molecular characterization of the relict species Turkogammarus aralensis from the Aral–Caspian basin, based on an integrative approach. Despite its relatively wide distribution, the taxonomic status of this species has long remained unclear, which is explained by the insufficient detail of historical descriptions, high morphological variability, and cases of misclassification into different genera.The research material was collected from Sarykamysh Lake in*

Uzbekistan. Molecular analysis was conducted using the ribosomal 18S rDNA marker. At the same time, the genetic differences observed among geographically separated populations indicate the presence of intraspecific differentiation processes within the species.

Keywords: *Turkogammarus aralensis, amphipods, morphology, molecular phylogeny, 18S rDNA, integrative taxonomy, Sarykamysh Lake, biodiversity, DNA barcoding, phylogeny, Aral Sea region*

Kirish

Amfipod qisqichbaqasimonlar Pontokaspiy faunasining eng xilma-xil va yuqori endemizmga ega guruhlaridan biri boʻlib, uning tarkibida 96 ta endemik tur qayd etilgan[3]. Ushbu turlarning qariyb 40%i soʻnggi oʻn yilliklarda tabiiy (mahalliy) arealidan tashqariga tarqalganligi aniqlangan [20].

Mazkur taksonlarning katta qismi sistematikasi hozirgacha toʻliq barqarorlashmagan: buning asosiy sabablari - tarixiy manbalardagi tur tavsiflarining eskirgan va yetarlicha batafsil boʻlmasligi, populyatsiyalararo hamda areal boʻylab sezilarli morfologik geterogenlik, shuningdek evolyutsion konvergentsiyadir. Shu bois, Pontokaspiy amfipod faunasini aniq va ishonchli taksonomik identifikatsiya qilish mahalliy hududlarda ularni muhofaza qilish choralarini asoslash, shuningdek invaziv tarqalish hududlarida monitoring va bioxavfsizlik baholashlarini samarali olib borish uchun muhim ilmiy-amaliy ahamiyatga ega.

Adabiyotlar tahlili

Turcogammarus Karaman va Barnard, 1979 - kichik, ehtimol monofiletik boʻlmagan avlod boʻlib, uchta turni oʻz ichiga oladi: ***Turcogammarus aralensis*** (Uljanin, 1875) - Orol dengizi va unga tutash hududlarda yashaydi[15], ***Turcogammarus spandli*** - Shimoliy Gretsiyadan ma'lum [14] va ***Turcogammarus turcarum*** [24] - Turkiyadagi Kichik Kavkazdan tavsiflangan.

Ushbu avlod Karaman va Barnard (1979) tomonidan bir necha turlar uchun taklif qilingan. Barnard va Barnard (1983) ushbu ***T. aralensis*** ni ushbu avlodga kiritgan. Soʻngra Stock va boshq. (1998) turni ***Obesogammarus*** Stock, 1974 avlodiga oʻtkazishni taklif qilgan.

T. aralensis ning sistematik oʻrni uzoq vaqt davomida noaniq boʻlib kelgan. U dastlab 1875 yilda Ulyanin tomonidan A.P. Fedchenkoning "Puteshestviy v Turkistan" asarida *"Gammarus aralensis"* nomi bilan tavsiflangan. Tavsif juda qisqa va yetarli darajada batafsil boʻlmagan. Asarda qayd etishicha, mazkur tur *Gammarus gracilis* Rathke, 1836 (=*Echinogammarus marinus* (Leach, 1815)) turiga yaqin hisoblangan hamda tana uzunligi 8–9 mm deb koʻrsatilgan. *T. aralensis* ni oʻrganishga eng muhim hissa Sowinsky (1894a, 1894b, 1898, 1904) tomonidan qoʻshilgan. U mazkur turni qadimgi shoʻrtob suvli Sarmatiya havzasidan kelib chiqqan relikt shakl sifatida baholab, uni *Gammarus marinus* va *Gammarus maeoticus* turlariga yaqin deb hisoblagan.

G.O. Sars (1896) Kaspiy dengizi qisqichbaqasimonlariga bagʻishlangan koʻp jildli asarida Karabugas (Kara-Bogaz-Gol) hududidan *Gammarus aralensis* var. *caspia* ni koʻrsatadi. Keyinchalik Sowinsky (1904) ushbu shakl Kaspiy dengizining ochiq suvlariga xos ekanini qayd etgan. Soʻngra Martynov (1924a) var. *caspia* Sars (Derzhavin, 1912 tomonidan Volga deltasi ogʻzidan ham topilgan) aslida Ponto-Kaspiy mintaqasida keng tarqalgan *Pontogammarus robustoides* turiga mansub degan fikrni bildirgan.

Stebbing (1899) yetarli asos boʻlmagan holda *Gammarus aralensis* ni *Dikerogammarus haemobaphes* bilan sinonimlashtiradi va bu taksonomik chalkashlikka sabab boʻladi. Ehtimol, shu holat oqibatida ayrim mualliflar gammaridlarning tashqi morfologiyasiga ortiqcha tayanib, keskin qarashlarni ilgari surganlar. Masalan, *Dikerogammarus villosus* va *Dikerogammarus palmatus* turlarini *Dikerogammarus haemobaphes* bilan birlashtirish taklif qilingan [31.34]. Yoki undan ham keskinroq yondashuv asosida *Dikerogammarus fluviatilus* hamda *Dikerogammarus aralensis* ni ham yuqoridagi tur bilan sinonimlashtirish taklif etilgan [18].

Shunga qaramay, *T. aralensis* (Uljanin, 1875) taksonomiyasi butun shu davr mobaynida ancha chalkash boʻlib qolgan - qarama-qarshi qarashlarga koʻra, tur endemik va Orol dengizida keng tarqalgan deb hisoblangan (Berg 1908), shu bilan birga *Dikerogammarus haemobaphes* (Eichwald, 1841) ning kichik sinonimi deb qaralgan [18] yoki *Dikerogammarus setosus* Schäferna, 1914 [3].uchun katta sinonim deb qabul qilingan [30].

Oʻzbekiston kitobining 2019 yilgi Oʻzbekiston Respublikasining Qizil kitobi 2-jild, 23 tartib raqamli 38-sahifasida keltirilgan Orol yonsuzari ham muallif I. Mirabdullayev tomonodan *Dikerogammarus aralensis* nomi bilan yuritilgan [16].

Alohida bir ishlar guruhi ushbu turlarga oid bir qator manbalarni oʻz ichiga oladi: ular yoki monografik yoritish shaklida (Mordukhai-Boltovskoi va boshq. 1969), yoki mahalliy hududda *T. aralensis* ning tarqalishini muhokama qiluvchi faunistik ishlardir [45.38]. Ayrim manbalarda ushbu turning arealini sezilarli darajada kengayganligi ham qayd etilgan [2.37.44.].

T. aralensis barcha ***Turcogammarus*** turlari ichida eng keng tarqalgan va eng koʻp uchraydigan tur boʻlishiga qaramay, hatto ayrim hududlarda begona (invaziv) tur sifatida ham qayd etilgan (Copilaș-Ciocianu va boshq. 2022a), u morfologik nuqtai nazardan eng kam oʻrganilgan hisoblanadi, chunki u hech qachon toʻgʻri tarzda tavsiflanmagan. Bu

holat uning identifikatsiyasi va avlod darajasidagi joylashuvi bilan bog‘liq jiddiy taksonomik chalkashliklarga olib kelgan.

1960 yildan beri inson aralashuvi tufayli Orol dengizi yirik ekologik fojiani boshdan kechirmoqda, natijada u bosqichma-bosqich qurib borib, o‘rnini cho‘l egallamoqda. Ekologik jihatdan sezgir bo‘lgan ushbu hudud faunasini muhofaza qilish bo‘yicha sa’y-harakatlar, Orol dengizi ekotizimining muhim tarkibiy qismi bo‘lgan ***T. aralensis*** ning genetik-populyatsion tuzilmasi uchun DNK barkod ma’lumotlar bazasini talab qilishi mumkin [1].

Ushbu maqolada biz ***T. aralensis*** ni to‘liq qayta tavsiflaymiz va birinchi bor uni Sariqamish amfipodlari orasidagi filogenetik o‘rnini keng qo‘llaniladigan ribosomal DNK 18S sohasi fragmentlari bo‘yicha baholaymiz.

Materiallar va usullar

Namuna olish. Namunalar qo‘l to‘ri yordamida Sariqamish ko‘lining O‘zbekiston hududi qismida 2024-yil iyul oyida (42°17`03.1N, 57°34`07.5E) ko‘lining qirg‘oq qismidan gidrobiologik qirg‘ich yordamida yig‘ildi (1-rasm,). Olingan namunalar dala sharoitida 96% etanol eritmasida fiksatsiya qilindi.

1-rasm. Tadqiqot hududi

Morfologiya. Namunalar to‘liq ravishda glitserin bilan to‘ldirilgan buyum oynachalarida disseksiya (maxsus asboblar yordamida ochib, ichki tuzilishini o‘rganish maqsadida qismlarga ajratish) qilindi. Mikroskop oynachalariga o‘rnatildi va ajratilgan qo‘shimchalar qopqoq oynacha bilan yopildi. Xitinli kutikulani tiniqlashtirish va yumshatish maqsadida glitserinli distillangan suvda ivitildi.

Tana uzunligi Stemi 305 stereomikroskopida o‘rnatilgan okulyar mikrometr yordamida o‘lchandi. Qo‘shimcha o‘lchovlar planshetli mikroskop BLC-480B asosida amalga oshirildi. Qo‘shimchalar Carl Zeiss NU-2 yorug‘lik mikroskopiga o‘rnatilgan chizish moslamasi yordamida Gorodkov (1961) usuliga muvofiq chizib olindi.

Mandibulyar palpning 3-bo‘g‘imidagi tukchalar joylashuvi uchun qo‘llanilgan nomenklatura Karaman (1970) va Stock (1974) tomonidan tavsiflangan standartga muvofiq berildi.

Tavsifiy terminologiya an’anaviy klassifikatsiya tizimiga asoslanadi; mazkur ishda biz yo‘g‘on va qattiq tuklarni ifodalash uchun “tikan”, nozik va odatda egiluvchan tuzilmalarni ifodalash uchun esa “tukcha” atamasidan foydalandik.

Namuna olingan joylar ko‘rsatilgan geografik xarita GIS dasturi yordamida tuzildi.

Molekulyar usullar. Molekulyar tahlil uchun foydalanilgan ***T. aralensis*** namunalari 2024 yilda Sariqamish ko‘lidan qirg‘oq qismining 1-1,5 m oralig‘idan elak yordamida yig‘ib olindi va dala sharoitida 96% etanol eritmasida saqlandi.

Orol gammarusi namunasidan umumiy DNKni ajratishda GeneJet genomik DNK (Thermo Fisher Scientific) reagentlar to‘plamidan foydalanildi. Ajratilgan umumiy DNKsidan polimeraza zanjirli reaksiyasini (PZR) o‘tkazish uchun ribosomal DNK 18S geni fragmentlari praymerlaridan (1262 forward-`3-GGTGGTGGATGGGGG-5`; 1719 reverse 3`-AGGGGGGGTGTGTRG-5`) foydalanildi (Winnepenninckx et al., 1994). PZR o‘tkazish uchun: 34,8 mkl bidistillirlangan suv, 5 mkl 10X Taq-bufer, 5 mkl 2,5 mM $MgCl_2$, 1 mkl 2 mkM 2'-dezoksinukleozid-5'-trifosfat, 1 mkldan to‘g‘ri va teskari praymerlar, 2 mkl DNK matrisasi, 0,2 mkl Taq-polimerazasi qo‘shildi. Aralashmani yakuniy hajmi 50 mkl ni tashkil etdi. Namunadagi umumiy DNKsi miqdorini aniqlashda spektrofotometr (Nanodrop) asbobidan foydalanildi. Buxoro bug‘usi yungidan ajratib olingan umumiy DNKni PZR qilishda ProFlex PCR System (Xitoy) amplifikatori yordamida amalga oshirildi. mtDNK 16S geni fragmentlari PZR-amplifikasiyasini o‘tkazish ish rejimi quyidagi tartibda amalga oshirildi: 1 – bosqich – 15 daqiqa davomida DNK ning 95°S sharoitda denaturasiyalanishi, 2 – bosqich – DNKning 94°S sharoitda 30 soniya davomida denaturasiyalanishi, 3 – bosqich – DNKda 53°S sharoitda 45 soniya davomida praymerlarning yumshatilishi, 4 – bosqich – 72°S sharoitda 1 daqiqa 40 soniya davomida elongasiyalanishi, 5 – bosqich – 72°S sharoitda 5 daqiqa davomida zanjirning elongasiyalanishi. Ikkinchidan to‘rtinchi bosqichgacha jarayon sikl ko‘rinishida 35 martagacha takrorlangan.

PSR mahsulotlarida DNKning mavjudligi 1,5% li agaroza gelida 120 V kuchlanish bilan elektroforez qilish usulida aniqlandi. DNKning amplifikasiyasi va DNKni geldan ajratib olishda ishlab chiqaruvchi ko‘rsatmalariga amal qilgan holda «Sileks M» (Moskva, Rossiya) firmasi tomonidan ishlab chiqarilgan reaktivlar to‘plamidan foydalanildi.

DNKni sikvens qilishda ABI PRISM® BigDye™ Terminator v. 3.1 reaktivlar to‘plami yordamida amalga oshirilib, reaksiya mahsulotlari ABI PRISM 3100-Avant avtomatik sekvenatorda qayd qilindi.

Olingan nukleotidlar ketma – ketligining tahlili Bioedit, Clustal W va DNAstar™ maxsus kompьyuter dasturi yordamida amalga oshirildi. Filogenetik daraxt tuzish uchun sikvensdan olingan gammaruslarga mansub turlar nukleotidlari ketma-ketliklari va Milliy biotexnologiya axborotlar markazidan (https://www.ncbi.nlm.nih.gov/) olingan DNK ketma-ketliklaridan foydalanildi va bu ketma ketliklar Bioedit dasturida ko‘lda tahrir qilindi, konsensus ketma-ketliklari Mega XI hisoblash dasturi yordamida hisoblab chiqildi. Olingan rDNK 18S sohasiga mansub nukleotidlar ketma-ketliklari maksimal extimollik usuli bilan (Maximum likelihood-ML) filogenetik daraxti 1000 ta butstrep takrorlash bilan amalga oshirildi.

Natijalar va ularning tahlili

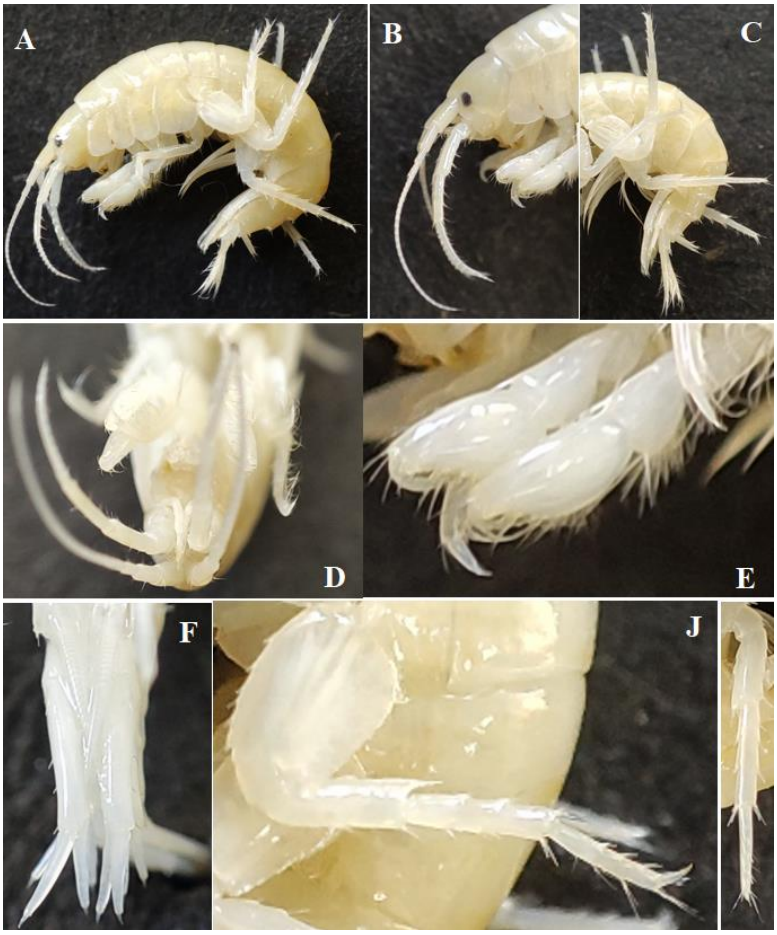
Avlod (Genus): Turcogammarus Karaman et Barnard, 1979



2-rasm. ***Turcogammarus aralensis*** **ning morfologik belgilari:** A — umumiy lateral ko‘rinishi; B — bosh qismi va antennalar; C — pleon va urosoma sohasi; D — og‘iz apparati va antennalarning oldingi ko‘rinishi; E — gnatopodlar va ko‘krak oyoqlari; F — telson va uropodlar distal qismi; J — uropodning tikan va tukchalari.

Umumiy tana morfologiyasi (2-rasm A). Tana baquvvat, silliq, urosoma segmentlari 1 va 2 da ajralib turuvchi dorsal kutikulyar oʻsimtalari bor. Rostrum noaniq; yon bosh boʻlagi chuqurchali, pastki antennal sinus oʻrtacha, yumaloq; koʻzlar yirik. Pleonitlar yon va dorsal chetlari boʻylab tuklarsiz; epimeral plastinkalar 1–3 ning har biri old qismida uzun ingichka setalar tutami bilan, ventral chetlari qattiq tuklar bilan, ayniqsa epimeron 2 da subventral qismida notekis tutamli ikki qator tuklar mavjud; 1-plastinkada distoposterior burchak ichkariga kirgan, 2 va 3-plastinkalarda esa choʻzilgan. Urosoma 1 va 2 urosomitlarning dorsal yuzasida sezilarli kutikulyar koʻtarilmalar bilan, har bir guruhda 4 yoki 5 tishli tikanlar va ular orasida joylashgan qisqa tuklar bilan qoplangan; urosomit 3 da orqa chetlarida yon guruhli tikanlar, ular orasida oʻrta qisqa tuklar tutami bor. Telson kengligidan uzunroq, chuqur ikkiga boʻlingan, har bir boʻlakda 2 tadan subapikal tishli tikan va ularning har biriga 2 ta oʻrtacha uzunlikdagi tuk mavjud.

Antennalar (2-rasm, B, D). Antenna I tana umumiy uzunligidan ancha qisqa, antenna II dan taxminan 0,1 marta uzunroq; pedunkul 1–3 boʻgʻimlari uzunlik nisbati 1:0,5:0,3, proksimal qismlarida qisqa tuklar tutami, 2-boʻgʻim oʻrtasida tuklar guruhi bilan; asosiy flagellyum 19 boʻgʻimli, har birida medial chetida qisqa tuklar bilan birga 1 tadan mayda suzuvchi tuzilma; qoʻshimcha oʻsimta 4 boʻgʻimli, yuz chetida qisqa tishli tikanlar, apikal oʻqi boʻylab koʻp sonli mayda yon tukchalar bor. Antenna II bez konusi qisqa; pedunkul 4 va 5-boʻgʻimlari uzunlik nisbati 1:0,8, har ikkalasi medial yuzada uzun qattiq tuklarning zich tutamlari bilan; flagellyum pedunkuldan ozroq qisqa, 6 boʻgʻimli, yon yuzalari va uchlarida uzun qattiq tuklar tutamli, juda kichik sezuvchi tuzilmalar mavjud emas.

Ogʻiz qismlari (2-rasm D). Yuqori lab sub-rombsimon, apikal qismida mayda tuklar guruhi bor. Mandibulalar deyarli teng: chap mandibula — kesuvchi qismi 5 tishli, mandibulaning harakatchan tishsimon oʻsimtasi 4 tishli; molyar orasida 6 ta tishli tikan qatori. Oʻng mandibula — kesuvchi qismi 4 tishli, bir nechta mayda tishchali. Pastki lab tuxumsimon, biroz konussimon ichki boʻlaklarga ega. Maxilla I assimetrik, palpalar uzun, yon yuzalarida 2 tadan patli tik bor; distal qismi tishli, chap palpada 5 tishli tikan va 4 oddiy tuk, oʻng palpada 6 tish va 2 tuk; tashqi plastinkada 11 ta taroqsimon koʻp tishli tikan, ichki boʻlaklari uchburchak, 14 patli tuk mavjud.

Gnatopodlar (Koʻkrak oyoqlari). Gnatopod I oʻrtacha tukli, basis (6-boʻgʻim) baquvvat, old va orqa chetlarida uzun patlanmagan tuklar, old tomonda qisqa tuklar qatori bor; karpus (5-boʻgʻim) uchburchaksimon, qisqichbaqasimonlar oyoq qoʻshimchasining oldingi boʻgʻimi (propodus) uchburchaksimon, tuxumsimon, kesuvchi cheti rivojlangan va aniqlovchi burchagida distal tishli 6 tikanli.

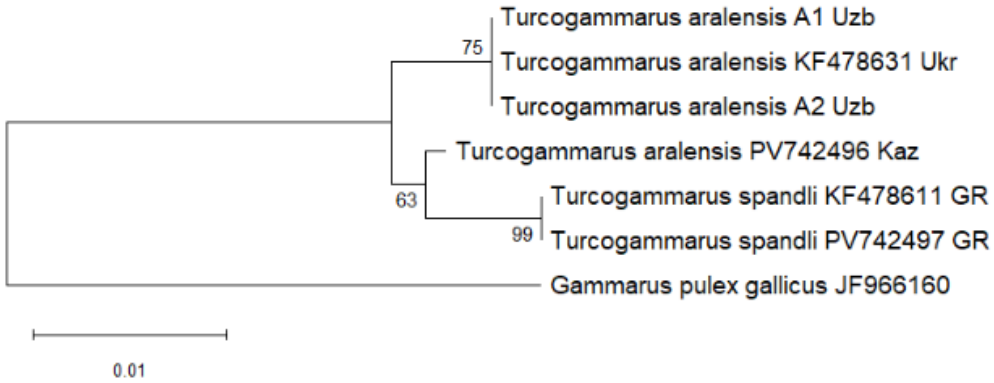
Pleopodlar va uropodlar (2-rasm E, J) qorin qismidagi qoʻshimcha oyoqchalari, lekin joylashuvi va vazifasi bilan farq qiladi. Pleopodlar 1–3 odatiy, pedunkullari uzun ingichka tuklar guruhlari bilan, retinakula 2 ilgakli va 3 ta qattiq oddiy tuk mavjud. Uropodlar 1–2 pedunkullari urosomadan tashqariga chiqadi, pedunkullarda chetlari boʻylab 2 yoki 3 tikan joylashgan; uropod I pedunkulida 2 basofasial tikan va tuklar guruhi mavjud; rami chetlari boʻylab 1 yoki 2 ta tikan, uropod I ichki rami (endopodit) dorsal yuzada 2 ta uzun qattiq tuk mavjud.

Uropod endopodit qisqa, tashqi ramidan qisqa, apikalda 1 ta tikan va medial yuzada 5 ta patli tuk mavjud; ventrodistal tishli tikanlar guruhi joylashgan; ekzopodit (tashqi rami) 2 boʻgʻimli, proksimal boʻgʻimida yon tomonda 3 juft tikan guruhi va chetlarida oʻrtacha zich mayda patli uzun tuklar, distal boʻgʻimi qisqa, apikalda tuklar toʻplami bor.

Molekulyar filogeniyasi.

Ushbu tadqiqotda *Turkogammarus* sp namunasi asosiy obyekt sifatida oʻrganilib, uning molekulyar filogenetik pozitsiyasi va turlararo evolyutsion munosabatlari oʻzaro maksimal echtimolik (Maximum Likelihood, ML) usuli asosida tuzilgan filogenetik daraxti MEGA12 dasturida bajarilgan tahlil qilindi. Filogenetik daraxtda tashqi guruh (outgroup) namunasi sifatida ishlatilgan *Gammarus pulex gallicus* (F966160) daraxtning eng ildiz qismida joylashgan bo'lib, u barcha *Turkogammarus* avlodi vakillaridan aniq ajralib chiqqan (3-rasm). Bu tanlov daraxtni to'g'ri ildizlantirishga va turkogammarus guruhi ichidagi monofiletik tuzilmani tasdiqlashga yordam beradi.

Quyidagi filogenetik daraxt *Turcogamarus* avlodiga mansub turlarning rDNK 18S geni fragmentlari asosida yaratilgan boʻlib, turlar oʻrtasidagi genetik aloqalarni koʻrsatadi. Daraxtda bootstrap qiymatlari yordamida filogenetik aniqlik ta'minlanib, u avlodni tavsiflash uchun foydalanilgan. Genbank (NCBI) bazasida rDNK 18S geni boʻyicha *Turcogamarus* avlodiga mansub ikkita turning mavjud boʻlib, shularining ketma-ketlikligi asosida daraxt tuzildi (3 - rasm).



3-rasm. *Turcogamarus* avlodiga mansub turlarining o‘zaro maksimal echtimolik (ML) usuli asosidagi filogenetik daraxti

Filogenetik tahlil natijalariga ko‘ra, O‘zbekistonni Sariqamish ko‘lidan olingan *Turcogamarus aralensis* A1 Uzb va A2 Uzb namunalari GenBank'dagi boshqa *T. aralensis* genotiplari bilan yaqin qarindoshlikda bo‘lib, ular bilan ikkita kladani hosil qilgani ko‘rsatdi. Birinchi kladada joylashgan *T. aralensis* KF478631 namunasi (Ukrainadan topilgan) bilan o‘rtacha bootstrap qo‘llab-quvvatlovi (≈75) aniqlanib, *T. aralensis* A1 Uzb va A2 Uzb namunalari ushbu taksonlar bilan genetik jihatdan yaqinligini ko‘rsatdi. Lekin tahlil uchun kiritilgan *T. aralensis* PV742496 turi (Qozoqston) namunasi past bootstrap qo‘llab-quvvatlovi bilan, boshqa alohida klada hosil qilib joylashdi.

Keyingi kladada *T. spandli* turning PV742497 va JF966160 namunalari filogenetik daraxtda yuqori qo‘llab-quvvatlovga ega (≈99) alohida monofiletik kladada joylashgan bo‘lib, bu ularning bir turga xos genetik yaqinlikni tasdiqlaydi.

Umuman olganda, *T. aralensis* namunalar o‘z turlariga xos bo‘lgan genetik kladalarda joylashganligi va bootstrap qiymatlari bilan qo‘llab-quvvatlanganligi ushbu namunalarni *T. aralensis* turiga tegishli deb tavsiflash mumkinligini bildiradi. Lekin Qozoqstonda aniqlangan *T. aralensis* PV742496 turi namunasini alohida klada hosil qilganligi tur populyatsiyalari ajralishni ko‘rsatadi. Genbankdagi boshqa populyatsiyalari bilan genetik uyg‘unligini hamda tur ichidagi filogenetik mustahkamligini tasdiqlaydi.

Ushbu yondashuvlar natijalari, O‘zbekiston hududida yashovchi pontagammaruslarning aniq molekulyar identifikatsiyasi va turlararo filogenetik munosabatlarining chuqurroq tushunilishida muhim ilmiy asos yaratmoqda. Kelgusidagi tadqiqotlarda rDNK 18S sohasidan tashqari, mitoxondrial COI genidan kengroq namunalar bazasi va geografik ma’lumotlar ham qo‘shilib, bu turlar o‘rtasidagi genetik va ekologik bog‘liqliklarni yanada chuqurroq o‘rganish zarurligi ta’kidlaymiz.

Muhokama

Ushbu tadqiqotda Sariqamish ko‘lining O‘zbekiston hududi qismidan olingan Turcogammarus aralensis namunalarining morfologik belgilari va rDNK 18S markeriga asoslangan molekulyar-filogenetik holati birgalikda tahlil qilindi. Olingan natijalar tur identifikatsiyasini faqat umumiy tashqi ko‘rinish asosida emas, balki urosoma, antennalar, epimeral plastinkalar, pleopod va uropodlar kabi diagnostik tuzilmalar majmuasi asosida baholash zarurligini ko‘rsatadi. Bu yondashuv Ponto-Kaspiy amfipodlarida tarixiy tavsiflarning qisqaligi, morfologik konvergensiya va avlodlararo taksonomik ko‘chirishlar bilan bog‘liq chalkashliklarni kamaytirishda muhim ahamiyatga ega [3].

Morfologik kuzatuvlar *T. aralensis* uchun xos bo‘lgan bir qator muhim belgilarni tasdiqladi. Jumladan, urosoma 1–2 segmentlaridagi dorsal kutikulyar ko‘tarilmalar, epimeral plastinkalarning ventral chetlaridagi tikan va tuklar kompleksi, antenna II pedunkul bo‘g‘imlarining zich va uzun tuklanishi, uropod III endopoditi va ekzopoditining nisbiy rivojlanishi mazkur turning diagnostikasida alohida ahamiyatga ega. Ayniqsa urosoma qurollanishi va orqa qo‘shimchalar tuzilishi Ponto-Kaspiy gammaroidlarida tur darajasidagi farqlanishni aniqlashda ishlatiladigan barqaror belgilardan biri hisoblanadi. Shu sababli ushbu ishda keltirilgan morfologik tavsif Sariqamish populyatsiyasini tarixiy Orolbo‘yi va Kaspiybo‘yi materiallari bilan qiyoslash imkonini beradi.

T. aralensis ning taksonomik tarixi uning hozirgi sistematik talqinini murakkablashtirgan. Tur dastlab Uljanin (1875) tomonidan Gammarus aralensis nomi bilan qisqa tavsiflangan, keyinchalik ayrim mualliflar uni Dikerogammarus, Obesogammarus yoki boshqa Ponto-Kaspiy gammaroidlariga yaqinlashtirgan. Bunday qarashlar, bir tomondan, eski tavsiflarda diagnostik belgilar yetarli darajada ko‘rsatilmaganligi, ikkinchi tomondan, Ponto-Kaspiy amfipodlarida tana shakli va tuklanish xarakterlarining ekologik sharoitga mos ravishda o‘zgaruvchanligi bilan bog‘liq. Mazkur tadqiqotda Sariqamish namunalarining morfologiyasi *Turcogammarus aralensis* talqiniga mos kelishi bu nomning O‘zbekiston hududidagi materiallar uchun qo‘llanishini asoslaydi.

Molekulyar filogenetik tahlil natijalari morfologik identifikatsiyani qo‘llab-quvvatlaydi. Sariqamish ko‘lidan olingan *T. aralensis* A1 Uzb va A2 Uzb namunalarining GenBank ma’lumotlar bazasidagi *T. aralensis* ketma-ketliklari bilan yaqin kladada joylashishi ushbu populyatsiyaning turga mansubligini tasdiqlaydi. Shu bilan birga *T. spandli* namunalari alohida, yuqori bootstrap qo‘llab-quvvatloviga ega klada hosil qilgani Turcogammarus avlodi ichida turlararo farqlanish mavjudligini ko‘rsatadi. Biroq rDNK 18S sohasi nisbatan konservativ marker bo‘lgani sababli, u tur ichidagi nozik filogeografik farqlarni to‘liq ochib bera olmaydi. Shuning uchun kelgusida COI va 16S kabi mitoxondrial markerlar hamda ko‘proq geografik namunalar jalb etilishi maqsadga muvofiq.

Filogenetik daraxtda Qozog‘iston materialiga mansub *T. aralensis* PV742496 namunasining alohida klada hosil qilishi tur ichida geografik differensiasiya mavjud bo‘lishi mumkinligini ko‘rsatadi. Bunday holat Aral-Kaspiy paleohavzasi tarixidagi gidrologik uzilishlar, sho‘rlanish rejimining o‘zgarishi va lokal populyatsiyalarning uzoq muddatli izolyatsiyasi bilan izohlanishi mumkin. Shu bilan birga, bitta marker va cheklangan namunalar asosida bunday farqni mustaqil evolyutsion birlik sifatida talqin qilish ehtiyotkorlikni talab qiladi. Hozirgi bosqichda bu natija Sariqamish, Orolbo‘yi, Shalkar va Volga-Sirdaryo tizimlari populyatsiyalarini kengroq qamrab olgan integrativ tahlillar zarurligini ko‘rsatadi.

Sariqamish ko‘li populyatsiyasining o‘rganilishi Orol dengizi inqirozi sharoitida alohida ekologik ahamiyatga ega. Orol dengizining regressiyasi, suv sathining pasayishi va sho‘rlanishning kuchayishi natijasida qadimgi Orol-Kaspiy faunasiga mansub ko‘plab gidrobiontlarning yashash joylari keskin qisqargan. *T. aralensis* kabi relikt pontogammaridlar bunday sharoitda faqat ayrim sho‘rtob yoki o‘zgaruvchan gidrologik rejimga ega havzalarda saqlanib qolishi mumkin. Shu jihatdan Sariqamish ko‘li O‘zbekiston hududidagi Ponto-Kaspiy relikt amfipodlarini saqlab qoluvchi muhim refugial hududlardan biri sifatida qaralishi mumkin.

Tadqiqot natijalari amaliy jihatdan ham muhimdir. O‘zbekiston Respublikasi Qizil kitobida ushbu taksonning *Dikerogammarus aralensis* nomi bilan berilishi tarixiy taksonomik qarashlar bilan bog‘liq bo‘lib, zamonaviy morfologik va molekulyar ma’lumotlar asosida nomenklaturani qayta ko‘rib chiqish zarurligini ko‘rsatadi. Tur nomining barqarorlashtirilishi nafaqat ilmiy sistematika uchun, balki muhofaza choralarini belgilash, monitoring dasturlarini yuritish va ma’lumotlar bazalarida yagona taksonomik birlikdan foydalanish uchun ham muhimdir.

Xulosa

Umuman olganda, ushbu ish Sariqamish ko‘li hududidan olingan *T. aralensis* namunalarining morfologik va molekulyar jihatdan tasdiqlanganligini ko‘rsatadi. Natijalar O‘zbekiston suv havzalaridagi Ponto-Kaspiy amfipodlarining taksonomik holatini aniqlashtirish, ularning tarixiy areali va hozirgi populyatsion tuzilmasini baholash uchun dastlabki asos yaratadi. Kelgusida turli mavsumlarda va turli sho‘rlanish gradientlarida yig‘ilgan namunalar, kengaytirilgan morfometrik tahlil, COI/16S markerlari bo‘yicha DNK barkodlash hamda GenBank ma’lumotlari bilan qiyosiy filogeografik tahlillar ushbu turning O‘zbekiston va Markaziy Osiyodagi real tarqalish chegaralarini aniqroq belgilash imkonini beradi.

Аннотация: *Статья посвящена анализу применения международных стандартов устойчивого развития в рыбной отрасли Республики Узбекистан. Рассматриваются современные глобальные подходы к устойчивому развитию, включая стандарты International Sustainability Standards Board (ISSB), принципы ESG и цели устойчивого развития United Nations (SDGs), а также их практическое применение в аквакультуре и рыбном хозяйстве. Проанализировано текущее состояние внедрения данных стандартов в отрасли, представлены статистические показатели развития рыбного хозяйства Узбекистана, выявлены основные ограничения и сформулированы предложения по интеграции стандартов устойчивого развития в систему управления и отчётности рыбохозяйственных предприятий.*

Ключевые слова: *ISSB, ESG, SDGs, рыбная отрасль, аквакультура, Узбекистан.*

O'ZBEKISTON BALIQCHILIK SANOATINING BARQAROR RIVOJLANISHI UCHUN XALQARO STANDARTLAR: QO'LLANILISHI, HOZIRGI HOLATI VA AMALIY TADBIRLAR ISTIQBOLLARI

Annotatsiya: *Maqola O‘zbekiston Respublikasi baliqchilik sohasida barqaror rivojlanishning xalqaro standartlarini qo‘llash tahliliga bag‘ishlangan. Unda barqaror rivojlanishga oid zamonaviy global yondashuvlar, jumladan, Xalqaro barqaror rivojlanish standartlari kengashi (ISSB) standartlari, ESG tamoyillari va Birlashgan Millatlar Tashkilotining Barqaror rivojlanish maqsadlari (SDGs) hamda ularning akvakultura va baliq xo‘jaligida amaliy qo‘llanilishi ko‘rib chiqiladi. Shuningdek, mazkur standartlarning sohada joriy etilishining hozirgi holati tahlil qilinadi, O‘zbekiston baliq xo‘jaligining rivojlanish statistik ko‘rsatkichlari keltiriladi, asosiy cheklovlar aniqlanadi hamda barqaror rivojlanish standartlarini baliqchilik korxonalarining boshqaruv va hisobot tizimiga integratsiya qilish bo‘yicha takliflar shakllantiriladi.*

Kalit so‘zlar: *ISSB, ESG, SDGs, baliqchilik sohasi, akvakultura, O‘zbekiston.*

INTERNATIONAL STANDARDS FOR SUSTAINABLE DEVELOPMENT IN THE FISHING INDUSTRY OF UZBEKISTAN: APPLICATION, CURRENT STATUS AND PROSPECTS FOR IMPLEMENTATION

Abstract: *This article is dedicated to analyzing the application of international sustainability standards in the fishery sector of the Republic of Uzbekistan. It examines contemporary global approaches to sustainable development, including the standards of the International Sustainability Standards Board (ISSB), ESG principles, and the United Nations Sustainable Development Goals (SDGs), as well as their practical application in aquaculture and fisheries. The current state of these standards' implementation in the sector is analyzed, statistical indicators of Uzbekistan's fishery development are presented, key constraints are identified, and recommendations are formulated for integrating sustainability standards into the management and reporting systems of fishery enterprises.*

Keywords: *ISSB, ESG, SDGs, fishery sector, aquaculture, Uzbekistan.*

Введение

Устойчивое развитие в последние годы стало центральной концепцией глобальной экономической и экологической политики. Международные организации, инвесторы и финансовые институты всё чаще требуют от предприятий раскрытия информации не только о финансовых результатах, но и о воздействии их деятельности на окружающую среду, общество и систему управления.

Для рыбной отрасли, напрямую зависящей от состояния водных экосистем и биологического разнообразия, внедрение стандартов устойчивого развития имеет особое значение. В условиях водного дефицита и климатических изменений для Uzbekistan становится актуальной задача интеграции международных стандартов устойчивого развития в практику управления рыбным хозяйством.

Развитие аквакультуры и рыбного хозяйства играет важную роль в обеспечении продовольственной безопасности, создании рабочих мест и устойчивом развитии сельских территорий. В этой связи внедрение международных стандартов устойчивого развития становится важным инструментом повышения эффективности и экологической устойчивости отрасли.

Материалы и методы:

Международные стандарты устойчивого развития: сущность и содержание

Стандарты ISSB (IFRS S1 и IFRS S2)

Совет по международным стандартам устойчивого развития — International Sustainability Standards Board — разработал глобальные стандарты раскрытия информации в области устойчивого развития:

- IFRS S1 — общие требования к раскрытию финансово значимой информации об устойчивом развитии;
- IFRS S2 — раскрытие информации, связанной с климатическими рисками и возможностями.

Данные стандарты направлены на то, чтобы компании системно раскрывали риски и возможности, связанные с устойчивым развитием, которые могут повлиять на их долгосрочную стоимость **Standards Board, (2023)** и **United Nations. (2015)**.

Принципы ESG

Подход ESG (Environmental, Social, Governance) является одним из ключевых инструментов оценки устойчивости деятельности компаний.

Для рыбной отрасли ESG-подход включает:

Экологические аспекты

- качество воды;
- сохранение биоразнообразия;
- контроль антропогенной нагрузки на экосистемы.

Социальные аспекты

- занятость населения;
- безопасность труда;
- развитие сельских территорий.

Управленческие аспекты

- прозрачность управления;
- управление экологическими рисками;
- соблюдение природоохранного законодательства.

Цели устойчивого развития ООН United Nations Environment Programme (UNEP). (2020) и Food and Agriculture Organization of the United Nations (FAO). (2021).

Рыбная отрасль Узбекистана напрямую связана с достижением целей устойчивого развития United Nations, прежде всего:

- ЦУР 2 — ликвидация голода;
- ЦУР 8 — достойная работа и экономический рост;
- ЦУР 12 — ответственное потребление и производство;
- ЦУР 14 — сохранение морских и водных экосистем.

Результаты и дискуции:

Экологические аспекты устойчивого развития рыбной отрасли

Экологическая устойчивость рыбного хозяйства определяется состоянием водных экосистем и их биоразнообразием.

Основными компонентами водных экосистем являются:

- фитопланктон — основа первичной продукции;
- зоопланктон — важная кормовая база для рыб;
- зообентос — индикатор экологического состояния водоёмов;

• ихтиофауна — завершающий элемент трофических цепей.

Нарушение экологического баланса приводит к деградации водоёмов, снижению рыбопродуктивности и росту экологических рисков. Международные стандарты устойчивого развития требуют учитывать эти факторы при стратегическом планировании и раскрытии информации.

Текущее состояние развития рыбной отрасли Узбекистана Министерство сельского хозяйства Республики Узбекистан. (2021) и Kim, V.V., & Saidova, F.N. (2022).

В последние годы рыбная отрасль Узбекистана демонстрирует устойчивый рост. Развитие интенсивной аквакультуры, расширение прудовых хозяйств и государственная поддержка отрасли способствуют увеличению объёмов производства.

Таблица 1

Динамика производства рыбы в Узбекистане

Год	Производство рыбы, тыс. Тонн	Темп роста
2022	157	—
2023	180	+14,6 %
2024	191,4	+6,3 %
2025	206,2	+7,7 %

Данные таблицы свидетельствуют о стабильной положительной динамике развития рыбной отрасли. В 2025 году производство рыбы превысило 206 тыс. тонн, что подтверждает рост производственного потенциала аквакультуры.

Таблица 2

Производство рыбы по регионам Узбекистана

Регион	Производство, тыс. тонн
Хорезмская область	35,9
Ташкентская область	23,4
Андижанская область	22,3
Самаркандская область	20,5
Наманганская область	20,0
Ферганская область	16,4
Республика Каракалпакстан	14,0
Джизакская область	12,5
Сырдарьинская область	11,7
Навоийская область	10,2
Сурхандарьинская область	7,8
Бухарская область	6,7
Кашкадарьинская область	4,6

Наибольший объём производства рыбы сосредоточен в Хорезмской, Ташкентской и Андижанской областях, что связано с благоприятными гидрологическими условиями и развитой инфраструктурой аквакультуры. Основные показатели развития рыбной отрасли

Таблица 3

Ключевые показатели рыбного хозяйства Узбекистана

Показатель	Значение
Общий объём производства рыбы	206,2 тыс. тонн
Производство аквакультуры	около 140 тыс. тонн
Импорт рыбы и морепродуктов	около 12 тыс. тонн
Доля рыбной продукции в сельском хозяйстве	более 1 трлн сум

Эти показатели демонстрируют возрастающую роль рыбной отрасли в структуре аграрной экономики страны.

Связь международных стандартов устойчивого развития и рыбной отрасли

Таблица 4

Применение международных стандартов устойчивого развития в рыбном хозяйстве

Стандарт	Основные требования	Практическое применение
ISSB (IFRS S1)	раскрытие информации об устойчивом развитии	экологическая и нефинансовая отчётность
ISSB (IFRS S2)	раскрытие климатических рисков	оценка влияния температуры воды
ESG	экологические, социальные и управленческие показатели	мониторинг качества воды и биоразнообразия
ЦУР ООН	глобальные цели устойчивого развития	продовольственная безопасность

Перспективы внедрения стандартов устойчивого развития

1. Формирование отраслевой модели устойчивого развития

Целесообразно разработать национальные рекомендации по применению стандартов ISSB и ESG с учётом специфики рыбной отрасли Узбекистана.

2. Развитие системы экологического мониторинга

Необходимо интегрировать данные о состоянии водных экосистем (качество воды, биоразнообразие, биомасса) в систему управленческой и нефинансовой отчётности предприятий.

3. Подготовка кадров

Важно развивать междисциплинарные компетенции специалистов на стыке экологии, экономики и управления устойчивым развитием.

4. Роль государства и инвесторов

Государственная поддержка и требования инвесторов могут стать ключевыми драйверами внедрения международных стандартов устойчивого развития в рыбной отрасли

Заключение

Международные стандарты устойчивого развития являются важным инструментом повышения экологической и экономической эффективности рыбной отрасли. Их внедрение в рыбное хозяйство Узбекистана позволит обеспечить сохранение биоразнообразия водных экосистем, повысить прозрачность деятельности предприятий и создать условия для долгосрочного устойчивого развития отрасли.

В условиях роста производства аквакультуры и усиления глобальных экологических требований интеграция стандартов устойчивого развития становится одним из ключевых факторов модернизации рыбной отрасли страны.

Annotatsiya: *Ushbu maqolada Farg'ona vodiysida uchraydigan oq laylak- larning yashash muhiti, tarqalishi va ularning ekologik xususiyatlari tahlil qilingan. Tadqiqot davomida laylaklarning asosan aholi punktlari, sug'oriladigan qishloq xo'jaligi yerlari, kanal va ariqlar atrofida yashashi aniqlangan. Shuningdek, ularning in qurish joylari, ozuqa manbalari va ko'payish jarayonlari haqida ma'lumotlar keltirilgan. So'nggi yillarda iqlim o'zgarishi, inson faoliyati va infratuzilmaning rivojlanishi natijasida laylaklarning yashash muhitida ayrim o'zgarishlar kuzatilayotgani ta'kidlangan. Maqolada laylaklar populyatsiyasini saqlash, ularning in qurish joylarini muhofaza qilish va ekologik muhitni asrash bo'yicha tavsiyalar berilgan.*

Kalit so'zlar: *oq laylak, Farg'ona vodiysi, yashash muhiti, migratsiya, in qurish joylari, ekologiya, muhofaza.*

АРЕАЛ ОБИТАНИЯ БЕЛЫХ АИСТОВ В ДОЛИНЕ ФЕРГАНЫ И ПРОБЛЕМЫ ИХ СОХРАНЕНИЯ

Аннотация**:** *В данной статье рассматриваются особенности среды обитания белого аиста (White Stork) в Ферганской долине, а также вопросы его распространения и экологических характеристик. В ходе исследования установлено, что аисты в основном обитают в населённых пунктах, на орошаемых сельскохозяйственных землях и вблизи каналов и водоёмов. В статье приводятся сведения о местах гнездования, кормовой базе и особенностях размножения птиц. Отмечается, что в последние годы под влиянием климатических изменений, хозяйственной деятельности человека и развития инфраструктуры наблюдаются изменения в местах обитания аистов. Также в работе предложены рекомендации по сохранению популяции белого аиста, охране мест гнездования и поддержанию экологического равновесия.*

Ключевые слова**:** *белый аист, Ферганская долина, среда обитания, миграция, гнездование, экология, охрана природы.*

HABITAT OF WHITE STORKS IN THE FERGANA VALLEY AND ISSUES OF THEIR CONSERVATION

Abstract: *This article analyzes the habitat, distribution, and ecological characteristics of the white stork in the Fergana Valley. The study shows that white storks mainly inhabit rural settlements, irrigated agricultural lands, and areas near canals and water bodies. Information about nesting sites, feeding resources, and breeding characteristics of the species is presented. In recent years, certain changes in the habitat of white storks have been observed due to climate change, human activities, and infrastructure development. The article also provides recommendations for the conservation of the white stork population, protection of nesting sites, and preservation of ecological balance in the region.*

Keywords: *white stork, Fergana Valley, habitat, migration, nesting sites, ecology, conservation.*

Kirish.

Oq laylak o‘zbekiston Qizil kitobiga xavf ostiga yaqin (*NT - Near Threatened)* kenja tur sifatida kiritilgan[1]. Uzoq muddatli tadqiqotlar shuni ko‘rsatadiki, O‘zbekistonda oq laylak populyatsiyasining holati juda o‘zgaruvchan bo‘lib, bu holat landshaftlarning antropogen o‘zgarishi hamda turning yuqori biologik moslashuvchanligi bilan bog‘liq[2-6]. O‘zbekiston hududida oq laylaklarning eng yirik koloniyalari Sirdaryo daryosining o‘rta oqimlarida, Chirchiq va Ohangaron daryolarining o‘rta va quyi oqimlarida, Farg‘ona vodiysida hamda Samarqand vohasida joylashgan. Son jihatdan kichik va kamayib borayotgan populyatsiyalar Jizzax va Samarqand viloyatlaridagi Turkiston tizmasi etaklarida, shuningdek Qashqadaryo va Surxondaryo viloyatlari vodiylarida qayd etilgan. Mazkur hududlarda oq laylak 1940–1950-yillargacha keng tarqalgan uya quruvchi qush bo‘lgan [7-8]. 2005-yilgacha O‘zbekiston hududida 745 ta uya quruvchi juft qayd etilgan bo‘lib, ularning 452 tasi aynan Farg‘ona vodiysiga to‘g‘ri kelgan [9].

Keyingi paytlarda global iqlim o‘zgarishi oqibatida oq laylaklarni yashash tarzi, ko‘payish dinamikasi, ozuqa manbalari, migratsion ko‘rsatkichlari hamda antrapogen faoliyat ta’siri natijasida ekologik xavf paydo bo‘layotgandek ko‘rinmoqda. Biroq, soxa olimlari tomonidan olib borilgan tadqiqotlar ko‘rsatishicha, iqlim isishi natijasida ba’zi laylaklar an’anaviy uzoq migratsiyani qisqartirishi yoki umuman migratsiya qilmasligi mumkin. Masalan, ayrim hududlarida ilgari uzoq issiq o‘lkalarga uchib ketadigan laylaklar endi qishni ham shu yerda o‘tkaza boshlagani kuzatilgan. Buning sababi qishlar iliqlashib, ozuqa topish imkoniyati saqlanib qolishi xarakterlanishidir. Lekin, oq laylaklarni yashash sharoitiga salbiy ta’sir etuvchi ekologik omillar xam yo‘q emas. Masalan, iqlim o‘zgarishi bilan bog‘liq botqoqlik va nam yerlarni kamayishi, hasharotlar va qurbaqalar kabi ozuqaning kamayishi, shahar va qishloqlarni kengayishi hamda atmosferada kimyoviy moddalarni ortishi kabi jarayonlar salbiy ta’sirga ega.

Tadqiqot natijalari ko‘rsatishicha, O‘zbekistonda oq laylaklar asosan **Farg‘ona vodiysi va Toshkent vohasida** ko‘proq uchraydi. Ilmiy hisob-kitoblarga ko‘ra, mamlakatda ularning soni 1990-yillardan keyin ma’lum darajada kamaygan.

Adabiyotlar taxlili.

Markaziy Osiyo, O‘zbekiston va Farg‘ona vodiysida Oq laylak bo‘yicha ilmiy tadqiqotlar turli davrlarda ornitologlar, biologlar va ilmiy muassasalar tomonidan olib borilgan. Bu tadqiqotlar asosan laylaklarning tarqalishi, migratsiyasi, in qurishi, populyatsiyasi va muhofazasini o‘rganishga qaratilgan. Markaziy Osiyo faunasini o‘rganish XIX–XX asrlarda boshlangan bo‘lib, rus zoologi Nikolay Zarudniy tomonidan bir nechta ekspeditsiyalar uyushtirib, Turkiston hududidagi qushlar faunasini o‘rgangan va minglab qush namunalarini yig‘gan. Bu olimning ishlari keyinchalik Markaziy Osiyo ornitologiyasi uchun asos bo‘lgan. O‘zbekistonda laylaklar bo‘yicha tadqiqotlar asosan universitetlar va ilmiy tashkilotlar tomonidan amalga oshirilgan. Xususan, Roman Kashkarov, Alisher Atakhodjaev va Yuliya Mitropolskayalar tomonidan O‘zbekistonda oq laylak populyatsiyasi, tarqalishi va antropogen ta’sirlarni o‘rganilgan.

O‘zbekistonda oq laylak populyatsiyasining o‘zgaruvchanligi va uning yuqori biologik moslashuvchanligi bilan bog‘liq masalalarni Sagitov 1987, Nazarov va Abdunazarov 1987, Shernazarov va boshq. 1994, Mitropolsky 2007, Kashkarov va boshq. 2016, Mamashukurov va Jabborov 2017 yillarda o‘rganib tadqiqot ishlarini olib borishgan .

Tadqiqot metodologiyasi.

Keyingi yillarda sun’iy yo‘ldosh tasvirlarini orqali oq laylaklarni yashash tarzini tahlil qilish, joylashgan uyalari to‘g‘risida ma’lumotlar olish, o‘ziga xos tuzilishi va joylashuvini oldindan aniqlash imkoniyatlari bo‘yicha Gritsina 2022, Fedorenko va Zima 2024 muvaffaqiyatli tajribalar o‘tkazgan [1].

Bugungi kunda oq laylaklarning yashash tarzi, migratsiyasi va oziqlanishini tadqiq qilishda turli zamonaviy ishlar amalga oshirilishi mumkin. Xususan, laylaklarning migratsiya yo‘nalishlari GIS xaritalariga integratsiya qilish, havfli zonalar (qurilish, magistrallar, cho‘llar) va biotoplar GIS orqali belgilash hamda muhofaza qilish hududlarini aniqlash, sun’iy to‘siqlar va suv inshoatlari ta’sirini baholash kabi ishlarni amalga oshirilishini nazarda tutadi.

Natijalar va ularning tahlili

Farg‘ona vodiysida uchraydigan oq laylak (*NT-Near Threatened)* Markaziy Osiyoda keng tarqalgan yirik qushlardan biri bo‘lib, u asosan inson yashaydigan hududlar bilan yaqin aloqada yashaydi**.** Oq laylaklar evolyutsion jihatdan qadimiy qushlardan hisoblanadi. Ilmiy ma’lumotlarga ko‘ra, ularning ajdodlari Yevroosiyo va Afrika hududlarida million yillar davomida shakllangan. Keyinchalik iqlim o‘zgarishlari va tabiiy muhitning o‘zgarishi natijasida laylaklar turli mintaqalarga tarqalgan. Farg‘ona vodiysi laylaklar uchun qulay tabiiy va antropogen muhitga ega hudud hisoblanadi. Shu sababli ular bu yerda uzoq vaqtdan beri yashab kelmoqda va mahalliy ekotizimning muhim qismi hisoblanadi.

Topografik nuqtayi nazardan Farg‘ona vodiysi Tyanshan va Hisor–Oloy tog‘ tizmalari bilan o‘ralgan keng tekislikdan iborat. Vodiyning asosiy qismi taxminan 22 000 km² maydonni egallaydi, va umumiy maydoni atrofidagi tog‘ tizmalari bilan birgalikda Farg‘ona vodiysining umumiy maydoni 80 000 km² gacha yetadi. Vodiyning tub qismi asosan tekislikdan iborat. Uning markaziy va g‘arbiy hududlarida qumli maydonlar sho‘rxok yerlari (solonchaklar), xususan Yozyovon va Qoraqalpoq cho‘llari bilan almashinib joylashgan. Tekislik qismi adirlar (past tog‘lar) va Qurama, Chotqol, Farg‘ona, Turkiston hamda Oloy tizmalari etaklari bilan o‘ralgan. Hududdagi eng yirik daryo Sirdaryodir .

2021-2023-yillarda O‘zbekistonning Farg‘ona vodiysida oq laylak (*Ciconia ciconia asiatica*) ning ko‘payuvchi juftlarini hisobga olish bo‘yicha tadqiqot o‘tkazildi. Tarixiy ma’lumotlarga ko‘ra, eng yuqori ko‘rsatkich 1990-yillarda qayd etilgan bo‘lib, o‘sha davrda taxminan 1340 ta ko‘payuvchi juft mavjud bo‘lgan. Oq laylaklar soni 2014 -2015-yillarda tarixiy minimum darajaga tushib ketdi bu davrda atigi 70 ta bolali juft qayd etildi [10-11]. Ushbu keskin kamayish elektr uzatish tarmoqlaridagi uya va inlarning ataylab olib tashlanishi bilan bog‘liq bo‘lgan.

2021-2023-yillardagi monitoring natijalariga ko‘ra, jami 897 ta uya aniqlanib, ularning 834 tasi (93%) ko‘payuvchi juftlar tomonidan band etilgan. Bu ko‘rsatkich 1990-yillarda qayd etilgan sonning 62,2 % foizini tashkil etgan.

Oq laylaklar tarqalgan hududlar maydoni 9467,1 km² ni tashkil etib, NDWI (Normalizatsiyalangan suv Indeksi) tahliliga asoslanib, potensial yashash muhitlari umumiy maydoni 11 511,5 km² deb baholanganligini ko‘rsatgan. Ko‘payuvchi qushlarning zichligi har 100 km² ga 7,24 juftni tashkil etgan.

Laylaklarni qanday va qay holatda yashash ko‘rsatkichlari ko‘p xollarda ular qoldirgan va yashayotgan uyalaridan aniqlash imkoniyati mavjud. Farg‘ona vodiysining ayrim joylarida oq laylak uyalari yashash vositasi sifatida turgan bo‘lsada, amalda mavjud qushlar tark etgan. Buning ham o‘ziga yarasha tabiiy ham iqtisodiy sabablari bor. Bizga ma’lumki, barcha uyalar Farg‘ona vodiysining tekislik qismida joylashgan bo‘lib, bu yerda oq laylaklar uya qurish uchun turli xil antropogen inshootlar hamda daraxtsimon o‘simliklardan foydalanib amalga oshirgan. Hududlar bo‘yicha uyalarning taqsimlanishi notekis bo‘lib, asosan geografik sharoitlarga bog‘liqligini ko‘rishimiz mumkin.

Farg‘ona viloyatida uyalarning aksariyati (197 ta) turanga (*Populus pruinosa*) daraxtlarida qurilgan bo‘lib, bunga ushbu hududda to‘qay (daryo bo‘yi) o‘rmonlarining qolgan ikki viloyatga nisbatan kengroq tarqalganligi sabab bo‘lgan. Namangan viloyatida esa eng ko‘p uyalar (277 ta) beton elektr ustunlarda aniqlangan. Bu holat keng elektr tarmoqlarining daryolar, kanallar, baliqchilik hovuzlari, sholi ekinlari hamda sun’iy suv omborlari kabi oziqlanish uchun qulay hududlarga yaqin joylashganligi bilan izohlanadi.

Umuman olganda, Farg‘ona vodiysi bo‘yicha uyalarning eng katta qismi (53%) beton elektr ustunlarda, 24% turanga daraxtlarida va 16% metall elektr ustunlarda joylashgan. Oq laylaklarning 110 kV gacha bo‘lgan elektr uzatish liniyalari ustunlarida uya qurishi qayd etildi. Suv minoralari, uyali aloqa minoralari va kichik yog‘och telegraf ustunlarida joylashgan uyalarning ulushi juda kam bo‘lib (2%), baland yog‘och elektr ustunlarida esa uyalarning atigi 1% aniqlangan [12].

Yuqoridagi ma’lumotlardan ko‘rinib turibdiki, oq laylaklarni yashash sharoiti ham hududiy jixatdan va ham son jihatdan o‘zgarishga ega bo‘lgan. Bunga bir nechta sabablarni ko‘rsatib o‘tish mumkin.

1. Laylaklar yashaydigan tabiiy muhitlar birmuncha qisqarib bormoqda. Ya’ni, axolini xo‘jalik maqsadida yangi yerlarni o‘zlashtirishi, tabiiy suv ta’minotidagi buzilishlar sabab bo‘lgan.

2.Laylaklar uya qurgan elektr tarmoqlarining yangilanishi, ustunlarning almashishi yoki ta’mirlanishi inlarning yo‘qolishiga yoki ko‘chishiga olib kelgan.

Farg‘ona vodiysidagi ekotizimni birmuncha o‘zgarishi oqibatida oq laylaklar yashash uyalarida noodatiy xolatlar namoyon bo‘layotganini ko‘rishimiz mumkin. Masalan, keyingi paytda laylak uyalari axoli tomlariga, suv minoralariga, masjid va tarixiy minora gumbazlariga in qurmoqda. Bundan tashqari ilgari laylaklar asosan, quruq shoxlar, o‘tlar, qamishlardan foydalangan. Hozir esa ba’zan in qurishda, sim parchalari, polietilen paketlar, plastik materiallar, latta va mato kabi sun’iy materiallar ham uchramoqda. Bu holatlar asosan inson faoliyati va muhit o‘zgarishi bilan bog‘liqligi haqiqatga yaqin.

Biz Oq laylaklar yashash joyi va migratsiyasini o‘rganish uchun Farg‘ona vodiysining hududida joylashgan viloyatlarining xar-bir tumanlariga fevral-mart oylarida borish orqali ularning uya qurgan joylarini aniq hisobga olish uchun GAT dasturidan foydalanib har bir o‘rganilgan tuman va hudud bo‘yicha laylaklar uyi manzili bo‘yicha GPS koordinatalari aniqlandi. Tadqiqot jarayonida laylak uyalari soni 96 ta ekanligi va bu uyalarni qurishda har-xil daraxt shoxlari masalan tut, gilos, terak va qamish, yantoq va bangidevona kabi o‘simliklardan foydalanilganligini ko‘rishimiz mumkin (1-rasm).

1-rasm. Oq laylak uyasidagi turli-xil chiqindilar.

Laylak uyalarining balandiligi qancha yuqori bo‘lsa bu uyalarning pastki qismlarini boshqa qushlar yani chumchuqlar yoki hind maynasi tomonidan kovaklar hosil qilinib uya sifatida foylanilayotganligi ko‘rish mumkin. Hududlar laylak uyalarining balandligi 15-20 sm dan 1,5 metr, uyalar diametri taxminan 80-90 sm dan 1,5 metr atrofida shakllantirilgan (2-rasm). Agar uyalar balandligi yuqori bo‘lsa uyaning tepa qismi diametri kichik past bo‘lsa diametri keng ekanligi aniqlandi.

2-rasm. Uyalarning turlicha balandligi.

Bundan tashqari uyalardagi individlar soni bo‘yicha monitoringi yuritildi. Buning natijasida 48 ta qushlar soni aniqlandi.

Ba’zi joylarda uyalar laylaklar tomonidan qayta tamirlash natijasida uyaning balandligi yuqori bo‘lganligi sababli ma’lum tomonga og‘ish holati va bu esa uyalarni agar kuchli shamol kuzatilsa qulash ehtimoli borligi aniqlandi. Bu uyalar asosan qishloq ho‘jalik maydonlarida kuzatildi va dala maydonlari atrofida tashlamalar borligi aniqlandi. Tashlamalarning taxminiy maydoni har bir dala maydonida turlicha va o‘rtacha 5-10 sotix atrofida hisoblandi (3-rasm). Bu tashlamalar bahor yoz oylarida ozuqa manbai bo‘lishi yani tashlamalardan qurbaqa va ilonlarni tutib yeyishi mumkin. Qish oylarida migratsiya qilmaydigan laylaklar asosan daryo bo‘ylariga yoki suv omborlari, baliqchilik ho‘jaliklariga baliq chavoqlari bilan oziqlanish uchun uchib boradi.

3-rasm. Oq laylak uyalar atrofidagi tashlamalar.

Farg‘ona vodiysida joylashgan Namangan viloyatining ayrim tumanlarida tuman elektr tarmoqlari xodimlari tomonidan yuqori kuchlanishli temir-beton sim yog‘ochlarning yuqori qismiga laylaklar uya qurmasligi va qo‘nmasligi uchun simlardan maxsus to‘qilgan uskunalarni joylashtirilganligi aniqlandi (4-rasm).

4-rasm. Laylaklar uya qurmasligi uchun simlardan maxsus to‘qilgan moslama.

Xulosa.

Farg‘ona vodiysi Markaziy Osiyoda oq laylaklar keng tarqalgan va uzoq vaqtdan beri yashab kelayotgan hududlardan biri hisoblanadi. Bu qushlar asosan inson yashaydigan hududlar, qishloq xo‘jaligi yerlari, sug‘orish kanallari va ochiq dalalarga yaqin joylarda yashaydi. Bunday muhit ular uchun ozuqa manbalariga boy bo‘lib, hasharotlar, qurbaqalar, mayda kemiruvchilar va boshqa kichik hayvonlar bilan oziqlanish imkonini beradi. Shu sababli Farg‘ona vodiysi laylaklar uchun qulay ekologik sharoitga ega hudud hisoblanadi.

So‘nggi yillarda laylaklarning yashash tarzi va in qurish joylarida muayyan o‘zgarishlar kuzatilmoqda. Bu o‘zgarishlar asosan global iqlim o‘zgarishi, inson faoliyati va tabiiy muhitning o‘zgarishi bilan bog‘liq. Iqlimning isishi, qurg‘oqchilik holatlarining ko‘payishi va suv rejimining o‘zgarishi laylaklar oziqlanadigan organizmlar soniga ta’sir ko‘rsatmoqda. Bu esa laylaklarning yashash hududlari va migratsiya jarayonlariga ma’lum darajada ta’sir qilishi mumkin.

Bundan tashqari, aholi punktlarining kengayishi, yangi binolar va infratuzilmalar qurilishi, daraxtlarning kesilishi kabi omillar ham laylaklarning an’anaviy in qurish joylarining o‘zgarishiga sabab bo‘lmoqda. Shu bilan birga, elektr ustunlari, aloqa tarmoqlari va boshqa sun’iy inshootlar laylaklar uchun yangi in qurish joylariga aylanmoqda. Ayrim hollarda ular in qurishda shox-shabbalar bilan birga plastik yoki boshqa sun’iy materiallardan ham foydalanishi kuzatilmoqda. Bu holat laylaklarning inson muhitiga moslashuvchan ekanligini ko‘rsatadi.

Xulosa qilib aytganda, Farg‘ona vodiysida laylaklar tabiiy va antropogen muhit o‘rtasida yashab, o‘zining yashash tarzini ma’lum darajada o‘zgartirib bormoqda. Shuning uchun ularni muhofaza qilish, in qurish joylarini saqlab qolish va tabiiy ekotizimni asrash muhim ahamiyatga ega. Bu esa kelgusida laylaklar populyatsiyasini barqaror saqlashga xizmat qiladi.

MICROCLONAL PROPAGATION TECHNOLOGY OF CONIFEROUS PLANTS FROM THE COLLECTION OF THE TASHKENT BOTANICAL GARDEN

Abstract. *This article discusses the optimization of microclonal propagation of coniferous plants. During the study, explants were effectively sterilized, and the most suitable nutrient media for their cultivation were selected. DKW, MS, WPM, N6, and B5 nutrient media were used in the experiments, and their efficiency was comparatively evaluated.*

Keywords: *in vitro propagation, nutrient media, microclonal propagation, coniferous plants, sterilization, explants.*

Kirish

Hozirgi kunda bioxilma–xillikni saqlash insoniyat oldidagi eng dolzarb ilmiy va amaliy masalalardan biri hisoblanadi. Tabiiy ekotizimlarning izdan chiqishi, iqlim o‘zgarishi, urbanizatsiya, sanoat faoliyati va antropogen ta’sirlar natijasida ko‘plab o‘simlik turlari yo‘qolish yoqasiga kelib qolmoqda. Biologik xilma–xillikning yo‘qolishi nafaqat ekotizimlarning barqarorligiga, balki oziq–ovqat, farmasevtika, qishloq xo‘jaligi va kosmetika sohalaridagi genetik resurslar zaxirasiga ham salbiy ta’sir ko‘rsatmoqda. Shu sababli, dunyo miqyosida o‘simlik genofondini saqlash va ularni qayta tiklashning ilmiy asoslangan mexanizmlarini ishlab chiqish dolzarb vazifaga aylandi.

Ignabargli o‘simliklarni mikroklonal ko‘paytirish jarayoni turli biologik, fiziologik va texnologik to‘siqlar bilan chegaralangan bo‘lib, u nafaqat ilmiy tadqiqotlarda, balki botanik bog‘lar va introduksiya markazlarida ham eng murakkab masalalardan biri sifatida qaraladi. Ignabargli turlarning tabiiy muhitda yuqori moslashuvchanligi va uzoq

umr ko‘rishi ularning umumiy biologik barqarorligini ta’minlasa–da, sun’iy sharoitda, ayniqsa introduksiya qilingan hududlarda o‘sish va ko‘paytirish jarayonlarida jiddiy muammolar yuzaga keladi. Botanik bog‘larda introduksiya qilingan turlarning ko‘pchiligi mahalliy iqlim sharoitida to‘liq generativ siklni amalga oshira olmaydi, quruq iqlim, yuqori harorat, havo namligining keskin o‘zgarishi, quvvatli shamollar, tuproq tarkibidagi farqlar va fotoperiodning boshqachaligi ularning fiziologiyasiga kuchli ta’sir ko‘rsatadi. Shu tufayli, bu turlarda urug‘ hosil bo‘lmasligi yoki urug‘ning yetilish bosqichida morfogenetik nuqsonlar paydo bo‘lishi, uning past unuvchanlikka ega bo‘lishini keltirib chiqaradi [1–2].

Materiallar va metodlar

Tadqiqot obyekti. Tadqiqot obyekti sifatida **Cryptomeria japonica (L.) D. Don , Abies nordmanniana (Stev.)** (*Pinaceae Lindl.*), **Picea orientalis (L.)** (*Pinaceae Lindl.*), **Sequoia sempervirens Engl.** (*Cupressaceae Bartl.*), *Abies numidica* de Lannoy ex Carrière (Pinaceae Lindl. **Pseudotsuga macrocarpa** (*Pinaceae Lindl.*)**, Abies numidica de Lannoy ex Carrière** (*Pinaceae Lindl.*) ignabargli o‘simliklar tanlandi.

Usullar. Tajriba o‘simliklarning izolyatsiya qilingan hujayralarini, to‘qimalarini va organlarini yetishtirish uchun Butenko [3] va Kalinin [4] tomonidan tavsiflangan standart usullar asosida o‘tkazildi.

Eksplantlar tanlash. Eksplant sifatida bir yillik novdalardagi apikal (uch) va lateral (yondosh) kurtaklar, shuningdek nekroz belgilari kuzatilmagan sog‘lom barg plastinkalari tanlandi. Apikal kurtaklar 0,5–1,0 sm uzunlikdagi bo‘laklar holatida olindi. Barg eksplantlari yosh, morfologik jihatdan sog‘lom va hech qanday mexanik yoki fiziologik shikastlanishsiz bo‘lishiga e’tibor berildi. Materiallar yil davomida, fevraldan oktyabrgacha bo‘lgan davrda**,** turli mavsumlarda o‘rganildi.

Ozuqa muhitlari . Driver va Kuniyuki Walnut (DKW) [5, 6], Murashige va Skoog (MS) [7], Woody Plant Medium (WPM) [8, 9], N6 va Gamborg B5 [10] muhitlari ishlatilgan

Natijalar va tahlillar

In vitro kulturasiga tadqiqot ob’ektini kiritishda besh xil ozuqa muhitini qo‘llash imkoniyatlari bo‘yicha kompleks tadqiqotlar o‘tkazildi. Tanlangan muhitlar – Murashige va Skoog (MS), Chu N6, Gamborg B5 (B5), Woody Plant Medium (WPM) va Driver va Kuniyuki Walnut (DKW) – turli o‘simlik guruhlari uchun ishlab chiqilgan bazaviy mineral muhitlar bo‘lib, ularning tarkibidagi makro– va mikroelementlar miqdori, ozuqa moddalarining nisbati hamda fiziologik faol moddalar ta’siri o‘rganildi.

Sterilizatsiyada «$KMnO_4$ → sovun → Belizna 20% + Tween 20 → $AgNO_3$ → 70% etanol → ko‘p marotaba steril yuvish» zanjiri bilan ≥85–90% sterillikka erishish mumkin. Kultura induksiyasi uchun gormonsiz muhit turga qarab: DKW – *C. japonica*, *A. nordmanniana*, *P. orientalis* uchun; MS – *S. sempervirens*, *P. macrocarpa*, *A. numidica* uchun tavsiya etiladi. Gormon rejimida BAP 0,5 mg/l + IMK 0,05 mg/l kombinatsiyasi yoki gormonsiz muhit qo‘llansin. Rizogenezda IMK 0,5 mg/l eng samarali bo‘lib, ildizlantirish torf muhitida amalga oshirilsin.

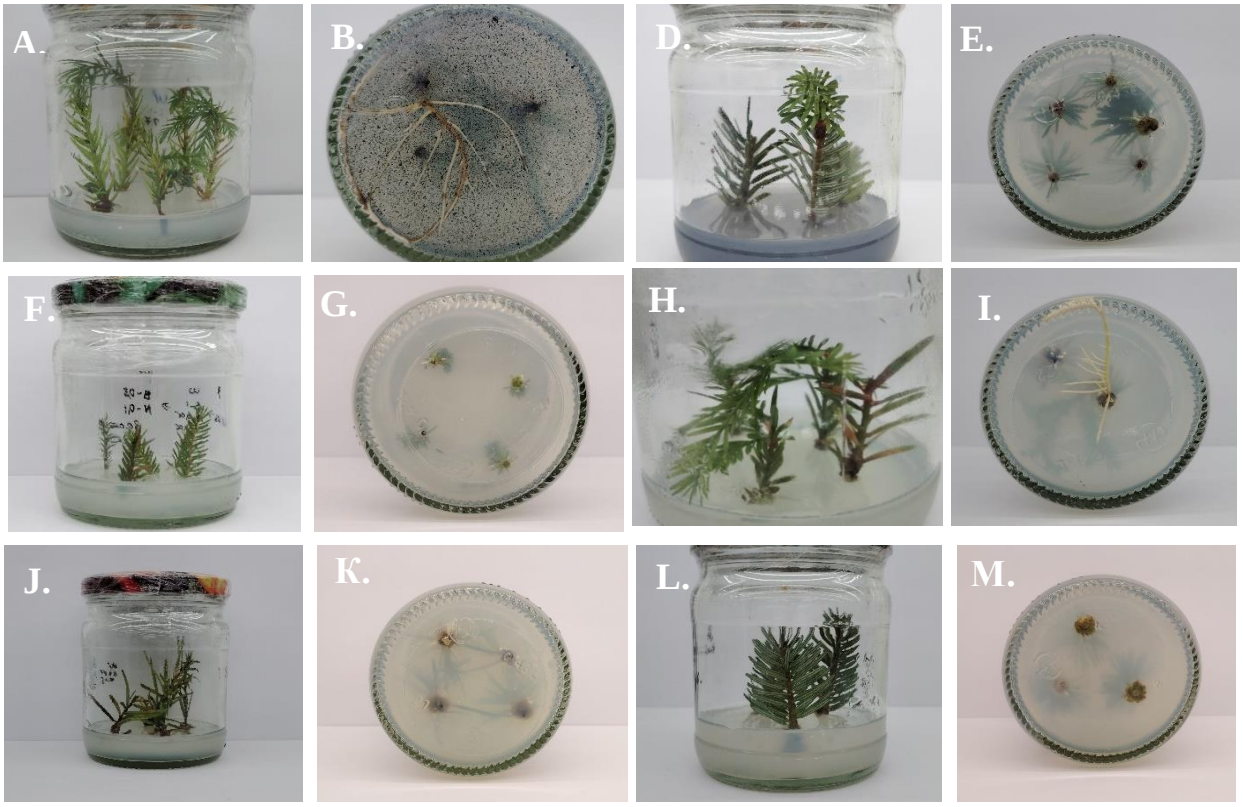
Barcha o‘rganilgan turlarda rizogenez jarayoni kulturaga kiritilgandan keyin uchinchi–beshinchi oyda, ya’ni prolongatsiya bosqichidan keyin boshlangan. Bu vaqtda ildiz initsiallari shakllanishni boshlab, IMK 0,5 mg/l konsentratsiyasida eng yuqori samara qayd etildi. Keyingi 2–3 oy mobaynida ildiz tizimi faol o‘sish davriga kirdi.

Rizogenez jarayonining samaradorligi va ildiz tizimining rivojlanish tezligi har bir turning biologik xususiyatlariga bog‘liq bo‘lib, ildizlanish intensivligi quyidagicha taqsimlandi (1–rasm):

Sequoia sempervirens Bu tur tez o‘suvchan va yuqori meristematik faollikka ega. Ildiz induksiyasi 3–oyda boshlanib, 5–oyga kelib ildiz tizimi kuchli rivojlandi. IMK ta’sirida ildizlar ko‘p, uzunligi 3–4 sm gacha bo‘lib, ildizlanish darajasi 90 ± 2 % ni tashkil qildi. Intensivligi yuqori. Faol o‘sish davri – 3–5 oy. Ildiz uzunligi: 5–6 sm. Ushbu o‘simlik noyabr oyida tuproq sharoitiga ko‘chirildi va hozirda tuproqga moslashish bosqichida kuzatuv ostida turibdi.

Abies numidica. Ildiz initsiallari 3–oydan keyin tez rivojlandi. 6–oyga kelib ildiz tizimi yaxshi tarmoqlangan holatda hosil bo‘ldi. Intensivligi o‘rtacha. Faol o‘sish davri: 3–6 oy. Ildiz uzunligi: 2,5–3,5 sm. Ushbu o‘simlik turida ildiz tizimining shakllanish boshlanishi kuzatildi, ammo ildizlanish jarayoni davom etayotgan o‘simliklar tuproqga ko‘chirilganda, ularning tuproq sharoitiga moslashishi kuzatilmadi. O‘simliklar chirib ketdi. Shuning uchun xulosa qilinddiki, o‘simliklarni ancha kam namlikka ega sharoitlarda adaptatsiya qilish zarur. Tadqiqotlar keyingi yil davom etadi.

Cryptomeria japonica Ortacha ildizlanish tezligiga ega tur. Ildizlar 5–6 oyda 4–5 sm gacha o‘sgan. Intensivlik yaxshi. Faol o‘sish davri: 3–6 oy. Ushbu o‘simlik noyabr oyida tuproq sharoitiga ko‘chirildi va hozirda tuproqga moslashish bosqichida kuzatuv ostida turibdi.



1-rasm. Explantlar adaptatsiya va rizogenez bosqichlari. A, B. Cryptomeria japonica; D, E. Abies nordmanniana; F, G. Picea orientalis; H, I. Sequoia sempervirens; J, K. Pseudotsuga macrocarpa; L, M. Abies numidica. Foto Xazratov A.T. Avgust 2025

Abies nordmanniana Ildiz initsiallari 3–oy oxirida paydo bo‘lib, to‘liq ildizlar 6–oyga kelib shakllangan. Intensivlik: o‘rtacha–past. Faol o‘sish davri: 3–6 oy. Ildiz uzunligi: 1,5–2 sm. Ushbu o‘simlik turida ildiz tizimining shakllanish boshlanishi kuzatildi, ammo ildizlanish jarayoni davom etayotgan o‘simliklar tuproqga ko‘chirilganda, ularning tuproq sharoitiga moslashishi kuzatilmadi. Shuning uchun xulosa qilinddiki, o‘simliklarni ancha kam namlikka ega sharoitlarda adaptatsiya qilish zarur. tadqiqotlar keyingi yil davom etadi.

Pseudotsuga macrocarpa. Rizogenez sekin kechgan, ildizlar 6–7 oylarda to‘liq rivojlangan. Intensivligi past. Faol o‘sish davri: 3–7 oy. Ildiz uzunligi: 1–1,5 sm. Ushbu o‘simlik turida ildiz tizimining shakllanish boshlanishi kuzatildi, ammo ildizlanish jarayoni davom etayotgan o‘simliklar tuproqga ko‘chirilganda, ularning tuproq sharoitiga moslashishi kuzatilmadi.

Picea orientalis Eng sekin ildizlanuvchi tur. Ildizlar 6–7 oylarda 1 sm gacha o‘sgan. Intensivlik: juda past. Faol o‘sish davri: 3–7 oy. Ildiz uzunligi: 0,8–1,2 sm. Ushbu o‘simlik turida ildiz tizimining shakllanish boshlanishi kuzatildi, ammo ildizlanish jarayoni davom etayotgan o‘simliklar tuproqga ko‘chirilganda, ularning tuproq sharoitiga moslashishi kuzatilmadi. O‘simliklar chirib ketdi. Shuning uchun xulosa qilinddiki, o‘simliklarni ancha kam namlikka ega sharoitlarda adaptatsiya qilish zarur.

Xulosa

Tadqiqot natijalariga ko‘ra, ushbu dastur doirasida o‘rganilgan ignabargli turlarning *in vitro* sharoitida o‘sish va rivojlanish jarayonlari turlararo jiddiy farq qiladi. Turlarning kulturaga kiritilishida gormonsiz muhitdan foydalanish barcha eksplantlarda barqaror moslashuvni ta’minladi. Ozuqa muhiti va fitogormonlar kombinatsiyalarining to‘g‘ri tanlanishi rivojlanish dinamikasini belgilab berdi. *Cryptomeria japonica* va *Sequoia sempervirens* eng yuqori o‘sish tezligi va fiziologik barqarorlikka ega bo‘lgan turlar sifatida aniqlandi. Ular ildizlanish bosqichini muvaffaqiyatli o‘tdi va tuproqga o‘tkazilganda ham yuqori moslashuv qobiliyatini namoyon qildi. Qolgan turlarda – *Abies numidica*, *Abies nordmanniana*, *Picea orientalis* va *Pseudotsuga macrocarpa* – rivojlanish dinamikasi past bo‘lib, rizogenez deyarli kuzatilmadi yoki past darajada kuzatilmoqda.

Minnatdorchilik

Ushbu tadqiqot O‘zbekiston Respublikasi Fanlar akademiyasi Botanika instituti huzuridagi akademik F.N. Rusanov nomidagi Toshkent Botanika bog‘ining Biotexnologiya laboratoriyasida amalga oshirildi. Tadqiqotlar 2025–2029 yillarga mo‘ljallangan “Botanika bog‘i kolleksiyalarini saqlash, istiqbolli turlarni introduksiya qilish hamda ularni Respublikaning turli sohalariga tavsiya etish” mavzusidagi Davlat dasturi doirasida, xususan, Biotexnologiya

laboratoriyasida bajarilayotgan “Innovatsion biotexnologiya usullaridan foydalanilgan holda Toshkent Botanika bog‘ida *in vitro* kolleksiyasini yaratish va uni raqamli hujjatlashtirish” nomli dasturi asosida amalga oshirildi.

XESTIA HUBNER, 1818 AVLODI TURLARNING (LEPIDOPTERA, NOCTUIDAE) FARG'ONA VODIYSIDA TARQALISHI

Botirov Elyor Arabboyevich
Farg'ona davlat universiteti, b.f.f.d (PhD), katta o'qituvchi
E-mail: elyorbotirov88@gmail.com
ORCID ID: https://orcid.org/0009-0007-0614-7301

Annotatsiya: *Mazkur tadqiqotda Xestia Hübner, 1818 (Lepidoptera, Noctuidae) avlodining uchta turi X. c-nigrum, X. xanthographa va X. baja – turlarining Farg'ona vodiysi tabiiy va agrotsenoz ekotizimlaridagi tarqalishi tahlil qilingan. Maqolada yig'ilgan materiallar asosida turlarning aniq topilma nuqtalari hamda geografik koordinatalari berilgan va zamonaviy tarqalish xaritasi ishlab chiqilgan.*

Kalit so'zlar: *Lepidoptera, Noctuidae, Noctua, Farg'ona vodiysi, tarqalish, agrotsenoz. ekotizim.*

РАСПРОСТРАНЕНИЕ ВИДОВ РОДА XESTIA HUBNER, 1818 (LEPIDOPTERA, NOCTUIDAE) В ФЕРГАНСКОЙ ДОЛИНЕ

Аннотация: *В данном исследовании проанализировано распространение трех видов рода Xestia Hübner, 1818 (Lepidoptera, Noctuidae) X. c-nigrum, X. xanthographa и X. baja – в естественных экосистемах и агроценозах Ферганской долины. На основе собранного материала в статье приводятся точные точки находок видов с указанием их географических координат, а также составлена карта их современного распространения.*

Ключевые слова: *Lepidoptera, Noctuidae, Noctua, Ферганская долина, агроценоз, экосистема.*

DISTRIBUTION OF SPECIES OF THE GENUS *XESTIA* HUBNER, 1818 (LEPIDOPTERA, NOCTUIDAE) IN THE FERGANA VALLEY

Abstract: *This study analyzes the distribution of three species belonging to the genus Xestia Hübner, 1818 (Lepidoptera, Noctuidae) X. c-nigrum, X. xanthographa and X. baja—within the natural ecosystems and agroecosystems of the Fergana Valley. Based on the collected material, the article provides the exact localities of the species along with their geographical coordinates, and a map of their current distribution has been compiled.*

Key words: *Lepidoptera, Noctuidae, Noctua, Fergana Valley, distribution, agroecosystem, ecosystem.*

Kirish

Tangachaqanotlilar (Lepidoptera) turkumining tunlamlar (Noctuidae) oilasi bioxilma-xilligi, ekologiyasi va taksonomiyasini o'rganish zamonaviy entomologiyaning muhim vazifalaridan biri hisoblanadi. Ushbu oila vakillari oziq zanjirining ajralmas qismi bo'lishi bilan bir qatorda, qishloq va o'rmon xo'jaligi biotsenozlarida iqtisodiy ahamiyatga ega bo'lgan asosiy guruh sanaladi. Xususan, Noctuinae kenja oilasiga mansub Xestia (Hübner, 1818) avlodi taksonomik jihatdan eng yirik, turlarga boy va ekologik moslashuvchan guruhlardan biri bo'lib, butun Palearktika va Nearktika mintaqa bo'ylab keng tarqalgan. Mazkur avlod vakillari xilma-xil tabiiy landshaftlarda, tog' ekotizimlarida hamda antropogen hududlarda (agrotsenozlarda) faol uchraydi. Avlod tarkibidagi qator turlar keng polifag xususiyatga ega bo'lib, turli ekinlarga jiddiy zarar yetkazishi bilan ajralib turadi. Shu sababli, *Xestia* avlod turlarining geografik koordinatalari va tarqalish areallarini hududlar kesimida aniq baholash ham nazariy, ham amaliy jihatdan o'ta dolzarb hisoblanadi.

Adabiyotlar tahlili va metodlar

G'arbiy Tyanshan tog'lari va unga yondosh hududlar faunasiga bag'ishlangan so'nggi tadqiqotlarda (Titov va boshq., 2025) mintaqa noktuidlari (Lepidoptera: Noctuidae) tarkibi bo'yicha muhim faunistik va morfologik ma'lumotlar keltirilgan. Xususan, mualliflar tomonidan *Xestia erschoffi* (Staudinger, 1896) turining Qozog'iston hududi uchun ilk bor

qayd etilganligi ta'kidlanib, turning yashash biotoplari hamda yetuk imago batafsil tasvirlangan. Shuningdek, mazkur ishda taksonomik identifikatsiya jarayonida hal qiluvchi ahamiyatga ega bo'lgan *Xestia erschoffi* turining erkak va urg'ochi zotlari jinsiy genitaliya tuzilishiga chuqur qiyosiy-morfologik tashxis taqdim etilgan [7].

So'nggi yirik faunistik tadqiqotlardan birida R. Joshi va hammualliflar (2025) tomonidan Hindiston hududida tarqalgan *Noctuidae* oilasining jami 1219 turni o'z ichiga olgan katalogi yaratilgan. Tahlillar shuni ko'rsatadiki, mintaqa faunasining 50% idan ortig'ini *Noctuinae* kenja oilasi tashkil etib, uning tarkibidagi Xestia (Hubner, 1818) urug'i 22 ta tur bilan eng xilma-xil va yetakchi taksonlar qatoridan joy olgan. Bu yuqori ko'rsatkich *Xestia* turlarining Osiyo qit'asi bo'ylab keng zoogeografik arealga ega ekanligini tasdiqlaydi va ularning morfologik-ekologik xususiyatlarini qiyosiy yoritilib berilgan [5].

A. Yu. Matov va hammualliflar (2024) Markaziy Yoqutiston tunlamlar faunasini o'rganish jarayonida *Xestia* (Hübner, 1818) avlodiga mansub qator turlarning ekologik va faunistik xususiyatlarini tahlil qilishgan. Tadqiqotda *Xestia penthima*, *X. subgrisea* va *X. albuncula* kabi turlarning ekologik guruhlari, yashash biotoplari hamda tarqalish areallari aniqlangan. Ushbu ma'lumotlar *Xestia* turlarining ekstremal iqlimga moslashuvini mintaqamiz faunasi bilan qiyosiy-zoogeografik jihatdan o'rganilgan [6].

Xestia c-nigrum va *Xestia semiherbida* turlarining morfologik identifikatsiyasiga oid muhim tadqiqotlardan biri Hindistonda Jagbir Singh Kirti va Charan Kamal Sekhon (2015) tomonidan olib borilgan bo'lib, ushbu ishda ayniqsa erkak individlarning genital morfologiyasi asosida aniqlovchi belgilar tizimlashtirilgan. Mualliflar tomonidan valva, aedeagus, uncus kabi asosiy kopulyativ tuzilmalarining shakli, sklerotizatsiya darajasi va ichki tuzilmalardagi farqlanishlar asosida turning diagnostik morfologik tavsifi ishlab chiqilgan. Mazkur morfologik ko'rsatkichlar *Xestia c-nigrum* turini unga filogenetik yaqin boshqa Noctuidae vakillaridan ishonchli ajratib turadigan asosiy taksonomik belgilar sifatida taklif etilgan bo'lib, ularning grafik tasvirlari va mikroskopik fotomateriallari turning identifikatsiya ko'rsatib o'tilgan [4].

O'zbekistonning turli ekologik hududlarida, jumladan Qizilqum cho'llari, Qoraqalpog'iston, Xorazm vohasi va Quyi Amudaryo okrugida tunlam kapalaklar (Noctuidae) faunasini o'rganishga qaratilgan tadqiqotlar olib borilgan. Ushbu tadqiqotlar tunlam kapalaklarning tabiiy va antropogen ekotizimlardagi tarqalishi, fenologiyasi va ekologik aloqalarini aniqlashga qaratilgan. Xususan, M. Bekchanova (2022) tomonidan Quyi Amudaryo okrugida olib borilgan tadqiqotlarda *Xestia c-nigrum* turining ekologik o'rni, uchrash chastotasi va yashash muhiti bo'yicha muhim ma'lumotlar taqdim etilgan. Tadqiqot mazkur turning faunistik tarkibdagi o'rni va ekotizimlar bilan aloqadorligini yoritib bergan [1].

Xususan, I. Zokirov (2019) tomonidan Markaziy Farg'ona hududida sabzavot-poliz ekinlari entomofaunasini o'rganish bo'yicha olib borilgan tadqiqotlar natijasida, ushbu turlar sabzavot va poliz ekinlarining fitofag zararkunandalari sifatida qayd etilgan. Tadqiqotda Xestia turlarining vegetatsiya mavsumidagi fenologik faolligi, ularning ozuqaviy afzalliklari va iqtisodiy zarar yetkazish darajalari ko'rsatilgan [8].

Shuningdek, M. Shermatov (2024) tomonidan Farg'ona vodiysi agrolandshaftlarida tangachaqanotli hasharotlar faunasi bo'yicha olib borilgan kompleks tadqiqotlarda *X. c-nigrum*, *X. xanthographa* va *X. baja* turlarining agroekotizimlardagi vertikal tarqalishi (yaruslar bo'yicha), ontogenez bosqichlari va ekinlar bilan trofik bog'liqligi tizimli tahlil qilingan. Ularning o'simlik fitosenozlarida egallagan ekologik nishi, zararlanish intensivligi va fenologik moslashuvlari alohida o'rganilgan [9].

2020–2024-yillar davomida Farg'ona vodiysi hududida tunlam kapalaklar (Lepidoptera: Noctuoidea) ning biologik xilma-xilligini o'rganish maqsadida dala tadqiqotlari olib borildi. Namunalar tabiiy va antropogen biotsenozlardan DRL-200 va DRL-250 rusumli yorug'lik tuzoqlari yordamida yig'ildi. Tutilgan kapalaklar etil atsetat bilan jonsizlantirilib, standart entomologik usullarga asosan kollektsiyalandi [2].

Avlod: *Xestia* Hübner, 1818. Mazkur avlod Golarktiya: Yevropa, Sibir, Shimoliy va Markaziy Osiyo, Shimoliy Afrikada tarqalgan turlarni birlashtiradi [3].

Xestia c-nigrum (Linnaeus, 1758) – Yevropa bo'ylab keng tarqalgan, Shimoliy va Markaziy Osiyo (shu jumladan Qozog'iston, Qirg'iziston, O'zbekiston) mintaqasida uchraydi. Shimoliy Amerikada 1979-yilda birinchi marta kuzatilib, so'ngra areali butun Kanada va AQShning shimoliy hududlariga kengaygan. *X. c-nigrum* Farg'ona vodiysining tadqiqot

olib borilgan barcha hududlarida, jumladan, tog‘ oldi va tog‘li mintaqalar, daryo vodiylari va qirg‘oqbo‘yi zonasi, adirliklar, cho‘l, yarim cho‘l va dasht mintaqalarida qayd etildi .

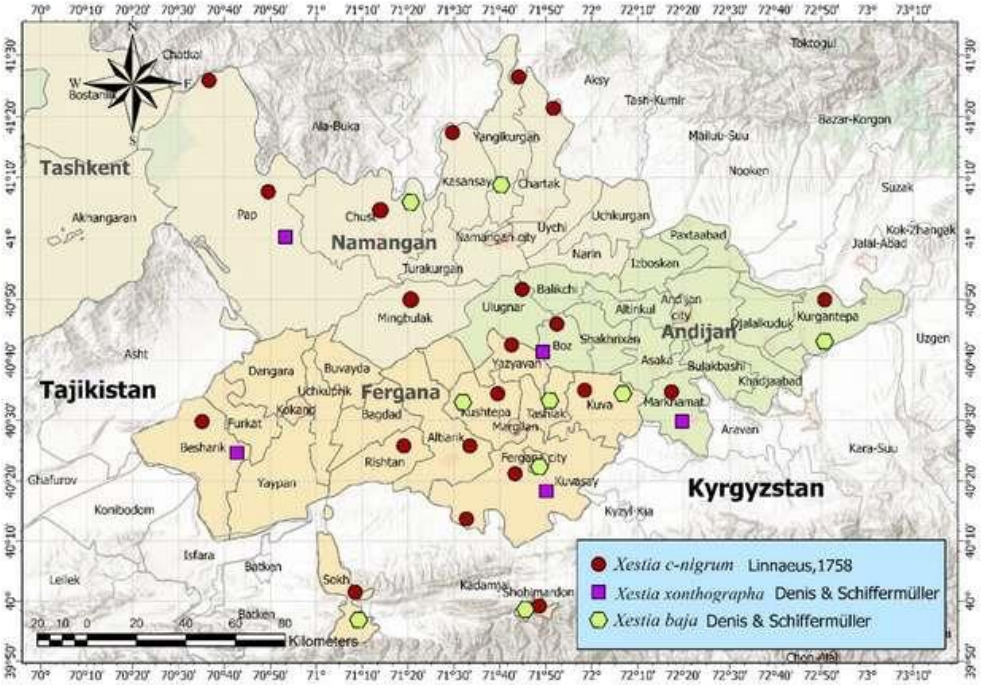
Aniqlangan hududlar: Namangan viloyati Pop tumani Parda Tursin qishlog‘i (41°04'34.5"N 70°51'54.8"E, ♂1, ♀2, 15.06.2024); Sang qishlog‘i (40°52'37.8"N 71°12'38.1"E, ♂1, ♀2, 08.08.2022); Yangiqo‘rg‘on tumani Zarkent qishlog‘i (41°24'21.9"N 71°40'47.0"E, ♂1, ♀2, 14.07.2020); Mingbuloq tumani Terak qishlog‘i (40°50'58.1"N 71°30'52.2"E, ♂3, ♀1, 05.07.2020); Andijon viloyati Ulug‘nor tumani Sariqsuv qishlog‘i (40°46'40.8"N 71°42'09.2"E, ♀1, 12.08.2020); Shahrixon tumani Qo‘rg‘oncha qishlog‘i (40°42'14.8"N 72°00'21.4"E, ♂3, 13.06.2020); Xo‘jaobod tumani Ipakchi qishlog‘i (40°38'45.4"N 72°35'13.2"E, ♀2, 27.06.2020); Farg‘ona viloyati Farg‘ona tumani Satkak qishlog‘i (40°24'06.4"N 71°42'34.0"E, ♂2, ♀1, 17.08.2021); Chimyon qishlog‘i (40°14'58.0"N 71°33'18.3"E, ♂1, 16.09.2023); Shohimardon qishlog‘i (39°58'40.4"N 71°47'37.4"E, ♂3, 14.07.2024); Qo‘shtepa tumani O‘qchi qishlog‘i (40°30'45.9"N 71°39'46.7"E, ♂1, ♀1, 25.07.2024); Yozyovon tumani Guliston qishlog‘i (40°33'32.6"N 71°45'07.7"E, ♀2, 10.08.2022); Quva tumani Tolmozor qishlog‘i (40°26'25.4"N 72°03'49.0"E, ♂3, ♀1, 12.06.2022); So‘x tumani Tul qishlog‘i (40°05'21.3"N 71°03'54.9"E, ♂1, ♀1, 10.07.2023).

Xestia xanthographa ([Denis & Schiffermüller], 1775) – Yevropa, Kavkaz, Kichik Osiyo, Markaziy Osiyo va Sibirgacha bo‘lgan Palearktik mintaqalarda keng tarqalgan. Farg‘ona vodiysining markaziy, janubiy hamda shimoliy-g‘arbiy hududlarida qayd etildi.

Aniqlangan hududlar: Namangan viloyati Pop tumani Sang qishlog‘i (40°52'37.8"N 71°12'38.1"E, ♂1, ♀1, 08.08.2022); Andijon viloyati Ulug‘nor tumani Sariqsuv qishlog‘i (40°46'40.8"N 71°42'09.2"E, ♂1, 12.08.2020); Marhamat tumani Polvontosh qishlog‘i (40°33'55.7"N 72°14'02.0"E, ♂2, ♀1, 09.08.2024); Farg‘ona viloyati Beshariq tumani Qiyali qishlog‘i (40°25'20.7"N 70°26'06.2"E, ♂2, 25.07.2023); Quvasoy shahar Chinortagi qishlog‘i (40°17'48.2"N 72°00'10.7"E, ♂3, ♀2, 23.07.2021).

Xestia baja ([Denis & Schiffermüller], 1775) – Palearktika mintaqasining Yevropa, Sibir, Kichik Osiyo, Kavkaz, Eron va Markaziy Osiyo (shu jumladan Qozog‘iston, Tojikiston, Qirg‘iziston) hududlarida tarqalgan. Farg‘ona vodiysining tog‘ oldi va tog‘li mintaqalari, adirliklar, cho‘l va yarim cho‘l mintaqalarida qayd etildi (1-rasm).

Aniqlangan hududlar: Namangan viloyati Kosonsoy tumani Tergachi qishlog‘i (41°09'26.4"N 71°29'32.6"E, ♀1, 15.07.2020); Andijon viloyati Xo‘jaobod tumani Ipakchi qishlog‘i (40°38'45.4"N 72°35'13.2"E, ♂2, ♀2, 27.06.2020); Farg‘ona viloyati Farg‘ona tumani Shohimardon qishlog‘i (39°58'40.4"N 71°47'37.4"E, ♂3, 14.07.2024); Qo‘shtepa tumani O‘qchi qishlog‘i (40°30'45.9"N 71°39'46.7"E, ♂1, ♀1, 25.07.2024); Quva tumani Tolmozor qishlog‘i (40°26'25.4"N 72°03'49.0"E, ♂2, ♀1, 12.06.2022); So‘x tumani Malbut qishlog‘i (40°00'34.8"N 71°07'06.0"E, ♂2, 08.07.2023).



1-rasm. *Xestia* avlodi tunlamlarining Farg‘ona vodiysida tarqalish areallari.

Xulosa

Farg‘ona vodiysi entomofaunasi tarkibida *Xestia* Hübner, 1818 avlodiga mansub uchta turi *X. c-nigrum*, *X. xanthographa* va *X. baja* turlarining zamonaviy tarqalish areallari aniqlandi. Ularning yashash biotoplari, aniq uchrash nuqtalari va geografik koordinatalari birinchi marta tizimlashtirilib, hududiy tarqalish xaritasi shakllantirildi.

Annotatsiya. *Ushbu maqolada Morus rubra L., Ptelea trifoliata L. va Forestiera neomexicana A. Gray turlarining in vitro sharoitida olingan regenerant o‘simliklarini grunt muhitiga moslashtirish jarayonlari qiyosiy tahlil qilindi. Tadqiqot davomida ozuqa muhitlari tarkibi, fitogormonlar kombinatsiyalari hamda eksplantlarning morfogen faolligi o‘rganildi. Adaptatsiya bosqichida turlar o‘rtasida sezilarli farqlar aniqlanib, M. rubra yuqori o‘sish sur’ati va 90% dan ortiq yashovchanlik ko‘rsatkichi bilan ajralib turdi. P. trifoliata muhitning kislotaliligiga sezgir bo‘lib, sekin o‘sish dinamikasini namoyon etdi, F. neomexicana esa ildiz tizimining ustun rivojlanishi bilan xarakterlandi. WPM bazaviy ozuqa muhiti gormonsiz sharoitda barcha turlar uchun yuqori adaptatsiya darajasini ta’minladi. Fitogormonlar ta’siri turga xos differensial reaksiyalarni ko‘rsatdi. Olingan natijalar in vitro ko‘paytirilgan o‘simliklarni gruntga moslashtirishda turga xos yondashuv zarurligini asoslab beradi .*

Kalit so‘zlar: *Morus rubra, Ptelea trifoliata, Forestiera neomexicana, in vitro, mikroklonal ko‘paytirish, adaptatsiya, ozuqa muhiti, fitogormonlar, rizogenez, yashovchanlik.*

ПРОБЛЕМЫ АДАПТАЦИИ К ГРУНТУ РАСТЕНИЙ, ПОЛУЧЕННЫХ *IN VITRO*: *M. RUBRA*, *P. TRIFOLIATA* И *F. NEOMEXICANA*

Аннотация. *В данной статье проведён сравнительный анализ процессов адаптации регенерантов растений видов Morus rubra L., Ptelea trifoliata L. и Forestiera neomexicana A. Gray, полученных в условиях in vitro, к грунтовым условиям. В ходе исследования изучены состав питательных сред, комбинации фитогормонов и морфогенетическая активность эксплантов. На этапе адаптации выявлены существенные межвидовые различия: M. rubra характеризовалась высокой скоростью роста и уровнем выживаемости более 90%. P. trifoliata оказалась чувствительной к кислотности среды и продемонстрировала замедленную динамику роста, тогда как F. neomexicana отличалась преимущественным развитием корневой системы. Базовая питательная среда WPM в безгормональном варианте обеспечила высокий уровень адаптации для всех исследованных видов. Воздействие фитогормонов носило видоспецифический характер. Полученные результаты обосновывают необходимость индивидуального подхода при адаптации растений, размноженных in vitro, к грунтовым условиям.*

Ключевые слова: *Morus rubra, Ptelea trifoliata, Forestiera neomexicana, in vitro, микроклональное размножение, адаптация, питательная среда, фитогормоны, ризогенез, выживаемость.*

PROBLEMS OF SOIL ADAPTATION OF IN VITRO-PROPAGATED PLANTS: *M. RUBRA*, *P. TRIFOLIATA* AND *F. NEOMEXICANA*

Abstract. *This study presents a comparative analysis of the adaptation processes of regenerant plants of Morus rubra L., Ptelea trifoliata L., and Forestiera neomexicana A. Gray obtained under in vitro conditions to soil environments. The composition of nutrient media, combinations of phytohormones, and morphogenetic activity of explants were investigated. Significant interspecific differences were revealed during the adaptation stage: M. rubra exhibited a high growth rate and survival exceeding 90%. P. trifoliata*

showed sensitivity to substrate acidity and demonstrated slower growth dynamics, whereas F. neomexicana was characterized by predominant root system development. The WPM basal medium in a hormone-free variant ensured a high level of adaptation for all studied species. The effect of phytohormones was species-specific. The obtained results substantiate the need for an individualized approach in adapting in vitro-propagated plants to soil conditions.

Keywords: *Morus rubra, Ptelea trifoliata, Forestiera neomexicana, in vitro, micropropagation, adaptation, nutrient medium, phytohormones, rhizogenesis, survival rate.*

Kirish

So‘nggi yillarda *in vitro* mikroklonal ko‘paytirish usullari o‘simliklarni tez va samarali ko‘paytirishda keng qo‘llanilmoqda. Biroq bunday o‘simliklarni grunt sharoitiga o‘tkazish murakkab bosqich bo‘lib, ular yuqori namlik va steril muhitga moslashganligi sababli kuchli stressga duch keladi. Adaptatsiya jarayonining muvaffaqiyati substrat, namlik, yorug‘lik va fitogormonlarga bog‘liq. Tadqiqotda *Morus rubra*, *Ptelea trifoliata* va *Forestiera neomexicana* turlarining *in vitro* regenerantlari o‘rganildi. Ishning maqsadi ushbu turlar uchun samarali adaptatsiya usullarini ishlab chiqishdan iborat.

Ishning maqsadi. Toshkent botanika bog‘i kolleksiyasidagi tanlangan turlarni *in vitro* kulturaga kiritish va tuproqqa moslashtirish protokollarini ishlab chiqish.

Materiallar va usullar

Tadqiqot obyeklari.

***Morus rubra* L.** (*Moraceae Gaudich.*), qizil tut. Tabiatda Shimoliy Amerikaning turli hududlarida tarqalgan. ***BFM*:** mevasida shakarlar; olma va limon kislotalari, pektinlar; dubillovchi, kul va bo‘yoqchi moddalar; S, V, RR vitaminlari; trigonalin; kauchuk, temir, kaliy va kalsiy moddalari ko‘p miqdorda mavjud.

***Ptelea trifoliata* L.** (*Rutaceae Juss.*), uch bargli pteleya. Shimoliy Amerikada – Kanadaning janubi, AQShning sharqi va janubi hamda Meksikada uchraydi. ***BFM*:** ildiz va barglaridan ajratilgan kokusaginin barqaror yallig‘lanishga qarshi va antioksidant ta’sirga ega.

***Forestiera neomexicana* A. Gray** (*Oleaceae Hoffmanns.*), neo–meksikalik forestiera. Trans–Pekosning g‘arbida, Yuta va Kaliforniyagacha bo‘lgan toshli yon bag‘irlar va cho‘l tekisliklarida o‘sadi. ***BFM*:** nashr qilingan ma’lumotlar yo‘q.

Ususllar Tadqiqotlar o‘simlik to‘qimalari va organlarini in vitro sharoitida yetishtirishning klassik va zamonaviy usullariga asoslandi. Metodologik yondashuv Butenko [1, 2], Kalinin [3, 4] va Batygina [5, 6] tomonidan tavsiflangan fundamental ishlanmalar asosida shakllantirildi .

Ozuqa muhitlari

Tadqiqotlarda bir nechta bazaviy ozuqa muhitlari qo‘llanildi: Murashige va Skoog (MS) [8], Chu N6 [10, 11], Gamborg B5 [12], Woody Plant Medium (WPM) [9] hamda Driver va Kuniyuki (DKW) [7]. Ushbu muhitlar turli o‘simlik guruhlari uchun ishlab chiqilgan bo‘lib, ularning mineral tarkibi, makro- va mikroelementlar nisbati, shuningdek fiziologik faol komponentlari o‘simliklarning morfogen jarayonlariga turlicha ta’sir ko‘rsatadi.

Har bir muhit quyidagi ko‘rsatkichlar asosida baholandi: eksplantlarning yashovchanligi, kallus hosil qilish qobiliyati, organogenez jarayonida novda va ildiz shakllanishi, regeneratsiya darajasi, adaptatsiya bosqichidagi yashovchanlik.

Baholash mezonlari sifatida kontaminatsiya darajasi (%), initsiatsiya samaradorligi, ildizlanish koeffitsienti va umumiy regeneratsiya ko‘rsatkichlari qabul qilindi.

Muhitlar 123°C haroratda, 2 atm bosimda 15 daqiqa davomida avtoklavda sterilizatsiya qilindi. Asosiy standart sifatida MS muhiti olinib, boshqa muhitlar bilan taqqoslash orqali optimal variant aniqlashtirildi.

Eksplantlarni tanlash

Tadqiqot uchun sog‘lom, patogensiz va viruslardan xoli o‘simlik materiallari tanlab olindi. Eksplantlar vegetatsiya davrida, faol o‘sish bosqichidagi to‘qimalardan olindi. Eksplant sifatida quyidagilar qo‘llanildi: apikal (uch) kurtaklar, lateral (yondosh) kurtaklar, bir yillik novdalar segmentlari, sog‘lom barg plastinkalari. Apikal kurtaklar 0,5–1,0 sm uzunlikdagi bo‘laklar holida ajratildi. Barg eksplantlari morfologik jihatdan sog‘lom va shikastlanmagan namunalar orasidan tanlandi.

Sterilizatsiya protokoli

Aseptik sharoitni ta’minlash maqsadida bir nechta sterilizatsiya sxemalari sinovdan o‘tkazildi:

- **1-protokol (ko‘p komponentli):** $KMnO_4$, sovun eritmasi, natriy gipoxlorit (“Belizna”) + Tween 20, $AgNO_3$ va etanol
- **2-protokol (soddalashtirilgan):** sovun, natriy gipoxlorit + Tween 20 va etanol
- **3-protokol (fungitsidli):** sovun, natriy gipoxlorit, propikonazol va etanol

Sterilizatsiya samaradorligi kontaminatsiya darajasi va eksplant yashovchanligi asosida baholandi.

Fitogormonlar va kulturaga kiritish

O‘sish regulyatorlari quyidagicha qo‘llanildi:

Auksinlar: 2,4-D, indol-3-sirka kislotasi (IAA), α-naftiluksus kislotasi (NAA), indol-3-moy kislotasi (IBA)

Sitokininlar: 6-benzilaminopurin (BAP), kinetin, tidiazuron (TDZ)

Fitogormonlarning zaxira eritmalari standart usullarga muvofiq tayyorlandi [3, 4]. Turli konsentratsiyalarda ko‘plab kombinatsiyalar sinovdan o‘tkazilib, optimal variantlar aniqlashtirildi.

Muhit tarkibiga 10–35 g/l saxaroza qo‘shildi.

Ildizlanish va moslashtirish

Regeneratsiya qilingan novdalar (≥2 sm) ildizlantirish muhitiga ko‘chirildi:

- IMK 0,5 mg/l yoki gormonsiz MS (½ konsentratsiya).

Moslashtirish bosqichi steril substratlarda amalga oshirildi: tuproq : qum : vermikulit (1:1:1) yoki tuproq : qum : vermikulit : perlit (1:1:1:1).

Yashovchanlikni oshirish uchun namlik bosqichma-bosqich kamaytirildi, bu mikroko‘paytirilgan o‘simliklarning *ex vitro* sharoitga moslashishida muhim omil hisoblanadi [1, 2].

Statistik tahlil

Barcha tajribalar kamida uch martalik takrorlarda o‘tkazildi (n=3). Har bir variantda 20–30 eksplant ishlatildi. Natijalar quyidagicha baholandi: foiz hisobida yashovchanlik, ildizlanish darajasi, regeneratsiya ko‘rsatkichlari. Ma’lumotlar o‘rtacha qiymat ± standart og‘ish shaklida ifodalandi. Statistik tahlil bir faktorli dispersiya tahlili (ANOVA) yordamida 95% ishonchlilik darajasida ($P < 0,05$) amalga oshirildi.

Natijalar va muhokamasi

M. rubra uchun moslashuv jarayoni faol va barqaror kechdi (. Birinchi oyda 5 –jadval)± 2 sm bo‘lgan o‘simliklar yil oxiriga kelib 50 ± 2 sm ga yetdi. O‘sish ildiz tizimining faol rivojlanishi (55 ± 2 sm gacha) bilan chambarchas bog‘liq bo‘ldi. Barglar soni, poya tarmoqlanishi va ildiz massasi ortishi yuqori moslashuv darajasini ko‘rsatdi. Natijada, bu tur uchun adaptatsiya darajasi 90% dan yuqori bo‘lib, bu uning fiziologik barqarorligi bilan izohlanadi.

P. trifoliata da o‘sish sekinroq kechdi: 5 sm dan yil oxirida 10 ± 2 sm gacha (2-jadval). Bu *M. rubra* ga nisbatan ikki barobar past ko‘rsatkichdir. Buning sababi sifatida gruntning neytral pH (6,5–7,0) bo‘lishi, holbuki tur tabiiy sharoitda kislotali tuproqlarda o‘sishi mumkin. Bu ildiz faoliyatini susaytirib, o‘sishni cheklaydi. Shunga qaramay, barglar sonining ortishi va poya sonining 4–5 taga yetishi o‘simlikning fiziologik faolligini saqlab qolganini ko‘rsatadi.

F. neomexicana da o‘sish sust, ammo barqaror bo‘ldi (3-jadval). Yil davomida bo‘yi 5 sm dan 10 ± 2 sm gacha oshdi, barglar soni esa 8 taga yetdi. Poya soni deyarli o‘zgarmadi (1–2 ta). Shu bilan birga, ildiz tizimi faol rivojlanib, 20 sm dan 40 ± 2 sm gacha o‘sdi. Bu kserofit tur uchun xos bo‘lgan ildiz ustunligi bilan bog‘liq bo‘lib, uning moslashuvi sekin, ammo barqaror ekanligini ko‘rsatadi.

1 – jadval – *M. rubra* turlarining gruntda o‘sish intensivligi

	Birinchi oy	**Ikkinchi oy**	**Uchinchi oy**	**To‘rtinchi oy**	**Beshinchi oy**	**Oltinchi oy**	**Bir yil**
Bo‘yi, sm	5±0,2	8±0,2	15±0,2	18±0,2	25±0,2	30±0,2	50±0,2

Ishchi tavsiya: M. rubra, P. trifoliata va F. neomexicana

1. *M. rubra*, *P. trifoliata* va *F. neomexicana* turlari uchun kulturaga kiritish bosqichida WPM gormonsiz muhiti bazaviy standart sifatida tavsiya etiladi, chunki u barcha turlarda 88–90% atrofida yuqori adaptatsiyani ta'minlaydi.

2. Elongatsiya bosqichida *M. rubra* uchun BAP 0,5 mg/l, *P. trifoliata* uchun BAP 0,2 + NSK 0,05 mg/l, *F. neomexicana* uchun TDZ 0,1 + NSK 0,05 mg/l kombinatsiyalari asosiy ishchi variantlar sifatida qo'llanilishi lozim.

3. Rizogenez bosqichida barcha turlar uchun ISK 0,5 mg/l bazaviy auksin sifatida qo'llansin, ildizlanish samaradorligini oshirish maqsadida ISK 0,5 + NSK 0,05 mg/l kombinatsiyasi tavsiya etiladi; *F. neomexicana* uchun esa imkoniyat bo'lganda ISK 0,5 + TDZ 0,1 mg/l sxemasi alohida qo'llanishi maqsadga muvofiq.

4. Gruntga moslashtirish bosqichida *M. rubra* uchun mo'tadil nam, neytral rN li, *P. trifoliata* uchun biroz kislotalilikka ega (pH 5,5–6,0), *F. neomexicana* uchun esa yaxshi drenajlangan, quruqroq substrat tavsiya etiladi; moslashuv davrida namlik va yorug'lik rejimlarini turga xos talablardan kelib chiqib boshqarish zarur.

Minnatdorchilik

Ushbu tadqiqot O'zbekiston Respublikasi Fanlar akademiyasi Botanika instituti huzuridagi akademik F.N. Rusanov nomidagi Toshkent Botanika bog'ining Biotexnologiya laboratoriyasida amalga oshirildi. Tadqiqotlar 2025–2029 yillarga mo'ljallangan "Botanika bog'i kolleksiyalarini saqlash, istiqbolli turlarni introduksiya qilish hamda ularni Respublikaning turli sohalariga tavsiya etish" mavzusidagi Davlat dasturi doirasida, xususan, Biotexnologiya laboratoriyasida bajarilayotgan "Innovatsion biotexnologiya usullaridan foydalanilgan holda Toshkent Botanika bog'ida *in vitro* kolleksiyasini yaratish va uni raqamli hujjatlashtirish" nomli dasturi asosida amalga oshirildi.

Uskunalar O'zbekiston Respublikasi Prezidentining 2017-yil 17-sentabrdagi PQ–3365-sonli "Ilmiy-tadqiqot muassasalarining moddiy-texnik bazasini yanada mustahkamlash va ularning faoliyat samaradorligini oshirish chora-tadbirlari to'g'risida"gi qaroriga muvofiq xarid qilingan. Mazkur qaror doirasida ilmiy-tadqiqot faoliyatini rivojlantirish, laboratoriya bazasini zamonaviy texnologiyalar bilan jihozlash hamda ilmiy ishlanmalar samaradorligini oshirish maqsadida zarur bo'lgan asbob-uskunalar bilan ta'minlash amalga oshirildi. Ushbu uskunalar tadqiqotlarning sifatli va ishonchli natijalarini olish, zamonaviy ilmiy metodlarni qo'llash hamda biotexnologik jarayonlarni samarali tashkil etish imkonini beradi.

Annotatsiya. *Ushbu tadqiqotda “Istiqlol” navi (Solanum lycopersicum L.) kotiledon eksplantlaridan kallus induksiyasini optimallashtirish maqsadida turli gormon kombinatsiyalari (BAP, NAA, 2,4-D va adeninsulfat) sinovdan o‘tkazildi. Tajribalar MS ozuqa muhitida uch takrorlikda olib borildi va kallus hosil bo‘lish chastotasi foizda baholandi. Eng yuqori natija FA8 variantida (0.5 mg/L BAP + 0.5 mg/L NAA + 40 mg/L adeninsulfat) kuzatilib, kallus induksiyasi 96.9% ga yetdi. 2,4-D qo‘llangan muhitlarda esa kallus hosil bo‘lish sezilarli darajada past bo‘ldi. Ushbu natijalar “Istiqlol” navida barqaror in vitro regeneratsiya tizimini yaratish imkonini beradi va keyinchalik CRISPR/Cas9 asosidagi gen tahriri hamda Agrobakteriya orqali transformatsiya uchun muhim platforma bo‘lib xizmat qiladi.*

Kalit so‘zlar: *pomidor, kotiledon eksplant, kallus induksiyasi, BAP, NAA, adeninsulfat, in vitro regeneratsiya, CRISPR/Cas9.*

ИНДУКЦИЯ КАЛЛУСА ПОД ВОЗДЕЙСТВИЕМ РЕГУЛЯТОРОВ РОСТА В КОТИЛЕДОННЫХ ЭКСПЛАНТАХ ТОМАТА (*SOLANUM LYCOPERSICUM* L.) СОРТА ИСТИҚЛОЛ

Аннотация. *В данном исследовании были протестированы различные комбинации гормонов (БАП, НУК, 2,4-Д и сульфат аденина) с целью оптимизации индукции каллуса in vitro из семядольных эксплантов сорта томата “Истиклол” (Solanum lycopersicum L.). Эксперименты проводились на питательной среде МС в трехкратной повторности, частота каллусообразования оценивалась в процентах. Наивысший результат был зафиксирован в варианте FA8 (0,5 мг/л БАП + 0,5 мг/л НУК + 40 мг/л сульфата аденина), где индукция каллуса достигла 96,9%. В средах с использованием 2,4-Д интенсивность каллусообразования была значительно ниже. Полученные результаты позволяют создать стабильную систему регенерации in vitro для сорта “Истиклол” и послужат важной платформой для последующего редактирования генов на основе CRISPR/Cas9 и агробактериальной трансформации.*

Ключевые слова: *томат, котиледонный эксплант, индукция каллуса, BAP, NAA, аденинсульфат, in vitro регенерация, CRISPR/Cas9.*

CALLUS INDUCTION IN COTYLEDON EXPLANTS OF TOMATO (*SOLANUM LYCOPERSICUM* L.) CV. ISTIQLOL UNDER THE INFLUENCE OF PLANT GROWTH REGULATORS

Abstract. *In this study, various hormone combinations (BAP, NAA, 2,4-D, and adenine sulfate) were tested to optimize in vitro callus induction from cotyledon explants of the “Istiqlol” tomato variety (Solanum lycopersicum L.). Experiments were conducted on MS medium in three replicates, and the callus induction frequency was evaluated as a percentage. The highest result*

was observed in the FA8 variant (0.5 mg/L BAP + 0.5 mg/L NAA + 40 mg/L adenine sulfate), where callus induction reached 96.9%. In contrast, callus formation was significantly lower in media containing 2,4-D. These results enable the establishment of a stable in vitro regeneration system for the "Istiqlol" variety and serve as a crucial platform for subsequent CRISPR/Cas9-based gene editing and Agrobacterium-mediated transformation.

Keywords: *tomato, cotyledon explant, callus induction, BAP, NAA, adenine sulfate, in vitro regeneration, CRISPR/Cas9.*

Kirish. Pomidor (*Solanum lycopersicum* L.) dunyo bo'yicha eng muhim sabzavot ekinlaridan biri bo'lib, oziq-ovqat sanoati uchun xomashyo sifatida keng qo'llaniladi. 2025 yilning birinchi choragida O'zbekistonda joriy yilda 5 869 tonna pomidor eksport qilib, taxminan 6,8 million AQSh dollari miqdorida daromad olingan [18]. Pomidor mevalari inson sog'lig'i uchun muhim bo'lgan vitaminlar, minerallar, likopen va β-karotin kabi antioksidant moddalarga boyligi bilan ajralib turadi [2,9].

Pomidor molekulyar genetika va o'simlik biotexnologiyasi sohasida eng qulay model o'simliklardan biri hisoblanadi. Pomidorda genetik o'zgarishlar kiritish, xususan, o'simliklar transformatsiyasi jarayonlarining muvaffaqiyati samarali *in vitro* regeneratsiya tizimining yo'lga qo'yilganligiga bevosita bog'liqdir [3,5].

O'simlik to'qimalarining regeneratsiya qobiliyati bir qator omillarga — genotip, eksplant turi va o'sish regulyatorlarining nisbatiga bog'liq bo'ladi [4,6]. Turli eksplantlar orasida ayniqsa kotiledon to'qimalari yuqori morfogen potensialga ega bo'lib, tez hujayra bo'linishi hamda to'liq o'simlikka aylanish qobiliyati bilan ajralib turadi [7].

Gormonlarning optimal muvozanati — sitokininlar (zeatin, benzilaminopurin (BAP) yoki kinetin) hamda auksinlar (indol-3-sirka kislotasi (ISK) yoki naftalenuksus kislotasi (NUK)) — kallus hosil bo'lishi va nihol regeneratsiyasini rag'batlantirishda muhim ahamiyat kasb etadi [10,14].

Mavzuga oid adabiyotlarning tahlili. Avvalgi tadqiqotlarda pomidor navlari o'rtasida kallus hosil bo'lishi va regeneratsiya samaradorligi bir xil sharoitda ham sezilarli darajada farq qilishi aniqlangan [13]. Masalan, Micro-Tom va M82 navlari yuqori regeneratsiya salohiyati tufayli ko'plab laboratoriyalarda model tizim sifatida qo'llanib kelinmoqda [8]. Shu bilan birga, tijoriy navlar hamda mahalliy populyatsiyalar, odatda, past regeneratsiya ko'rsatkichlariga ega bo'lib, ular uchun gormonlarning optimal nisbati va kultura sharoitlarini alohida moslashtirish talab etiladi [1,11].

Optimallashtirilgan regeneratsiya protokoli nafaqat mikroko'paytirish uchun, balki ilg'or biotexnologik jarayonlar — xususan, Agrobacterium orqali genetik transformatsiya va CRISPR/Cas9 texnologiyasi asosidagi gen tahriri uchun ham muhim ahamiyatga ega [12,15]. Kotiledon eksplantlaridan tez va samarali regeneratsiya tizimini ishlab chiqish transgen yoki genetik o'zgartirilgan pomidor o'simliklarini qisqa vaqt ichida olish imkonini yaratadi. Bu esa navlarning hosildorligi, abiotik stresslarga chidamliligi va oziqaviy qiymatini oshirish orqali barqaror qishloq xo'jaligi rivojiga xizmat qiladi [16,17].

Shu bois, ushbu tadqiqotning asosiy maqsadi pomidor genotiplarida kotiledon eksplantlaridan kallus induktsiyasini optimallashtirishdan iborat.

Tadqiqot metodologiyasi. Tadqiqot uchun O'zbekiston seleksiyasiga mansub pomidorning Istiqlol (*Solanum lycopersicum* L. cv.) navi tanlab olindi. Dastlab urug'lar steril bo'lmagan sharoitda 15 daqiqa davomida 2% xo'jalik sovunining 72 % konsentratsiyali eritmasi bilan ishlov berildi. Keyin ular ikki marta 3 daqiqa davomida distillangan suvda yuvildi. Keyingi jarayonlar laminar boksda davom ettirildi. O'simlik materiallari "Prozaro" fungitsidining 0.01 % eritmasida 5 daqiqa davomida ushlab turildi. So'ng distillangan suvda 3 daqiqa davomida ikki marta yuvildi. 1.5–3 daqiqa davomida urug'lar 0.1 % kumush nitrat ($AgNO_3$) eritmasida sterillandi. Shundan so'ng o'simlik materiali ikki marta steril suvda yuvilib, to'g'ridan-to'g'ri oziqa muhitiga o'tkazildi.

Steril urug'larni dastlab, $MS_{1/2}$ [8] oziqa muhitlarida modifikatsiyalangan oziqaviy muhitda kuzatildi. Barcha rivojlanish induktsiyasi $MS_{1/2}$ oziqa muhitlarining gormonsiz variantlarida olib borildi. Oziqa muhitiga 7,0 g/l agar va 30 g/l saxaroza qo'shildi. Avtoklavda sterillashdan oldin oziqa muhitining pH qiymati 5,6–5,8 ga keltirildi. Har bir tajriba 30 ta urug'dan iborat 3 ta takrorda, randomizatsiya usulida amalga oshirildi. Kontaminatsiya darajasi va urug'larning unib chiqish foizi sterilizatsiyadan so'ng 30 kungacha qayd etildi.

Kallus induktsiyasi. *In vitro* sharoitda o'stirilgan nihollardan sog'lom kotiledon to'qimalari ajratib olindi. Har bir kotiledon maydoni taxminan 0,5–0,7 sm^2 ni tashkil etuvchi kotiledon disklari (eksplantlar) tayyorlandi. Eksplantlar MS oziqa muhitiga joylashtirildi. Oziqa muhiti tarkibiga 30 g/l saxaroza, 7 g/l agar, adenin sulfat moddasi hamda o'sish regulyatorlari — benzilaminopurin (BAP), naftiluksus kislotasi (NUK) va 2,4-dixlorfenoksiuksus kislotasi (2,4-D) turli konsentratsiyalarda qo'shildi (konsentratsiyalar 1-jadvalda keltirilgan). Eksplantlar xona harorati 24±2 °C, yoritilishi 1000 lyuks, namligi 70 % bo'lgan sharoitda va kerakli fotoperiod (16 soat kun, 8 soat tun) ta'minlangan holda joylashtirildi.

Eksplantlarda kallus to'qimasining hosil bo'lish samaradorligi kallus induktsiyasi chastotasi (%) ko'rsatkichi asosida baholandi. Ushbu ko'rsatkich quyidagi formula asosida hisoblab chiqildi:

$$\text{Kallus induksiyasi chastotasi (\%)} = \left(\frac{\text{Kallus hosil bo'lgan eksplantlar soni}}{\text{Joylashtirilgan eksplantlar soni}}\right) \times 100$$

Tahlil va natijalar. Kotiledon disklari o‘sish regulyatorlari (BAP, NUK va 2,4-D) turli kontsentratsiyalarda qo‘shilgan MS ozuqa muhitida o‘stirildi. Tadqiqotlar natijasida mazkur regulyatorlar kontsentratsiyalarining pamidor eksplantlaridan kallus hosil bo‘lishiga turlicha ta’sir ko‘rsatishi aniqlandi. Pomidorning kotiledon eksplantlaridan kallus induktsiyasi 2–4 hafta ichida to‘liq shakllanishi kuzatildi.

1-jadval

Kallus induksiyasiga turli konsentratsiyadagi sitokinin va auksinning ta’siri

Variant	mg/L				Kallus induksiyasi (%)	Kallusning xususiyati
	BAP	NUK	2,4-D	Adenin sulfat		
FA1	0.5	1	-	-	53.1±0.39	LYCFR
FA2	1	1	-	-	64.7±0.79	WGCN
FA3	2	0.5	-	-	31.0±0.80	WCZN
FA4	1	0.5	-	-	4.53±0.52	LYCN
FA5	1	1	-	40	74.7±1.07	WYCR
FA6	2	1	-	40	65.5±0.51	LBGWC
FA7	0.1	0.1	-	40	47.0±0.75	YGCFR
FA8	0.5	0.5	-	40	96.9±0.81	GYCN
D1	-	-	0.1	-	7.9±0.9	BWCR
D2	-	-	0.5	-	7.06±0.26	BWCR
D3	-	-	1	-	11.4±0.33	BCF
D4	0.5	-	-	-	33.5±0.41	WYCN

Shartli belgilar: ***B*** *– qo‘ng‘ir,* ***G*** *– yashil,* ***Y*** *– sarg‘ish,* ***W*** *– oq,* ***D*** *– to‘q,* ***L*** *– och,* ***C*** *– zich,* ***F*** *– bo‘sh,* ***N*** *– tugunli,* ***R*** *– ildiz.*

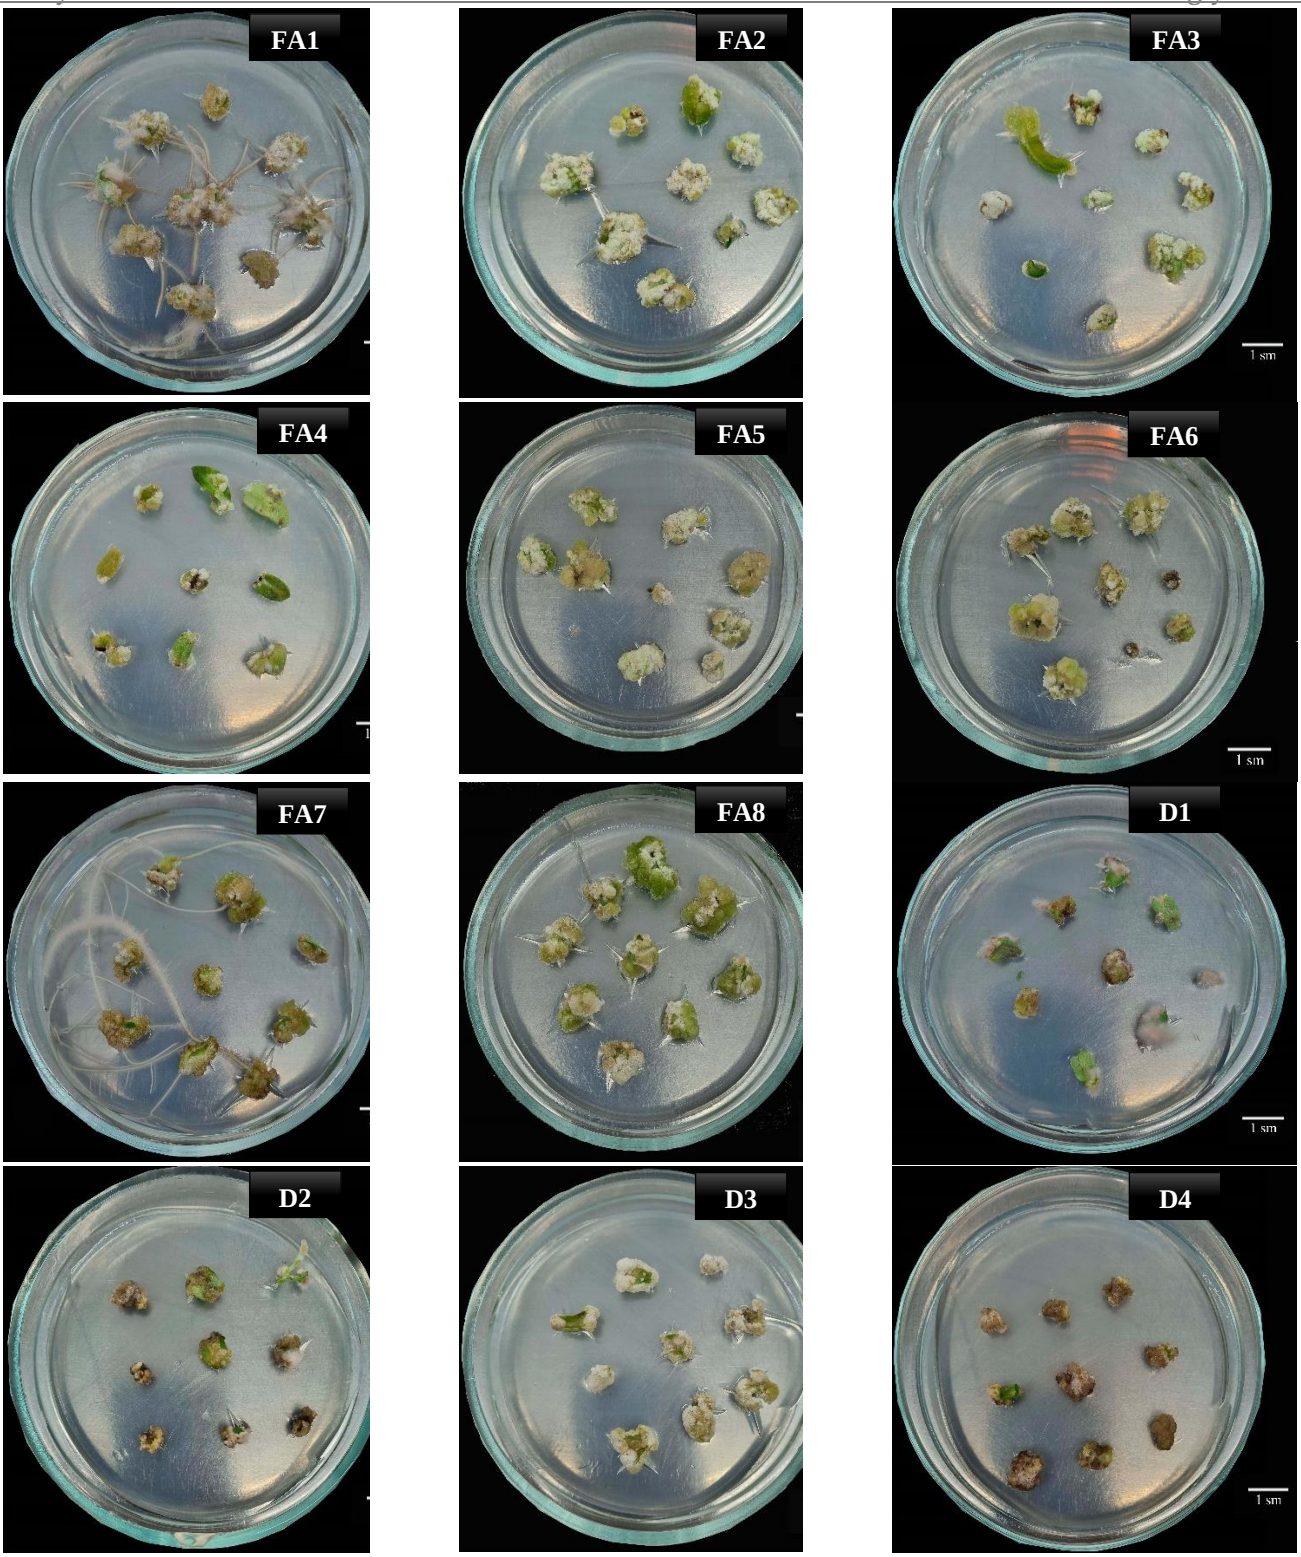
Olingan natijalar shuni ko‘rsatdiki, BAP va NAA kombinatsiyalari kallus induktsiyasida yuqori samaradorlik ko‘rsatdi, 2,4-D qo‘llangan variantlarda kallus hosil bo‘lish darajasi ancha past bo‘ldi (1-jadval, 1-rasm).

BAP + NAA qo‘llanilgan variantlar (FA1–FA8). Bu guruhda kallus hosil bo‘lish ko‘rsatkichi 4,5% dan 96,9% gacha o‘zgarib turdi. Minimal natija FA4 (1 mg/l BAP + 0,5 mg/l NAA) variantida kuzatilib, kallus hosil bo‘lishi atigi 4,53%ni tashkil etdi. Gormonlarning muvozanati yetarli bo‘lmaganligi sababli hujayra proliferatsiyasi sust kechgan deb hisoblanadi.

Eng yuqori kallus induktsiyasi FA8 (0,5 mg/l BAP + 0,5 mg/l NAA + 40 mg/l adenin sulfat) variantida qayd etildi — 96,9%. Ushbu muhitda hosil bo‘lgan kallus GYCN (yashil-sarghish, zich, tugunli) tipda bo‘lib, faol o‘sish va morfogen potensialning yuqorililigini ko‘rsatdi. Adenin sulfat qo‘shilgan variantlar (FA5–FA8) umumiy ravishda yuqori ko‘rsatkichlarga ega bo‘lib, uning hujayra bo‘linishini faollashtiruvchi qo‘shimcha manba sifatida samarali ishlagani aniqlandi.

2,4-D qo‘llanilgan variantlar (D1–D3). 2,4-Dning 0,1–1 mg/l oralig‘idagi kontsentratsiyasi kallus hosil bo‘lishida kutilganidek past natijalar berdi. Induksiya darajasi 7,06–11,4% atrofida bo‘lib, kallus odatda qoramtir, zichligi past va morfologik faolligi sust ko‘rinishda kuzatildi (BWCR, BCF). Bu ko‘rsatkichlar 2,4-D ning pomidor kotiledonlari uchun optimal bo‘lmasligini ko‘rsatadi.

BAPning yakka qo‘llanilgan varianti (D4). 0,5 mg/l BAP qo‘llanilganda kallus hosil bo‘lish darajasi 33,5%ni tashkil etdi. Hosil bo‘lgan kallus WYCN – oq-sarghish, zich va tugunli tuzilmaga ega bo‘lib, sitokininning o‘zi ham kallus hosil bo‘lishini rag‘batlantirishi mumkinligini tasdiqlaydi.



1-rasm. Pomidor kotiledon eksplantlarida turli gormon kombinatsiyalari bilan hosil bo‘lgan kalluslar

Xulosa va takliflar. Tadqiqotda pomidor eksplantlarida turli gormon kontsentratsiyalarining kallus induktsiyasiga ta’siri o‘rganildi. Natijalarga ko‘ra, BAP + NAA + adenin sulfat kombinatsiyasi kallus hosil bo‘lishini sezilarli darajada kuchaytiradi. Eng yuqori ko‘rsatkich FA8 varianti (0,5 mg/l BAP + 0,5 mg/l NAA + 40 mg/l adenin sulfat)da qayd etilib, kallus induktsiyasi 96,9%ni tashkil etdi. 2,4-D qo‘llangan variantlarda esa kallus hosil bo‘lishi past bo‘lib, kallusning tuzilishi bo‘sh va qo‘ng‘ir tusli bo‘ldi. Bu BAP–NAA–adenin sulfat kombinatsiyasi pomidorda kallogenez uchun eng maqbul ekanini ko‘rsatdi.

Annotatsiya: *Farmasevtika va tibbiyot uchun muhim bo‘lgan o‘simlik turlarini asrab avaylash balki ularni ko‘paytirish xom ashyosini yetishtirish huzirgi kunda muhim ahamiyatga ega. Turikston ayugasi hozirgi vaqtga kelib tabiatdagi zahirasi tobora kamayib ketayotgan turlardan biri hisoblanadi, shu bilan birga tibbiyot va farmasetika uchun muhim dorivor o‘simlik hisoblanadi. Yuqoridagilarni hisobga olib, Turkiston ayugasini ko‘paytirish texnologiyasini ishlab chiqish, hamda yetishtirilgan xom ashyoni fitokimyoviy tahlil qilish tadqiqot ishini muhim qismi hisoblanadi.*

Kalit so‘zlar: *iqlim o‘zgarishi, pilantatsiya, xomashyo, dorivor, mikro va makroelimentlar, xromatografiya, vitamin, aminokislota, Zarafshon tog‘tizmasi.*

ФИТОХИМИЧЕСКИЙ АНАЛИЗ АЮГИ ТУРКЕСТАНСКОЙ (*AJUGA TURKISTANICA (REGEL) BRIQ.*), ВЫРАЩЕННОЙ В ЮЖНОЙ ЧАСТИ ЗАРАФШАНСКОГО ГОРНОГО ХРЕБТА

Аннотация: *Сохранение видов растений, имеющих важное значение для фармацевтики и медицины, а также их размножение и выращивание сырья в настоящее время приобретают особую актуальность. Аюга туркестанская на сегодняшний день относится к видам, запасы которых в природе постепенно сокращаются, при этом она является важным лекарственным растением для медицины и фармацевтики. Учитывая вышеизложенное, разработка технологии размножения аюги туркестанской, а также фитохимический анализ выращенного сырья являются важной частью данного исследования.*

PHYTOCHEMICAL ANALYSIS OF AJUGA TURKISTANICA *(AJUGA TURKISTANICA (REGEL) BRIQ.)* CULTIVATED IN THE SOUTHERN ZARAFSHAN MOUNTAIN RANGE

Abstract: *The conservation of plant species that are important for pharmaceuticals and medicine, as well as their propagation and the cultivation of raw materials, is of great importance today. Ajuga turkestanica is currently considered one of the species whose natural reserves are gradually declining; at the same time, it is an important medicinal plant for medicine and pharmaceuticals. Considering the above, the development of propagation technology for Ajuga turkestanica, as well as the phytochemical analysis of the cultivated raw material, constitutes an important part of this research.*

Keywords: *climate change, plantation, raw materials, medicinal plant, micro- and macroelements, chromatography, vitamins, amino acids, Zarafshan mountain range.*

Kirish

Yer yuzida o‘simliklarning soni yarim milliondan oshadi, va yer sharida bir xil tarqalmagan, har bir tur va turkumlar iqlim va boshqa xususiyatlarga ko‘ra ma’lum geogirafik hududda umuman uchiramaydi yoki kam uchiraydi, ayrim o‘simliklar mutloqo uchiramaydi. Tadqiqot ob’ekti bo‘lgan Turkiston ayugasi xuddi shunday endim turlardan hisoblanadi va tabiiy holda faqatgina Markaziy Osiyoda uchiraydi. Bu tur keyingi yillarda ariali bir qancha qisqarib ketayotgan o‘simlik hisoblanadi. Bularning sababi ekologiyaning buzilishi iqlimning keskin isishi va insonlarning tabiatdan oqilona foydalanmasligi sabab bo‘layapdi. Turkiston ayugasi urug‘idan sekin ko‘payadi va urug‘idan ko‘payishi uchun qulayiroq muhit talab qiladi. Turkiston ayugasining farmasevtika va tibbiyot uchun bir qancha amaliy ahamiyatga ega, chunki bu o‘simlikning fitokimyoviy tarkibi bir qancha biologik faol moddalarga boy. Turkiston ayugasi hayotiy shakliga ko‘ra chala buta o‘simlik hisoblanadi. Bu o‘simlik endemik tur hisoblanib, Hisor tog‘ tizmasining bir

qancha massivlarida uchiraydi lekin tarqalish ariali juda kichik. Tabiatda uchiraydigan tabiiy zahirasi ham juda kam. Tabiiyki uning xom ashyosiga bo‘lgan ehtiyojni pilantatsiyalarda ekib yetishtirish orqali ta’minlash mumkin (1-rasm).

1-rasm. Turkiston ayugasining umumiy ko‘rinishi

Adabiyotlar tahlili

Bu turni, 1882-yilda o‘simlikshunos va botanik olim Regel tomonidan ilk marta tavsiflab berilgan, keyinchalik Briq tomonidan mukammal tahlil qilingan [D. Ulashov va boshqalar 2025 :370]. O‘simlikning tarkibida fitoekdisteroidlar deb ataluvchi ikkilamchi metabolitlarni to‘playdi. Ushbu moddalar biologik faol komponentlar sifatida qaraladi. *Ajuga* turkumi *Lamiaceae* oilasiga mansub bo‘lib, taxminan 50 turkum va 300 ga yaqin tur, kenja turlar navlarni o‘z ichiga oladi va Osiyo, Afrika, Avstraliya, Shimoliy Amerika va Yevropa hududlarida tarqalgan [B. Mamarasulov va boshqalar 2022: 44].

Tarkibida tibbiyot uchun muhum bo‘lgan ayugalakton, ekdisteron, siasteron, turkesteron, ayugosteron steroid moddalar uchiraydi [O. Xojimatov va boshqalar 2021: 14]. Tadqiqotchilar tomonidan Turkiston ayugasining sog‘lom va sifatli nihollarini yetishtirishda, 2022 - yil Surxandaryo viloyatidan uning novdalarini SAG MChJ in vitro laboratoriyasiga olib kelingan strel holatda nihollari ko‘paytirilgan [B. Qodirov va boshqalar 2024 : 3]

Turkiston ayugasi tarkibidan olingan ayrim ekstraktlar yurak qon - tomir faoliyatiga tasiri o‘rganilgan. Tajriba kalamush aortasida sinab ko‘rilgan. Tadqiqot natijalariga ko‘ra ushbu o‘simlik ekstrakti ion transport tizimlariga samarali ta’sir ko‘rsatishi aniqlangan [Eshbakova A. va boshqalar 2024 : 1214]. Bir qaator tadqiqotchilar tomonidan uning tarkibidagi ikkilamchi moddalar sof holda ajiratib olingan hamda bu moddalar tavsiflab berilgan [Omonturdiev S. va boshqalar 2019 : 28]. Xomashyosini yig‘ish vaqti va tartibi haqida bir qancha malumotlar bor. Turkiston ayugasining xom ashyosi iyul oyining boshlarida, ommaviy gullash davrida yig‘ib olinadi. Bu vaqtda faqat shoxlarning gullagan, bargli uchki qismlari terib olinadi. Yig‘ilgan xomashyo yaxshi shamollatiladigan chordoqlarda yoki soyabon ostida, qog‘oz yoki mato ustiga 5 - 7 sm qalinlikda yoyib quritiladi va vaqti - vaqti bilan ag‘darib turiladi. Xomashyoni 35-50 °C haroratli maxsus quritgichlarda ham quritish mumkin. Tayyor xomashyo 5 - 15 kg sof og‘irlikdagi qoplarda, maydalangan holdagi xomashyo esa 10 - 30 kg li qoplarda saqlanadi [Xujanov A. va boshqalar 2021 : 49]. Bundan tashqari mamlakatimizning bir qancha olimlar tomonidan bu o‘simlikning xloroplastlarining genom ketma - ketliklari tahlil qilingan [Elena Nikitina va boshqalar 2026 : 117]. Yildan yilga iqlimning o‘zgarishi respublikamiz hududidagi barcha o‘simliklar shu jumladan tadqiqot ob’ektimiz bo‘lgan turkiston ayugasiga ham ko‘payishi va rivojlanishiga salbiy ta’sir ko‘rsatmoqda. Bu dorivorlik xususiyatini o‘rganish bo‘yicha bir qancha tajribalar olib borilgan [D.Ulashov va boshqalar 2025 : 125] . Bu o‘simliktarkibidagi biofaol moddalar mushak muskullarining uzoq vaqt davomida ishlashiga xizmat qiladi [S. Artur va boshqalar 2014 : 2585].

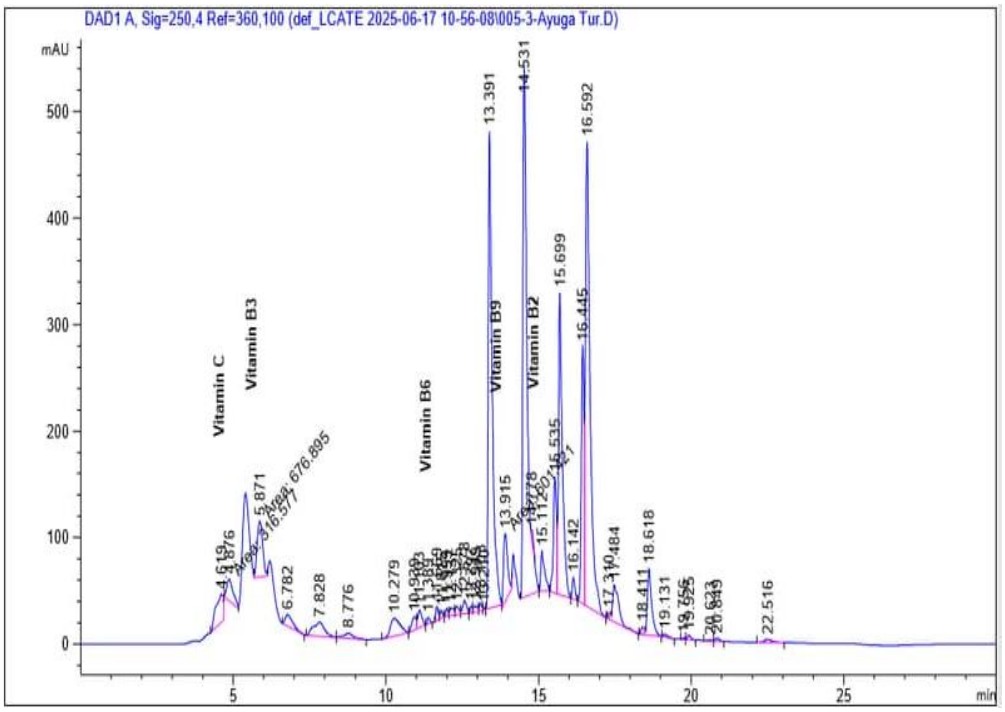
Tadqiqot metodologiyasi

Tadqiqot ishi Zarafshon tog‘ tizmasining janubiy yonbag‘rlarida, hududi jihatdan Qashqadaryo viloyati Chiroqchi tumanida olib borayapmiz. Tuman hududi Qashqadaryo viloyatining shimoliy qismida joylashgan bo‘lib cho‘l zonasi dengiz sathidan 400 - 600 m, adirlarda esa 700 - 900 m, tog‘li hududlari esa 1200 - 1500 m balandlikda joylashgan. Iqlimi keskin kontinental bo‘lib, yanvar oyida o‘rtacha harorat 2.7 °C iyulning o‘rtacha harorati esa 28 °C ni tashkil qiladi. Olib borilayotgan ajriba stansiyasi dengiz sathidan 700 - 800 metr balandlikda joylashgan. Turkiston ayugasininig urug‘idan tog‘ridan to‘g‘ri ko‘paytirish murakkabligini hisobga olib Respublikamizda bir qator ishlar amalga oshirilmoqda.

Natijalar va ularning tahlili

Turkiston ayugasining xom - ashyosi tarkibidagi, mikro va makroelimentlar aminokislotalar, flavonoidlar, vitaminlarni aniqlashda O‘zR FA Bioorganik kimyo institutining “Oqsillar va peptidlar kimyosi” laboratoriyasida U. Ishimov rahbarligida tahlillar qilindi. Bunda plazmalar induktiv bog‘langan mass - spektrometriya metodidan (ISP-MS) foydalanildi. Buning uchun o‘simlikning xona haroratida quritilgan biomassasidan analitik tarozida ma’lum miqdorda tortib olindi. Namuna tarkibidagi suvda eruvchi vitaminlar yuqori samaradorlikka ega bo‘lgan suyuqlik xromatografiyasi usuli yordamida aniqlandi. Tortmadan 5-10 gr miqdorida analitik tarozida tortib olinib, 300 ml hajmdagi yassi kolbaga solinadi. Ustiga 50 ml 40% li etanol eritmasidan qo‘shiladi. Aralashma magnit aralashtirgich, teskari sovutkich bilan jihozlanib, 1 soat davomida intensiv aralashtirib turgan holda qaynatiladi va keyinchalik 2 soat davomida xona haroratida aralashtiriladi. Aralashma tindirilib filtrlab olinadi. Qolgan qismiga 25 ml 40 foiz etanoldan solib 2 marta qayta ekstraksiya qilindi. Filtratlar birlashtirildi va 100 ml o‘lchagich kolbaga solinib chizig‘igacha 40% etanol bilan to‘ldiriladi (5-10%). Hosil bo‘lgan eritma sentrafugada 7000 oborot/minut tezlikda 10 daqiqa davomida aylantiriladi. Hosil bo‘lgan eritma ustki qismidan analiz uchun olindi (Jadval-1).

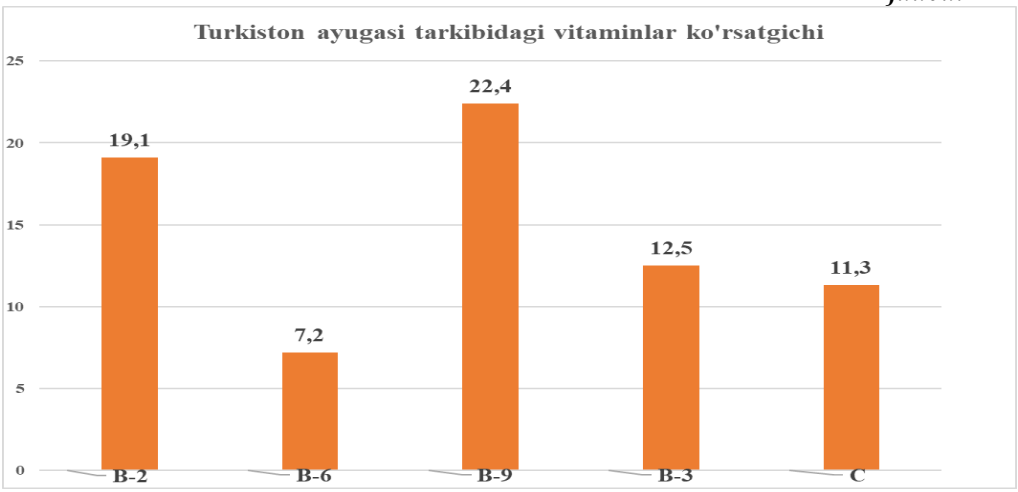
Jadval-1



Turkiston ayugasining tarkibida bir qancha muhim bo‘lgan vitaminlar xromatagirafiya usulida aniqlandi va tahlil qilindi (jadval- 2).

Jadvaldan ko‘rinib turibdiki eng ko‘p uchiraydigan vitamin B- 9 bo‘lib, eng kam uchiraydigan vitamin esa B-6 ekanini ko‘rishimiz mumkin.

Jadval-2



Xulosa

Tadqiqotimiz davomida turkiston ayugasining o‘sishi va rivojlanishi tuproq tarkibi biomassa ko‘rsatgichlari aniqlandi. Tajribalarni olib borish davomida uning fitokimyoviy tarkibi o‘rganildi. Uning xom ashyosi tarkibida bir qancha faol moddalar aniqlandi va tahlil qilindi. Aniqlangan biofaol moddalardan vitaminlar, mikro va makroelimentlar, aminokislotalar, flavonoidlar miqdor jihatdan tahlil qilindi. Tahlilarga ko‘ra turkiston ayugasi tibbiyot va farmasevtika sohasi uchun kerakli xom ashyo ekanligini, uning yetishtirish texnologiyasini ishlab chiqish muhim ekanligini xulosa qidik.

Annotatsiya: *Ushbu maqolada Meloidogyne turiga mansub nematodalar tomonidan yetkazilayotgan zarar va ular bilan kurashishda qo‘llaniladigan muhim metodlar yoritilgan. Maqolada ushbu nematodalarning biologiyasi, ular olib keladigan salbiy oqibatlar, agrotexnik, kimyoviy, biologik va integratsiyalashgan kurash usullarining ahamiyati, samaradorligi va amalga oshirish yo‘llari keng yoritilgan. Xususan, ekologik xavfsizlik tamoyillarini saqlagan holda ishlab chiqarishda samarali va barqaror kurash choralarini joriy qilish zaruriyati asoslab berilgan.*
Kalit so‘zlar: *Meloidogyne, nematodalar, o‘simlik kasalliklari, integratsiyalashgan kurash, biologik usullar, kimyoviy usullar, agrotexnika, ekologik xavfsizlik.*

МЕТОДЫ БОРЬБЫ С НЕМАТОДАМИ РОДА MELOIDOGYNE

Аннотация: *В данной статье рассматриваются вред, причиняемый нематодами рода Meloidogyne, и важные методы борьбы с ними. Подробно обсуждается биология этих нематод, негативные последствия их применения, важность, эффективность и внедрение агротехнических, химических, биологических и комплексных методов борьбы. В частности, обосновывается необходимость внедрения эффективных и устойчивых мер борьбы в производстве при соблюдении принципов экологической безопасности.*

METHODS USED IN THE CONTROL OF *MELOIDOGYNE* NEMATODES

Abstract*: This article discusses the damage caused by nematodes of the genus Meloidogyne and the important methods used to combat them. The article extensively discusses the biology of these nematodes, the negative consequences they cause, the importance, effectiveness and implementation of agrotechnical, chemical, biological and integrated control methods. In particular, the need to introduce effective and sustainable control measures in production while maintaining the principles of environmental safety is justified.*
Keywords: *Meloidogyne, nematodes, plant diseases, integrated control, biological methods, chemical methods, agrotechnical, environmental safety.*

Kirish

Meloidogyne avlodiga mansub nematodalar qishloq xo‘jalik ekinlariga eng ko‘p zarar yetkazuvchi zararkunalilardan biri hisoblanadi. Ular, ayniqsa, sabzavot va poliz ekinlarining ildiz tizimiga chuqur ta’sir etib, o‘simliklarning o‘sishida va hosildorligida jiddiy muammolar keltirib chiqaradi. Ildizlarda yuzaga keluvchi bo‘rtmalar, o‘simliklarning oziqlanishini va suvni o‘zlashtirishini cheklaydi, natijada o‘simliklar nobud bo‘lishigacha olib keladi. Meloidogyne nematodalariga qarshi kurashishda har tomonlama yondashuv muhim ahamiyatga ega. Bugungi kunda integratsiyalashgan zararkunandalarni boshqarish tamoyillariga asoslangan holda, kimyoviy, agrotexnik, biologik va fizikaviy kurash usullari o‘zaro maqbul uyg‘unlashtiriladi. Bu yondashuv har bir usulning kuchli va zaif tomonlarini

inobatga olgan holda, yuqori va barqaror samaradorlikka erishish, tuproq va atrof-muhitning ekologik sog‘lomligini saqlashga xizmat qiladi.

Meloidogyne bilan kurashda profilaktik va agrotexnik tadbirlarga alohida e’tibor qaratiladi. Ekin almashinuvi va chidamli navlardan foydalanish, yer haydash va tozalash, sug‘orish va o‘g‘itlash tizimini to‘g‘ri tashkil etish zararkunandalar populyatsiyasini kamaytirishda asosiy rol o‘ynaydi. Kuchli zararlanish holatida esa, kimyoviy vositalardan foydalanish maqsadga muvofiq bo‘lib, ular qisqa muddatda yuqori natija beradi. Bundan tashqari, tuproqni quyosh energiyasi yordamida isitish va boshqa fizikaviy usullar kimyoviy preparatlardan foydalanmasdan ham nematodalar sonini kamaytirishda samarali hisoblanadi. Shu tariqa, Meloidogyne nematodalariga qarshi kurash kompleks va ilmiy asoslangan yondashuvni, dalaning o‘ziga xos holatiga mos metodlarning to‘g‘ri kombinatsiyasini talab qiladi. Bu esa nafaqat ekinlarni himoya qilish, balki qishloq xo‘jalik sohasida barqaror va ekologik toza hosil yetishtirishga zamin yaratadi.

Adabiyotlar tahlili va metodologiya

Meloidogyne nematodasi o‘simliklar ildiz tizimiga zarar yetkazadi va turli xil ekinlarda hosildorlikning keskin kamayishiga sabab bo‘ladi. Ushbu nematodalar o‘simlik ildizlarida g‘udaklar hosil qiladi, natijada o‘simliklarning oziqlanishi va suvdan foydalanishi yomonlashadi. Bu esa o‘simlik rivojlanishining oqsashiga, barglarning sarg‘ayishiga, kurtak va hosil sonining kamayishiga va oxir-oqibat hosilning yo‘qolishiga olib keladi. Shuning uchun ushbu zararli organizmlarga qarshi kompleks va samarali kurash choralarini ishlab chiqish muhim ahamiyat kasb etadi. Meloidogyne nematodalari tropik va subtropik iqlim sharoitida keng tarqalgan, biroq o‘rta va mo‘tadil zonalarda ham tez moslashuvi va ko‘payuvchanligi tufayli katta xavf tug‘diradi. Mazkur zararli organizmlar ekinlarning barcha o‘sish fazalarida faoliyat yuritadi va bir mavsumda bir necha avlod berishi mumkin. Ularning karantin zararkunandalari toifasiga kirgani, shuningdek, xalqaro qishloq xo‘jaligi savdosi uchun jiddiy tahdid bo‘lishi sababli, profilaktika va doimiy monitoring tadbirlariga alohida e’tibor qaratilishi lozim [1].

Kurashda birlamchi manfaat agrotexnik usullardan iborat bo‘lib, ularni to‘g‘ri va o‘z vaqtida amalga oshirish, dalada kasallik manbalarini kamaytirish va infeksiyalangan hududlar chegarasini qisqartirishga xizmat qiladi. Sariq, fusariyoz va bakterioz kasalliklarni yengillashtirish, ehtiyotkorlik bilan urug‘ materiallari va ko‘chatlarni saralash hamda dezinfeksiya qilish bu borada muhim ahamiyatga ega. Shuningdek, yerga ekishdan oldin ekin qoldiqlarini chuqur haydash, dalani yetarli dam olish uchun ekin almashinuvidan foydalanish samarali natija beradi. Qolgan ekin qoldiqlari va yovvoyi begona o‘tlar nematodlar uchun muhit bo‘lishi mumkin. Shu sababli, dalani doimiy tozalash hamda parvarish qilish zarur. Ayrim holatlarda nematodalarga chidamli va tolerant navlarni tanlash ham muvaffaqiyatli usullardan biridir. Hozirgi zamon seleksiyasi ushbu yo‘nalishda jadal rivojlanmoqda va turli sabzavot, dukkakli va boshqa madaniy ekinlarning kasallikka chidamli navlari yaratilmoqda. Bunday navlarni qo‘llash yordamida zararli organizmlar sonini bir necha barobar kamaytirish mumkin. Shu o‘rinda, mahalliy ekologik-iqlim sharoitiga mos keluvchi navlardan foydalanish maqsadga muvofiq. Chidamli navlarning doimiy ekilishi esa xavfni yanada kamaytiradi.

Biologik kurash ham katta ahamiyatga ega. So‘nggi yillarda biologik vositalardan, jumladan, foydali mikroorganizmlar — trixoderma, bacillus turdagi bakteriyalardan foydalangan holda amalga oshiriladi. Ushbu antagonistik mikroorganizmlar nematod tuxumlari va lichinkalariga kuchli zarar yetkazadi va ularni tabiiy ravishda nazorat qiladi. Biologik preparatlar tabiiy muhitga zarar yetkazmaydi, foydali entomofauna va tuproq mikroflorasiga salbiy ta’sir ko‘rsatmaydi. Biologik kurash vositalarining asosiy afzalligi ularning ekologik xavfsizligi va barqaror natijalar berishidadir. Bundan tashqari, ular boshqa metodlar bilan birgalikda qo‘llanganda ham yuqori samara beradi.Alohida e’tibor talab qiladigan jarayonlardan biri nematoodalarga qarshi kimyoviy kurash usullaridir. Kimyoviy preparatlar (nematosidlar) — karbonatli, fosfor-organik va boshqa guruh moddalar — zararkunandalarga to‘g‘ridan-to‘g‘ri ta’sir ko‘rsatadi. Lekin, ularni ishlatishda ekologik xavfsizlik, mahsulot sifatidagi qoldiq miqdor (maksimal ruxsat etilgan daraja), inson va jonivorlar salomatligi muhofazasini inobatga olish shart. Kimyoviy preparatlar tez va sifatli natija bersa-da, ularni noto‘g‘ri va haddan ortiq qo‘llash tuproqda zaharlı moddalarning yig‘ilib qolishiga, tuproq unumdorligining pasayishiga olib keladi. Shu bois, ilmiy asoslangan kimyoviy kurash protokollariga qat’iy amal qilish zarur. Davriy ravishda kimyoviy va boshqa usullarni muvofiqlashtirib qo‘llash natijasida, zararli organizmlar qarshiligini (rezistentlik) oldini olish mumkin. Nematosidlarning ekologiyaga va odam sog‘lig‘iga ta’siri har doim nazorat ostida bo‘lishi kerak. So‘nggi vaqtlarda ekologik xavfsiz va samarali yangi avlod preparatlari ishlab chiqilmoqda. Kimyoviy moddalar bilan ishlashda himoya vositalaridan foydalanish, to‘g‘ri dozalash, maxsus me’yor va texnika xavfsizligini qat’iy bajarish zarur [2].

Natijalar va Muhokama

Integratsiyalashgan kurash choralari — bir necha usullar kompleksdan foydalanishda samaradorlik yuqori bo‘ladi. Masalan, agrotexnik, biologik va kimyoviy kurash usullarining birgalikda qo‘llanilishi natijasida nematodlar soni sezilarli darajada kamayadi. Integratsiyalashgan metodlar o‘simliklarni himoyalashni yanada mukammal qilish, qurish

xarajatlarini kamaytirish hamda ekologik tozalikka rioya etish imkonini beradi. Tuproq unumdorligi, hosildorlik oshadi va zararkunanda populyatsiyasi barqaror tarzda nazorat ostida tutiladi. Ushbu yondashuvda nafaqat kimyoviy, balki biokimyoviy va agrotadbirlar uyg‘unligini saqlash, xalqaro standart talablariga mos harakat qilish muhimdir. Meloidogyne nematodalari bilan kurashning zamonaviy ikki asosiy yo‘nalishi mavjud: ekologik xavfsizlik va iqtisodiy maqbullik. Birinchi yo‘nalishda muqim ekologik va foydali muhitni saqlash, sog‘lom agro-ekotizimni rivojlantirish maqsad qilinadi. Iqtisodiy efficiency esa, xarajatlarning qisqartirilishi va uzluksiz, barqaror hosil olishga tayangan. Buning uchun har bir dala, ekish sharoiti va ekin xususiyatlariga mos individual strategiyalar tanlanadi. Har bir usulning o‘ziga xos afzallik va kamchiliklari bo‘lsa-da, ularni to‘g‘ri, aniq va muvofiqlikda qo‘llash eng yuqori natijaga olib keladi [3].

So‘nggi yillarda ilmiy tadqiqotlar natijasida yangi biologik vositalar, zamonaviy ekin navlari va innovatsion kimyoviy preparatlar ishlab chiqilmoqda. Bu borada zamonaviy IT texnologiyalar, masalan, zamonaviy tuproq monitoringi, dronlar yordamida dala tahlili va kasallik tarqalishini oldindan baholash metodlari ishlab chiqilgan. Ularning joriy etilishi fermerlar, qishloq xo‘jaligi mutaxassislari uchun qulay, tezkor va aniqroq chora-tadbirlarni amalga oshirish imkonini beradi. Ilmiy-innovatsion yutuqlar ortidan nematodalarga qarshi kurash doimiy yangilab boriladi. Har bir strategiya va kurash usulining samarali natija berishi uchun doimiy bilim almashish, tajriba o‘rtoqlashish va yangi yondashuvlarni sinovdan o‘tkazish muhim. Bu borada viloyat, tuman va respublika darajasida tayanch laboratoriyalar va o‘quv markazlari bo‘lishi va agronomlar, fermerlar muntazam malaka oshirishi talab etiladi. Shu bilan birga, xalqaro tajribalar va ilmiy tahlillar asosida, mahalliy sharoitda yuqori natija bera oladigan metodlarni tanlash maqsadga muvofiq. Kurashning muvaffaqiyatli olib borilishi uchun tuproq tahlilini zamon talabiga mos apparatlar va dasturlar asosida olib borish, tuproq mikrobiologik tahlilini amalga oshirish, dalada o‘sadigan yovvoyi o‘tlar, zararli va foydali mikroorganizmlar muvozanatini doimiy monitoring qilish zarur. Barcha tadbirlar muvofiqlashtirilgan va tizimli bo‘lishi kerak. Har bir dalada nematod monitoringini muntazam o‘tkazish, kuzatuv natijalarini tahlil qilish va natijalarga asosan o‘z vaqtida zaruriy choralarni ko‘rish muhim [4].

Meloidogyne avlodiga mansub nematodalarning tarqalishi va qishloq xo‘jalik ekinlariga yetkazadigan zarari ular yashaydigan muhit sharoitiga bog‘liq ravishda o‘zgarib turadi. Shu sababli, nematodalarga qarshi turli kurash tadbirlarini amalga oshirish talab etiladi. Nematodalar bilan kurashish tizimi integratsiyalashgan zararkunandalarni boshqarish (IZB) konsepsiyasiga asoslanadi. Mazkur konsepsiya kimyoviy, biologik, agrotexnik va fizikaviy usullarning maqbul kombinatsiyasini o‘z ichiga oladi. Har bir usulning o‘ziga xos afzalliklari va kamchiliklari mavjud bo‘lib, ularni to‘g‘ri uyg‘unlashtirish orqali yuqori samaradorlikka erishish mumkin.

Ochiq dala maydonlarida va issiqxona sharoitida o‘rtacha yoki kuchsiz zararlangan dalalarda, avvalo profilaktik, agrotexnik va fizikaviy kurash tadbirlari muhim ahamiyat kasb etadi. Agrotexnik tadbirlar orasida ekin almashlab ekish alohida o‘rin tutadi. Nematodalar bilan zararlangan maydonlarda 2–3 yil davomida ildiz bo‘rtma nematodalariga chidamli ekin navlarini yetishtirish populatsiyani sezilarli darajada kamaytiradi. Xususan, g‘alla ekinlari, makkajo‘xori va ayrim o‘t turlari nematodalar uchun xo‘jayin hisoblanmaydi yoki yomon xo‘jayin sanaladi.

Kimyoviy preparatlar qishloq xo‘jaligi ekinlarining nematodalar bilan kuchli zararlangan o‘choqlarida qo‘llanishi mumkin [26; 1–105-b.]. Kimyoviy dorilar issiqxonalarda va nematodalar bilan kuchli zararlanadigan monokultura ekinlarda yuqori samaraga ega. Nematodalarga qarshi ishlatiladigan kimyoviy preparatlar nematitsidlar deb ataladi. Ular ta’sir mexanizmiga ko‘ra bir necha guruhlarga bo‘linadi: fosfororganik birikmalar, karbamatlar, fumigantlar va biologik kelib chiqishli preparatlar. Har bir guruh preparatlari xavfsizlik darajasi, samaradorligi va qo‘llash usuli jihatidan bir-biridan farq qiladi [5].

Mazkur tadqiqot ishlari 2025 yil iyul–oktyabr oylarida Farg‘ona viloyati Quva tumani hududida joylashgan “Oq oltin” fermer xo‘jaligi dala maydonlarida ochiq dala sharoitida olib borildi. Tadqiqotning asosiy maqsadi Meloidogyne avlodiga mansub ildiz bo‘rtma nematodalariga qarshi Oksamil 24 % nematotsid preparatining samaradorligini aniqlashdan iborat bo‘ldi. Oksamil karbamat guruhi vakili bo‘lib, sistematik ta’sirga ega nematitsid hisoblanadi. U o‘simlik ildizlari orqali so‘rilib, nematoda lichinkalari bilan aloqaga tushadi hamda ularning asab tizimiga ta’sir ko‘rsatadi.

Tajriba uchun ajratilgan umumiy maydon 25 sotixni tashkil etdi. Tajriba uchastkalari agrotexnik talablar asosida tayyorlandi: tuproq haydalib, tekislandi va ekishga tayyor holga keltirildi. Tadqiqot bodring (Cucumis sativus L.) o‘simligida olib borildi. Bodring o‘simligi ildiz bo‘rtma nematodalari bilan ko‘p zararlanadigan sabzavotlar qatoriga kiradi. Uning ildizlari nisbatan yupqa va yumshoq bo‘lgani uchun nematodalar uchun oson kirish yo‘li yuzaga keladi. Vegetatsiya davrining qisqaligi tufayli bu ekinda nematodalar yil davomida bir necha avlod yetishtirish imkoniga ega bo‘ladi.

Tajriba nazorat hamda tajriba variantlariga ajratildi. Nazorat variantida hech qanday kimyoviy ishlov bajarilmadi. Tajriba variantida esa Oksamil 24 % nematotsid preparati qo‘llanildi. Tajriba 3 takrorlanishda tashkil etib, har bir takror

alohida uchastkaga joylashtirildi. Uchastkalar o‘rtasida tasodifiy tarqatish metodi qo‘llanildi. Har bir variant uchun ajratilgan maydon 5 sotixni tashkil etdi. Variantlar orasida 0,5 metrli ajratuvchi chiziqlar qoldirildi.

Agrotexnik tadbirlar tizimiga chuqur shudgorlash (nematodalarning pastki qatlamlarga siljib, nobud bo‘lishi uchun), o‘simlik qoldiqlarini daladan yig‘ib chiqarish va yo‘qotish (tuxum va lichinkalarning saqlanishi oldini olish), optimal sug‘orish rejimini saqlash, organik o‘g‘itlardan foydalanish (tuproq biotasini yaxshilash), shuningdek karantin choralarini ko‘rish (zararlangan maydonlardan asbob-uskuna va tuproqni boshqa hududlarga ko‘chirishning oldini olish) kiradi [6].

Fizikaviy usullar qatorida tuproqni bug‘ yoki quyosh energiyasi yordamida isitish (solyarizatsiya) eng samarali choralardan biri sifatida ajralib turadi. Solyarizatsiya usulida yoz oylarida (iyul–avgust) shudgorlangan dala sirtiga shaffof polietilen plyonka yopiladi. Quyosh nurlari ostida tuproq harorati 50–60°C darajagacha ko‘tariladi va bu nematoda tuxumlari hamda lichinkalarini nobud etadi. Ushbu usul kimyoviy preparatlarsiz ham nematodalar sonini sezilarli darajada kamaytirishga imkon beradi.

Xulosa

Meloidogyne nematodalari bilan kurashish zamonaviy qishloq xo‘jaligida murakkab va mas’uliyatli vazifaga aylangan. Faol va barqaror kurash choralarini aniqlash, ijtimoiy-iqtisodiy va ekologik talablarga javob beradigan metodlarni tanlash dolzarb masalalardan biridir. Kurashning har bir bosqichida agrotexnik, kimyoviy va biologik metodlarning muvofiqlikda foydalanilishi yuqori samaradorlikni ta’minlaydi. Innovatsion yondashuvlar, ilmiy tadqiqotlar natijalari bilan uyg‘un holda olib borilayotgan chora-tadbirlar hosildorlikni oshirish, o‘simlik sog‘lomligini yaxshilash va atrof-muhitni muhofaza qilish imkonini beradi. Doimiy monitoring, tuproq tahlili va zamonaviy texnologiyalar yordamida zararkunandalarga qarshi barqaror natijalarga erishiladi. Bu borada mahalliy va xalqaro tajribani inobatga olib, kasalliklarga qarshi kurashni samarali tashkil qilish dolzarb vazifa bo‘lib qolmoqda.

Annotatsiya: *Ushbu maqolada anjir (Ficus carica L.) daraxtining asosiy zararkunandalari, ularning bioekologik xususiyatlari hamda o‘simlikka yetkazadigan zarari yoritilgan. Anjir parvonasi (Choreutis nemorana Hb.), anjir barg burgachasi (Homotoma ficus L.), anjir po‘stloqxo‘r qo‘ng‘izi, anjir mumsimon soxta qalqondori va o‘rgimchakkana (Tetranychus urticae Koch.) kabi zararkunandalarning rivojlanish xususiyatlari, tarqalishi va iqtisodiy ahamiyati tahlil qilingan. Shuningdek, anjir plantatsiyalarida zararkunandalar sonini nazorat qilish va zararini kamaytirishda biologik, agrotexnik hamda kimyoviy kurash usullarining samaradorligi ko‘rib chiqilgan. Integrallashgan himoya tizimidan foydalanish anjir hosildorligini saqlash, mahsulot sifatini oshirish va ekologik muvozanatni ta’minlashning muhim omili ekanligi ta’kidlangan.*

Kalit so‘zlar: *Zararkunandalar, anjir parvonasi, anjir barg burgachasi, o‘rgimchakkana, po‘stloqxo‘r qo‘ng‘iz, soxta qalqondor, bioekologiya, integrallashgan himoya, biologik kurash, agrotexnik tadbirlar, hosildorlik.*

ОСНОВНЫЕ ВРЕДИТЕЛИ ФИГОВОГО ДЕРЕВА И МЕРЫ ПО БОРЬБЕ С НИМИ.

Аннотация: *В данной статье рассмотрены основные вредители инжира (Ficus carica L.), их биоэкологические особенности и наносимый ими ущерб растению. Проанализированы особенности развития, распространения и хозяйственное значение таких вредителей, как инжирная моль (Choreutis nemorana Hb.), инжирная листоблошка (Homotoma ficus L.), инжирный короед, восковая ложнощитовка инжира и паутинный клещ (Tetranychus urticae Koch.). Также рассмотрена эффективность биологических, агротехнических и химических методов борьбы для контроля численности вредителей и снижения их вредоносности в насаждениях инжира. Подчёркивается, что использование интегрированной системы защиты растений является важным фактором сохранения урожайности инжира, повышения качества продукции и обеспечения экологического равновесия.*

Ключевые слова: *Вредители, инжирная моль, инжирная листоблошка, паутинный клещ, короед, ложнощитовка, биоэкология, интегрированная защита, биологическая борьба, агротехнические мероприятия, урожайность.*

MAIN PESTS OF FIG TREE AND MEASURES TO FIGHT AGAINST THEM

Abstract: *This article discusses the main pests of fig (Ficus carica L.), their bioecological characteristics, and the damage they cause to the plant. The developmental features, distribution, and economic importance of such pests as the fig moth (Choreutis nemorana Hb.), fig psylla (Homotoma ficus L.), fig bark beetle, fig wax scale insect, and two-spotted spider mite (Tetranychus urticae Koch.) are analyzed. The effectiveness of biological, agrotechnical, and chemical control methods for regulating pest populations and reducing their harmful effects in fig plantations is also considered. The study emphasizes that the use of an integrated pest management system is an important factor in maintaining fig productivity, improving fruit quality, and ensuring ecological balance.*

Keywords: *Pests, fig moth, fig psylla, spider mite, bark beetle, scale insect, bioecology, integrated pest management, biological control, agrotechnical measures, productivity.*

Kirish

Anjir qimmatli mevali ekinlardan biri bo‘lib, uning hosildorligi va mahsulot sifati turli biotik omillar, xususan zararkunandalar ta’sirida sezilarli darajada kamayishi mumkin. Anjir zararkunandalari turli bioekologik xususiyatlarga

ega bo‘lib, asosan barglar, mevalar va novdalarda yashaydi hamda o‘simlik to‘qimalari hisobiga oziqlanadi. Natijada o‘simlikning normal o‘sishi, rivojlanishi va hosil berish jarayonlari izdan chiqadi. Ayniqsa, anjir pashshasi (*Cacopsylla ficus*) va anjir o‘rgimchagi (*Eriophyes ficus*) kabi zararkunandalar anjir plantatsiyalarida keng tarqalgan bo‘lib, barglarning qurishi, fotosintez jarayonining pasayishi hamda novdalar o‘sishining sekinlashishiga sabab bo‘ladi.

Zararkunandalar o‘simliklarning fiziologik va biologik jarayonlariga salbiy ta’sir ko‘rsatib, ularning immunitetini pasaytiradi va kasalliklarga chidamliligini susaytiradi. Shu bois anjir ekinlarida zararkunandalarga qarshi samarali kurash choralarini ishlab chiqish va qo‘llash muhim ahamiyat kasb etadi. Hozirgi kunda biologik, kimyoviy va agrotexnik usullarni uyg‘unlashtirgan holda qo‘llash zararkunandalar sonini nazorat qilishning eng samarali yo‘llaridan biri hisoblanadi. Bundan tashqari, ekologik xavfsiz va agroekologik yondashuvlarga asoslangan himoya tadbirlari hosilni saqlash bilan birga atrof-muhit muvozanatini ham asrashga xizmat qiladi. Shu sababli anjirning asosiy zararkunandalarini, ularning bioekologik xususiyatlarini hamda ularga qarshi kurash choralarini o‘rganish qishloq xo‘jaligi samaradorligini oshirish va sifatli hosil yetishtirishda muhim ilmiy-amaliy ahamiyatga ega.

Asosiy qism

Anjir (*Ficus carica L.*) — tutdoshlar oilasiga mansub, qadimdan yetishtirib kelinadigan subtropik mevali o‘simlik bo‘lib, uning mevasi shirin ta'mli, vitamin va mineral moddalarga boy hisoblanadi. Anjir yangi va quritilgan holda iste'mol qilinadi hamda xalq tabobati va oziq-ovqat sanoatida keng qo‘llaniladi. Dunyoning ko‘plab tropik va subtropik hududlarida keng tarqalgan qimmatli mevali ekinlardan biri hisoblanadi. Respublikamizda ham anjirning sariq anjir, Qarshi anjiri, Kadota, Smirna qora anjiri kabi navlari yetishtiriladi. Anjir yuqori hosildorligi, tez hosilga kirishi hamda mevalarining oziqaviy va shifobaxsh xususiyatlari bilan ajralib turadi. Biroq ushbu ekin turli zararkunandalar va kasalliklar ta’sirida zarar ko‘radi, bu esa hosildorlikning pasayishiga hamda mahsulot sifatining yomonlashishiga olib keladi [1].

Tadqiqotchilarning ma’lumotlariga ko‘ra, anjir daraxtida 40 dan ortiq zararkunanda turlari uchrashi mumkin. Ularning ichida anjir parvonasi, anjir barg burgachasi, anjir po‘stloqxo‘r qo‘ng‘izi, anjir mumsimon soxta qalqondori hamda o‘rgimchakkana asosiy iqtisodiy ahamiyatga ega zararkunandalar hisoblanadi [2]. Anjirning eng xavfli zararkunandalaridan biri anjir parvonasi (*Choreutis nemorana Hb.*) hisoblanadi. Ushbu zararkunanda barglar bilan oziqlanib, ularning yuzasini shikastlaydi. Natijada barglarning fotosintez faoliyati pasayadi, o‘simlikning o‘sishi sustlashadi va hosil miqdori kamayadi. Anjir parvonasining biologiyasi va unga qarshi kurash masalalari Sharqiy Zakavkaziya, Gruziya, Ozarbayjon, Armaniston, Moldova, Qrim va O‘zbekiston hududlarida keng o‘rganilgan. Tadqiqotlar natijasida ushbu zararkunanda anjir plantatsiyalarida katta iqtisodiy zarar yetkazishi aniqlangan [3]. Anjirda keng tarqalgan zararkunandalardan yana biri anjir barg burgachasi (*Homotoma ficus L.*) hisoblanadi. Mazkur hasharot yil davomida bir avlod berib rivojlanadi va tuxum holatida qishlaydi. Bahor oylarida tuxumlardan lichinkalar chiqib, barglarning orqa tomonida yashay boshlaydi. Yosh lichinkalar barg tomirlari orasida yashirin hayot kechirsa, keyingi yoshdagi lichinkalar koloniya holida joylashadi. Ular o‘simlik shirasi bilan oziqlanib, barglarning deformatsiyalanishiga va fiziologik faoliyatining buzilishiga sabab bo‘ladi [4].

Anjir barg burgachasi rivojlanishining dastlabki bosqichlari mart oyining oxiri va aprel oyining boshlariga to‘g‘ri keladi. Lichinkalarning asosiy qismi may oyining oxiri va iyun oyining boshlarida voyaga yetadi. Ayrim tadqiqotchilar ushbu zararkunandaning yoz davomida boshqa o‘simliklarga ko‘chib o‘tishi, kuzda esa yana anjir daraxtlariga qaytib tuxum qo‘yishini qayd etganlar [5]. Anjir po‘stloqxo‘r qo‘ng‘izi ham anjir plantatsiyalarida uchraydigan xavfli zararkunandalardan biridir. Ushbu hasharot novda va poyalarning po‘stlog‘i ostida yashab, daraxtning oziqa moddalarini tashuvchi to‘qimalarini zararlaydi. Natijada novdalarning qurishi, daraxtning zaiflashishi va hosildorlikning kamayishi kuzatiladi. Respublikamizda ushbu zararkunandaning biologiyasi va ekologiyasi yetarli darajada o‘rganilmagan bo‘lsa-da, uning anjirga sezilarli zarar yetkazishi qayd etilgan [6].

Anjir mumsimon soxta qalqondori ham iqtisodiy ahamiyatga ega zararkunandalardan hisoblanadi. Ushbu zararkunanda nafaqat anjirga, balki pista, anor, sitrus o‘simliklari, urug‘li va danakli meva daraxtlari hamda tokka ham zarar yetkazadi. Zararkunanda o‘simlik shirasi bilan oziqlanib, barglar va novdalarning zaiflashishiga olib keladi. Kuchli zararlanish natijasida daraxtlarning o‘sishi susayadi, hosildorlik pasayadi va meva sifati yomonlashadi [7]. Anjir ekinlarida o‘rgimchakkana (*Tetranychus urticae Koch.*) ham keng tarqalgan zararkunandalardan biridir. O‘rgimchakkana juda ko‘p turdagi madaniy va yovvoyi o‘simliklarda uchraydi. Tadqiqotlarga ko‘ra, u 250 ga yaqin o‘simlik turini zararlashi mumkin. Ayniqsa sariq anjir navlarida kuchli zarar keltirishi aniqlangan. O‘rgimchakkana barglarning pastki qismida yashab, hujayra shirasi bilan oziqlanadi. Zararlangan barglarda avval mayda sarg‘ish dog‘lar paydo bo‘ladi, keyinchalik barglar qurib to‘kiladi. Bu esa fotosintez jarayonining pasayishiga va hosildorlikning kamayishiga sabab bo‘ladi [8].

O‘rgimchakkana mavsum davomida 11–13 avlod berib rivojlanishi mumkin. Voyaga yetgan urg‘ochi zotlari daraxt po‘stloqlari ostida va o‘simlik qoldiqlari orasida qishlaydi. Bahor faslida ular faol rivojlanib, qisqa muddat ichida son jihatdan keskin ko‘payadi. Shu sababli o‘rgimchakkana bilan kurashishda doimiy monitoring olib borish muhim

hisoblanadi [8]. Anjir zararkunandalari o‘simliklarning fiziologik jarayonlariga salbiy ta’sir ko‘rsatadi. Ular barglarning fotosintez faoliyatini kamaytiradi, oziqa moddalar almashinuvini buzadi va o‘simlik immunitetining pasayishiga olib keladi. Natijada daraxtlar turli kasalliklarga nisbatan sezgir bo‘lib qoladi. Zararkunandalar ta’sirida hosil miqdori kamayibgina qolmay, uning sifati ham yomonlashadi. Shu sababli anjir plantatsiyalarida zararkunandalarga qarshi kurashish muhim agrotexnik tadbir hisoblanadi [9]. Hozirgi vaqtda anjir zararkunandalariga qarshi kurashda integrallashgan himoya tizimi qo‘llanilmoqda. Bu tizim biologik, kimyoviy va agrotexnik usullarni birgalikda qo‘llashni nazarda tutadi. Biologik kurashda zararkunandalarning tabiiy kushandalari, jumladan parazit va yirtqich hasharotlardan foydalaniladi. Agrotexnik usullar qatoriga bog‘larni toza saqlash, zararlangan novdalarni kesib tashlash, o‘simlik qoldiqlarini yo‘qotish hamda daraxtlarni to‘g‘ri parvarish qilish kiradi. Zarurat tug‘ilganda kimyoviy preparatlar qo‘llaniladi, biroq ularni ishlatishda ekologik xavfsizlik talablariga qat’iy rioya qilish lozim [10].

Shunday qilib, anjirning asosiy zararkunandalari biologiyasi, ekologiyasi va zarar keltirish xususiyatlarini chuqur o‘rganish ularga qarshi samarali kurash choralarini ishlab chiqishda muhim ahamiyat kasb etadi. Integrallashgan himoya tizimidan foydalanish anjir hosildorligini saqlash, mahsulot sifatini oshirish hamda ekologik muvozanatni ta’minlashning eng maqbul yo‘li hisoblanadi.

XULOSA

Anjir (*Ficus carica L.*) qimmatli mevali ekinlardan biri bo‘lib, uning hosildorligi va mahsulot sifati turli zararkunandalar ta’sirida sezilarli darajada pasayishi mumkin. Tadqiqotlar natijasida anjir parvonasi, anjir barg burgachasi, anjir po‘stloqxo‘r qo‘ng‘izi, anjir mumsimon soxta qalqondori hamda o‘rgimchakkana anjirning asosiy zararkunandalari ekanligi aniqlandi. Ushbu zararkunandalar o‘simlikning barglari, novdalari va boshqa vegetativ organlarini zararlab, fotosintez jarayonining pasayishi, o‘sish va rivojlanishning susayishi hamda hosildorlikning kamayishiga sabab bo‘ladi. Anjir zararkunandalarining bioekologik xususiyatlarini o‘rganish ularga qarshi samarali kurash choralarini ishlab chiqishda muhim ahamiyatga ega. Zararkunandalar sonini nazorat qilishda biologik, agrotexnik va kimyoviy usullarni uyg‘unlashtirgan holda qo‘llash yuqori samaradorlik beradi. Ayniqsa, integrallashgan himoya tizimidan foydalanish hosilni saqlab qolish, mahsulot sifatini oshirish hamda atrof-muhit ekologik muvozanatini ta’minlash imkonini yaratadi.

Shunday qilib, anjir plantatsiyalarida zararkunandalarga qarshi o‘z vaqtida va ilmiy asoslangan kurash choralarini amalga oshirish mo‘l va sifatli hosil olishning muhim omillaridan biri hisoblanadi. Kelgusida anjir zararkunandalarining biologiyasi, ekologiyasi va ularga qarshi ekologik xavfsiz kurash usullarini yanada chuqurroq o‘rganish ushbu sohada olib borilayotgan ilmiy tadqiqotlarning dolzarb yo‘nalishlaridan biri bo‘lib qoladi.

Annotasiya: *Bakteriofag terapiya bakterial infeksiyalarni davolashda bakteriyalarni yo‘q qiluvchi viruslar-bakteriofaglardan foydalanishga asoslangan usuldir. Antibiotiklarga chidamli bakteriyalar ko‘payib borayotgan sharoitda ushbu yondashuv muhim alternativ davolash vositasi sifatida qaralmoqda. Maqolada bakteriofag terapiyaning mohiyati, afzalliklari va zamonaviy tibbiyotdagi ahamiyati yoritiladi.*

Kalit so‘zlar: *bakteriofag, fag terapiya, antibiotiklarga chidamlilik, bakterial infeksiya, biologik davolash, virus, mikrobiologiya, zamonaviy tibbiyot.*

BACTERIOPHAG THERAPY: AN ALTERNATIVE APPROACH TO ANTIBIOTICS IN MODERN MEDICINE

Annotation*: Bacteriophage therapy is a method based on the use of bacteria-destroying viruses - bacteriophages - in the treatment of bacterial infections. In the context of the increasing number of antibiotic-resistant bacteria, this approach is considered an important alternative treatment. The article discusses the essence, advantages and significance of bacteriophage therapy in modern medicine.*

Keywords: *bacteriophage, phage therapy, antibiotic resistance, bacterial infection, biological treatment, virus, microbiology, modern medicine.*

БАКТЕРИОФАГНАЯ ТЕРАПИЯ: АЛЬТЕРНАТИВНЫЙ ПОДХОД К АНТИБИОТИКАМ В СОВРЕМЕННОЙ МЕДИЦИНЕ

Аннотация: *Фаготерапия — это метод, основанный на использовании бактериоуничтожающих вирусов — бактериофагов — в лечении бактериальных инфекций. В контексте растущего числа антибиотикорезистентных бактерий этот подход рассматривается как важная альтернатива лечению. В статье обсуждаются сущность, преимущества и значение фаготерапии в современной медицине.*

Ключевые слова*: бактериофаг, фаготерапия, антибиотикорезистентность, бактериальная инфекция, биологическое лечение, вирус, микробиология, современная медицина.*

XX asrda antibiotiklarning kashf etilishi tibbiyot sohasida ulkan burilish yasab, ko‘plab bakterial kasalliklarni samarali davolash imkonini berdi. Antibiotiklar yordamida pnevmoniya, sil, sepsis kabi xavfli infeksiyalar ustidan nazorat kuchaydi va inson umr davomiyligi sezilarli darajada oshdi. Biroq vaqt o‘tishi bilan antibiotiklardan haddan tashqari va noto‘g‘ri foydalanish natijasida ko‘plab bakteriyalarda ularga nisbatan chidamlilik shakllandi. Bugungi kunda antibiotiklarga rezistent bakteriyalar global sog‘liqni saqlash tizimidagi eng dolzarb muammolardan biri bo‘lib, yangi va samarali davolash usullarini izlashni talab qilmoqda.

Shunga ko‘ra, bakteriofag terapiya zamonaviy tibbiyotda qayta e’tibor qozonayotgan istiqbolli yo‘nalishlardan biridir. Bakteriofaglar-bu bakteriyalarni zararlab, ularni yo‘q qiluvchi maxsus viruslar bo‘lib, tabiatda juda keng tarqalgan. Ular inson organizmidagi foydali hujayralarga zarar yetkazmasdan, ma’lum turdagi patogen bakteriyalarni nishonga olishi bilan ahamiyatlidir. Bakteriofag terapiya ilk bor XX asr boshlarida ilmiy jihatdan asoslangan bo‘lsa-da, antibiotiklar ommalashgach, ko‘plab mamlakatlarda bu usulga qiziqish kamaygan. Shunga qaramay, ayrim davlatlarda, xususan Gruziya va Sharqiy Yevropa hududlarida fag terapiya amaliyoti saqlanib qolgan.

Hozirgi kunda antibiotiklarga chidamli infeksiyalar sonining ortishi bakteriofag terapiyani qayta o‘rganish va uni klinik amaliyotga joriy etish zaruratini kuchaytirmoqda. Ushbu usulning selektivligi, biologik tabiati va murakkab bakterial infeksiyalarga qarshi samaradorligi uni tibbiyotning istiqbolli yo‘nalishlaridan biriga aylantiradi.

Bakteriofaglarning kashf etilishi mikrobiologiya tarixidagi muhim bosqichlardan biri hisoblanadi. 1915-yilda ingliz olimi Frederik Tvort bakteriyalarni parchalay oladigan noma’lum biologik agent mavjudligini kuzatgan. Keyinchalik, 1917-yilda fransuz-kanadalik olim Feliks d’Herelle ushbu hodisani batafsil o‘rganib, uni **“bakteriofag”**-ya’ni “bakteriyalarni yutuvchi” deb nomlagan. D’Herelle bakteriofaglarning dizenteriya, vabo va boshqa ichak infeksiyalariga qarshi samarali bo‘lishi mumkinligini ta’kidlab, fag terapiyani amaliyotga tatbiq etgan ilk olimlardan biri bo‘lgan.

1920-1930-yillarda bakteriofag terapiya Yevropa va AQSh da ayrim bakterial kasalliklarni davolashda qo‘llanilgan. O‘sha davrda fag preparatlari turli infeksiyalar, jumladan stafilokokk va streptokokk kasalliklariga qarshi sinovdan o‘tkazilgan. Biroq ilmiy metodologiyaning yetarli darajada rivojlanmagani, faglarning biologik xususiyatlari to‘liq o‘rganilmagani va natijalarning barqaror emasligi sababli bu usul keng ommalasha olmadi.

1940-yillarda penitsillin va boshqa antibiotiklarning ommaviy ishlab chiqarilishi bakteriofag terapiyaga bo‘lgan qiziqishni keskin kamaytirdi. Antibiotiklar tezkor, keng ta’sir doirasiga ega va qo‘llashda qulay bo‘lgani uchun G‘arb tibbiyotida asosiy davolash vositasiga aylandi. Natijada fag terapiya ko‘plab davlatlarda deyarli unutilgan.

Shunga qaramay, Sobiq Sovet Ittifoqi davlatlari, ayniqsa Gruziyada bakteriofag terapiya rivojlanishda davom etdi. 1923-yilda Tbilisi shahrida tashkil etilgan Eliava instituti bakteriofaglarni o‘rganish va klinik qo‘llash bo‘yicha dunyodagi eng yirik markazlardan biriga aylandi. Bu yerda turli bakterial infeksiyalar uchun fag preparatlari ishlab chiqildi va amaliyotda qo‘llanildi.

XXI asrga kelib antibiotiklarga chidamli bakteriyalar sonining ortishi sababli bakteriofag terapiya yana global ilmiy hamjamiyat e’tiboriga tushdi. AQSh, Yevropa va Osiyo davlatlarida fag terapiya bo‘yicha yangi klinik tadqiqotlar boshlandi. Genetika va biotexnologiya sohasidagi yutuqlar esa bakteriofaglarni yanada samarali va xavfsiz shaklda qo‘llash imkoniyatlarini kengaytirdi. Shu tariqa, bakteriofag terapiya tarixiy tajribadan zamonaviy innovatsion davolash usuliga aylanish yo‘lida rivojlanmoqda.

Bakteriofag terapiya zamonaviy tibbiyotda antibiotiklarga muqobil yoki qo‘shimcha davolash usuli sifatida bir qator muhim afzalliklarga ega. Eng asosiy ustunliklaridan biri uning yuqori darajadagi selektivligidir. Bakteriofaglar faqat ma’lum turdagi bakteriyalarni nishonga oladi, ya’ni ular patogen mikroorganizmlarni yo‘q qilgan holda inson organizmidagi foydali mikrofloraga deyarli zarar yetkazmaydi. Bu xususiyat ayniqsa ichak mikrobiotasi muvozanatini saqlashda katta ahamiyatga ega bo‘lib, antibiotiklardan farqli ravishda disbakterioz kabi asoratlarning oldini olishga yordam beradi.

Yana bir muhim afzallik-bakteriofaglarning antibiotiklarga chidamli bakteriyalarga qarshi samarali ta’sir ko‘rsatishidir. Hozirgi vaqtda “superbakteriyalar” deb ataluvchi ko‘plab patogen turlar oddiy antibiotiklarga javob bermay qo‘ygan. Bunday holatlarda fag terapiya muqobil yechim sifatida katta imkoniyat yaratadi, chunki bakteriofaglar bakteriyalarni yo‘q qilishning butunlay boshqa biologik mexanizmiga ega.

Bundan tashqari, bakteriofaglarning o‘z-o‘zini ko‘paytirish xususiyati ham muhim afzallik hisoblanadi. Infeksiya mavjud joyda faglar bakteriyalarni topib, ularning ichida ko‘payadi va shu orqali o‘z ta’sir kuchini oshiradi. Bu esa davolash samaradorligini tabiiy ravishda kuchaytiradi va ko‘pincha qo‘shimcha yuqori dozalarni talab qilmaydi.

Bakteriofag terapiya yana nisbatan kam toksik bo‘lishi bilan ham ajralib turadi. Ular tirik organizm hujayralariga zarar yetkazmaydi, chunki faqat bakteriyalar ichida ko‘payadi. Shu sababli allergik reaksiyalar va og‘ir nojo‘ya ta’sirlar antibiotiklarga nisbatan kamroq uchraydi.

Shuningdek, fag terapiya murakkab va surunkali infeksiyalar, jumladan biofilm hosil qiluvchi bakteriyalar keltirib chiqaradigan kasalliklarda ham istiqbolli hisoblanadi. Biofilm ichida joylashgan bakteriyalar antibiotiklarga chidamli bo‘lib, ularni yo‘q qilish qiyin kechadi, biroq bakteriofaglar bu qatlamga kirib borib, bakteriyalarni zararlashi mumkin.

Bakteriofag terapiya ko‘plab istiqbolli afzalliklarga ega bo‘lishiga qaramay, uning amaliy qo‘llanilishida bir qator muhim kamchiliklar va cheklovlar ham mavjud. Eng asosiy muammolardan biri uning juda tor ta’sir doirasidir. Har bir bakteriofag faqat ma’lum bir bakteriya turi yoki hatto uning ayrim shtammlarigagina ta’sir ko‘rsatadi. Bu esa aniq va tezkor laborator diagnostikani talab qiladi, chunki noto‘g‘ri tanlangan fag davolash samarasiz bo‘lishi mumkin. Antibiotiklar esa ko‘pincha keng ta’sir doirasiga ega bo‘lgani uchun klinik amaliyotda qulayroq hisoblanadi.

Yana bir muhim cheklov-bakteriofaglarning biologik barqarorligi bilan bog‘liq muammolardir. Faglar tashqi muhit omillariga (harorat, pH, saqlash sharoiti) sezgir bo‘lishi mumkin, bu esa ularni ishlab chiqarish va saqlash jarayonini murakkablashtiradi. Bundan tashqari, organizmning immun tizimi ba’zan bakteriofaglarni begona agent sifatida aniqlab, ularni neytrallashi mumkin, bu esa terapiya samaradorligini kamaytiradi.

Bakteriyalar ham vaqt o‘tishi bilan bakteriofaglarga nisbatan chidamlilik rivojlantirishi mumkin. Bu holat fag terapiyaning uzoq muddatli samaradorligini cheklaydi va doimiy ravishda yangi fag turlarini izlab topish yoki ularni

yangilab turish zaruratini tug‘diradi. Hozircha ko‘plab mamlakatlarda bakteriofag terapiya to‘liq standartlashtirilmagan va klinik protokollar yetarli darajada bir xil emas, bu esa uning keng joriy etilishiga to‘sqinlik qiladi.

Asosiy kamchiliklar va ularning izohi

Kamchilik yoki cheklov	Tavsifi
Tor ta’sir doirasi	Faqat ma’lum bakteriya yoki shtammlarga ta’sir qiladi, aniq diagnostika talab etadi
Immun tizim reaksiyasi	Organizmdagi immun javob faglarni yo‘q qilishi mumkin
Saqlash va barqarorlik muammosi	Harorat va muhitga sezgir, maxsus sharoit talab etadi
Bakterial rezistentlik	Bakteriyalar vaqt o‘tishi bilan faglarga chidamli bo‘lishi mumkin
Standartlashmagan klinik protokollar	Ko‘plab davlatlarda yagona tibbiy standartlar hali ishlab chiqilmagan

Umuman olganda, ushbu cheklovlar bakteriofag terapiyaning klinik amaliyotga keng joriy etilishini sekinlashtirsada, zamonaviy biotexnologiya va gen muhandisligi yordamida bu muammolarni bartaraf etish bo‘yicha izlanishlar davom etmoqda.

Hozirgi kunda bakteriofag terapiya qayta tiklanayotgan va tez rivojlanayotgan biologik tibbiyot yo‘nalishlaridan biri hisoblanadi. Antibiotiklarga chidamli bakteriyalar (AMR-antimicrobial resistance) global muammo sifatida kuchayib borayotgan bir sharoitda fag terapiya klinik tibbiyot, veterinariya va hatto oziq-ovqat sanoatida ham qo‘llanilish imkoniyatlari bilan alohida e’tibor qozonmoqda. Zamonaviy amaliyotda bakteriofaglar eng ko‘p teri va yumshoq to‘qimalar infeksiyalari, kuyish jarohatlari, osteomiyelit, siydik yo‘llari infeksiyalari hamda nafas yo‘llari kasalliklarini davolashda sinovdan o‘tkazilmoqda. Bundan tashqari, bakteriofaglar biofilm bilan bog‘liq infeksiyalarda ham istiqbolli vosita sifatida qaralmoqda.

Biofilm-bu bakteriyalarning himoya qatlam hosil qilib yashash shakli bo‘lib, ularni antibiotiklardan himoya qiladi. Faglar esa ushbu biofilm ichiga kirib borib, bakteriyalarni parchalash xususiyatiga ega bo‘lgani uchun, tibbiyotda juda murakkab hisoblangan infeksiyalarni davolashda samarali bo‘lishi mumkin. Shuningdek, oziq-ovqat sanoatida bakteriofaglar Salmonella, Listeria va E. coli kabi patogenlarni kamaytirish uchun dezinfeksiyalovchi biologik vosita sifatida qo‘llanilmoqda, bu esa oziq-ovqat xavfsizligini oshirishga xizmat qiladi.

So‘nggi yillarda biotexnologiya va gen muhandisligi sohasidagi rivojlanish bakteriofag terapiyani yanada takomillashtirish imkonini bermoqda. “Fag kokteyllari” deb ataluvchi bir nechta bakteriofag turlarini birlashtirgan preparatlar ishlab chiqilmoqda. Bu yondashuv bakteriyalarning turli shtammlariga qarshi kengroq ta’sir doirasini ta’minlashga yordam beradi. Bundan tashqari, CRISPR-Cas texnologiyasi yordamida genetik jihatdan modifikatsiyalangan bakteriofaglar yaratish ustida ham ilmiy izlanishlar olib borilmoqda. Bunday faglar nafaqat bakteriyalarni yo‘q qilish, balki ularning antibiotiklarga chidamlilik genlarini ham bostirish imkoniyatiga ega bo‘lishi mumkin.

Kelajakda bakteriofag terapiyaning shaxsiylashtirilgan tibbiyot (personalized medicine) bilan integratsiyasi katta ahamiyat kasb etishi kutilmoqda. Har bir bemorning infeksiyasiga mos maxsus fag preparatlarini tanlash orqali davolash samaradorligini sezilarli darajada oshirish mumkin bo‘ladi. Shu bilan birga, sun’iy intellekt va bioinformatika yordamida yangi bakteriofaglarni tezkor aniqlash va loyihalash imkoniyatlari ham kengaymoqda.

Shunga qaramay, ushbu yo‘nalishning keng joriy etilishi uchun hali ham bir qator muammolar mavjud. Eng asosiylari-klinik sinovlarning yetarli emasligi, standartlashtirilgan protokollarning to‘liq ishlab chiqilmaganligi va ko‘plab mamlakatlarda huquqiy-regulyator bazaning sust rivojlanganligidir. Ammo jahon miqyosida antibiotiklarga chidamli infeksiyalar muammosining kuchayishi bakteriofag terapiyani kelajak tibbiyotining muhim yo‘nalishlaridan biriga aylantirishi shubhasizdir. Bakteriofag terapiya bugungi kunda ilmiy tadqiqotlardan klinik amaliyotga o‘tish bosqichida turgan innovatsion yondashuv bo‘lib, yaqin kelajakda u an’anaviy antibiotiklar bilan bir qatorda muhim davolash usullaridan biri sifatida keng qo‘llanilishi mumkin.

Bakteriofag terapiya zamonaviy tibbiyotda antibiotiklarga chidamli bakterial infeksiyalar muammosini hal qilishga qaratilgan eng istiqbolli biologik yondashuvlardan biri hisoblanadi. O‘tkazilgan tahlillar shuni ko‘rsatadiki, bakteriofaglar o‘zining yuqori selektivligi, tabiiy kelib chiqishi va patogen bakteriyalarga qarshi aniq yo‘naltirilgan ta’siri bilan an’anaviy antibiotiklardan sezilarli darajada farq qiladi. Ayniqsa, foydali mikroflorani saqlab qolishi va faqat zararli bakteriyalarni yo‘q qilishi uni xavfsizroq davolash usuli sifatida ajratib turadi.

Shu bilan birga, bakteriofag terapiya antibiotiklarga chidamli “superbakteriyalar” keltirib chiqaradigan infeksiyalarni davolashda muhim alternativ yo‘l bo‘lib xizmat qilishi mumkin. Uning o‘z-o‘zini ko‘paytirish xususiyati, biofilm ichiga kirib borish qobiliyati va turli murakkab infeksiyalarga qarshi samaradorligi uni klinik tibbiyot uchun juda

muhim vositaga aylantiradi. Ammo ushbu usulning keng qo‘llanilishiga tor ta’sir doirasi, standartlashtirish muammolari va immun javob kabi ayrim cheklovlar to‘sqinlik qilmoqda.

Hozirgi zamonaviy biotexnologiyalar, gen muhandisligi va bioinformatika-ning rivojlanishi bakteriofag terapiyaning imkoniyatlarini sezilarli darajada kengaytirmoqda. Fag kokteyllari, genetik modifikatsiyalangan bakteriofaglar va shaxsiylashtirilgan davolash usullari bu yo‘nalishning kelajagi yanada yorqin bo‘lishini ko‘rsatadi. Shu sababli, bakteriofag terapiya nafaqat ilmiy tadqiqotlar uchun qiziqarli mavzu, balki kelajak tibbiyotining muhim amaliy yo‘nalishi sifatida ham katta ahamiyat kasb etadi.

Annotatsiya: *Maqolada Bassia hyssopifolia turining taksonomik holati, morfologik belgilari, ekologik xususiyatlari hamda O‘zbekiston hududidagi tarqalishi tahlil qilinadi. Tadqiqot TASH gerbariysida saqlanayotgan namunalar va adabiy manbalar asosida amalga oshirilgan. Natijalar tur O‘zbekistonning deyarli barcha yirik floristik rayonlarida uchrashini, ayniqsa sho‘rxok tuproqlar, sug‘orish tizimlari atrofi va antropogen buzilgan yerlarda keng tarqalganligini ko‘rsatadi.*

Kalit so‘zlar: *Bassia hyssopifolia, galofit, sho‘rxok tuproqlar, O‘zbekiston florasi, fitogeografiya, ekologiya, tarqalish, TASH gerbariyi.*

РАСПРОСТРАНЕНИЕ, ЭКОЛОГИЯ И БИОГЕОГРАФИЧЕСКАЯ ХАРАКТЕРИСТИКА *BASSIA HYSSOPIFOLIA* (PALL.) KUNTZE В УЗБЕКИСТАНЕ

Аннотация: *В статье анализируются таксономическое положение, морфологические признаки, экологические особенности и распространение вида Bassia hyssopifolia на территории Узбекистана. Исследование основано на материалах гербария TASH и литературных источниках. Результаты показывают, что вид широко распространён практически во всех крупных флористических районах страны, особенно на солончаках, вдоль ирригационных систем и на антропогенно нарушенных территориях.*

Ключевые слова: *Bassia hyssopifolia, галофит, солончаки, флора Узбекистана, фитогеография, экология, распространение, гербарий TASH.*

DISTRIBUTION, ECOLOGY AND BIOGEOGRAPHICAL CHARACTERISTICS OF BASSIA HYSSOPIFOLIA (PALL.) KUNTZE IN UZBEKISTAN

Annotation: *The article analyzes the taxonomic status, morphological features, ecological characteristics, and distribution of Bassia hyssopifolia in Uzbekistan. The study is based on materials from the TASH herbarium and relevant literature sources. The results show that the species is widely distributed across most major floristic regions of the country, particularly in salt marshes, along irrigation systems, and in anthropogenically disturbed habitats.*

Keywords: *Bassia hyssopifolia, halophyte, salt marshes, flora of Uzbekistan, phytogeography, ecology, distribution, TASH herbarium.*

Kirish

Bassia hyssopifolia (Pall.) Kuntze Amaranthaceae oilasiga mansub bo‘lib, ilgari *Echinopsilon hyssopifolius* (Pall.) Moq. nomi bilan ham ma’lum bo‘lgan. Tur Yevrosiyoning qurg‘oqchil va yarim qurg‘oqchil hududlarida keng tarqalgan

galofit o‘simliklardan biri hisoblanadi [1, 2]. O‘zbekiston florasida u sho‘rlangan ekotizimlarning xarakterli komponentlaridan biri sifatida qayd etilgan.

Adabiyotlar tahlili

Markaziy Osiyo florasiga oid dastlabki tadqiqotlarda *Bassia hyssopifolia* Chenopodiaceae (hozir Amaranthaceae tarkibida) vakili sifatida qayd etilgan [1]. Pallas tomonidan tasvirlanganidan so‘ng tur Yevropa va Osiyo floralarida keng o‘rganilgan. Moqin-Tandon (1840) ushbu turni *Echinopsilon hyssopifolius* nomi ostida tavsiflab, uning morfologik belgilarini batafsil bergan [2]. Keyingi taksonomik qayta ishlashlar natijasida Kuntze (1891) tomonidan hozirgi nomi *Bassia hyssopifolia* sifatida mustahkamlangan [3]. O‘rta Osiyo florasi bo‘yicha klassik ishlarda (Bochantev, Pratov) tur sho‘rlangan hududlarning tipik komponenti sifatida keltiriladi [4, 5]. Ushbu manbalarda uning Farg‘ona vodiysi, Mirzacho‘l, Qizilqum va Amudaryo deltasi kabi hududlarda keng tarqalganligi qayd etilgan. So‘nggi ekologik tadqiqotlarda tur antropogen landshaftlarga juda moslashgan ruderal va segetal begona o‘t sifatida baholanadi. U sug‘oriladigan yerlar, paxta va beda ekinzorlarida tez tarqalishi bilan ajralib turadi [5, 6]. Fitogeografik nuqtai nazardan, *Bassia hyssopifolia* Palearktika elementiga mansub bo‘lib, uning keng areali O‘rta dengizbo‘yi mamlakatlaridan Markaziy Osiyo va Sharqiy Osiyogacha cho‘ziladi [6].

Tadqiqot metodologiyasi

Ushbu tadqiqot floristik, adabiyotlar va gerbariy tahlil usullari asosida amalga oshirildi.

1. Materiallar manbalari. Tadqiqot uchun quyidagi manbalar ishlatildi:

- TASH (Toshkent) gerbariy fondi materiallari;
- O‘zbekiston florasiga oid ilmiy adabiyotlar [4, 5];
- tarixiy floristik yozuvlar va etiketka ma’lumotlari.

2. Gerbariy tahlili. Gerbariy namunalar morfologik belgilari (poya balandligi, barg shakli, tuklanish darajasi, gul tuzilishi) asosida qayta identifikatsiya qilindi. Namunalar floristik rayonlar bo‘yicha sistemalashtirildi.

3. Floristik tahlil. Tur tarqalishi O‘zbekistonning asosiy floristik okruglari (Farg‘ona, Tyanshan, Mirzacho‘l, Qizilqum, Zarafshon va Orolbo‘yi) kesimida tahlil qilindi [7]. Har bir hudud uchun ekologik sharoitlar (sho‘rlanish darajasi, tuproq tipi, antropogen bosim) hisobga olindi.

Natijalar va ularning tahlili

Taksonomik holati

Tur: *Bassia hyssopifolia* (Pall.) Kuntze

Sinonimi: *Echinopsilon hyssopifolius* (Pall.) Moq.

Tip namunasi: Ispaniya, Kataloniya, Lleida yaqinidagi zaytunzorlar, 06.10.1841, G. F. Reuter (lektotip – G).

Morfologik tavsifi**.** O‘simlik bir yillik bo‘lib, poyasi 10–100 sm balandlikda, tik yoki ko‘tarilib o‘suvchi, oddiy yoki shoxlangan. Poyaning ayniqsa yuqori qismi jingalak tuklar bilan qoplangan. Barglari navbat bilan joylashgan, qisqa bandli, butun chekkali, lansetsimon yoki chiziqsimon-lansetsimon, uchi o‘tkir. Barglarning ikki tomoni yoki pastki qismi yumshoq va uzun chalkash tuklar bilan qoplangan. Gullari barg qo‘ltig‘ida joylashgan 2–3 gulli to‘plamlardan tashkil topgan boshoqsimon to‘pgul hosil qiladi. Gullari ikki jinsli va besh a’zoli. Gulqo‘rg‘oni tukli bo‘lib, mevalanish davrida urug‘ni o‘rab turadi. Urug‘lari gorizontal joylashgan, tuxumsimon yoki yumaloq-tuxumsimon, silliq, eni 1–1,75 mm.

Fenologiyasi: ***Tur iyun–sentyabr oylarida gullaydi va mevalaydi.***

Ekologiyasi: **Bassia hyssopifolia** ***asosan sho‘rxok va sho‘rtob tuproqlarda o‘suvchi galofit o‘simlikdir. U quyidagi biotoplarda uchraydi:***

- sho‘rxok yerlarda;
- kanal va ariqlar bo‘yida;
- tashlandiq va ruderal hududlarda;
- eski chorva qo‘nalg‘alarida;
- sug‘oriladigan agrotsenozlarda begona o‘t sifatida;
- tekisliklar, adirlar hamda tog‘larning quyi va o‘rta mintaqalarida.

Tur dengiz sathidan 500–2800 m balandlik oralig‘ida uchraydi.

Umumiy areali. Bassia hyssopifolia *O‘rta dengizbo‘yi mamlakatlari, Rossiyaning Yevropa qismi, Afg‘oniston, Livan, Suriya, Iroq, Eron, Pokiston, Xitoy, Mo‘g‘uliston va Markaziy Osiyo davlatlarida tarqalgan.*

O‘zbekistonda tarqalishi: *TASH gerbariy materiallari tur O‘zbekistonning ko‘plab floristik rayonlarida uchrashini ko‘rsatadi.*

G‘arbiy Tyanshan floristik okrugi: Tur Chotqol tizmasi, Qurama tizmasi va Toshkent atrofi sho‘rxok maydonlarida qayd etilgan. Namangan viloyatining Pop va Chust tumanlari hamda Sirdaryo vodiysi bo‘ylarida uchraydi.

Farg‘ona floristik okrugi: Janubiy Chotqol va Sharqiy Oloy rayonlarida, ayniqsa Farg‘ona vodiysining sho‘rxok va qumli hududlarida keng tarqalgan. Vannovskaya, Vuadil, Shohimardon havzasi va Markaziy Farg‘ona massivlaridan yig‘ilgan namunalar mavjud.

Hisor tizmasi va Surxon vohasi: G‘uzor atrofi sho‘rxoklari, Qizilchi qishlog‘i yaqinlari hamda Termiz atrofidagi hududlarda uchraydi.

Markaziy Farg‘ona: Buvayda, Yozyovon, Qo‘qon, Marg‘ilon, Namangan va Andijon hududlarida ko‘plab gerbariy yig‘malari mavjud. Tur bu yerlarda sho‘rxoklar, qumlar, beda maydonlari va paxta dalalarida begona o‘t sifatida uchraydi.

O‘rta Sirdaryo havzasi: Chinoz va Mirzacho‘l rayonlarida, jumladan Sirdaryo qirg‘oqlari, Sardoba ko‘li atrofi va Golodnaya dasht sho‘rxoklarida keng tarqalgan.

Qizilqum va Buxoro vohalari: Buxoro vohasi, Kogon–G‘ijduvon atroflari, Kenimex hududi va Qizilqumning janubi-g‘arbiy qismlarida qayd etilgan. Asosan sho‘rxok va taqirsimon tuproqlarda uchraydi.

Zarafshon vodiysi: Narpay, Shirobudin, Qorako‘l va Karmana atrofidagi sug‘oriladigan yerlarda va sho‘rxok uchastkalarda uchraydi.

Janubiy Orolbo‘yi: Xorazm, Qo‘ng‘irot, Chimboy va Kegeyli rayonlarida, Amudaryo deltasi hamda Orol dengizi qirg‘oqbo‘yi hududlarida keng tarqalgan. Bu hududlarda tur sho‘rlangan o‘tloqlar va tashlandiq yerlarda dominant yoki subdominant holatda uchrashi mumkin.

Xulosa

Bassia hyssopifolia O‘zbekiston florasida keng tarqalgan galofit tur hisoblanadi. U sho‘rlangan tuproqlarga yuqori darajada moslashgan bo‘lib, antropogen ta’sir kuchli bo‘lgan agroekotizimlar va ruderal maydonlarda ham muvaffaqiyatli rivojlanadi. TASH gerbariy ma’lumotlari tur respublikaning deyarli barcha yirik floristik rayonlarida uchrashini ko‘rsatadi. Shu sababli mazkur tur sho‘rlanish jarayonlari va galofit o‘simliklar florasini o‘rganishda muhim indikator turlardan biri sifatida qaralishi mumkin.

Minnatdorchilik. Ushbu maqola O‘zbekiston Respublikasi Fanlar akademiyasi Botanika institutining 2025-2029-yillarga mo‘ljallangan «Raqamli tabiat» davlat dasturi doirasida O‘zbekiston florasi laboratoriyasining «Markaziy Osiyo hududini yangi botanik-geografik rayonlashtirish xaritasini ishlab chiqish va o‘simliklar xilma-xilligini to‘r tizimli xaritalash» ilmiy-tadqiqot dasturi hamda FA-0-64792 “O‘zbekiston florasidagi polimorf oilalarning taksonomik reviziyasi”. (2021-2025 yy.) fundamental loyihasi doirasida chop etilmoqda.

Annotatsiya. *Mazkur maqolada Namangan viloyati hududida tarqalgan Fabaceae oilasi ayrim vakillarining ekologik va dorivorlik xususiyatlari tahlil qilindi. Tadqiqot davomida turlarning hayotiy shakllari, ekologik guruhlari, tarqalishi hamda dorivorlik ahamiyati o'rganildi. Natijada ushbu oila vakillari biologik faol moddalarga boyligi va farmakologik ahamiyati bilan muhim ekani aniqlandi.*

Kalit so'zlar. *Fabaceae, dorivor o'simliklar, ekologik guruhlar, bioxilma-xillik, Namangan viloyati, flora, kserofit, mezofit, dorivorlik xususiyatlari, biologik faol moddalar.*

«ЛЕКАРСТВЕННЫЕ СВОЙСТВА И ЭКОЛОГИЯ НЕКОТОРЫХ ПРЕДСТАВИТЕЛЕЙ СЕМЕЙСТВА FABACEAE, РАСПРОСТРАНЁННЫХ В НАМАНГАНСКОЙ ОБЛАСТИ»

Аннотация. *В данной статье проанализированы экологические и лекарственные свойства некоторых представителей семейства Fabaceae, распространённых на территории Наманганской области. В ходе исследования изучены жизненные формы видов, их экологические группы, распространение и лекарственное значение. Установлено, что представители данного семейства богаты биологически активными веществами и имеют важное фармакологическое значение.*

Ключевые слова: *Fabaceae, лекарственные растения, экологические группы, биоразнообразие, Наманганская область, флора, ксерофиты, мезофиты, лекарственные свойства, биологически активные вещества.*

"MEDICINAL PROPERTIES AND ECOLOGY OF SOME FABACEAE SPECIES DISTRIBUTED IN NAMANGAN REGION"

Abstract. *This article analyzes the ecological and medicinal properties of some representatives of the Fabaceae family distributed in the territory of Namangan viloyati. During the research, the life forms, ecological groups, distribution, and medicinal significance of the species were studied. The results showed that representatives of this family are rich in biologically active compounds and possess important pharmacological significance.*

Keywords*: Fabaceae, medicinal plants, ecological groups, biodiversity, Namangan region, flora, xerophytes, mesophytes, medicinal properties, biologically active compounds.*

Kirish. Yer yuzida o'simliklar qoplami biosferaning barqarorligini ta'minlovchi asosiy omillardan biri bo'lib, organik moddalar hamda kislorodning muhim manbai hisoblanadi. So'nggi yillarda global iqlim o'zgarishi, antropogen bosimning ortishi va bioxilma-xillikning qisqarishi natijasida tabiiy flora tarkibini o'rganish, foydali o'simlik turlarini muhofaza qilish va ulardan oqilona foydalanish dolzarb ilmiy yo'nalishlardan biriga aylangan (Korovin, 1962; Zakirov, 1955). Ayniqsa, dorivor o'simliklarni aniqlash, ularning tabiiy zaxiralarini baholash hamda farmatsevtika sanoatida foydalanish imkoniyatlarini kengaytirish bugungi kunning muhim vazifalaridan biri hisoblanadi.

Fabaceae Lindl. oilasi gulli o'simliklarning eng yirik oilalaridan biri bo'lib, dunyo florasida 700 dan ortiq turkum va 20 mingga yaqin turni o'z ichiga oladi (Lock, 2005). Oila vakillari tropik, subtropik va mo'tadil mintaqalarda keng tarqalgan bo'lib, ekologik hamda xo'jalik jihatdan katta ahamiyatga ega. Markaziy Osiyo, xususan Tyanshan va Pomir-

Oloy tog‘ tizimlari Fabaceae oilasi vakillarining muhim xilma-xillik markazlaridan biri hisoblanadi (Juramurodov va boshq., 2023). Tadqiqotchilar ma’lumotlariga ko‘ra, Hedysarum L. turkumining o‘zidan Markaziy Osiyoda 81 ta tur uchrab, ulardan 46 tasi endem turlar hisoblanadi (Juramurodov va boshq., 2023). O‘zbekiston florasida ham ushbu oilaga mansub ko‘plab dorivor, yem-xashak va tuproq unumdorligini oshiruvchi turlar uchraydi (Vvedenskiy, 1955).

Adabiyotlar tahlili.

Fabaceae oilasi vakillarining taksonomiyasi, filogeniyasi, ekologiyasi va geografik tarqalishi bo‘yicha dunyo olimlari tomonidan keng ko‘lamli tadqiqotlar olib borilgan. Xususan, Lock (2005) tomonidan Fabaceae oilasining sistematik tarkibi va global tarqalishi yoritilgan. Choi va Ohashi (2003) hamda Nafisi va boshq. (2019) tomonidan Hedysarum turkumining morfologik va filogenetik xususiyatlari tadqiq etilgan. Juramurodov va boshq. (2023) Markaziy Osiyoda tarqalgan Hedysarum turlarining filogenetik aloqalari va biogeografiyasini o‘rganib, Tyanshan hamda Pomir-Oloy hududlari ushbu turkumning muhim evolyutsion markazlaridan biri ekanligini qayd etgan.

O‘zbekiston florasida Fabaceae oilasi vakillarining tarqalishi va sistematikasi bo‘yicha Vvedenskiy (1955), Kovalevskaya (1981), Tojibaev va boshq. (2016, 2022) tomonidan ilmiy izlanishlar olib borilgan. Keyingi yillarda respublika hududida floristik tadqiqotlarning kengayishi natijasida ko‘plab turlarning yangi tarqalish nuqtalari aniqlanib, ularning zamonaviy taksonomik holati qayta ko‘rib chiqilmoqda (Juramurodov va boshq., 2024). Biroq Namangan viloyatida tarqalgan Fabaceae oilasi ayrim dorivor vakillarining ekologik xususiyatlari va amaliy ahamiyati bo‘yicha maqsadli tadqiqotlar yetarli darajada amalga oshirilmagan.

Shu sababli Namangan viloyatida uchrovchi ayrim Fabaceae vakillarining tarqalishi, ekologiyasi va dorivorlik xususiyatlarini o‘rganish, ularning tabiiy resurslarini baholash hamda muhofaza qilish choralarini ishlab chiqish muhim ilmiy-amaliy ahamiyat kasb etadi.

Tadqiqot metodologiyasi

Mazkur tadqiqotda Namangan viloyati hududida tarqalgan Fabaceae oilasi ayrim vakillarining ekologik va dorivorlik xususiyatlari o‘rganildi. Tadqiqot davomida geobotanik, floristik va qiyosiy-tahliliy metodlardan foydalanildi. Turlarning nomlari “Флора Узбекистана” (Vvedenskiy, 1955), “Conspectus Florae Asiae Mediae” (Kovalevskaya, 1981) hamda Plants of the World Online (POWO) ma’lumotlari asosida aniqlashtirildi.

Tadqiqot jarayonida dala kuzatuvlari asosida turlarning tarqalish hududlari, ekologik guruhlari va hayotiy shakllari aniqlandi. O‘simliklarning dorivorlik xususiyatlari bo‘yicha ma’lumotlar ilmiy adabiyotlar hamda farmakobotanik manbalar asosida tahlil qilindi (Orekhov, 1955). Shuningdek, Fabaceae oilasi vakillarining Markaziy Osiyodagi tarqalishi va taksonomik holatini baholashda Juramurodov va boshq. (2023) tomonidan olib borilgan filogenetik tadqiqotlar natijalaridan foydalanildi.

Tadqiqot natijalari ekologik va dorivorlik jihatdan qiyosiy tahlil qilinib, hudud florasidagi Fabaceae vakillarining ilmiy-amaliy ahamiyati baholandi.

Tadqiqot natijalari va ularning tahlili

Olib borilgan tadqiqotlar natijasida Namangan viloyati hududida tarqalgan Fabaceae oilasiga mansub bir qator dorivor va ekologik jihatdan muhim turlar aniqlandi. Tadqiq etilgan turlar ekologik guruhlari, hayotiy shakllari hamda dorivorlik xususiyatlariga ko‘ra bir-biridan farqlanishi bilan ajralib turadi.

Tahlil natijalariga ko‘ra, hududda ko‘p yillik o‘t o‘simliklari ustunlik qilishi kuzatildi. Xususan, *Glycyrrhiza glabra* L., *Psoralea drupacea* Bunge, *Medicago sativa* L. va *Trifolium pratense* L. kabi turlar ko‘p yillik o‘t hayotiy shakliga mansub ekanligi aniqlandi. Bu esa Fabaceae oilasi vakillarining Namangan viloyati sharoitiga yuqori darajada moslashganligini ko‘rsatadi. Ekologik jihatdan mezofit va kserofit turlar asosiy o‘rinni egallaydi. Ayniqsa, *Psoralea drupacea* hamda *Alhagi pseudalhagi* qurg‘oqchil adir va cho‘llashgan hududlarda keng tarqalganligi bilan xarakterlanadi.

Tadqiq etilgan turlarning tarqalishida hududning relef va iqlim sharoiti muhim rol o‘ynashi kuzatildi. Mezofit turlar, jumladan *Trifolium pratense* va *Medicago sativa* asosan sernam o‘tloqlar, soy bo‘ylari hamda sug‘oriladigan agrotsenozlarda uchrasa, kserofit va halofit turlar tekislik, sho‘rlangan va quruq hududlarda tarqalgan. *Glycyrrhiza glabra* ning daryo bo‘ylari va nam qumloqlarda uchrashi uning gidrofil sharoitlarga nisbatan moslashganligini ko‘rsatadi.

Fabaceae oilasi vakillarining dorivorlik xususiyatlari ham muhim ilmiy-amaliy ahamiyatga ega ekanligi aniqlandi. Xususan, *Glycyrrhiza glabra* ildizida glitsirrizin kislotasi va flavonoidlarning mavjudligi uning balg‘am ko‘chiruvchi hamda yallig‘lanishga qarshi vosita sifatida qo‘llanilishiga sabab bo‘ladi. *Psoralea drupacea* tarkibidagi furanokumarinlar dermatologik kasalliklarni davolashda muhim ahamiyat kasb etadi.

1-jadval

Namangan viloyatida uchrovchi ayrim Fabaceae vakillarining ekologik guruhlari va dorivorlik ahamiyati

№	Turning lotincha va o‘zbekcha nomi	Hayotiy shakli va ekologik guruhi	Tarqalgan asosiy hududlari va	Dorivorlik xususiyatlari va asosiy faol moddalari

			ekotizimlari	
1	*Glycyrrhiza glabra* L. (Shirinmiya)	Koʻp yillik ildizpoyali oʻt, mezofit-halofit	Sirdaryo va Norin daryolari boʻylari, toʻqayzorlar, nam qumloqlar	Ildizida glitsirrizin kislotasi, flavonoidlar mavjud. Balgʻam koʻchiruvchi, yalligʻlanishga qarshi vosita sifatida qoʻllaniladi.
2	*Psoralea drupacea* Bunge (Oq qurama, akra)	Koʻp yillik yirik ildizpoyali oʻt, kserofit	Pop, Chust, Uychi adirlari, yoʻl yoqalari va tashlandiq yerlar	Barg va mevalarida furanokumarinlar (psoralen) mavjud. Vitiligo va boshqa teri kasalliklarini davolashda qoʻllaniladi.
3	*Alhagi pseudalhagi* (M.Bieb.) Desv. (Oddiy yantoq)	Tikonli koʻp yillik oʻt, kserofit-halofit	Tekisliklar, choʻllashgan hududlar, shoʻrlangan sugʻoriladigan maydonlar	Tarkibida taninlar, flavonoidlar va C vitamini mavjud. Siydik va safro haydovchi, antiseptik taʼsirga ega
4	*Astragalus sieversianus* Pall. (Sivers astragali)	Koʻp yillik oʻt yoki yarim butacha, kserofit	Chust va Kosonsoy togʻ oldi yonbagʻirlari, quruq adirlar	Tarkibida polisaxaridlar va alkaloidlar mavjud. Yurak faoliyatini yaxshilash hamda qon bosimini pasaytirishda qoʻllaniladi
5	*Medicago sativa* L. (Madaniy beda)	Koʻp yillik oʻt, mezofit	Sugʻoriladigan agrolandshaftlar, bogʻlar, ariq boʻylari	Vitaminlar (K, C, E), saponinlar va oqsillarga boy. Qon toʻxtatuvchi va umumiy quvvat beruvchi vosita
6	*Trifolium pratense* L. (Qizil sebarga)	Koʻp yillik oʻt, mezofit	Chodak va Yangiqoʻrgʻon togʻ oldi oʻtloqlari, soy boʻylari	Tarkibida efir moylari, flavonoidlar va glikozidlar mavjud. Shamollashga qarshi, antiseptik va ternatuvchi xususiyatga ega
7	*Vicia sativa* L. (Oddiy burchoq)	Bir yillik chirmashuvchi oʻt, mezofit	Ekinzorlar cheti, bogʻlar va nam madaniy landshaftlar	Oqsil va aminokislotalarga boy. Xalq tabobatida yumshatuvchi hamda yara bitkazuvchi vosita sifatida foydalaniladi

Shuningdek, *Alhagi pseudalhagi* tarkibidagi flavonoidlar va tanin moddalarining antiseptik hamda siydik haydovchi xususiyatga egaligi aniqlandi.

Tahlillar shuni koʻrsatdiki, hududda uchrovchi Fabaceae oilasi vakillari nafaqat ekologik jihatdan, balki farmakologik va xoʻjalik ahamiyati bilan ham muhim hisoblanadi. Shu sababli ushbu turlarni muhofaza qilish, tabiiy populyatsiyalarini monitoring qilish hamda dorivor xomashyo sifatida oqilona foydalanish istiqbolli yoʻnalishlardan biri hisoblanadi.

Xulosa. Olib borilgan tadqiqotlar natijasida Namangan viloyati hududida tarqalgan Fabaceae oilasi ayrim vakillarining ekologik va dorivorlik xususiyatlari tahlil qilindi. Tadqiq etilgan turlar orasida *Glycyrrhiza glabra* L., *Psoralea drupacea* Bunge, *Alhagi pseudalhagi* (M.Bieb.) Desv., *Astragalus sieversianus* Pall., *Medicago sativa* L., *Trifolium pratense* L. va *Vicia sativa* L. kabi turlar ekologik moslashuvchanligi hamda dorivor ahamiyati bilan ajralib turishi aniqlandi.

Tahlillar natijasida Fabaceae oilasi vakillarining asosiy qismi mezofit va kserofit ekologik guruhlarga mansubligi hamda tekislik, adir va togʻ oldi ekotizimlarida keng tarqalganligi qayd etildi. Shuningdek, ushbu turlarning tarkibida flavonoidlar, alkaloidlar, glikozidlar, saponinlar va vitaminlar kabi biologik faol moddalar mavjudligi ularning xalq tabobati va farmatsevtika sanoatidagi muhim ahamiyatini koʻrsatdi.

Aniqlanishicha, urbanizatsiya, yaylov bosimining ortishi va tabiiy hududlarning oʻzlashtirilishi ayrim dorivor turlarning tabiiy populyatsiyalariga salbiy taʼsir koʻrsatmoqda. Shu sababli Fabaceae oilasi vakillarining tabiiy resurslarini muhofaza qilish, ularning tarqalishini monitoring qilish hamda dorivor xomashyo sifatida oqilona foydalanish muhim ilmiy-amaliy ahamiyat kasb etadi.

Ushbu maqola Namangan davlat universiteti Biologiya kafedrasida amalga oshirilayotgan 2025–2027-yillarga moʻljallangan “Bioxilma-xilligi xavf ostidagi hudud sifatida Fargʻona vodiysi florasining raqamli platformasini ishlab chiqish” nomli amaliy tadqiqot loyihasi doirasida tayyorlandi.

FARG‘ONA VODIYSI SHAROITIDA DORIVOR GULXAYRI (ALTHAEA OFFICINALIS L.) URUG‘LARINING LABORATORIYA VA DALA SHAROITIDAGI UNUVCHANLIGINI

Baratova Moxidil Raximovna
Boratova O‘g‘iloy Qodirjon qizi
Andijon qishloq xo‘jaligi va agrotexnologiyalar instituti

Annotatsiya: *Ushbu maqolada dorivor gulxayri (Althaea officinalis L.) o‘simligining urug‘ unuvchanligi laboratoriya va dala sharoitlarida o‘rganilgan. Laboratoriya tajribalarida urug‘larning unish ko‘rsatkichlari turli harorat rejimlarida (+10°C, +15°C, +20°C, +25°C, +30°C va +35°C) baholandi. Tadqiqot natijalariga ko‘ra, urug‘larning eng yuqori unuvchanligi +25°C haroratda kuzatilib, yakuniy unuvchanlik 91,5 % ni tashkil etdi. Dala tajribalari Andijon, Beshariq va Uchqo‘rg‘on tumanlari sharoitida turli ekish muddatlarida olib borildi. Eng yuqori dala unuvchanligi 20-martdagi ekish muddatida qayd etildi. Tadqiqot natijalari dorivor gulxayrini madaniy holda yetishtirish texnologiyasini takomillashtirish, yuqori sifatli xomashyo bazasini yaratish hamda dorivor o‘simliklar plantatsiyalarini tashkil etishda muhim ilmiy-amaliy ahamiyatga ega.*

Kalit so‘zlar: *dorivor gulxayri, Althaea officinalis L., urug‘ unuvchanligi, harorat rejimi, laboratoriya tajribasi, dala sharoiti, ekish muddati, Farg‘ona vodiysi, dorivor o‘simliklar, plantatsiya, agroiqlim sharoiti.*

ЛАБОРАТОРНЫЕ И ЛЕВЫЕ ИССЛЕДОВАНИЯ ВЕГЕТАТИВНЫХ СВОЙСТВ СЕМЯН ALTHAEA OFFICINALIS L. В ДОЛИНЕ ФЕРГАНА

Аннотация: *В данной статье изучена всхожесть семян лекарственного алтея (Althaea officinalis L.) в лабораторных и полевых условиях. В лабораторных опытах показатели прорастания семян оценивались при различных температурных режимах (+10°C, +15°C, +20°C, +25°C, +30°C и +35°C). Результаты исследований показали, что наибольшая всхожесть семян наблюдалась при температуре +25°C и составила 91,5 %. Полевые исследования проводились в условиях Андижанского, Бешарыкского и Учкурганского районов в различные сроки посева. Максимальная полевая всхожесть была отмечена при посеве 20 марта. Полученные результаты имеют важное научно-практическое значение для совершенствования технологии возделывания лекарственного алтея, создания качественной сырьевой базы и организации плантаций лекарственных растений.*

Ключевые слова: *лекарственный алтей, Althaea officinalis L., всхожесть семян, температурный режим, лабораторный опыт, полевые условия, сроки посева, Ферганская долина, лекарственные растения, плантация, агроклиматические условия.*

LABORATORY AND FIELD VEGETABILITY OF ALTHAEA OFFICINALIS L. SEEDS IN THE FERGANA VALLEY

Abstract: *This article presents the results of studies on seed germination of marshmallow (Althaea officinalis L.) under laboratory and field conditions. In laboratory experiments, seed germination was evaluated at different temperature regimes (+10°C, +15°C, +20°C, +25°C, +30°C, and +35°C). The results showed that the highest germination rate was observed at +25°C, reaching 91.5%. Field experiments were conducted in the Andijan, Beshariq, and Uchqo‘rg‘on districts under different sowing dates. The highest field germination was recorded for seeds sown on March 20. The obtained results are of significant scientific and practical importance for improving the cultivation technology of marshmallow, establishing a high-quality raw material base, and developing medicinal plant plantations.*

Keywords: *marshmallow, Althaea officinalis L., seed germination, temperature regime, laboratory experiment, field conditions, sowing date, Fergana Valley, medicinal plants, plantation, agro-climatic conditions.*

Respublikamizda dorivor o‘simliklardan oqilona foydalanish, ularning tabiiy va madaniy xomashyo bazasini kengaytirish hamda farmatsevtika sanoatini mahalliy xomashyo bilan ta’minlash dolzarb vazifalardan biri hisoblanadi. Shu munosabat bilan dorivor o‘simliklarni madaniy holda yetishtirishning ilmiy asoslarini ishlab chiqish, biologik va

agrotexnologik xususiyatlarini chuqur o‘rganishga alohida e’tibor qaratilmoqda. O‘zbekiston Respublikasi Prezidentining 2022-yil 20-maydagi PF-139-sonli Farmoni hamda PQ-251-sonli Qarori dorivor o‘simliklar plantatsiyalarini rivojlantirish, qayta ishlashni qo‘llab-quvvatlash va qo‘shimcha qiymat zanjirlarini yaratish bo‘yicha muhim vazifalarni belgilab berdi.

Dorivor gulxayri (Althaea officinalis L.) qimmatli dorivor o‘simliklardan biri bo‘lib, uning yer ustki va yer ostki organlari tarkibida shilliq moddalar, flavonoidlar, polisaxaridlar va boshqa biologik faol birikmalar mavjud. Ushbu o‘simlik farmatsevtika sanoati hamda xalq tabobatida keng qo‘llanilishi bilan ahamiyatlidir. Dorivor gulxayrini plantatsiya usulida yetishtirishda sifatli urug‘ materialini tanlash, urug‘larning unuvchanlik xususiyatlarini o‘rganish va optimal ekish muddatlarini aniqlash muhim ahamiyat kasb etadi.

Urug‘larning unuvchanligi o‘simliklarning keyingi o‘sishi va rivojlanishini belgilovchi asosiy biologik ko‘rsatkichlardan biri hisoblanadi. Unuvchanlik darajasi harorat, namlik, tuproq sharoiti va ekish muddatiga bog‘liq holda o‘zgaradi. Shu sababli Farg‘ona vodiysi sharoitida dorivor gulxayri urug‘larining laboratoriya va dala sharoitidagi unuvchanligini o‘rganish, optimal harorat va ekish muddatlarini aniqlash ilmiy va amaliy jihatdan muhim hisoblanadi.

Tadqiqotning maqsadi: Farg‘ona vodiysi sharoitida dorivor gulxayri (Althaea officinalis L.) urug‘larining laboratoriya va dala sharoitidagi unuvchanligini aniqlash hamda urug‘larning unishi uchun maqbul harorat rejimi va ekish muddatlarini belgilashdan iborat.

Laboratoriya sharoitida dorivor gulxayri urug‘larining eng maqbul unish haroratini aniqlash maqsadida +10°C. +15°C. +20°C. +25°C. +30°C va +35°C haroratlarida termostatga qo‘yildi va kuzatishlar 21–25 kun davomida olib borildi.Tajriba natijalariga ko‘ra +25°C harorat — urug‘larning eng maqbul unish sharoiti bo‘lib. yakuniy unuvchanlik 91.5 % ni tashkil etdi. Ushbu haroratda urug‘lar 6-7 kundan so‘ng unib chiqishni boshladi va unish jarayoni 21–25 kunda to‘liq yakunlandi.

Dorivor gulxayri urug‘larning unuvchanligi +10°C haroratda 22.2 % ni tashkil qildi. Pas harorat ta‘sirida urug‘larning ko‘pchiligi mog‘orlab. chirib ketganligi kuzatildi. +15°C haroratda unish 10-11 kunga kechikdi va umumiy unuvchanlik 32.7 % ni tashkil etdi. Bu harorat urug‘larning fiziologik faoliyatining minimal chegarasiga yaqinligini ko‘rsatadi. +20°C haroratda unish faollashdi va unuvchanlik 72.7 % ga yetdi. Urug‘lar 8-9 kundan so‘ng unib chiqishni boshladi va jarayon nisbatan barqaror kechdi. +30°C haroratda dastlab unish tezroq boshlansa-da. yakuniy unuvchanlik faqat 60.8 % ni tashkil qildi. Yuqori harorat urug‘larda stress holatini yuzaga keltirdi. +35°C haroratda unuvchanlik yanada pasayib. 43.7 % ga tushdi. Bu sharoitda urug‘larning metabolik faoliyati buzilganligi va ba‘zilari nobud bo‘lgani kuzatildi.

Dorivor gulxayrini urug‘larining unuvchanligi Andijon qishloq xo‘jaligi va agratexnalogiyalar institutini laboratoriyasida aniqlandi.Farg‘ona vodiysi sharoitida dorivor gulxayri o‘simligining urug‘ unuvchanligini o‘rganish bahor mavsumining mart–aprel oylarida amalga oshirildi.

Dala sharoitida dorivor gulxayri urug‘larining unuvchanligi;Dala sharoitida dorivor gulxayri — *(Althaea Officinalis L.)*o‘simligining generativ (urug‘) orqali ko‘paytirish jarayonlari turli agroiqlim va tuproq sharoitlarida o‘rganildi. Tadqiqot ishlari Beshariq tumani. Andijon tumanidagi och bo‘z tuproqlari hamda Namangan tumani hududida joylashgan o‘rtacha qumoq tuproq sharoitlarida olib borildi.Dorivor gulxayri urug‘i 24 soatgacha iliq suvda ivitib so‘ngra urug‘lar soyada sepiluvchan holatga keltirilib darxol dala sharoitida tuproq namligi saqlangan holda ekildi. Tajribalar ochiq dala sharoitida tashkil etildi. Dala kuzatuvlari natijalariga ko‘ra. urug‘larning unuvchanligi tuproqning mexanik tarkibi. namlik darajasi. sho‘rlanish ko‘rsatkichi hamda harorat rejimiga bevosita bog‘liq ekanligi aniqlandi. Tog‘ oldi adirlik hududida. tuproqning yaxshi drenajlangan va namlikni me‘yorida saqlovchi sharoitida urug‘larning unib chiqishi nisbatan yuqori bo‘lib. nihollarning rivojlanishi barqaror kechdi.Yarim toshloq tekislik sharoitida urug‘larning unib chiqishi biroz sekinlashgani. ayrim hollarda tuproq zichligi va namlik yetishmovchiligi sababli nihollar siyrak joylashgani kuzatildi. O‘rtacha sho‘rlangan qumoq tuproqlarda esa urug‘larning unish jarayoni cho‘zilgan bo‘lib. sho‘r ta‘siri natijasida ayrim urug‘larning unmay qolishi qayd etildi.

Izoh; M±m-O‘rtacha arifmetik qiymat (M) va uning o‘rtacha xatoligini (m) ifodalaydi.

**V – Variatsiya koeffitsienti*

Olingan tadqiqot natijalari shuni ko‘rsatadiki, dorivor gulxayri urug‘larining dala unuvchanligi ko‘rsatkichlari ekish muddatlari va hududiy iqlim sharoitlariga to‘g‘ridan-to‘g‘ri bog‘liq holda qonuniyatli ravishda o‘zgarib borgan.

Eng yuqori unuvchanlik dinamikasi barcha hududlarda 20.03.2023 yildagi muddatda kuzatildi. Bunda Andijon tumani sharoitida maksimal unuvchanlik 84% ni tashkil etgan bo‘lsa, ushbu ko‘rsatkich Uchqo‘rg‘on tumanida 79%, Beshariq tumanida esa nisbatan pastroq, ya’ni 72% ni tashkil etdi. Ekish muddatlari kechiktirilib (05.04 va 20.04 muddatlar), havo haroratining ko‘tarilishi va tuproq namligining kamayishi hisobiga unuvchanlik foizi barcha hududlarda pasayib borishi aniqlandi. Xususan, 20.04.2023 yildagi oxirgi ekish muddatida unuvchanlik Andijonda 66% gacha, Beshariqda esa 60% gacha tushib ketganligi qayd etildi.

Olingan birlamchi ma’lumotlarning matematik-statistik tahlili shuni ko‘rsatadiki, barcha variantlar bo‘yicha variatsiya koeffitsiyenti (V%) 2.4% dan 3.8% gacha bo‘lgan optimal qiymatlarni qayd etdi. Biometrik tadqiqotlarda ushbu ko‘rsatkichning 10% lik mezondan past bo‘lishi, bajarilgan dala tajribalarining yuqori aniqlik darajasini hamda foydalanilgan urug‘ materialining gomogenligini (bir xilligini) ilmiy jihatdan to‘liq isbotlaydi(2-jadval).

Annotatsiya. *Ushbu tadqiqotda Orolbo'yi hududidagi ekstremal sho'rlangan ekotizimlarning geokimyoviy va fizik-kimyoviy ko'rsatkichlari o'rganildi. Namunalar G'arbiy Orol dengizi, Sudoche ko'li, qurigan Orol dengizi tubi, Ustyurt platosi hamda artezian quduqlar bilan bog'liq muhitlardan yig'ildi. Suv, cho'kindi va tuproq namunalarida pH, sho'rlanish darajasi, xlorid, sulfat, kaltsiy, magniy va ftor ionlari miqdori aniqlandi. Tadqiqot natijasida Orolbo'yi hududida kuchli geokimyoviy gradientlar shakllanganligi qayd etildi. G'arbiy Orol dengizi namunalari maksimal sho'rlanish va minerallashuv ko'rsatkichlarini namoyon etdi. Sudoche ko'li va rizosfera tuproqlarida esa nisbatan past sho'rlanish kuzatildi. Yerosti suv tizimlari yuqori harorat va past minerallashuv bilan tavsiflandi. Olingan natijalar ekstremal sho'rlangan muhitlarning ekologik xususiyatlarini baholash hamda ushbu hududlarda shakllangan mikrobial hamjamiyatlarni keyingi tadqiq qilish uchun muhim ilmiy asos yaratadi.*

Kalit so'zlar: *Orolbo'yi, sho'rlanish, geokimyo, ekstremal sho'rlaish, ekotizimlar, cho'kindi, yerosti suvlari, rizosfera.*

ГЕОХИМИЧЕСКИЕ И ФИЗИКО-ХИМИЧЕСКИЕ ИНДИКАТОРЫ ЧРЕЗВЫЧАЙНО ЗАСОЛЕННЫХ ЭКОСИСТЕМ В АРАЛЬСКОМ РЕГИОНЕ

Аннотация. *В данной работе были исследованы геохимические и физико-химические показатели экстремально засоленных экосистем Приаралья. Образцы были собраны из Западного Аральского моря, озера Судочье, высохшего дна Аральского моря, плато Устюрт, а также из сред, связанных с артезианскими скважинами. В образцах воды, донных отложений и почв определяли pH, уровень солености, содержание хлоридов, сульфатов, кальция, магния и фтора. Результаты исследования показали наличие выраженных геохимических градиентов в экосистемах Приаралья. Образцы Западного Аральского моря характеризовались максимальными показателями солености и минерализации. В отложениях озера Судочье и ризосферных почвах отмечались относительно низкие показатели солености. Подземные воды отличались повышенной температурой и низкой минерализацией. Полученные результаты создают научную основу для дальнейшего изучения микробных сообществ экстремально засоленных сред Приаралья.*

Ключевые слова: *Приаралье, засоление, геохимия, гиперсоленые экосистемы, донные отложения, подземные воды, ризосфера.*

GEOCHEMICAL AND PHYSICOCHEMICAL INDICATORS OF EXTREMELY SALINATED ECOSYSTEMS IN THE ARAL REGION

Annotation. *This study investigated the geochemical and physicochemical characteristics of extremely saline ecosystems in the Aral Sea region. Samples were collected from the Western Aral Sea, Sudoche Lake, the dried Aral Sea bed, the Ustyurt Plateau, and environments associated with artesian wells. Water, sediment, and soil samples were analyzed for pH, salinity, and concentrations of chloride, sulfate, calcium, magnesium, and fluoride ions. The results revealed pronounced geochemical gradients across the studied ecosystems. Samples from the Western Aral Sea exhibited the highest salinity and mineralization levels. In contrast, lower salinity values were recorded in Sudoche Lake sediments and rhizosphere soils. Groundwater systems were characterized by elevated temperatures and relatively low mineralization. The obtained results provide an important scientific basis for further investigation of microbial communities inhabiting extreme saline environments of the Aral Sea region.*

Keywords: *Aral Sea region, salinity, geochemistry, hypersaline ecosystems, sediments, groundwater, rhizosphere.*

Kirish. Orol dengizining qurishi XX asrning eng yirik ekologik inqirozlaridan biri sifatida baholanadi. Sug‘oriladigan dehqonchilik maydonlarini kengaytirish maqsadida Amudaryo va Sirdaryo suvlarining intensiv ravishda burib yuborilishi natijasida dengiz sathi keskin pasaygan va suv hajmi bir necha barobarga kamaygan.

Orolbo‘yi hududida sho‘rlanish, geokimyoviy transformatsiya va ekstremal ekologik sharoitlarning shakllanishi mikroorganizmlar tarkibi va faoliyatiga kuchli ta’sir ko‘rsatishi aniqlangan. Biroq G‘arbiy Orol dengizi, qurigan dengiz tubi, Sudoche ko‘li hamda artezian quduqlar bilan bog‘liq ekologik tizimlarning fizik-kimyoviy gradientlari hali yetarli darajada kompleks o‘rganilmagan. Ayniqsa, turli ekologik nishalarda ion tarkibi, sho‘rlanish darajasi va geokimyoviy omillarning o‘zaro bog‘liqligini baholash muhim ilmiy ahamiyatga ega hisoblanadi. Shu munosabat bilan mazkur tadqiqotning maqsadi Orolbo‘yi hududidagi suv, cho‘kindi va tuproq namunalarining fizik-kimyoviy xususiyatlarini tahlil qilish hamda ushbu muhitlarda shakllangan geokimyoviy gradientlarni baholashdan iborat bo‘ldi.

Adabiyotlar tahlili. Miklin ma’lumotlariga ko‘ra, 1960-yillarda Orol dengizining umumiy maydoni taxminan 68 ming km² ni tashkil etgan bo‘lsa, keyingi o‘n yilliklarda dengiz hajmining 80% dan ortig‘i yo‘qolgan. Shu bilan birga, suv sho‘rlanishi dastlabki 10 g/L dan ayrim hududlarda 100–140 g/L gacha ortgan. Bunday o‘zgarishlar dengiz ekotizimining tubdan transformatsiyalanishiga olib kelgan [1].

Zavialov tomonidan olib borilgan gidrologik tadqiqotlarda G‘arbiy Orol dengizining ayrim qismlarida sho‘rlanish 200 g/L dan oshgani qayd etilgan. Muallifning ta’kidlashicha, bug‘lanish jarayonining kuchayishi natijasida suv tarkibida xlorid va sulfat ionlari keskin konsentratsiyalangan. Ayniqsa, natriy xlorid va magniy sulfat tuzlari dominant ion komponentlar sifatida aniqlangan. Bunday ekstremal sharoitlar ko‘pchilik gidrobiontlarning yo‘qolishiga olib kelgan va faqat yuqori sho‘rlanishga moslashgan organizmlar saqlanib qolgan [2].

Orolbo‘yi hududida cho‘llanish va ikkilamchi sho‘rlanish jarayonlari ham intensiv ravishda rivojlangan. Saiko va Zonn ma’lumotlariga ko‘ra, qurigan dengiz tubidan yiliga millionlab tonna tuz va chang atmosferaga ko‘tariladi. Bu jarayon nafaqat Orolbo‘yi hududida, balki Markaziy Osiyoning boshqa mintaqalarida ham tuproq degradatsiyasi va sho‘rlanishning kuchayishiga sabab bo‘lmoqda [3].

Rengasamy sho‘rlangan tuproqlarda yuqori ion konsentratsiyasi o‘simliklar va mikroorganizmlar uchun asosiy stress omillaridan biri ekanligini ko‘rsatgan. Muallif ma’lumotlariga ko‘ra, sho‘rlanish darajasi 40 dS/m dan oshganda ko‘pchilik mikroorganizmlar faolligi keskin kamayadi [4].

Ekstremal sho‘rlangan muhitlarda asosan galotolerant va galofil mikroorganizmlar rivojlanadi. Oren gipersho‘rlangan ekotizimlarda Archaea domeniga mansub *Haloferax*, *Halobacterium* va *Haloarcula* kabi mikroorganizmlar dominant bo‘lishini qayd etgan. Muallif ma’lumotlariga ko‘ra, ayrim galofil arxeyalar 300 g/L gacha bo‘lgan sho‘rlanish sharoitida ham faol o‘sish qobiliyatini saqlab qoladi. Bundan tashqari, gipersho‘rlangan muhitlarda *Dunaliella salina* kabi mikroalgalar ham keng tarqalgan bo‘lib, ular glitserol sintezi orqali osmotik bosimga moslashadi [5].

Ventosa va hammualliflar gipersho‘rlangan muhitlarning metagenomik tadqiqotlari asosida bunday ekotizimlarda mikrobial xilma-xillik sho‘rlanish gradienti bilan chambarchas bog‘liqligini ko‘rsatgan. Mualliflar tuz konsentratsiyasi oshgani sari bakterial xilma-xillik kamayib, galoarxeyalarning ulushi ortishini aniqlagan. Ayrim gipergalin ko‘llarda Archaea ulushi umumiy prokariotlar sonining 80–90% gacha yetishi qayd etilgan [6].

Cho‘kindi muhitlarda oltingugurt aylanishi alohida ekologik ahamiyatga ega. Muyzer va Stams sulfat-reduksiyalovchi bakteriyalar anaerob cho‘kindilarda organik moddalar parchalanishining asosiy ishtirokchilaridan biri ekanligini ko‘rsatgan. Mualliflar *Desulfovibrio*, *Desulfobacter* va *Desulfotomaculum* avlodlariga mansub bakteriyalar sulfatni qaytarish orqali vodorod sulfid hosil qilishini ta’kidlagan. Sulfat reduksiyasi ayniqsa organik moddalarga boy va kislorod miqdori cheklangan qatlamlarda intensiv kichadi [7].

Jorgensen cho‘kindilardagi oltingugurt aylanishi bo‘yicha olib borgan tadqiqotlarida sulfat-reduksiya jarayonlari cho‘kindining quyi qatlamlarida ustun bo‘lishini ko‘rsatgan. Muallif ma’lumotlariga ko‘ra, anaerob qatlamlarda sulfat

konsentratsiyasining kamayishi vodorod sulfid hosil bo‘lishi bilan birga kechadi va qora rangli temir sulfidlari shakllanishiga olib keladi. Bu esa qora loyqa cho‘kindilarning hosil bo‘lishiga sabab bo‘lishi mumkin [8].

Sho‘rlangan tuproqlarda o‘simlik rizosferasi alohida mikroekologik zona hisoblanadi. Bulgarelli va hammualliflar rizosfera hududida o‘simlik ildizlari mikroorganizmlar tarkibini faol boshqarishini ko‘rsatgan. Mualliflarning ta’kidlashicha, ildiz eksudatlari mikroorganizmlar uchun qo‘shimcha oziqa manbai bo‘lib xizmat qiladi va natijada rizosferada mikrobiologik faollik oshadi [9].

Galofit o‘simliklar bilan bog‘liq mikrobiomlar sho‘rlangan muhitlarga moslashishda muhim rol o‘ynaydi. Yuan va hammualliflar sho‘rlangan tuproqlarda o‘suvchi galofitlarning rizosferasida tuzga chidamli bakteriyalar ustunligini aniqlagan. Tadqiqotchilar ayrim rizobakteriyalar o‘simliklarning sho‘rlanishga chidamliligini oshirishini va ion balansini barqarorlashtirishini ko‘rsatgan [10].

Yerosti va geotermal suv tizimlari ham o‘ziga xos mikrobial ekotizimlar hisoblanadi. Inskeep va hammualliflar Yellovstone geotermal tizimlarida olib borilgan metagenomik tadqiqotlar asosida mikroorganizmlar tarkibi asosan harorat va geokimyoviy omillar bilan belgilanishini aniqlagan. 40–80°C oralig‘idagi muhitlarda termofil bakteriyalar va arxeyalar dominant bo‘lishi qayd etilgan [11].

Kolman va hammualliflar geotermal va meteorit suvlarning aralashishi natijasida shakllangan gidrotermal tizimlarda yuqori mikrobial xilma-xillik kuzatilishini ko‘rsatgan. Mualliflar bunday muhitlarda kimyoviy gradientlarning shakllanishi turli trofik guruhdagi mikroorganizmlar rivojlanishi uchun qulay ekologik sharoit yaratishini ta’kidlagan [12].

Tadqiqot metodologiyasi. Tadqiqot hududlari va namuna olish. Tadqiqot ishlari 2022-yil kuz mavsumida Orolbo‘yi hududining turli tabiiy-ekologik zonalarida olib borildi. Namunalar G‘arbiy Orol dengizi akvatoriyasi, Orolqum sahrosi, Sudoche ko‘li hamda Ustyurt platosidan yig‘ildi. Tadqiqot davomida suv, tub cho‘kindisi va tuproq namunalarining fizik-kimyoviy ko‘rsatkichlarini aniqlashga asosiy e’tibor qaratildi.

Suv namunalari steril polimer idishlarga yig‘ilib, qirg‘oq zonasidan ma’lum masofada hamda suv qatlamining o‘rta qismidan olindi. Namuna olish jarayonida tashqi omillar ta’sirini kamaytirish maqsadida barcha idish va asbob-uskunalar oldindan steril holatga keltirildi.

Tub cho‘kindisi namunalari qirg‘oqbo‘yi hududlari hamda suv osti qatlamidan maxsus metall probirkalar yordamida olindi. Cho‘kindi yadrolari qatlamlar bo‘yicha ajratilib, yuqori va quyi gorizontlar alohida tahlil qilindi. Sudoche ko‘lidan olingan cho‘kindilar ham xuddi shu tamoyil asosida yig‘ildi.

Qurigan Orol dengizi tubida shakllangan tuproq namunalari qirg‘oq zonasiga yaqin hududlardan olindi. Shu bilan birga, mazkur hududda tarqalgan teresken o‘simligi — *Kraschenninnikovia ewersmanniana* atrofidagi rizosfera tuprog‘i ham tadqiqot ob’ekti sifatida tanlab olindi. Nazorat namunasi sifatida Ustyurt platosining tabiiy tuproqlari ishlatildi. Tuproq namunalari 2–20 sm chuqurlik oralig‘idan yig‘ildi.

Bundan tashqari, Orol dengizining qurigan qismida joylashgan artezian quduqlardan oqib chiqayotgan suvlar ham o‘rganildi. Ushbu suv namunalari steril idishlarda yig‘ilib, keyingi laboratoriya tahlillariga qadar sovuq sharoitda saqlandi. Quduq suvlari hosil qilgan oqim atrofidagi cho‘kindilar hamda siyanobakterial qoplamalar steril uskunalar yordamida alohida yig‘ib olindi [7].

Barcha namunalar laboratoriyaga yetkazilgunga qadar 4°C haroratda saqlanib, fizik-kimyoviy tahlillar uchun tayyorlandi.

Fizik-kimyoviy ko‘rsatkichlarni aniqlash. Suv va tuproq namunalarining fizik-kimyoviy ko‘rsatkichlari standart analitik metodlar asosida aniqlandi [13]. Muhitning kislotalilik darajasi (pH) “Mettler Toledo FiveEasy F20” pH-metri yordamida o‘lchandi.

Kaltsiy va magniy ionlari miqdori kompleksometrik titrlash usuli yordamida aniqlanib, titrant sifatida Trilon B (EDTA) eritmasidan foydalanildi [14, 15]. Xlorid ionlari argentometrik titrlashning Mohr usuli asosida kaliy xromat indikatori ishtirokida baholandi [13, 16].

Sulfat ionlari miqdori bariy xlorid yordamida gravimetrik usulda aniqlanib, hosil bo‘lgan cho‘kma quritilib tortish orqali hisoblab chiqildi [14]. Eruvchan ftor birikmalari ion-selektiv elektrod qo‘llanilgan potensiometrik usul yordamida o‘lchandi [13].

Olingan natijalar asosida tadqiqot hududlaridagi suv va tuproq muhitining sho‘rlanish darajasi, ion tarkibi hamda ekologik xususiyatlari baholandi.

Natijalar va ularning tahlili. Orolbo‘yi hududidan olingan suv, cho‘kindi va tuproq namunalarining fizik-kimyoviy tahlillari o‘rganilgan muhitlar o‘rtasida sezilarli geokimyoviy tafovutlar mavjudligini ko‘rsatdi. Tadqiq etilgan ob’ektlar ekologik va gidrologik xususiyatlariga ko‘ra uch asosiy guruhga ajratildi: (i) tabiiy suv havzalari — G‘arbiy Orol dengizi va Sudoche ko‘li; (ii) qurigan Orol dengizi tubi hamda Ustyurt platosi tuproqlari; va (iii) yerosti suvlari hamda ular bilan bog‘liq mikrobial muhitlar.

G‘arbiy Orol dengizi va Sudoche ko‘li

G‘arbiy Orol dengizi suv namunalari (AW1 va AW2) barcha o‘rganilgan namunalarga nisbatan eng yuqori sho‘rlanish darajasiga ega bo‘ldi (1-jadval).

Jadval 1

G‘arbiy Orol dengizi va Sudoche ko‘li namunalari fizik-kimyoviy xususiyatlari

Belgi	Namuna tavsifi	T (°C)	pH	Sho‘rlik (‰)	Cl^- (mg/L)	Ca^{2+} (mg/L)	Mg^{2+} (mg/L)	SO_4^{2-} (mg/L)	F^- (mg/L)
AW1	*Orol dengizi suvi, qirg‘oqdan 10 m*	23	8.3	220	117764.1	nt	nt	10266.8	nt
AW2	Orol dengizi suvi, qirg‘oqdan 100 m	23	8.3	220	117764.1	nt	nt	10266.8	nt
AD1	Orol dengizi cho‘kindisi, to‘lqin zonasi	16	nt	nt	87673.1	nt	nt	16036.4	nt
AD2	Orol dengizi cho‘kindisi, qora loyqa	nt	nt	nt	nt	nt	nt	nt	nt
AD3	Orol dengizi cho‘kindisi, yadro ustki qismi	15	nt	nt	101293.4	nt	nt	29177.9	nt
AD4	Orol dengizi cho‘kindisi, yadro quyi qismi	15	nt	nt	109487.3	nt	nt	8431.3	nt
SD	Sudoche ko‘li cho‘kindisi	19	8.1	10	3652	0	0	4451	0.8
Izoh: nt – aniqlanmagan yoki o‘lchanmagan									

Qirg‘oqdan turli masofalarda olingan ushbu ikki namunaning sho‘rlanishi bir xil bo‘lib, 220‰ ni tashkil etdi. Suv muhitining pH qiymati 8.3 ga teng bo‘lib, kuchsiz ishqoriy sharoit qayd etildi. Ion tarkibida xlorid ionlari dominant komponent sifatida aniqlanib, ularning miqdori 117 764.1 mg/L ga yetdi. Sulfat ionlari konsentratsiyasi ham yuqori bo‘lib, 10 266.8 mg/L dan oshdi.

Orol dengizi cho‘kindilari uchta nuqtadan yig‘ildi. AD1 va AD2 namunalari to‘lqin zonasidan olingan bo‘lib, cho‘kindilar yuzasi qattiq qobiq bilan qoplanganligi, uning ostida esa qora rangli loyqa qatlam mavjudligi kuzatildi. AD3 va AD4 namunalari esa qirg‘oqdan 10 m uzoqlikda va suv chuqurligi 1 m bo‘lgan hududdan olingan yadro cho‘kindilarining yuqori va quyi qatlamlarini tashkil etdi. Ushbu cho‘kindilar ham qora loyqa tuzilishga ega edi.

Cho‘kindilar uchun umumiy sho‘rlanish aniqlanmagan bo‘lsa-da, xlorid ionlari konsentratsiyasi juda yuqori bo‘lib, 87 673.1–109 487.3 mg/L oralig‘ida qayd etildi. Eng yuqori xlorid miqdori quyi qatlamda (AD4) kuzatildi. Sulfat ionlari konsentratsiyasi esa suv namunasiga qaraganda pastroq bo‘ldi. Ayniqsa, sulfatning eng past miqdori yadro quyi qatlamida aniqlanib, bu qatlamlarda oltingugurt birikmalarining transformatsiyasi sodir bo‘layotganligini ko‘rsatdi.

Sudoche ko‘li cho‘kindisi (SD) Orol dengizi namunalari bilan taqqoslaganda ancha past sho‘rlanish darajasiga ega bo‘ldi. Ushbu namunada umumiy sho‘rlanish 10‰ ni tashkil etdi. pH qiymati 8.1 bo‘lib, kuchsiz ishqoriy muhit saqlandi. Xlorid va sulfat ionlari mos ravishda 3652.0 mg/L va 4451.0 mg/L ni tashkil etdi. Bundan tashqari, mazkur namunada 0.8 mg/L miqdorda ftor ionlari ham aniqlangan.

Qurigan Orol dengizi tubi va Ustyurt platosi tuproqlari

AS namunasi hozirgi Orol dengizi qirg‘og‘idan 50 m uzoqlikdagi sobiq dengiz tubidan olingan nam qumli tuproqdan iborat bo‘ldi (2-jadval).

Jadval 2

Qurigan Orol dengizi tubi va Ustyurt platosi tuproqlari fizik-kimyoviy xususiyatlari

Belgi	Namuna tavsifi	pH	Sho‘rlik (‰)	Cl^- (mg/L)	Ca^{2+} (mg/L)	Mg^{2+} (mg/L)	SO_4^{2-} (mg/L)
AS	Sobiq Orol dengizi tubi tuprog‘i	8.8	82	3640	656	96	4608
RS	Krascheninnikovia ewersmanniana rizosfera tuprog‘i	8.4	6.3	105	nt	nt	398
US1	Quruq buloq tubidagi tuproq	8.4	4	25	140	12	424
US2	Yon bag‘ir tuprog‘i	7.9	13	788	202	52	650

Belgi	Namuna tavsifi	pH	Sho‘rlik (‰)	Cl^- (mg/L)	Ca^{2+} (mg/L)	Mg^{2+} (mg/L)	SO_4^{2-} (mg/L)
US3	Janubiy Ustyurt platosi tuprog‘i	8.8	nt	nt	nt	nt	398
Izoh: nt – aniqlanmagan yoki o‘lchanmagan							

Ushbu namunada sho‘rlanish 82‰ ni tashkil etdi, bu esa Orol dengizi suviga qaraganda pastroq, biroq Sudoche ko‘li cho‘kindisiga nisbatan sezilarli darajada yuqori ekanligini ko‘rsatdi. pH qiymati 8.8 bo‘lib, tadqiqotdagi eng yuqori ishqoriy ko‘rsatkichlardan biri sifatida qayd etildi. Xlorid va sulfat ionlari konsentratsiyasi mos ravishda 3640.0 mg/L va 4608.0 mg/L ni tashkil etdi. Shuningdek, ushbu namunada kaltsiy va magniy ionlari ham yuqori miqdorda aniqlandi.

RS namunasi *Krascheninnikovia ewersmanniana* rizosferasidan olingan tuproq bo‘lib, ushbu o‘simlik qurg‘oqchilik va sulfatli sho‘rlanishga chidamliligi bilan ajralib turadi. Rizosfera tuprog‘ining pH qiymati yuqori bo‘lsa-da, umumiy minerallashuv AS namunasiga qaraganda sezilarli darajada past bo‘ldi. Sho‘rlanish 6.3‰ ni tashkil etdi, xlorid ionlari miqdori 105.0 mg/L, sulfat ionlari esa 398.0 mg/L bo‘ldi.

Ustyurt platosidan olingan US1, US2 va US3 namunalari nazorat sifatida qo‘llanildi. Ushbu namunalarning pH qiymati ishqoriy bo‘lib, sho‘rlanish darajasi hamda xlorid va sulfat ionlari miqdori RS namunasiga yaqin ko‘rsatkichlarni namoyon etdi. Minimal sho‘rlanish qiymati US1 namunasida qayd etilib, 4% ni tashkil etdi.

Yerosti suvlari va buloq tizimlari

WW1, WW2 va WW3 namunalari qurigan Orol dengizi tubida joylashgan chuqur quduqlardan olingan yerosti suvlaridan iborat bo‘ldi (3-jadval).

Jadval 3

Quduq suvlari, mikrob matlari va buloq cho‘kindilarining fizik-kimyoviy xususiyatlari

Belgi	Namuna tavsifi	T (°C)	pH	Sho‘rlik (‰)	Cl^- (mg/L)	Ca^{2+} (mg/L)	Mg^{2+} (mg/L)	SO_4^{2-} (mg/L)	F^- (mg/L)
WW1	1-quduq suvi (580 m)	41	7	2.1	nt	1.2	0	nt	nt
WW2	2-quduq suvi (560 m)	55	7.6	2.2	nt	2.2	nt	nt	nt
WW3	Issiq suv qudug‘i	47	8.3	2.5	734	3.7	nt	744	nt
WM	Mikrob mat	21	8	5	598.1	nt	0	0	1.1
WD1	Qizg‘ish-qora cho‘kindi	19	8.8	6	610	nt	0	681	1
WD2	Qora cho‘kindi	18	8.8	20	161	nt	nt	1900	nt
Izoh: nt – aniqlanmagan yoki o‘lchanmagan									

Suvlar 560–630 m chuqurlikdan chiqib, sho‘r tuproq yuzasida buloq shaklida oqib chiqqan. Quduqlardan oqib chiqayotgan suv harorati 41–55°C oralig‘ida bo‘lib, quduq chuqurligi bilan aniq bog‘liqlik kuzatilmadi.

Quduq suvlarining sho‘rlanish darajasi barcha suv muhitlari orasida eng past bo‘lib, 2.1–2.5‰ oralig‘ida qayd etildi. Barcha namunalardagi eng past pH qiymati WW1 namunasida aniqlanib, 7.0 ni tashkil etdi. WW3 namunasi nisbatan yuqori minerallashgan bo‘lib, unda xlorid ionlari 734.0 mg/L va sulfat ionlari 744.0 mg/L ga yetdi.

WW1 qudug‘idan oqib chiqayotgan buloqdan mikrob mat (WM) va cho‘kindi namunalari (WD1 va WD2) ham yig‘ildi. Buloq bo‘ylab harorat asta-sekin kamayib bordi, aksincha sho‘rlanish esa ortib bordi. Oqim manbasida sho‘rlanish minimal darajada bo‘lib, oqimdan 50 m uzoqlikdagi WD2 namunasida 20‰ gacha yetdi. WM va WD1 namunalarida ftor ionlari mos ravishda 1.1 mg/L va 1.0 mg/L miqdorda qayd etildi.

Olingan natijalar Orolbo‘yi hududida kuchli fizik-kimyoviy va geokimyoviy gradient shakllanganligini ko‘rsatdi. Tadqiq etilgan muhitlar o‘rtasidagi asosiy tafovutlar evaporatsiya intensivligi, gidrologik izolyatsiya, yerosti suvlarining ta’siri hamda tuzlarning uzoq muddatli akkumulyatsiyasi bilan bog‘liq bo‘lishi mumkin [1, 2].

G‘arbiy Orol dengizi suvlarida qayd etilgan juda yuqori sho‘rlanish darajasi dengizning gipergalin tizimga aylanganligini tasdiqlaydi [1]. Xlorid ionlarining dominantligi hamda sulfatlarning yuqori konsentratsiyasi suvning uzoq muddat davomida bug‘lanishi natijasida erigan tuzlarning konsentratsiyalanishini aks ettiradi [2]. Bunday ekstremal sho‘rlanish sharoitlari faqat galotolerant va galofil mikroorganizmlar yashashi mumkin bo‘lgan selektiv ekologik muhitni shakllantiradi [5].

Orol dengizi cho‘kindilarida sulfat ionlari konsentratsiyasining suvga nisbatan past bo‘lishi oltingugurt aylanishi bilan bog‘liq mikrobiologik va geokimyoviy jarayonlarning mavjudligini ko‘rsatishi mumkin. Ayniqsa, yadro quyi qatlamida sulfat miqdorining keskin kamayishi sulfat-reduksiyalovchi mikroorganizmlar faoliyati natijasida sulfatlarning qaytarilishi ehtimolini ko‘rsatadi [7]. Qora rangli loyqa qatlamlarning mavjudligi ham anaerob jarayonlarning rivojlanayotganidan dalolat beradi.

Sudoche ko‘li cho‘kindilaridagi past sho‘rlanish darajasi ko‘lning Amudaryo bilan bog‘lovchi kanal orqali qisman chuchuklanishi bilan izohlanishi mumkin [1]. Natijada Orol dengiziga nisbatan xlorid va sulfat ionlari sezilarli darajada kamaygan. Bu esa Sudoche ko‘lining gidrologik rejimi Orol dengizidan farqlanishini ko‘rsatadi.

Qurigan Orol dengizi tubi tuproqlarida yuqori sho‘rlanishning saqlanib qolishi hududda ikkilamchi sho‘rlanish jarayonlari hanuz faol davom etayotganligini ko‘rsatadi. Kaltsiy va magniy ionlarining yuqori konsentratsiyasi evaporit va gipsli minerallarning to‘planishi bilan bog‘liq bo‘lishi mumkin. Bunday sharoitlar biologik faollikni cheklovchi asosiy ekologik stress omillaridan biri hisoblanadi [17].

Kraschenninnikovia ewersmanniana rizosferasida sho‘rlanishning keskin kamayishi o‘simlik ildizlari atrofida nisbatan barqaror mikro-muhit shakllanganligini ko‘rsatadi. O‘simliklarning ion almashinuviga ta’siri, organik moddalar ajratishi va rizosfera mikroorganizmlarining faolligi natijasida lokal desalinizatsiya yuzaga kelishi mumkin. Shu sababli rizosfera zonasi ekstremal sho‘rlangan muhitda mikroorganizmlar uchun ekologik refugium vazifasini bajarishi ehtimol [9].

Ustyurt platosi tuproqlarining nisbatan past minerallashuvi ushbu hududlarning Orol dengizi qurigan tubiga qaraganda sho‘rlanish jarayonlaridan kamroq ta’sirlanganligini ko‘rsatadi. Nazorat namunalari bilan rizosfera tuprog‘i o‘rtasidagi o‘xshashlik esa o‘simliklar ta’sirida rizosfera muhitining nisbatan barqarorlashishini ko‘rsatishi mumkin [9].

Yerosti suvlarida sho‘rlanishning pastligi ularning chuqur geologik qatlamlardan kelib chiqishi va ochiq evaporatsion tizimlardan nisbatan izolatsiyalanganligi bilan izohlanadi [6]. Shu bilan birga, yuqori harorat qiymatlari ushbu suvlarning geotermal tabiatga ega ekanligini ko‘rsatadi. Bunday sharoitlar termotolerant mikroorganizmlar uchun o‘ziga xos ekologik nishalarni hosil qilishi mumkin [11].

Buloq oqimi bo‘ylab sho‘rlanishning asta-sekin ortib borishi suv yuzasida evaporatsiya jarayonlari kuchayishi natijasida minerallarning ikkilamchi konsentratsiyalanishi bilan bog‘liq bo‘lishi ehtimol [2]. Mikrob matlari va cho‘kindilarda ftor ionlarining aniqlanishi esa ushbu suvlarning chuqur geologik manbalar bilan bog‘liqligini ko‘rsatadi.

Mualliflar hissasi, manfaatlar to‘qnashuvi va moliyalashtirish. Mualliflar hissasi: barcha mualliflar tadqiqot konsepsiyasi, ma’lumotlarni tahlil qilish va maqolamatnini tayyorlashda teng hissa qo‘shgan. Manfaatlar to‘qnashuvi: mualliflar manfaatlar to‘qnashuviyo‘qligini bildiradi. Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

ZAMBURUG‘LARNING EKOLOGIK VA BIOTEXNOLOGIK XUSUSIYATLARI

Jambilov Dostonbek Ravshanjon o‘g‘li
Qo‘qon universiteti Andijon filiali
Tibbiyot fakulteti, «Mikrobiolgogiya, virusologiya va immunologiya» kafedrasi o‘qituvchisi

Annotatsiya. *Ushbu maqolada zamburug‘larning ekologik va biotexnologik xususiyatlariga oid zamonaviy ilmiy ma’lumotlar tizimli ravishda tahlil qilingan. Zamburug‘larning ekotizimlarda organik moddalarning parchalanishi, modda va energiya aylanishini ta’minlashi, tuproq unumdorligini saqlashdagi hamda o‘simliklar bilan simbiotik munosabatlar shakllantirishdagi roli yoritilgan. Shuningdek, ularning fermentativ faolligi, organik kislotalar va boshqa biologik faol metabolitlar sintezi, lignotsellyulozali xomashyoni biokonversiya qilish, chiqindilarni biologik utilizatsiya qilish hamda ifloslangan muhitlarni bioremediatsiya qilishdagi imkoniyatlari tahlil etilgan. Adabiyotlar sharhi asosida zamburug‘larning ekologik moslanish mexanizmlari va sanoat biotexnologiyasidagi amaliy ahamiyati o‘rtasidagi uzviy bog‘liqlik ochib berilgan. Tadqiqot natijalari zamburug‘larning ekologik barqarorlikni ta’minlash va innovatsion biotexnologik jarayonlarni rivojlantirishdagi muhim biologik resurs ekanligini ko‘rsatadi. Shuningdek, mikotoksinlar bilan bog‘liq xavflar va ularni nazorat qilishning zamonaviy yondashuvlari ham muhokama qilingan.*

Kalit so‘zlar: *zamburug‘lar, ekologiya, biotexnologiya, saprotroflar, mikoriza, lignin parchalanishi, fermentlar, biokonversiya, bioremediatsiya, mikotoksinlar.*

ЭКОЛОГИЧЕСКИЕ И БИОТЕХНОЛОГИЧЕСКИЕ СВОЙСТВА ГРИБА

Аннотация. *В данной статье систематически анализируются современные научные данные об экологических и биотехнологических свойствах грибов. Подчеркивается роль грибов в разложении органического вещества в экосистемах, обеспечении круговорота вещества и энергии, поддержании плодородия почвы и формировании симбиотических отношений с растениями. Также анализируются их ферментативная активность, синтез органических кислот и других биологически активных метаболитов, биоконверсия лигноцеллюлозного сырья, биологическая утилизация отходов и биоремедиация загрязненных сред. На основе обзора литературы раскрывается неразрывная связь между механизмами экологической адаптации грибов и их практическим значением в промышленной биотехнологии. Результаты исследования показывают, что грибы являются важным биологическим ресурсом для обеспечения экологической устойчивости и развития инновационных биотехнологических процессов. Также обсуждаются риски, связанные с микотоксинами, и современные подходы к их контролю.*

Ключевые слова: *грибы, экология, биотехнология, сапротрофы, микориза, разложение лигнина, ферменты, биоконверсия, биоремедиация, микотоксины.*

ECOLOGICAL AND BIOTECHNOLOGICAL PROPERTIES OF FUNGI

Abstract. *This article systematically analyzes modern scientific data on the ecological and biotechnological properties of fungi. The role of fungi in the decomposition of organic matter in ecosystems, ensuring the circulation of matter and energy, maintaining soil fertility, and forming symbiotic relationships with plants is highlighted. Their enzymatic activity, synthesis of organic acids and other biologically active metabolites, bioconversion of lignocellulosic raw materials, biological utilization of waste, and bioremediation of polluted environments are also analyzed. Based on a literature review, the inextricable link between the ecological adaptation mechanisms of fungi and their practical significance in industrial biotechnology is revealed. The results of the study show that fungi are an important biological resource for ensuring ecological sustainability and developing innovative biotechnological processes. The risks associated with mycotoxins and modern approaches to their control are also discussed.*

Keywords: *fungi, ecology, biotechnology, saprotrophs, mycorrhiza, lignin decomposition, enzymes, bioconversion, bioremediation, mycotoxins.*

Zamburug‘larning ekologik xususiyatlari deganda ularning turli muhitlarda yashashi, modda va energiya oqimlariga ta’siri hamda biotik aloqalarni shakllantirishdagi roli tushuniladi. Bu xususiyatlar avvalo zamburug‘ hujayra devorining kimyoviy tarkibi, gifa tuzilishi va sporalar orqali tarqalish strategiyalari bilan belgilanadi, chunki gifa tarmog‘i substrat ichiga kirib borib, fermentlarni tashqi muhitga ajratish orqali oziqa moddasini “tashqi hazm” shaklida

o‘zlashtiradi. Masalan, o‘rmon to‘shamasida saprotrof zamburug‘lar barg va yog‘och qoldiqlarini bosqichma-bosqich parchalab, humus shakllanishini tezlashtiradi va o‘simliklar uchun mineral elementlar mavjudligini oshiradi. Adabiyotlarda o‘rmon ekotizimlarida yer usti o‘simlik biomassa mahsuldorligining muhim qismi aynan zamburug‘lar vositachiligidagi mineralizatsiya tezligiga bog‘liqligi ko‘rsatiladi, ayrim biotsenozlarda yillik organik qoldiqning 60–80 foizigacha qismi mikroorganizmlar, jumladan zamburug‘lar tomonidan parchalanishi qayd etiladi [1]. Bunday yuqori ulush zamburug‘larning lignotsellyuloza kabi murakkab polimerlarga moslashgan oksidlovchi-gidrolitik ferment tizimlari mavjudligi bilan tushuntiriladi, bu esa ularni ekotizimlarda “asosiy destruktor” sifatida ajratib turadi [2].

Zamburug‘larning ekologik moslanish mexanizmi ularning trofik strategiyalari orqali aniq namoyon bo‘ladi, ya’ni saprotrof, parazit va simbiotrof guruhlar modda almashinuvida turlicha vazifa bajaradi. Saprotroflar uchun mexanizm substratni kolonizatsiya qilish, fermentlar kompleksini sekretsiya qilish va hosil bo‘lgan monomerlarni gifa orqali so‘rib olishdan iborat bo‘lsa, parazitlar uchun mexanizm xo‘jayin to‘qimasiga kirish, effektor molekulalar yordamida himoya reaksiyalarini bostirish hamda oziqa oqimini o‘zlashtirish bilan tavsiflanadi. Simbiotrof mikoriza zamburug‘larida esa mexanizm o‘simlik ildizi bilan funksional birlik hosil qilib, fosfor va mikroelementlarni yetkazish evaziga uglevodlarni olishga asoslanadi, natijada ikki tomonlama foydali almashinuv yuzaga keladi. Masalan, arbuskulyar mikoriza o‘simliklarning fosfor o‘zlashtirishini kuchaytirib, qurg‘oqchilik sharoitida hosildorlikni barqarorlashtirishi ko‘plab agroekotizimlarda kuzatiladi. Statistik jihatdan, qishloq xo‘jaligi tuproqlarida mikoriza bilan kolonizatsiya darajasi agrotexnika va kimyoviy yuklamaga qarab keskin farqlanadi, intensiv tizimlarda bu ko‘rsatkich pasayib, minimal ishlov berishda esa ortishi qayd etilgan bo‘lib, ayrim tajribalarda ildiz kolonizatsiyasi 30–70 foiz diapazonda bo‘lishi mumkinligi ko‘rsatiladi [3]. Gifa tarmog‘i ildizning “faol so‘rish yuzasi”ni geometrik jihatdan kengaytiradi, diffuziya cheklovini kamaytiradi va tuproqning mikromuhitlaridagi fosfatlarning mobilizatsiyasini kuchaytiradi, bu jarayonlarda organik kislotalar va fosfataza fermentlari muhim rol o‘ynaydi [4].

Zamburug‘larning biogeokimyoviy sikllardagi o‘rni, ayniqsa, uglerod aylanishi va lignin parchalanishida yaqqol ko‘rinadi. Lignin parchalanishi deganda aromatik halqali murakkab polimerning oksidlovchi fermentlar yordamida kichikroq fraksiyalarga ajralishi tushuniladi, bu esa o‘simlik biomassasining uzoq muddatli barqaror komponentini parchalash imkonini beradi. Mexanizm sifatida oq chiriyotgan zamburug‘larda lakaza, lignin peroksidaza va marganets peroksidaza kabi fermentlar ishtirok etib, radikal oksidlanish zanjirlarini ishga tushiradi va ligninning nisbatan inert bog‘larini uzadi; bu jarayon ko‘pincha H_2O_2 ishtirokida kechadi. Masalan, *Phanerochaete chrysosporium* modeli lignotsellyuloza biodestruksiyasida keng o‘rganilgan bo‘lib, yog‘och substratlarida massaning sezilarli kamayishi va aromatik birikmalar spektrining o‘zgarishi bilan tavsiflanadi. Miqdoriy ko‘rsatkich sifatida, lignotsellyuloza substratlarida laboratoriya sharoitida 2–6 hafta ichida quruq massaning 20–40 foizgacha yo‘qolishi tur va sharoitga bog‘liq ravishda kuzatilishi mumkinligi ta’kidlanadi [2]. Oksidlovchi fermentlar selektivligi va mediator molekulalar mavjudligi lignin parchalanish tezligini belgilaydi, shuningdek, azot cheklangan sharoitlarda ligninolitik fermentlar ekspressiyasi kuchayishi zamburug‘larning ekologik strategiyasi sifatida talqin qilinadi [1].

Biotexnologik xususiyatlar zamburug‘larning sanoat, tibbiyot, qishloq xo‘jaligi va ekologik texnologiyalarda foydali mahsulot yoki xizmat yaratish qobiliyatini anglatadi. Bu qobiliyatning mexanizmi genetik jihatdan boshqariladigan metabolik yo‘llar, fermentlar biosintezi, ikkilamchi metabolitlar hosil bo‘lishi hamda bioprotsess muhitiga moslashuv bilan izohlanadi, chunki zamburug‘lar osmotik bosim, pH va substrat tarkibiga javoban metabolik oqimlarni qayta taqsimlay oladi. Masalan, *Aspergillus niger* tomonidan limon kislotasi ishlab chiqarish klassik biotexnologik jarayon bo‘lib, uglevodlar muhitida yuqori kislotabardoshlik va oksidlovchi metabolizm ustunligi natijasida organik kislota to‘planadi. Raqamlar bilan ifodalaganda, sanoat miqyosida limon kislotasi ishlab chiqarish hajmi yillik millionlab tonnalar bilan baholanadi va bu segmentning muhim qismi zamburug‘ fermentatsiyasiga tayanadi [5]. Muhitda fosfor va azotning nisbiy cheklanishi, mikroelementlar muvozanati hamda erigan kislorod darajasi sitrat sikli oqimini sitrat to‘planishi tomonga og‘diradi, shuningdek, morfologiya (pellet yoki filament) massoalmashtirishni belgilab, chiqimga bevosita ta’sir ko‘rsatadi [6].

Zamburug‘ fermentlari biotexnologiyada alohida yo‘nalish bo‘lib, ularning amaliy qiymati katalitik faollik, substrat spetsifikligi va nisbatan yumshoq sharoitlarda ishlashi bilan belgilanadi. Fermentlar ishlab chiqarish mexanizmi ko‘pincha induktsiya va katabolit repressiyasi bilan tartibga solinadi, ya’ni muhitda ma’lum substrat mavjudligi mos ferment genlarining ekspressiyasini kuchaytiradi, oson hazm bo‘ladigan shakarlar esa aksincha pasaytirishi mumkin. Masalan, sellulazalar kompleksi *Trichoderma reesei* kabi zamburug‘larda sellyuloza va gemitsellyulozani glyukoza hamda ksilozaga qadar gidrolizlaydi, bu esa bioetanol va biogaz uchun xomashyo tayyorlashda asosiy bosqich hisoblanadi. Statistik ko‘rsatkich sifatida, fermentativ gidroliz samaradorligi oldindan ishlov berish turiga qarab keskin o‘zgaradi va ayrim texnologik sxemalarda ferment sarfi bir tonna quruq biomassa uchun o‘nlab kilogramm ekvivalentiga yetishi mumkinligi, shuningdek, shakar hosildorligi 60–90 foiz diapazonda bo‘lishi mumkinligi ko‘rsatiladi [6]. Sellulazaning endoglukonaza, ekzoglukonaza va β-glyukozidaza komponentlari sinergiyasi polimerning kristallik darajasi va lignin

bilan bog‘liqligiga bog‘liq bo‘lib, lignin miqdori yuqori bo‘lgan substratlarda noxush adsorbsiya tufayli ferment yo‘qotishlari ortadi [5].

Zamburug‘larning bioremediatsiyadagi roli ekologik biotexnologiyaning istiqbolli yo‘nalishi bo‘lib, u ifloslantiruvchi moddalarni biologik yo‘l bilan zararsizlantirish yoki immobilizatsiya qilishni anglatadi. Mexanizm ikki asosiy yo‘nalishda kechadi: birinchisi biosorbsiya va bioakkumulyatsiya orqali og‘ir metall ionlarini hujayra devori komponentlari bilan bog‘lash, ikkinchisi esa oksidlovchi fermentlar yordamida aromatik va xlororganik birikmalarni parchalashdir; bu yerda xitin, xitozan va glukanlar funksional guruhlari muhim bog‘lovchi markaz bo‘lib xizmat qiladi. Masalan, oq chiriyotgan zamburug‘lar neft mahsulotlari va bo‘yoq moddalari tarkibidagi aromatik fraksiyalarni kamaytirishda qo‘llanib, chiqindi suvlarning rangini pasaytirish yoki toksiklikni qisqartirishga erishiladi. Raqamlar bilan aytganda, ayrim tajriba sharoitlarida bo‘yoq moddalari rangining 50–90 foizgacha kamayishi, og‘ir metall ionlarining esa biosorbsiya orqali sezilarli darajada ushlanishi qayd etilgan bo‘lib, natija shtamm, pH va kontakt vaqtiga kuchli bog‘liq ekani ta’kidlanadi [7]. Lakaza va peroksidazalar keng substrat doirasiga ega bo‘lib, radikal mexanizmlar orqali toksikantlarni kamroq zaharli metabolitlarga aylantiradi, biosorbsiya esa ion almashinish va kompleks hosil qilish reaksiyalariga asoslanadi, bu jarayonlar kinetik va termodinamik parametrlar bilan tavsiflanadi [2].

Zamburug‘larning biotexnologik qo‘llanilishida xavfsizlik masalasi alohida ahamiyatga ega bo‘lib, mikotoksinlar va allergenlar bilan bog‘liq xavflarni ilmiy asosda boshqarish zarur. Mikotoksinlar deganda *Aspergillus, Fusarium* va *Penicillium* kabi jinslar ishlab chiqaradigan ikkilamchi metabolitlar tushuniladi, ular oziq-ovqat va yem-xashak zanjirida to‘planib, inson va hayvon salomatligiga zarar yetkazishi mumkin. Mexanizm sifatida toksin biosintezi ma’lum gen klasterlari bilan boshqarilib, namlik, harorat va substrat tarkibi kabi omillar bilan induktsiyalanadi; masalan, aflatoksinlar biosintezi oksidlovchi-qaytaruv fermentlari ishtirokidagi ko‘p bosqichli yo‘l orqali amalga oshadi. Masalan, noto‘g‘ri saqlangan don mahsulotlarida zamburug‘ kolonizatsiyasi oshib, toksin kontaminatsiyasi xavfi kuchayadi va bu holat oziq-ovqat xavfsizligi tizimlarida muntazam monitoring talab qiladi. Statistik jihatdan, global miqyosda don va yong‘oq kabi mahsulotlarning ma’lum ulushi mikotoksinlar bilan ifloslanishi qayd etilib, iqtisodiy yo‘qotishlar va sanitariya cheklovlari yuzaga keladi, ayrim hududlarda nam iqlim sharoiti xavfni yanada oshirishi ko‘rsatiladi [5]. Xavfni kamaytirish uchun HACCP tamoyillari, tezkor analitik usullar (xromatografiya va immunotestlar) hamda bionazorat agentlardan foydalanish integratsiyalashgan yondashuvni talab qiladi, chunki faqat bitta choraga tayanish ekologik va texnologik o‘zgaruvchanlik sababli yetarli bo‘lmaydi [7].

Zamburug‘larning ekologik va biotexnologik xususiyatlarini solishtirma tahlil qilish ularning “tabiiy destruktor” sifatidagi rolidan “sanoat katalizatori” sifatidagi roliga o‘tishda umumiy mexanistik asos mavjudligini ko‘rsatadi. Ta’rif jihatidan, har ikkala holatda ham markaziy o‘rin tashqi fermentatsiya va metabolik moslashuvga tegishli bo‘lib, zamburug‘lar substratni tashqi muhitda o‘zgartirib, so‘ng o‘zlashtiradi. Mexanizm bir tomondan ekotizimda lignotsellyulozaning parchalanishi va elementlar qayta aylanishini ta’minlasa, ikkinchi tomondan sanoat sharoitida ayni fermentlar va metabolitlar ishlab chiqarish, xomashyoni biokonversiya qilish hamda ifloslantiruvchilarni parchalash kabi vazifalarni bajaradi. Masalan, lakaza fermenti o‘rmon to‘shamasida lignin oksidlanishida ishtirok etar ekan, texnologik jihatdan u tekstil bo‘yoqlarini rangsizlantirish, qog‘oz sanoatida biobelyo qilish va fenolik ifloslantiruvchilarni kamaytirishda qo‘llanadi. Raqamlar bilan ifodalaganda, ekologik tizimlarda yillik organik modda oqimining katta qismi mikrobiologik parchalanishga to‘g‘ri kelishi, biotexnologiyada esa fermentlar va organik kislotalar bozori yirik sanoat segmentini tashkil etishi haqidagi ma’lumotlar zamburug‘larning ikki yo‘nalishdagi ahamiyatini tasdiqlaydi [1; 6].

Xulosa. Zamburug‘lar ekotizimlarda modda aylanishi, tuproq unumdorligi va biotik aloqalarning barqarorligini ta’minlaydigan asosiy funksional guruh hisoblanadi. Ularning gifa asosli oziqlanishi va tashqi fermentlar sekretsiyasi lignotsellyuloza parchalanishi hamda mineral elementlarning qayta mobilizatsiyasida yuqori samaradorlik beradi. Shu bilan birga, ayni mexanizmlar sanoat biotexnologiyasida organik kislotalar, fermentlar va bioremediatsiya xizmatlarini yaratish uchun ilmiy asos bo‘lib xizmat qiladi. Amaliy qo‘llashda mikotoksin xavfini baholash va biosamaradorlikni jarayon parametrlari orqali boshqarish zarurligi aniqlanadi.

G‘O‘ZADA MIQDOR VA SIFAT BELGILARINING KORRELYATSIYASI

Mamajonov Abrorbek Adiljonovich
Andijon davlat universiteti Genetika va biotexnologiya kafedrasi katta o‘qituvchisi
biomamajonov0021@gmail.com

Annotatsiya. *Mazkur tezisda F_2 duragay avlodda morfobiologik belgilarini bitta ko‘sakdagi paxta vazni bilan korrelyatsion bog‘liqlik darajalarining taxlillari keltirilgan.*

Kalit so‘zlar: *korrelyatsiya, t-kriteriya (tr).*

КОРРЕЛЯЦИЯ КОЛИЧЕСТВЕННЫХ И КАЧЕСТВЕННЫХ ПРИЗНАКОВ ХЛОПКА

Аннотация. *В данной тезисе анализируется степень корреляции между морфобиологическими признаками с массой хлопчатника в одной коробочке у гибридов F_2.*

Ключевые слова: *корреляция, t-критерия (tr).*

CORRELATION OF QUANTITATIVE AND QUALITATIVE TRAITS IN COTTON

Annotation. *This thesis analyzes the degree of correlation between morphobiological characteristics and the mass of cotton in one boll in F2 hybrids.*

Keywords: *correlation, t-criterion (tr).*

Mamlakatimiz va chet el olimlari tomonidan g‘o‘zaning sifat va miqdor belgilarning irsiylanishida va korrelyatsion bog‘liqligi borasida bir qator tadqiqot ishlari olib borilgan. Xususan, M.M.Ergashev g‘o‘zaning sifat belgilari bilan miqdoriy belgilar o‘rtasidagi korrelyatsion bog‘liqliklarini o‘rganib, rangli tolaga nisbatan tolaning oq bo‘lishi tola chiqimi, indeksi va uzunligi bilan ijobiy korrelyatsion bog‘lanishni yuzaga keltirishini va ularning rivojlanishiga ijobiy ta’sir ko‘rsatishini aniqlagan (1; 22-b.).

G‘o‘zaning nav va tizmalarida qimmatli xo‘jalik belgilar orasidagi korrelyatsion bog‘liqliklar borasida ilmiy tadqiqot ishlari olib borilgan. Lekin adabiyotlar tahliliga ko‘ra, morfologik va miqdor belgilar o‘rtasidagi nisbiy bog‘liqlik kam o‘rganilgan.

Tadqiqotda barcha F_2 o‘simliklarda barg shakli bo‘yicha uchta fenologik guruhga ajralishi kuzatildi. Ular: besh kirtikli, besh qirqimli va besh kesilgan, nisbatlari mos ravishda 1:2:1 nisbatga yaqin ekanligi qayd etildi. Shu uch xil barg shakli fonida shakllangan bitta ko‘sakdagi paxta vazni mos ravishda korrelyatsion koeffisientlari (r) va t-kriteriyalari (tr) aniqlandi [2; 31-32 b.].

1-jadval

№	F_2 kombinatsiyalari	Bitta ko‘sakdagi paxta vazni					
		Besh kirtikli		Besh kesilgan		Besh qirqimli	
		r	tr	r	tr	r	tr
1	F_2 G‘olib x Andijon-35	0,13	2,06	0,11	1,74	-0,06	-1,03
2	F_2 G‘olib x Qizil baraka	0,09	1,36	-0,1	-1,51	0,02	0,3
3	F_2 G‘olib x *G.mustelinum* Mers ex Watt	0,04	0,69	0,008	0,14	0,01	0,17
4	F_2 (G‘olib Andijon-35) x Qizil baraka	0,11	2	-0,08	-1,45	0,17	3,09
5	F_2 (G‘olib x Andijon-35) x *G.mustelinum* Mers ex Watt	0,09	1,69	0,09	1,69	-0,11	-2,07

Tajribada F_2 duragaylarning barchasi ona o‘simlik sifatida besh qirqimli barg shakliga ega G‘olib navidan foydalanildi. Boshqa tajriba ashyolarining barg shakli besh kirtikli fenotipga ega.

Bitta ko‘sakdagi paxta vazni va barg shakllarining korrelyatsion bog‘liqligi

1-jadval dalillariga ko‘ra, bitta ko‘sakdagi paxta vazni va besh kirtikli barg o‘rtasidagi korellyatsion koeffisientlar 0,04 dan 0,13 oralig‘ida bo‘ldi. F_2 G‘olib x Andijon-35 duragaylarining korrelyatsion bog‘liqlik darajasi (r=0,13) va faktik tr kriteriyasining ko‘rsatkichiga asoslanib (tr=2,06) nisbiy bog‘liqlik ahamiyatli ekanligini qayd etildi.

Bitta ko‘sakdagi paxta vazni va besh kesilgan barg o‘rtasidagi korrelyatsion munosabat tr ko‘rsatkichi -0,08 dan 0,11 oralig‘ida ekanligi qayd etildi. tr natijalari besh kesilgan barg shakli bilan mazkur miqdoriy belgi o‘rtasida qat’iy uyg‘unlik yo‘q ekanligini tasdiqlamoqda.

Besh qirqilgan barg shakli va bitta ko‘sakdagi paxta vazni belgisi o‘rtasida korrelyatsion ko‘rsatkich -0,11 dan 0,17 oralig‘ida bo‘ldi. F_2 (G‘olib x Andijon-35) x Qizil baraka duragaylarida ijobiy (tr=3,09) va F_2 (G‘olib x Andijon-35) x *G.mustelinum* Mers ex Watt. duragaylarida salbiy (tr=-2,07) korrelyatsion bog‘liqlik mavjudligi aniqlandi [45; 31-32 b.].

G‘o‘zada besh kirtikli va besh qirqimli barg shakli bilan bitta ko‘sakdagi paxta vazni orasida qat’iy bo‘lgan ijobiy korrelyatsion bog‘liqlik qayd etildi. F_2 (G‘olib x Andijon -35) x *G.mustelinum* Mers ex Watt kombinatsiyasining besh qirqimli o‘simliklarida muqarrar bo‘lgan salbiy korrelyatsion bog‘liqlik aniqlandi.

HAZM QILISH A'ZOLARI

Bahtiyorova Marjona Ilhomjon qizi
Biologiya yo'nalishi 2-bosqich talabasi.
Maxsudova Malika Xolmatjanovna
Andijon davlat pedagogika institute Jismoniy madaniyat kafedrasi.

Annotatsiya: *Mazkur maqolada hazm qilish a'zolarining tuzilishi, funksiyalari va inson salomatligidagi o'rni va uni turli adabiyotlardagi taxlili haqida so'z yuritiladi. Ovqat hazm qilish tizimiga kiruvchi asosiy a'zolar — og'iz bo'shlig'i, qizilo'ngach, oshqozon, ichaklar hamda yordamchi bezlarning vazifalari yoritilgan. Shuningdek, sog'lom ovqatlanish va gigiyena qoidalariga amal qilish hazm qilish tizimi faoliyatini yaxshilashi haqida ma'lumot berilgan. Maqolada hazm qilish tizimida uchraydigan ayrim kasalliklar va ularning oldini olish usullari ham qisqacha bayon etilgan.*

Kalit so'zlar:*hazm qilish tizimi, oshqozon, ichaklar, qizilo'ngach, ovqat hazm qilish, sog'lom ovqatlanish, gigiyena, organizm, hazm jarayoni.*

ПИЩЕВАРИТЕЛЬНЫЕ ОРГАНЫ

Аннотация: *В данной статье рассматриваются строение органов пищеварения, их функции, роль в здоровье человека, а также их анализ в различных литературных источниках. Освещены функции основных органов пищеварительной системы — ротовой полости, пищевода, желудка, кишечника, а также вспомогательных желез. Кроме того, представлена информация о том, что соблюдение принципов здорового питания и правил гигиены способствует улучшению деятельности пищеварительной системы. В статье также кратко описаны некоторые заболевания пищеварительной системы и методы их профилактики.*

Ключевые слова:*пищеварительная система, желудок, кишечник, пищевод, пищеварение, здоровое питание, гигиена, организм, процесс пищеварения.*

DIGESTIVE ORGANS

Annotation: *This article discusses the structure of the digestive organs, their functions, their role in human health, and their analysis in various literature sources. The functions of the main organs of the digestive system, including the oral cavity, esophagus, stomach, intestines, and accessory glands, are described. In addition, information is provided on how following the principles of healthy nutrition and maintaining proper hygiene can improve the functioning of the digestive system. The article also briefly outlines some diseases of the digestive system and methods for their prevention.*

Keywords:*digestive system, stomach, intestines, esophagus, digestion, healthy nutrition, hygiene, organism, digestive process.*

Kirish. Hazm a'zolari ovqat moddasini mexanik maydalash kimyoviy moddalar ta'sirida parchalash , qonga yoki limfaga so'rilishini ta'minlash , chiqindi moddalarni tashqi muhitga chiqarish kabi vazifalarni bajaradi. Hazm tizimining ko'pchilik qismi devori ikki qavatli nayni eslatadi. Ichki nay a'zolarning shilliq qavatidan hosil bolsa, tashqi nay mushak va seroz pardadan hosil bo'ladi.Bu ikki nay orasida biriktiruvchi to'qimadan iborat, qon tomirlarga boy bo'lgan shilliq osti qavati joylashgan. Bu ikki nay nisbatan harakat qilish xususiyatiga ega. SHilliq osti qavati to'qimalarini va mushak tolalari burama shaklida joylashganligidan og'iz bo'shlig'i sohasidan to'g'ri ichak tarafiga harakatlanadi. Ko'pgina hazm qilish a'zolarining devori to'rt qavatdan tashkil topadi: 1)ichki-shilliq qavat, 2)shilliq osti qavati, 3)mushak qavati, 4)tashqi-seroz parda qavati. A'zo devoridagi har bir qavat hosilaning qalinligi shu a'zoning vazifasiga bog'liq bo'ladi. Ba'zi a'zoda mushak qavati yaxshi taraqqiy etgan bo'lsa (me'da), boshqa a'zolarda shilliq qavat rivojlanadi

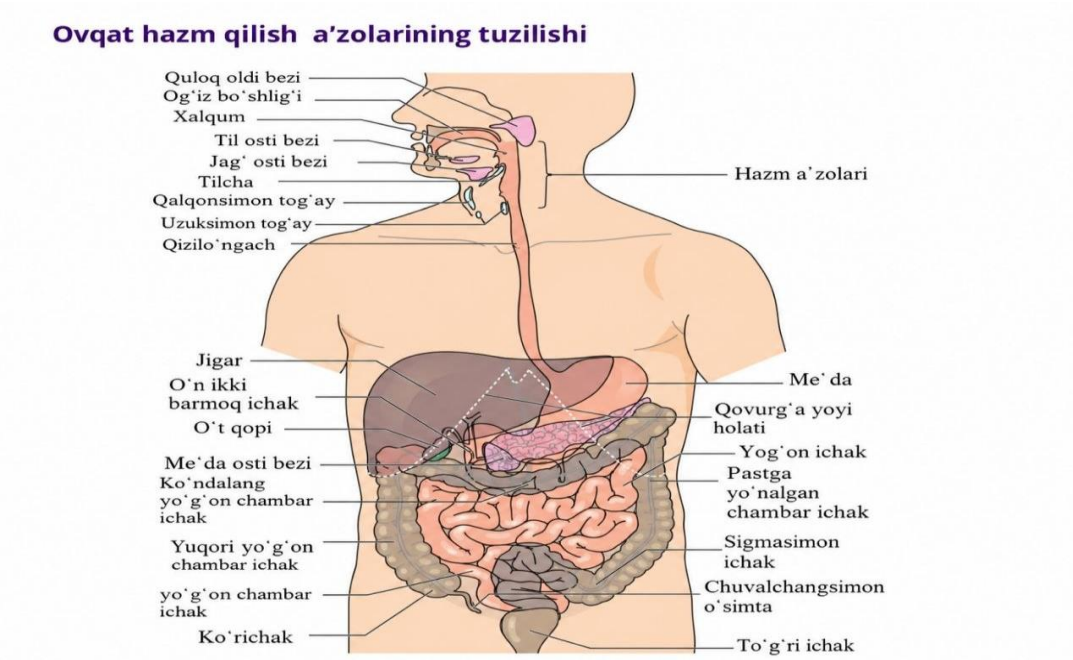
Mavzuga oid adabiyotlar tahlili. Ovqat hazm qilish tizimi mavzusi biologiya, anatomiya va fiziologiya fanlarida keng o'rganilgan muhim bo'limlardan biri hisoblanadi. Turli adabiyotlarda ushbu tizimning tuzilishi, vazifalari va kasalliklari batafsil yoritilgan. Ilmiy manbalarda ovqat hazm qilish tizimi og'iz bo'shlig'idan boshlab to to'g'ri ichakkacha davom etadigan murakkab organlar majmui sifatida ta'riflanadi. Masalan, anatomiyaga oid adabiyotlarda og'iz

bo‘shlig‘i, halqum, qizilo‘ngach, oshqozon, ingichka va yo‘g‘on ichaklarning tuzilishi va ularning vazifalari alohida ko‘rsatib berilgan. Shuningdek, jigar, oshqozon osti bezi va o‘t pufagi kabi yordamchi organlarning ovqat hazm qilish jarayonidagi roli ham muhim deb baholanadi. Fiziologiyaga oid manbalarda esa ovqat hazm qilish jarayoni bosqichma-bosqich tahlil qilinadi: mexanik maydalash, kimyoviy parchalanish, fermentlar ta’siri va oziq moddalarning qonga so‘rilishi kabi jarayonlar ilmiy asosda tushuntiriladi. Bu jarayonlarning buzilishi turli kasalliklarni keltirib chiqarishi ham adabiyotlarda ta’kidlangan. Tibbiy adabiyotlarda ovqat hazm qilish tizimi kasalliklari (gastrit, yara kasalligi, gepatit va boshqalar) ham keng yoritilib, ularning sabablari, belgilari va oldini olish yo‘llari ko‘rsatiladi. Ayrim zamonaviy manbalarda esa sog‘lom ovqatlanish va gigiyena qoidalariga rioya qilish orqali ushbu tizimni asrash muhimligi ta’kidlanadi. Umuman olganda, adabiyotlar tahlili shuni ko‘rsatadiki, ovqat hazm qilish tizimi inson hayot faoliyati uchun juda muhim bo‘lib, uning to‘g‘ri ishlashi butun organizm salomatligiga bevosita ta’sir qiladi

Hazm qilish tizimi ikkita asosiy qismdan iborat: Gastrointestinal trakt va turli yordamchi tuzilmalar hamda a’zolar. Gastrointestinal trakt oziqlanish kanali ham deb ataladi ovqat kiradigan og‘iz bo‘shlig‘idan boshlanadigan uzun mushakli naychadan iborat bolib, u halqum (pharynx), qizilo‘ngach (esophagus), me’da (stomach), ingichka va yog‘on ichaklar orqali davom etadi, hamda to‘g‘ri ichak va anusda tugaydi, bu yerda chiqindi najas (fekak massa)sifatida chiqariladi.

Yordamchi tuzilmalar va a’zolar quyidagilarni o‘z ichiga oladi: so‘lak bezlari, shilliq (mukoz) bezlar, til, tishlar, jigar, o‘t pufagi va oshqozon osti bezi (pankreas). Bularning barchasi hazm qilish tizimida muhim funksiyalarga ega. Ovqat G.I. trakt bo‘ylab mushak qatlamlari tomonidan hosil qilinadigan peristaltik harakatlar yordamida oldinga siljitiladi. Ko‘plab yordamchi tuzilmalar ovqatni o‘zgartirish, hazm qilish, so‘rilish yoki transport qilishga yordam beruvchi fermentlar yoki boshqa moddalarning ajralishi orqali traktga yordam beradi.

Og‘iz bo‘shlig‘i (cavitas oris, grekcha-stoma) hazm a’zolar tizimining boshlang‘ich qismi. Og‘iz bo‘shlig‘i pastdan og‘iz diafragmasi (diaphragma orisi) yuqoridan qattiq va yumshoq tanglay, yon tomondan lunjlar, old tomondan lablar bilan chegaralansa, orqada tomoq teshigi (fauces) vositasida halqum bilan qo‘shiladi. Tishlar va jag‘larning alveolyar o‘simtasi og‘iz bo‘shlig‘ini ikki qism: og‘iz dahlizi va xususiy og‘iz bo‘shlig‘iga ajratadi. U ovqatni qabul qilish, maydalash, namlash va hazm qilishga tayyorlash vazifasini bajaradi.[2,243-244].



Organning kasalligi. Og‘iz bo‘shlig‘i hazm jarayonining boshlang‘ich nuqtasi bo‘lib, bu yerdagi patologiyalar butun tizimga ta'sir qiladi.Stomatit: Og‘iz shilliq qavatining yallig‘lanishi.

Sabablari: Viruslar (gerpes), zamburug‘lar (kandidoz) yoki mexanik jarohatlar. Davolash: Antiseptik eritmalar bilan chayish (Xlorgeksidin), og‘riqsizlantiruvchi gellar va og‘ir holatlarda antibiotik/antivirus preparatlari.

Parodontit: Milk va tish atrofidagi to‘qimalarning yallig‘lanishi.

Davolash: Professional tozalash, milk osti kuretaji va mahalliy yallig‘lanishga qarshi terapiya.

Albatta bu profilaktika shifokor nazorati ostida bolishi kerak.

Halqum:(pharynx) bosh va bo‘yin sohasida joylashgan toq a’zo bo‘lib, hazm va nafas tizimiga kiradi. U quyg‘uchsimon shaklda bo‘lib uzunligi 12-14 sm. Halqum yuqorida kalla asosiga birikadi. Hazm qilish jarayonida

halqumning asosiy vazifasi og‘iz bo‘shlig‘ida hosil bo‘lgan ovqat luqmasini qizilo‘ngachga o‘tkazishdan iborat. Yutish vaqtida halqum muskullari qisqarib, ovqatning pastga harakatlanishini ta’minlaydi. Yutish jarayonida hiqildoq ustidagi qopqoqcha — epiglottis nafas yo‘lini berkitib turadi, bu ovqat va suyuqliklarning nafas yo‘llariga tushib ketishining oldini oladi. Halqum shilliq qavat bilan qoplangan bo‘lib, ovqatning oson sirpanib o‘tishiga yordam beradi.[2,257-258].

Halqum kasalliklari. Laringit, halqumning yallig‘lanishi bilan tavsiflanadi, bu ovozning xirillashi, ovozning yo‘qolishi va tomoqdagi bir qator noqulayliklar kabi alomatlarga olib kelishi mumkin bo‘lgan keng tarqalgan holat. Laringitning sabablari turlicha bo‘lib, virusli va bakterial infektsiyalar vokal zo‘riqish, chekish va alkogol va ifloslantiruvchi moddalar kabi tirnash xususiyati beruvchi omillar bilan bir qatorda keng tarqalgan aybdorlardir. Laringitning asosiy belgilaridan biri bu ovozning xirillashi, bu erda ovoz xiralashgan yoki taranglashishi mumkin. Bu ko‘pincha zaiflashgan yoki butunlay yo‘qolgan ovoz bilan birga keladi, bu esa gapirishni qiyinlashtiradi. Qo‘shimcha alomatlar tomoqdagi qitiqlash hissi, tomoq og‘rig‘i, quruq tomoq va quruq yo‘talni o‘z ichiga olishi mumkin, bularning barchasi laringit bilan og‘rigan odamlarning umumiy noqulayligiga hissa qo‘shadi.

Qizilo‘ngach hazm qilish tizimining muhim a’zolaridan biri bo‘lib, halqum va oshqozonni bog‘lovchi muskulli naydan iborat. Uning uzunligi kattalarda o‘rtacha 25–30 smni tashkil etadi.
Qizilo‘ngachning asosiy vazifasi ovqat va suyuqliklarni halqumdan oshqozonga yetkazib berishdir. Bu jarayon qizilo‘ngach devoridagi muskullarning ritmik qisqarishi va bo‘shashishi, ya’ni **peristaltika harakatlari** yordamida amalga oshadi. Qizilo‘ngachning ichki qavati shilliq parda bilan qoplangan bo‘lib, ovqatning oson siljishiga yordam beradi. Unda hazm qiluvchi fermentlar deyarli ajralmaydi, shuning uchun qizilo‘ngachda ovqatning kimyoviy hazm bo‘lishi sodir bo‘lmaydi. Qizilo‘ngachning yuqori va pastki sfinkterlari (halqasimon muskullari) ovqatning bir yo‘nalishda harakatlanishini ta’minlaydi hamda oshqozon tarkibining orqaga qaytib chiqishiga to‘sqinlik qiladi.[4,261]

Qizilo‘ngach kasalliklari. Qizilo‘ng‘ach kasalliklari qizilo‘ng‘achga ta'sir qiluvchi kasalliklar spektrini o‘z ichiga oladi. G‘arb mamlakatlarida qizilo‘ngachning eng keng tarqalgan holati gastroezofagial reflyuks (kislotali me'da suyuqligi qizilo‘ngach orqasiga oqib o‘tadigan holat, natijada oshqozon yonishi paydo bo‘ladi, tez-tez yurak urishi gastroezofagial reflyuks kasalligining belgilaridan biri) kasalligi bo‘lib, surunkali shakllarda qizilo‘ng‘ach epiteliyasining o‘zgarishiga olib keladi, bu esa tibbiyotda Barrett qizilo‘ng‘achi deb nomlanadi. O‘tkir kasallik ezofagit (qizilo‘ngachning yallig‘lanishi), korroziy (o‘yuvchi) moddalar (masalan, sho‘r suv)ini iste'mol qilish natijasida kelib chiqqan travma yoki qizilo‘ngach varikozlari, Boerhaave (talaffuzi: Burxave) sindromi (ya'ni, bu sindrom - qizilo‘ngach ichidagi bosimning keskin o‘sishi tufayli yuzaga keladigan devorining yorilishi ko‘rinishidagi oldingi sog‘lom qizilo‘ngachning shikastlanishining maxsus turi) yoki Mallory-Vays ko‘z yoshlari singari tomirlarning yorilishi kabi bir qator infeksiyalarni o‘z ichiga olishi ham mumkin.

Oshqozon: oshqozon (gaster) hazm nayining eng kengaygan qismi hisoblanadi. Oshqozon qorin bo‘shlig‘ining yuqori qismida diafragma va jigar ostida joylashadi. Oshqozon hazm qilish tizimining kengaygan qismi bo‘lib, qizilo‘ngach bilan ingichka ichak orasida joylashgan. U ovqatni vaqtincha saqlash, aralashtirish va hazm qilish vazifalarini bajaradi. Oshqozon devori kuchli muskullardan tashkil topgan bo‘lib, ularning qisqarishi natijasida ovqat maydalanadi va oshqozon shirasi bilan aralashadi. Oshqozon shirasi tarkibida xlorid kislota (HCl), fermentlar va shilliq modda mavjud. Xlorid kislota mikroblarni zararsizlantiradi va fermentlarning faoliyat ko‘rsatishi uchun qulay muhit yaratadi. Oshqozon shirasi tarkibidagi pepsin fermenti oqsillarni parchalay boshlaydi. Shilliq modda esa oshqozon devorini kislotaning ta’siridan himoya qiladi. Oshqozonda ovqat bir necha soat davomida qayta ishlanib, yarim suyuq massa — ximus holatiga keladi. So‘ngra u oshqozonning pastki qismidagi sfinkter orqali o‘n ikki barmoqli ichakka o‘tadi. [5,283-285].

Oshqozon kasalliklari. Oshqozon kasalliklari deganda oshqozonga ta'sir qiladigan kasalliklar tushuniladi. Oshqozonning har qanday sababga ko‘ra infeksiyasi bilan yallig‘lanishi gastrit deb ataladi va oshqozon-ichak traktining boshqa qismlarini qo‘shganda gastroenterit deb ataladi. Gastrit surunkali holatda davom etsa, u atrofik gastrit, pilorik stenoz (oshqozondan ingichka ichakning birinchi qismiga (pilorus) teshikning torayishi) va oshqozon saratoni kabi bir qancha kasalliklar bilan bog‘liqdir. Yana bir keng tarqalgan holat - oshqozon yarasi ya'ni shikastlanishidir. Yaralar oshqozon shilliq qavatini buzadi, bu oshqozon to‘qimasini oshqozon kislotalaridan himoya qiladi. Peptik yaralar ko‘p hollarda bakterial Helicobacter pylori (odatda oshqozonda topiladigan, gram-manfiy, mikroaerofil, spiral (spiral) bakteriya) infeksiyasidan kelib chiqadi. Epstein-Barr virusi infeksiyasi oshqozon saratonini qo‘zg‘atadigan yana bir omildir.

Ichaklar hazm qilish tizimining eng uzun qismi bo‘lib, ular **ingichka ichak** va **yo‘g‘on ichak**ga bo‘linadi. Ichaklarda ovqatning asosiy hazm bo‘lishi va oziq moddalarining so‘rilishi amalga oshadi.
Ingichka ichak: Ingichka ichak o‘n ikki barmoqli ichak, och ichak va yonbosh ichakdan iborat. Bu yerga oshqozondan kelgan ovqat massasi tushadi. Ingichka ichakda oshqozon osti bezi shirasi, o‘t suyuqligi va ichak shirasi ta’sirida oqsillar, yog‘lar va uglevodlar oddiy moddalargacha parchalanadi. Ingichka ichak devoridagi ko‘plab so‘rg‘ichlar (vorsinkalar)

yordamida hosil bo‘lgan oziq moddalar qonga va limfaga so‘riladi.
Yo‘g‘on ichak. Yo‘g‘on ichakda asosan suv va mineral tuzlar so‘riladi. Bu yerda foydali bakteriyalar yashab, ayrim vitaminlarni hosil qiladi. Hazm bo‘lmagan qoldiqlar zichlashib, najas shakllanadi va to‘g‘ri ichak orqali tashqariga chiqariladi.

Ichak(Intestines) kasalliklari. Ichak tizimi ingichka va yo‘g‘on ichakdan iborat bo‘lib, so‘rilish va defekatsiya jarayonlari uchun javobgar.
Ingichka ichak (Small Intestine).
Enterit: Ingichka ichakning yallig‘lanishi, ko‘pincha infeksiya yoki noto‘g‘ri ovqatlanish natijasi.
Malabsorbsiya sindromi: Ozuqa moddalarining so‘rilmasligi.
Yo‘g‘onichak (Large Intestine).
Kolit: Yo‘g‘on ichak yallig‘lanishi (Nospetsifik yarali kolit - NYAK eng og‘ir turlaridan biri).
Enterokolit: Bir vaqtning o‘zida ham ingichka, ham yo‘g‘on ichakning zararlanishi.

Yuqorida ovqat hazm qilish tizimi a’zolari hamda ularda uchrashi mumkin bo‘lgan ayrim kasalliklar haqida ma’lumot berildi. Mazkur kasalliklarning kelib chiqishining oldini olish, ovqat hazm qilish tizimi faoliyatini me’yorda saqlash va sog‘lom turmush tarzini shakllantirishda ovqatlanish gigiyenasi muhim o‘rin tutadi. Ovqatlanish gigiyenasi oziq-ovqat mahsulotlarini to‘g‘ri tanlash, saqlash va iste’mol qilish qoidalarini o‘z ichiga oladi. Ratsional va muvozanatli ovqatlanish organizmning ozuqa moddalarga bo‘lgan ehtiyojini qondirib, ovqat hazm qilish a’zolarining normal faoliyat yuritishiga yordam beradi. Shuningdek, ovqatlanish tartibiga rioya qilish, sifatli va xavfsiz mahsulotlardan foydalanish, shaxsiy gigiyena qoidalariga amal qilish hamda zararli odatlardan voz kechish ko‘plab ovqat hazm qilish tizimi kasalliklarining oldini olishda muhim ahamiyat kasb etadi. Shu bois, quyida ovqatlanish gigiyenasi va uning sog‘liqni saqlashdagi o‘rni haqida batafsil ma’lumot keltiriladi. [3, 180-181]

1. Avvalo, ovqatni o‘z vaqtida va belgilangan tartib asosida iste'mol qilish zarur. Kun davomida 3–4 mahal bir xil vaqtda ovqatlanish oshqozon va ichaklarning faoliyatini me'yorlashtiradi, hazm shiralarining o‘z vaqtida ajralishiga yordam beradi. Ovqatni shoshilmasdan, yaxshilab chaynab iste’mol qilish hazm jarayonini yengillashtiradi va oshqozonga tushadigan yukni kamaytiradi.

2. Juda issiq yoki haddan tashqari sovuq taomlarni iste’mol qilish, ortiqcha yog‘li, sho‘r, achchiq va tez tayyorlanadigan mahsulotlarni ko‘p iste’mol qilish oshqozon va ichak shilliq qavatiga salbiy ta’sir ko‘rsatishi mumkin. Shu sababli bunday mahsulotlarni me’yorida iste’mol qilish tavsiya etiladi. Ovqatlangandan so‘ng darhol og‘ir jismoniy mehnat bilan shug‘ullanmaslik, aksincha, organizmga ma’lum darajada dam berish foydali hisoblanadi. Shuningdek, muntazam jismoniy faollik, yetarli uyqu va zararli odatlardan voz kechish ovqat hazm qilish tizimining sog‘lom faoliyatini ta’minlaydi.

3. Ovqat tayyorlash va iste’mol qilishda sanitariya-gigiyena qoidalariga qat’iy rioya qilish lozim. Meva va sabzavotlarni yaxshilab yuvish, oziq-ovqat mahsulotlarini toza va mos haroratda saqlash, ovqat tayyorlashdan oldin va ovqatlanishdan avval qo‘llarni sovun bilan yuvish ichak yuqumli kasalliklarining oldini olishda muhim o‘rin tutadi. Sifati buzilgan, muddati o‘tgan yoki noto‘g‘ri saqlangan mahsulotlarni iste’mol qilish zaharlanish va ovqat hazm qilish tizimi kasalliklariga sabab bo‘lishi mumkin. Ratsionning muvozanatli bo‘lishi ham 361ata ahamiyatga ega. Kundalik ovqat tarkibida oqsillar, yog‘lar, uglevodlar, vitaminlar, mineral moddalar va yetarli miqdorda suv bo‘lishi zarur. Meva-sabzavotlar, sut mahsulotlari, go‘sht va don mahsulotlarini me’yorida iste’mol qilish organizmning ehtiyojini qondirib, ichak faoliyatini yaxshilaydi. Tolaga boy mahsulotlar ich qotishining oldini oladi va foydali ichak mikroflorasining rivojlanishiga yordam beradi.

Xulosa.

Ovqat hazm qilish tizimi bo‘yicha o‘rganilgan ma’lumotlar tahlili shuni ko‘rsatadiki, bu tizim inson organizmida murakkab va uzluksiz jarayonlarni amalga oshiradi. Ovqat hazm qilish og‘iz bo‘shlig‘idan boshlanib, qizilo‘ngach, oshqozon, ingichka ichak va yo‘g‘on ichak orqali yakunlanadi. Har bir organning o‘ziga xos vazifasi mavjud bo‘lib, ular bir-biri bilan uzviy bog‘liq holda ishlaydi. Tahlil natijalariga ko‘ra, ovqat hazm qilish jarayoni uch asosiy bosqichdan iborat:1.Mexanik parchalanish (og‘iz bo‘shlig‘ida chaynash) 2.Kimyoviy parchalanish (oshqozon va ichaklarda fermentlar ta’siri) 3.So‘rilish jarayoni (ingichka ichakda oziq moddalarning qonga o‘tishi). Shuningdek, jigar, oshqozon osti bezi va o‘t pufagi ovqat hazm qilishda yordamchi organlar sifatida muhim rol o‘ynashi e’tirofetiladi. Ular ishlab chiqaradigan fermentlar va o‘t suyuqligi ovqatni to‘liq parchalanishiga yordam beradi. Natijalar shuni ko‘rsatdiki, ovqat hazm qilish tizimining to‘g‘ri ishlashi organizmning energiya bilan ta’minlanishi, o‘sishi va sog‘lom rivojlanishi uchun juda muhimdir. Ushbu tizimda yuzaga keladigan buzilishlar esa turli kasalliklarga olib kelishi mumkin. Umuman olganda, o‘rganish natijalari ovqat hazm qilish tizimi inson hayot faoliyatida asosiy o‘rin tutishini tasdiqlaydi va sog‘lom ovqatlanish madaniyatining ahamiyatini yana bir bor ko‘rsatadi.

Har bir a’zo o‘z vazifasini bajarib, organizmni energiya va zarur oziq moddalar bilan ta’minlaydi. Xulosa qilib aytganda, ovqat hazm qilish tizimi inson hayoti uchun juda muhim bo‘lib, u to‘g‘ri ishlasa organizm sog‘lom va kuchli bo‘ladi

BIOLOGICAL

TUZ STRESSI SHAROITIDA *AZOTOBACTER CHROOCOCCUM* SHTAMMLARIDA ALG GENLARINING IFODALANISHI VA MAKROMOLEKULYAR TUZILMA O'ZGARISHLARI: ADABIYOTLAR SHARHI

M.A.Soliyeva
M.A.Pattayeva
B.A.Rasulov
O'zR FA Genetika va o'simliklar eksperimental biologiyasi instituti

Annotatsiya: *Tuz stressi mikroorganizmlar uchun eng muhim ekologik cheklov omillaridan biri bo'lib, hujayra metabolizmi va genetik regulyatsiya tizimlariga sezilarli ta'sir ko'rsatadi. Azotobacter chroococcum — erkin yashovchi diazotrof bakteriya sifatida tuproq unumdorligini saqlash va biotexnologik jarayonlarda katta ahamiyatga ega. Ushbu sharh maqolada A. chroococcum shtammlarida tuz stressiga javoban alg genining ifodalanish darajasi, alginat biosintezi va polimerning makromolekulyar tuzilmasidagi o'zgarishlar bo'yicha mavjud ilmiy ma'lumotlar tahlil qilinadi. Shuningdek, tuz stressi sharoitida hujayraning osmotik moslashuvi, ion homeostazi, hamda ekzopolisaxaridlar orqali himoya mexanizmlari muhokama qilinadi. Sharh natijalari A. chroococcum ning genetik va biokimyoviy moslashuv mexanizmlarini tushunishda, shuningdek tuzga chidamli biopolimer ishlab chiqaruvchi shtammlar seleksiyasida ilmiy asos bo'lib xizmat qilishi mumkin.*

Kalit so'zlar: *Azotobacter chroococcum, alg gen, alginat, tuz stressi, ekzopolisaxarid, osmotik moslashish, gen regulyatsi.*

ЭКСПРЕССИЯ ГЕНОВ ALG В ШТАММАХ AZOTOBACTER CHROOCOCCUM И ИЗМЕНЕНИЯ МАКРОМОЛЕКУЛЯРНОЙ СТРУКТУРЫ В УСЛОВИЯХ СОЛЕВОГО СТРЕССА: ОБЗОР ЛИТЕРАТУРЫ

Аннотация: *Солевой стресс является одним из важнейших экологических ограничивающих факторов для микроорганизмов, оказывая существенное влияние на клеточный метаболизм и системы генетической регуляции. Azotobacter chroococcum - свободноживущая диазотрофная бактерия, имеющая большое значение в сохранении плодородия почвы и биотехнологических процессах. В данной обзорной статье анализируются существующие научные данные о степени экспрессии гена альги в ответ на солевой стресс у штаммов A. chroococcum, биосинтезе альгината и изменениях в макромолекулярной структуре полимера. Также обсуждаются осмотическая адаптация клетки в условиях солевого стресса, ионный гомеостаз и защитные механизмы с помощью экзополисахаридов. Результаты обзора могут служить научной основой для понимания генетических и биохимических механизмов адаптации A. chroococcum, а также для селекции солеустойчивых биополимер-продуцирующих штаммов.*

Ключевые слова: *Azotobacter chroococcum, альгинный ген, альгинат, солевой стресс, экзополисахарид, осмотическая адаптация, регуляция генов.*

EXPRESSION OF ALG GENES AND CHANGES IN THE MACROMOLECULAR STRUCTURE OF AZOTOBACTER CHROOCOCCUM STRAINS UNDER SALT STRESS: A LITERATURE REVIEW.

Abstract: *Salt stress is one of the most important environmental limiting factors for microorganisms and has a significant impact on cellular metabolism and genetic regulation systems. Azotobacter chroococcum - as a free-living diazotrophic bacterium, is of great importance in maintaining soil fertility and biotechnological processes. This review article analyzes existing scientific data on the degree of expression of the alg gene in response to salt stress in A. chroococcum strains, alginate biosynthesis, and changes in the macromolecular structure of the polymer. Osmotic adaptation of the cell under conditions of salt stress, ion homeostasis, and defense mechanisms through exopolysaccharides are also discussed. The results of the review can serve as a scientific basis for understanding the mechanisms of genetic and biochemical adaptation of A. chroococcum, as well as for the selection of salt-tolerant biopolymer-producing strains.*

Keywords: *Azotobacter chroococcum, alg gene, alginate, salt stress, exopolysaccharide, osmotic adaptation, gene regulation.*

Kirish

So'nggi yillarda global iqlim o'zgarishlari va intensiv qishloq xo'jaligi natijasida tuproq tuzlanishining ortishi mikrobiotsenozlarning biologik barqarorligiga jiddiy tahdid solmoqda. Tuproqdagi yuqori miqdordagi natriy va xlor

ionlari mikroorganizmlarning hujayra ichidagi osmotik muvozanatini buzib, oqsil denaturatsiyasi, membrana shikastlanishi va oksidativ stress kabi jarayonlarni keltirib chiqaradi. Shu sababli, halofilik va halotolerant mikroorganizmlarning stressga javob mexanizmlarini o‘rganish ularning ekologik moslashuvini tushunishda muhim ahamiyat kasb etadi. *Azotobacter chroococcum* — erkin yashovchi, azot fiksatsiya qiluvchi bakteriya bo‘lib, tuproq ekotizimlarida azot aylanishining muhim ishtirokchisi hisoblanadi. Bu bakteriya stress sharoitlarida turli himoya mexanizmlarini ishga soladi, jumladan, ion almashinuvi tizimlari, antioksidant fermentlar, hamda himoya polimerlari sintezini kuchaytiradi. Ushbu polimerlardan biri — alginat, u hujayra yuzasida suv muvozanatini saqlash, ion oqimini cheklash va qurishdan himoya qilishda muhim rol o‘ynaydi. Alginat biosintezi alg gen kompleksi tomonidan boshqariladi. Ushbu genlar UDP-mannuron kislotadan polimer hosil bo‘lish, asetillanish, sekretsiya va makromolekulyar tuzilmaning shakllanish bosqichlarini nazorat qiladi. Oldingi tadqiqotlarda *Pseudomonas aeruginosa* turlarida tuz stressi ostida alg genlari ekspressiyasi kuchayishi kuzatilgan, biroq *Azotobacter chroococcum* bo‘yicha bu jarayon yetarlicha o‘rganilmagan. Tuz stressi sharoitida *A. chroococcum* da alg genining faollashuvi bilan birga alginatning fizik-kimyoviy xususiyatlarida, jumladan molekulyar massasi va M/G (mannuron/guluron) nisbati o‘zgarishi aniqlangan. Bu o‘zgarishlar bakteriyaning himoya qobig‘ini mustahkamlab, uning og‘ir sharoitlarda yashovchanligini oshiradi. Shu nuqtayi nazardan, alg genining ekspressiyasi va alginat strukturasidagi o‘zgarishlarni chuqur tahlil qilish *Azotobacter* jinsining stressga moslashuv strategiyasini tushunish uchun ilmiy asos yaratadi. Shu sababli, ushbu maqola mavjud adabiyotlar asosida *Azotobacter chroococcum* ning tuz stressiga javob mexanizmlarini, xususan alg genining regulyatsiyasi va alginat makromolekulyar tuzilmasidagi o‘zgarishlarni tizimli tahlil qiladi. Bu sharh kelgusidagi eksperimental tadqiqotlar uchun yo‘nalish berish, shuningdek tuz tolerant bakterial biopolimerlar ishlab chiqarishni optimallashtirishga xizmat qilishi kutilmoqda.

Azotobacter chroococcum va tuz stressiga javob mexanizmlari

Tuz stressi mikroorganizmlar uchun eng keng tarqalgan abiotik stress omillaridan biridir. Yuqori konsentratsiyadagi Na^+ va Cl^- ionlari hujayra ichidagi osmotik muvozanatni buzib, suv yo‘qotilishi, oqsillar denaturatsiyasi, lipid peroksidlanishi hamda hujayra metabolizmining izdan chiqishiga sabab bo‘ladi. Shu bois, tuz stressiga bardoshli mikroorganizmlar o‘z hayot faoliyatini saqlab qolish uchun bir nechta moslashuv mexanizmlarini ishga soladi. *Azotobacter chroococcum* hujayralari yuqori tuzlilikda ion homeostazini saqlash uchun natriy va kaliy oqimini qat’iy nazorat qiladi. Na^+ ionlarining ortiqcha kirib kelishi hujayra osmotik bosimini oshiradi, shuning uchun bakteriya Na^+/H^+ antiporterlar va K^+-transport tizimlari orqali ion almashinuvini boshqaradi. K^+ ioni osmotik bosimni muvozanatlashda asosiy kation sifatida xizmat qiladi. Shuningdek, Trk, Kup, va Kdp tipidagi kaliy transport tizimlarining faollashuvi bu jarayonni qo‘llab-quvvatlaydi [1,2]. Tuz stressi sharoitida hujayralar ichki osmotik bosimni tartibga solish uchun kichik molekulali kompatibil osmolaytlar — trehaloz, prolin, glutamat va betain kabi moddalarni to‘playdi. Ushbu birikmalar oqsillarni denaturatsiyadan himoya qiladi, suv molekulalarini bog‘laydi va hujayra ichidagi osmotik muvozanatni tiklaydi. *A. chroococcum* da trehaloz biosintezi bilan bog‘liq otsA va otsB genlarining faolligi tuz stressi ta’sirida ortgani aniqlangan. Bu genlar orqali hosil bo‘lgan trehaloz nafaqat osmoprotektor, balki antioksidant rolini ham bajaradi [3,4]. Tuz stressi natijasida hosil bo‘ladigan reaktiv kislorod turlari (ROS) hujayra komponentlariga zarar yetkazadi. A. chroococcum bu tahdiddan superoksid dismutaza (SOD), katalaza (CAT) va glutation reduktaza (GR) kabi fermentlar orqali himoyalanadi. Ushbu fermentlar erkin radikallarni neytrallashtiradi va hujayra redoks muvozanatini saqlab turadi. Shu bilan birga, peroksiredoksin va tioredoksin tizimlari ham stress davrida faollashadi, bu esa oqsil oksidlanishining oldini oladi [5]. Tuz stressiga javob mexanizmlarining yana bir muhim yo‘nalishi — ekzopolisaxarid (EPS) sintezi. *A. chroococcum* tuzli sharoitda hujayra atrofida qalin polisaxarid qobiq hosil qiladi, bu suv yo‘qotilishini kamaytiradi va ion oqimini cheklaydi. EPS tarkibida asosan alginat, shuningdek galaktan va mannan tipidagi polisaxaridlar mavjud. Alginat bakteriyaning tashqi muhit bilan bevosita aloqasini tartibga soluvchi barer sifatida harakat qiladi. Shu sababli, tuz stressi paytida alg genlarining faollashuvi EPS biosintezini kuchaytiradi. Biofilm shakllanishi ham himoya strategiyasi sifatida xizmat qiladi. Biofilm matritsasi hujayralarni tuz ionlaridan va suv tanqisligidan himoya qiladi. Tadqiqotlar shuni ko‘rsatadiki, A. chroococcum shtammlarida NaCl kontsentratsiyasi oshgan sari biofilm hosil bo‘lish intensivligi ham ortadi, bu esa yashovchanlikni oshiradi [6,7].

Stressga javob beruvchi genlar va regulyatorlar

Tuz stressi A. chroococcum ning transkripsion tarmog‘ida keng o‘zgarishlarni keltirib chiqaradi. Bunda rpoS, osmC, dnaK, va groEL genlari faollashib, umumiy stressga javob tizimini ishga soladi. RpoS sigma omili o‘sishning stasionar bosqichida va stress sharoitlarida ko‘plab himoya genlarining transkripsiyasini boshqaradi. DnaK va GroEL esa shaperon sifatida oqsillarni denaturatsiyadan saqlaydi va ularning to‘g‘ri konformatsiyasini tiklaydi. Bundan tashqari, A. chroococcum ning global regulyatorlari, jumladan AlgU (σ22) va AmrZ, alginat biosintezi bilan bevosita bog‘liq bo‘lib, tuz stressi paytida alg gen kompleksining ifodalanishiga ta’sir ko‘rsatadi. Bu esa bakteriyaning tuzlilikka chidamli fenotipini shakllantiruvchi muhim omil hisoblanadi [8]. Azotobacter chroococcum tuz stressiga qarshi ko‘p darajali himoya tizimiga ega: ion transporti va osmotik regulyatsiyadan tortib, antioksidant himoya va polisaxarid

biosintezigacha. Ushbu mexanizmlar o‘zaro integratsiyalashgan bo‘lib, ularning markazida alg gen kompleksi turadi. Shu sababli, keyingi bo‘limlarda aynan ushbu kompleksning tuzilmasi va regulyatsion mexanizmlarini batafsil tahlil qilish maqsadga muvofiqdir [9].

Alg gen kompleksi va alginat biosintezi mexanizmi

Alginat biosintezi — *Azotobacter chroococcum* hujayrasida polisaxarid hosil bo‘lishi, modifikatsiyasi va sekretsiyasini o‘z ichiga oluvchi ko‘p bosqichli jarayon bo‘lib, bu jarayon alg gen kompleksi tomonidan nazorat qilinadi. Ushbu gen kompleksi 12 dan ortiq genlarni o‘z ichiga oladi va ular polisaxaridning prekursordan yakuniy polimer holatiga o‘tishining barcha bosqichlarini boshqaradi [10]. Birinchi bosqichda, fruktoza-6-fosfat va mannoz-6-fosfatdan UDP-D-mannuron kislotasi hosil bo‘ladi. Bu jarayonda AlgA (phosphomannose isomerase/GDP-mannose pyrophosphorylase) va AlgD (GDP-mannose dehydrogenase) fermentlari asosiy rol o‘ynaydi[11]. UDP-mannuron kislotaning hosil bo‘lishi biosintez zanjirining tezlikni cheklovchi bosqichidir. Keyingi bosqichda Alg8 va Alg44 komplekslari yordamida mannuron kislotasi qoldiqlari polimer zanjirga ulanadi. Polimer hosil bo‘lgach, u periplazma orqali tashiladi, bu jarayon AlgE va AlgK oqsillari tomonidan boshqariladi. Nihoyat, polisaxaridning fizik-kimyoviy xususiyatlarini shakllantiruvchi acetyltransferase (AlgI, AlgJ, AlgF) fermentlari uning asetillanish darajasini belgilaydi [12]. Alg genlari ekspressiyasi ko‘plab transkripsion regulyatorlar orqali nazorat qilinadi. *A. chroococcum* da bu jarayonda eng muhim omil — AlgU (σ^22) sigma faktori bo‘lib, u RpoE oilasiga mansub va membrana stressiga javoban faollashadi [8]. Normada AlgU, MucA deb nomlanuvchi anti-sigma oqsil bilan kompleks hosil qilib, inaktiv holatda saqlanadi. Tuz stressi yoki oksidativ stress sharoitida MucA parchalanib, AlgU ajraladi va algD promotorini faollashtiradi [9]. Shuningdek, GacS/GacA ikki komponentli tizimi alg genlarining ekspressiyasini ikkilamchi signallar orqali modulyatsiya qiladi. Bu tizim *A. chroococcum* da stressga javob sifatida osmoprotektantlar sintezi va biofilm hosil bo‘lishi bilan koordinatsiyalangan tarzda ishlaydi [6].

Tuz stressi sharoitida alginat biosintezi

Tuz stressi sharoitida alg genlarining ifodalanish darajasi ortadi va bu hujayraning himoya mexanizmlaridan biri sifatida xizmat qiladi. Natijada sintezlangan alginat polimerining M/G nisbati (mannuron/guluron kislotasi) o‘zgaradi — bu esa polimerning ion almashinuv xususiyatlarini yaxshilaydi [13]. Alginatning yuqori M-tarkibli shakli Na^+ ionlariga nisbatan ko‘proq bog‘lanish qobiliyatiga ega bo‘lib, hujayra tashqi muhitidagi osmotik bosimni muvozanatlashtiradi [2]. Eksperimental ma’lumotlar shuni ko‘rsatadiki, 0.5–1.0 M NaCl konsentratsiyali muhitda *A. chroococcum* shtammlarida algD, alg8, va alg44 genlarining transkripsiyasi 2–3 baravar oshadi [3]. Shu bilan birga, polimerning o‘rtacha molekulyar massasi ham ortib, viskozligi yuqorilaydi — bu bakteriyaning biofilm qatlamini mustahkamlaydi va dehidratsiyadan himoya qiladi [6].

Alginatning makromolekulyar tuzilmasi va fiziologik ahamiyati

Alginat — bu β-D-mannuron (M) va α-L-guluron (G) kislotasi qoldiqlaridan tashkil topgan birikma polisaxarid bo‘lib, ular β(1→4) glikozid bog‘lari orqali o‘zaro ulanadi. Bu monomerlarning tartibi va nisbati polimerning fizik-kimyoviy xususiyatlarini, jumladan, viskozlik, ion bog‘lanish qobiliyati, va gel hosil qilish potentsialini belgilaydi [14]. Alginat molekulasidagi M/G nisbati bakteriya shtammi, o‘sish sharoiti va stress omillariga qarab o‘zgaradi. Azotobacter chroococcum da bu nisbat odatda 1.2–1.8 atrofida bo‘ladi, biroq tuz stressi (0.5–1.0 M NaCl) ta’sirida M bloklari miqdori ortadi, natijada polimerning moslashuvchanligi oshadi [6]. M-bloklar yuqori gidrofil xususiyatga ega bo‘lib, ular suvni ko‘proq ushlab turadi, shu orqali hujayraning dehidratsiyadan himoyasini ta’minlaydi [11]. Aksincha, G-bloklar ko‘proq Ca^{2+} va Na^+ kabi kationlarni bog‘lay oladi, bu esa ion almashinuv jarayonini boshqaradi. Natijada, alginatning yuqori G-tarkibli segmentlari hujayra yuzasida gel struktura hosil qilib, tashqi muhitdagi ionlarning o‘tishini cheklaydi [10]. Shu sababli, tuz stressi sharoitida polimerning G-segmentlari kuchayishi hujayra devorining mexanik barqarorligini oshiradi. *A. chroococcum* alginati odatda 200–600 kDa oralig‘idagi molekulyar massaga ega bo‘ladi, lekin stress sharoitida bu qiymat 800 kDa gacha oshadi [12]. Yuqori molekulyar massa polimerning reologik xususiyatlarini yaxshilaydi, ya’ni uning yopishqoqligi (viskozligi) ortadi. Bu xususiyat biofilm qatlamining mustahkamlanishiga, shuningdek, ion va suv o‘tkazuvchanligini cheklashga xizmat qiladi [13]. Shu tufayli, tuz stressi ostida sintez qilingan alginat nafaqat struktural, balki funksional himoya vositasi sifatida ham harakat qiladi. Alginat hujayra tashqi qobig‘ida namlik barqarorligini saqlash, oksidativ stressni kamaytirish, va ion muvozanatini saqlashda muhim rol o‘ynaydi. U biofilm hosil bo‘lishida asosiy komponentlardan biri bo‘lib, bakteriyani nafaqat tuz, balki issiqlik va quruqlik stresslaridan ham himoya qiladi [7]. Tuzli sharoitda biofilm qatlamining qalinligi oshadi, bu esa diffuziya jarayonlarini cheklab, hujayra ichidagi ion homeostazini barqarorlashtiradi. Shu bilan birga, alginatning gidrofil xususiyati tufayli u suv molekulalarini saqlab turadi va osmotik bosim farqini yumshatadi [15].

Xulosa va istiqbolli tadqiqot yo‘nalishlari

Tuz stressi mikroorganizmlarning hayotiy faoliyatiga sezilarli ta’sir ko‘rsatuvchi ekologik omillardan biridir. *Azotobacter chroococcum* singari erkin yashovchi diazotrof bakteriyalar ushbu stressni yengish uchun bir qator molekulyar va biokimyoviy moslashuv mexanizmlarini ishlab chiqqan. Adabiyotlar tahlili shuni ko‘rsatadiki, bu mexanizmlar

orasida osmotik regulyatsiya, antioksidant himoya tizimi, va ekzopolisaxarid (EPS) biosintezi eng muhim ahamiyatga ega. Ushbu jarayonlarning markazida joylashgan alg gen kompleksi bakteriya hujayrasida alginat biosintezini boshqaradi. algD, alg8, alg44, algE, va algK genlari turli bosqichlarda ishtirok etib, polisaxaridning shakllanishi, modifikatsiyasi va tashilishini ta'minlaydi. Stress sharoitida σ^22 (AlgU) sigma faktori faollashuvi orqali ushbu genlar transkripsiyasi kuchayadi va natijada hujayra tashqi qobig'ida alginat miqdori ortadi. Tuz stressi natijasida sintezlangan alginat polimerining M/G nisbati, asetillanish darajasi va molekulyar massasi o'zgaradi — bu esa uning fizik-kimyoviy xususiyatlarini o'zgartirib, bakteriyaning osmotik barqarorligini ta'minlaydi. Xususan, yuqori M-tarkibli alginatlar suvni ko'proq ushlab turadi, yuqori G-tarkibli segmentlar esa kation almashinuvi orqali hujayrani Na^+ toksikligidan himoya qiladi. Barcha bu o'zgarishlar *A. chroococcum*ning stressga moslashuvini kuchaytirib, biofilm hosil bo'lishini rag'batlantiradi, bu esa koloniyani suv tanqisligi yoki ion ortiqligidan himoya qiladi. Shu tariqa, alginat nafaqat strukturaviy komponent, balki fiziologik himoya molekulasi sifatida ham xizmat qiladi.

Istiqbolli tadqiqot yo'nalishlari

Adabiyot tahlili natijalariga ko'ra, bir necha yo'nalishlarda ilmiy izlanishlarni chuqurlashtirish maqsadga muvofiq:

1. Alg genlarining ekspressiya dinamikasi, *A. chroococcum* shtammlarida algD, alg8, va alg44 genlarining qPCR orqali transkripsion faolligini turli NaCl konsentratsiyalarida aniqlash. Bu natijalar orqali tuz stressining doza-ta'sir munosabatini o'rganish mumkin.

2. Alginatning makromolekulyar strukturasi va fizik-kimyoviy tahlili, FTIR, NMR yoki GPC (gel permeation chromatography) usullaridan foydalangan holda M/G nisbati, asetillanish darajasi va molekulyar massani aniqlash. Bu orqali gen ekspressiyasi va polimer xususiyatlari o'rtasidagi korrelyatsiyani aniqlash mumkin.

3. Stressga bardoshli biopolimer ishlab chiqaruvchi shtammlar seleksiyasi, turli halotolerant *Azotobacter* shtammlarini ajratish va ularning biopolimer sintezi potentsialini baholash. Sanoat miqyosida foydalanish uchun tuz tolerant biopolimer ishlab chiqarish platformalarini rivojlantirish.

4. Genetik muhandislik yondashuvlari, algU, mucA, va gacA genlarining CRISPR/Cas9 yoki plazmid asosida regulyatsiyasini o'zgartirish orqali alginat sintezini oshirish. Shu bilan birga, stressga bardoshli promotorlar orqali alg genlarining induktsiyalangan ekspressiya sistemalarini yaratish istiqbolli yo'nalish hisoblanadi.

Yakuniy xulosa

Xulosa qilib aytganda, *Azotobacter chroococcum* da tuz stressi sharoitida alginat biosintezi va alg gen ekspressiyasi muhim himoya mexanizmini tashkil etadi. Alginatning makromolekulyar tuzilmasidagi o'zgarishlar bakteriyaning ekologik moslashuvini yaxshilaydi va bu jarayonni chuqurroq o'rganish, kelgusida biotexnologik va agronomik amaliyotlarda stressga chidamli mikroorganizmlardan foydalanish imkonini beradi.

Annotatsiya. *Mazkur tadqiqotda kalamushlarda eksperimental o'tkir pankreatit modeli sharoitida bir nechta polifenol birikmalarning periferik qonning gematologik ko'rsatkichlariga ta'siri baholandi. Eksperimental o'tkir pankreatit laboratoriya kalamushlarida L-arginin gidroxlorid yordamida chaqirildi. Keyinchalik hayvonlarga Punigan (Punica granatum pustlog'i polifenollari), Kurchavka (Atraphaxis pyrifolia polifenollari), va Providin (Uzum danagi polifenollari), preparatlari 50 va 100 mg/kg dozalarda kiritilib, ularning periferik qonning asosiy gematologik ko'rsatkichlariga ta'siri o'rganildi va bunda periferik qon ko'rsatkichlarining sezilarli o'zgarishi kuzatildi. Tadqiq etilgan birikmalar orasida Providin eng yuqori samaradorlikni namoyon etib, ayniqsa 100 mg/kg dozada eritrotsitlar, gemoglobin va gematokrit ko'rsatkichlarining statistik ahamiyatli darajada tiklanishini ta'minladi. Olingan natijalar polifenol birikmalarning gematoprotektor xususiyatlarga ega ekanligini hamda ularni o'tkir pankreatitda qo'llash istiqbolli ekanligini ko'rsatdi.*

Kalit so'zlar*: o'tkir pankreatit, L-arginin gidroxlorid, polifenol birikmalar, Punigan, Kurchavka, Providin, gematologik ko'rsatkichlar, gematoprotektor ta'sir.*

ОЦЕНКА ВЛИЯНИЯ ПОЛИФЕНОЛЬНЫХ СОЕДИНЕНИЙ НА ГЕМАТОЛОГИЧЕСКИЕ ПОКАЗАТЕЛИ В ЭКСПЕРИМЕНТАЛЬНОЙ МОДЕЛИ ОСТРОГО ПАНКРЕАТИТА

Аннотация. *В данном исследовании оценивалось влияние нескольких полифенольных соединений на гематологические показатели периферической крови в условиях экспериментальной модели острого панкреатита у крыс. Экспериментальный острый панкреатит у лабораторных крыс вызывали с помощью L-аргинина гидрохлорида. Далее животным вводили препараты Пуниган (полифенолы коры Punica granatum), Курчавка (полифенолы Atraphaxis pyrifolia) и Провидин (полифенолы виноградных косточек) в дозах 50 и 100 мг/кг, изучали их влияние на основные гематологические показатели периферической крови, при этом наблюдалось значительное изменение показателей периферической крови. Среди исследованных соединений провидин показал наибольшую эффективность, особенно в дозе 100 мг/кг, обеспечивая статистически значимое восстановление показателей эритроцитов, гемоглобина и гематокрита. Полученные результаты показали, что полифенольные соединения обладают гемопротекторными свойствами и их применение при остром панкреатите является перспективным.*

Ключевые слова*: острый панкреатит, L-аргинин гидрохлорид, полифенольные соединения, Пуниган, Курчавка, Провидин, гематологические показатели, гемопротекторное действие.*

EVALUATION OF THE EFFECT OF POLYPHENOL COMPOUNDS ON HEMATOLOGICAL INDICATORS IN AN EXPERIMENTAL ACUTE PANCREATITIS MODEL

Abstract. *In this study, the effect of several polyphenolic compounds on peripheral blood parameters was evaluated under the conditions of an experimental acute pancreatitis model in rats. Experimental acute pancreatitis was induced in laboratory rats using L-arginine hydrochloride. Subsequently, animals were administered Punigan (Punica granatum bark polyphenols), Kurchavka*

(Atraphaxis pyrifolia polyphenols), and Providin (Grape seed polyphenols) at doses of 50 and 100 mg/kg; their effect on the main hematological parameters of peripheral blood was studied, and a significant change in peripheral blood parameters was observed. Among the studied compounds, Providine demonstrated the highest efficacy, ensuring a statistically significant restoration of erythrocyte, hemoglobin, and hematocrit levels, especially at a dose of 100 mg/kg. The results obtained showed that polyphenolic compounds possess hematoprotective properties and are promising for use in acute pancreatitis.

Keywords: *acute pancreatitis, L-arginine hydrochloride, polyphenolic compounds, Punigan, Curchavka, Providin, hematological indicators, hemoprotective effect.*

Kirish. O‘tkir pankreatit – oshqozon osti bezining keng tarqalgan yallig‘lanish kasalliklaridan biri bo‘lib, og‘ir kechishi va yuqori o‘lim ko‘rsatkichlari bilan ahamiyatli hisoblanadi. Kasallik patogenezida hazm fermentlarining erta faollashuvi, atsinar hujayralar shikastlanishi, yallig‘lanish jarayonlari va oksidlovchi stress muhim o‘rin tutadi. Reaktiv kislorod shakllarining ortiqcha hosil bo‘lishi hujayralardagi metabolik muvozanatni izdan chiqarib, yallig‘lanish mediatorlari sintezini kuchaytiradi hamda patologik jarayonning chuqurlashishiga olib keladi. Shu bois, antioksidant xususiyatlarga ega tabiiy birikmalardan foydalanish o‘tkir pankreatitni davolashning istiqbolli yo‘nalishlaridan biri sifatida qaralmoqda [1,2]. So‘nggi yillarda o‘simlik polifenollari antioksidant va yallig‘lanishga qarshi xususiyatlari tufayli o‘tkir pankreatitni davolashda istiqbolli biofaol birikmalar sifatida katta qiziqish uyg‘otmoqda. Tadqiqotlar ularning oksidlovchi stress, yallig‘lanish reaksiyalari, kalsiy gomeostazi buzilishi, autofagiya va apoptoz jarayonlarini modulyatsiya qilish orqali kasallik rivojlanishini cheklashi mumkinligini ko‘rsatmoqda. Shu sababli polifenol birikmalarning o‘tkir pankreatitdagi terapevtik salohiyatini baholash dolzarb ilmiy ahamiyat kasb etadi [3]. Zamonaviy diagnostika va davolash usullari takomillashib borayotganiga qaramay, kasallikning og‘ir shakllarini erta aniqlash muammosi dolzarbligicha qolmoqda. So‘ngi yillarda atom-kuch mikroskopiyasi usuli yordamida eritrotsit membranasining morfofunksional xususiyatlarini o‘rganish orqali o‘tkir pankreatitning og‘irlik darajasini baholash, kasallik kechishini prognoz qilish va uning og‘irlashuvini erta aniqlash uchun qo‘shimcha mezon sifatida xizmat qilishi mumkin [4,5]. Eksperimental o‘tkir pankreatitda periferik qon ko‘rsatkichlarining o‘zgarishi yallig‘lanish jarayonining og‘irligi va organizmning kompensator reaksiyalarini baholashda muhim ahamiyatga ega. Biroq mavjud tadqiqotlarning aksariyatida asosiy e’tibor biokimyoviy va morfologik ko‘rsatkichlarga qaratilgan bo‘lib, periferik qonning gematologik parametrlari hamda ularning farmakologik korreksiyasi yetarli darajada o‘rganilmagan. O‘tkir pankreatit kalamushlarda muayyan aminokislotalarning, jumladan L-arginin, L-ornitin, L-lizin va L-gistidinning yuqori dozalarini qorin bo‘shlig‘i ichiga yuborish orqali chaqiriladi. Bu moddalar oshqozon osti bezida bosqichma-bosqich rivojlanuvchi nekroz hamda u bilan bog‘liq shikastlanishlarni yuzaga keltiradi. Shuning uchun mazkur modellar nekrozlanuvchi o‘tkir pankreatitning molekular mexanizmlari va regeneratsiya jarayonlarini o‘rganish uchun qulay hisoblanadi [6]. Adabiyot ma’lumotlariga ko‘ra, L-arginin chaqirgan o‘tkir pankreatit modeli yallig‘lanish reaksiyasining kuchayishi, leykotsitlar infiltratsiyasi, trombotsitlar faollashuvi, mikrotsirkulyatsiya buzilishlari hamda periferik qonning ayrim gematologik ko‘rsatkichlarida o‘zgarishlar bilan tavsiflanadi [7,8]. Shu sababli mazkur ishda eksperimental o‘tkir pankreatit modelida polifenol birikmalarning periferik qon hujayralari ko‘rsatkichlariga ta’siri o‘rganilib, ularning gematoprotektor faolligi baholandi.

Tadqiqot usuli va materiallari. Tajribalar tana vazni 180±20 g bo‘lgan, 10-14 kun davomida karantin muddatini to‘liq o‘tagan sog‘lom oq laboratoriya kalamushlarida olib borildi. Hayvonlar erkin ozuqa va suv ichishi mumkin bo‘lgan standart vivariy sharoitida saqlanib, muhit harorati 22-24°C, nisbiy namlik 50-60% darajada hamda qilinishiga 12 soat qolganda hayvonlar ozuqasi ratsiondan olib tashlandi, ichimlik suvini qabul qilish esa erkin holatda bo‘ldi.

Eksperimental o‘tkir pankreatit modeli L-arginin gidroxlorid (L-arginine hydrochloride) yordamida chaqirildi. Ushbu model yuqori dozadagi L-argininning me’da osti bezi atsinar hujayralariga selektiv toksik ta’sir etishiga asoslangan bo‘lib, natijada mazkur hujayralarning distrofiyasi, interstitsial shishi, yallig‘lanish infiltratsiyasi va nekrotik o‘zgarishlari rivojlanadi. Mazkur model eksperimental pankreatitni chaqirishda keng qo‘llaniladigan va ishonchli usullardan biri hisoblanadi. L-arginin eritmasini tayyorlash. L-arginin gidroxlorid steril holatdagi 0,9%li natriy xlorid eritmasida eritilib, uning konsentratsiyasi 20% ni tashkil etdi. Eritmaning pH ko‘rsatkichi 7,0 -7,4 tashkil etib, bunda 1 N NaOH eritmasidan foydalanildi. Tayyorlangan eritma har bir tajriba oldidan yangi tayyorlanib, steril sharoitlarda qo‘llanildi. O‘tkir pankreatit chaqirish maqsadida kalamushlarga L-arginin gidroxlorid 2000 mg/kg dozada qorin bo‘shlig‘i ichiga yuborildi. Bunda preparat 1 soat interval bilan 2 marotaba kiritildi va umumiy yuborilgan doza 4000 mg/kg ni tashkil etdi. Salbiy nazorat (sog‘lom) guruhi hayvonlariga xuddi shu hajmda fiziologik eritma yuborildi. L-arginin kiritilgandan keyin hayvonlarda umumiy holsizlik, harakat faolligining pasayishi, piloreksiya va ozuqa qabul qilishning kamayishi kabi klinik belgilari kuzatildi. Pankreatit induksiya qilinganidan 48 soat o‘tgach, hayvonlardan 10 tasi tasodifiy tanlab olindi va ularning qon zardobida glyukoza (mmol/l) hamda amilaza fermenti miqdori CYPRESS DIAGNOSTICS (Belgiya) va HUMAN (Germaniya) kompaniyalarining yuqori sezgir test-to‘plamlari yordamida aniqlandi.

Olingan natijalar sog‘lom hayvonlar ko‘rsatkichlari bilan taqqoslanganda statistik jihatdan ahamiyatli farqlar qayd etildi. Shundan so‘ng pankreatit chaqirilgan hayvonlar quyidagi tajriba guruhlariga ajratildi va ular: 1-guruh salbiy nazorat (sog‘lom hayvonlar); 2-guruh pankreatit chaqirilgan, ammo davolanmagan ijobiy nazorat; 3,4-guruhlar Puniganning 50 va 100 mg/kg dozalari; 5,6-guruhlar Kurchavkaning 50 va 100 mg/kg dozalari; 7,8-guruhlar Providinning 50 va 100 mg/kg dozalari va 9-guruh qiyosiy Resveratrol preparatining 30 mg/kg terapevtik dozasi qo‘llanilgan guruhlardan iborat bo‘ldi. Pankreatit chaqirilgandan so‘ng 21 kun davomida hayvonlarga yuqorida keltirilgan polifenol birikmalar maxsus zond orqali oshqozonga kiritildi. Tajribaning so‘ngi kunida hayvonlarda periferik qon tahlili ya’ni: leykotsitlar - WBC, limfotsitlar foizi - Lym%, granulotsitlar foizi - Gran%, eritrotsitlar - RBC, gemoglobin- HGB, gematokrit - HCT, eritrotsitlarning o‘rtacha hajmi - MCV, eritrotsitlardagi o‘rtacha gemoglobin miqdori- MCH, eritrotsitlardagi o‘rtacha gemoglobin konsentratsiyasi - MCHC, PLT – trombotsitlarning miqdoriy ko‘rsatkichlari Dymind DH36 – yarimavtomatik gematologiya analizatorida (ishlab chikaruvchi: Shenzhen Dymind Biotechnology Co., Ltd. Xitoy) aniqlandi. Olingan tadqiqot natijalari. O‘tkir pankreatit modelida olingan gematologik natijalar tahlili shuni ko‘rsatdiki, L-arginin gidroxlorid yordamida chaqirilgan eksperimental pankreatit hayvonlarda yallig‘lanish jarayoni, gemopoez va periferik qon ko‘rsatkichlarida sezilarli o‘zgarishlarni yuzaga keltirdi. Olingan natijalar quyidagi 1-jadvalda keltirildi.

Izoh: *p<0,05; ** p<0,01; ***p<0,005 -ijobiy nazorat guruhiga nisbatan ahamiyatli farqlar; #p<0,09 - ijobiy nazorat guruhiga nisbatan tendensiya. leykotsitlar - WBC, limfotsitlar foizi - Lym%, granulotsitlar foizi - Gran%, eritrotsitlar - RBC, gemoglobin- HGB, gematokrit - HCT, eritrotsitlarning o‘rtacha hajmi - MCV, eritrotsitlardagi o‘rtacha gemoglobin miqdori- MCH, eritrotsitlardagi o‘rtacha gemoglobin konsentratsiyasi - MCHC, trombotsitlar- PLT.

Nazorat guruhida leykotsitlar (WBC) miqdori 7,4±0,45×10^9/l ni tashkil etib, sog‘lom hayvonlar ko‘rsatkichiga (10,1±2,05×10^9/l) nisbatan kamayganligi qayd etildi. Puniganning 50 va 100 mg/kg dozalari qo‘llanilgan guruhlarda mazkur ko‘rsatkichlar mos ravishda 6,3±1,9 va 7,0±1,9×10^9/l ni tashkil qilib, nazorat guruhi darajasida saqlanib qoldi. Olingan natijalar ushbu dozalar ta’sirida immun tizimi funksional holatining to‘liq tiklanmaganligini va yallig‘lanish jarayonini cheklashda kuchli ta’sir ko‘rsatmaganligini ko‘rish mumkin. Kurchavkaning 50 mg/kg dozasida WBC ko‘rsatkichi 10,9±2,2×10^9/l ga yetgan bo‘lib, bu sog‘lom hayvonlar darajasiga yaqinlashgan. Bu holat ushbu preparatning immun tizim faolligini qo‘llab-quvvatlashi va yallig‘lanish fonida hujayraviy javobni me’yorlashtirishi mumkinligini bildiradi. Biroq uning 100 mg/kg dozasida WBC 8,75±0,95×10^9/l bo‘lib, pastroq natija qayd etgan. Eng yaxshi natijalar Providin qo‘llanilgan guruhlarda kuzatildi. Xususan, uning 50 va 100 mg/kg dozalarida WBC miqdori mos ravishda 11,4±1,0×10^9/l va 12,3±1,8×10^9/lni tashkil etib, nazoratga nisbatan statistik ahamiyatli farqlar bilan ortdi, (p<0,01 va p<0,05). Limfotsitlar ulushi (Lym%) deyarli barcha guruhlarda barqaror saqlangan bo‘lsa-da, Puniganning 100 mg/kg dozasida ushbu ko‘rsatkich 0,87±0,006 gacha kamaydi va nazoratga nisbatan statistik ahamiyatli farq qayd etildi (p<0,01).

Eritrotsit ko‘rsatkichlari tahlilida nazorat guruhida eritrotsitlar, gemoglabin va gematokrit miqdorlarining sezilarli pasayishi kuzatildi. Bu o‘zgarishlar eksperimental pankreatit fonida intoksikatsiya, mikrotsirkulyatsiya buzilishi va gemodinamik o‘zgarishlar bilan bog‘liq bo‘lishi mumkin. Nazorat guruhida eritrotsitlar 3,8±0,3×10^{12}/l ni tashkil etgan bo‘lsa, sog‘lom hayvonlarda ushbu ko‘rsatkich 5,4±0,55×10^{12}/l bo‘ldi. Gemoglabin miqdori ham 192±27,3 g/l dan 137±15,1

g/l gacha kamaygan. Providin ayniqsa eritrotsitar tizim ko‘rsatkichlarini tiklashda yuqori samara ko‘rsatgan bo‘lib, 100 mg/kg dozada eritrotsitlar miqdorini 5,2±0,1×10¹²/l gacha tikladi va nazoratga nisbatan statistik ahamiyatli farqqa erishdi, ($p<0,005$). Shuningdek mazkur dozada gemoglabin miqdori 183,5±9,1 g/l gacha, gematokrit miqdori 0,580±0,02 gacha ortib, statistik ahamiyatli farqlar namoyon etdi ($p<0,05$ va $p<0,01$). MCV, MCH va MCHC ko‘rsatkichlarida katta farqlar kuzatilmagan. Bu holat pankreatit modeli asosan eritrotsitlar soni va gemoglobin miqdoriga ta’sir qilganini, ammo eritrotsitlarning morfometrik xususiyatlari nisbatan barqaror saqlanganligini ko‘rsatadi. Trombotsitlar (PLT) ko‘rsatkichlari tahlilida Providinning 100 mg/kg dozasi qo‘llanilgan guruhda nazoratga nisbatan ortish tendensiyasi kuzatildi, ($p<0,09$), biroq ushbu o‘zgarish statistik ishonarli bo‘lmadi. Resveratrol qo‘llanilgan guruhda esa trombotsitlar miqdorining ma’lum darajada pasayishi qayd etildi. Bu holat preparatlarning gemostaz tizimiga turlicha ta’sir ko‘rsatish xususiyatiga ega ekanligini ko‘rsatishi mumkin.

Xulosa. Eksperimental pankreatit modelida periferik qonning gematologik ko‘rsatkichlarida sezilarli o‘zgarishlar kuzatilib, nazorat guruhida leykotsitlar, eritrotsitlar, gemoglobin va gematokrit miqdorlarining kamayishi aniqlandi. Bu holat pankreatit fonida yallig‘lanish jarayoni, endogen intoksikatsiya, mikrotsirkulyator buzilishlar hamda immun-gemopoetik tizim faoliyatidagi o‘zgarishlar rivojlanganligini ko‘rsatadi. Tadqiq etilgan namunalar orasida Providin eng yuqori terapevtik samaradorlikni namoyon qildi. Xususan, uning 50 va 100 mg/kg dozalari leykotsitlar miqdorini nazorat guruhiga nisbatan statistik ahamiyatli darajada oshirib, immun tizimi faolligini tiklashga ijobiy ta’sir ko‘rsatdi. Shuningdek, Providinning 100 mg/kg dozasi eritrotsitlar, gemoglobin va gematokrit ko‘rsatkichlarini me’yorlashtirishda yuqori samara namoyon qilib, qon hosil bo‘lish jarayonlari va qonning funksional xususiyatlarini yaxshilashga ko‘maklashishi mumkinligi aniqlandi. Kruchavkaning 50 mg/kg dozasi leykotsitar ko‘rsatkichlarni yaxshilashda ijobiy ta’sir ko‘rsatgan bo‘lsa-da, yuqori dozada mazkur samaraning nisbatan kamayishi kuzatildi. Punigan guruhlarida esa gematologik ko‘rsatkichlarning nazorat darajasida saqlanib qolishi uning immun va gemopoetik tizimlarga ta’siri cheklanganligini ko‘rsatdi. Umuman olganda, olingan natijalar Providinning eksperimental pankreatit sharoitida immunomodulyator, gemoprotektor hamda gematologik ko‘rsatkichlarni me’yorlashtiruvchi potensial ta’sirga ega ekanligini ko‘rsatadi va uni keyingi farmakologik tadqiqotlar uchun istiqbolli ekanligini asoslaydi.

Annotatsiya:*Mazkur maqolada biologik xilma-xillikni saqlashda ekologik ta'limning ahamiyati ilmiy jihatdan yoritilgan. Biologik xilma-xillikning ekologik tizimlar barqarorligi, tabiiy resurslardan oqilona foydalanish hamda insoniyat taraqqiyotidagi o'rni tahlil qilingan. Shuningdek, biologik xilma-xillikning kamayishiga olib kelayotgan asosiy omillar, ekologik ta'limning mazmun-mohiyati va vazifalari hamda yosh avlodda ekologik madaniyatni shakllantirishning dolzarb masalalari ko'rib chiqilgan. O'zbekiston sharoitida biologik xilma-xillikni saqlash va ekologik ta'limni rivojlantirishning ustuvor yo'nalishlari ilmiy asoslangan.*
Kalit so'zlar: *biologik xilma-xillik, ekologik ta'lim, ekologik madaniyat, ekotizim, bioresurslar, barqaror rivojlanish, tabiatni muhofaza qilish, ekologik savodxonlik.*

ЗНАЧЕНИЕ ЭКОЛОГИЧЕСКОГО ОБРАЗОВАНИЯ В СОХРАНЕНИИ БИОЛОГИЧЕСКОГО РАЗНООБРАЗИЯ

Аннотация: *В данной статье с научной точки зрения раскрывается значение экологического образования в сохранении биологического разнообразия. Проанализирована роль биологического разнообразия в обеспечении устойчивости экологических систем, рациональном использовании природных ресурсов и развитии человеческого общества. Кроме того, рассмотрены основные факторы, приводящие к сокращению биологического разнообразия, сущность и задачи экологического образования, а также актуальные вопросы формирования экологической культуры у молодого поколения. Научно обоснованы приоритетные направления сохранения биологического разнообразия и совершенствования экологического образования в условиях Узбекистана.*
Ключевые слова: *биологическое разнообразие, экологическое образование, экологическая культура, экосистема, биоресурсы, устойчивое развитие, охрана природы, экологическая грамотность.*

THE ROLE OF ENVIRONMENTAL EDUCATION IN THE CONSERVATION OF BIODIVERSITY

Abstract: *This article scientifically examines the importance of environmental education in the conservation of biodiversity. The role of biodiversity in maintaining ecosystem stability, ensuring the rational use of natural resources, and supporting human development is analyzed. In addition, the main factors contributing to biodiversity loss, the essence and objectives of environmental education, and current issues related to the development of environmental culture among the younger generation are discussed. The study also substantiates the priority directions for biodiversity conservation and the improvement of environmental education in the context of Uzbekistan.*
Keywords: *biodiversity, environmental education, environmental culture, ecosystem, biological resources, sustainable development, nature conservation, environmental literacy.*

Kirish

XXI asrda ekologik muammolarning global tus olishi biologik xilma-xillikni saqlash masalasini insoniyat oldidagi eng muhim vazifalardan biriga aylantirdi. Aholi sonining ortishi, sanoatlashuv, urbanizatsiya jarayonlarining jadallashuvi va tabiiy resurslardan haddan tashqari foydalanish natijasida ko'plab biologik turlar soni qisqarib bormoqda. Bu holat nafaqat tabiatga, balki iqtisodiyot, qishloq xo'jaligi, sog'liqni saqlash va ijtimoiy taraqqiyotga ham bevosita ta'sir ko'rsatmoqda.

Biologik xilma-xillik insoniyat mavjudligining tabiiy asosi hisoblanadi. U tirik organizmlar, ularning genetik xususiyatlari va yashash muhitlarining rang-barangligini ifodalovchi murakkab biologik tizimdir. Bugungi kunda biologik xilma-xillikni saqlash masalasi ekologiya, biologiya, geografiya va pedagogika fanlarining dolzarb

yo‘nalishlaridan biri sifatida e’tirof etilmoqda. Mazkur jarayonda ekologik ta’lim muhim o‘rin tutib, jamiyatda ekologik ong va mas’uliyatni shakllantirishning samarali vositasi sifatida namoyon bo‘lmoqda.

Asosiy qism

Biologik xilma-xillik Yer yuzidagi barcha tirik organizmlar, ularning genetik xususiyatlari hamda ekotizimlarining turli-tumanligini ifodalovchi ilmiy tushunchadir. U genetik, tur va ekotizim darajalarida namoyon bo‘ladi. Genetik xilma-xillik tirik organizmlarning moslashuvchanligini ta’minlasa, tur xilma-xilligi ekotizimlarning barqaror faoliyat yuritishiga xizmat qiladi. Ekotizim xilma-xilligi esa tabiatdagi murakkab biologik va ekologik jarayonlarning uzluksizligini ta’minlaydi.

Biologik xilma-xillikning ahamiyati juda keng qamrovli hisoblanadi. Avvalo, u ekotizimlarning barqarorligini ta’minlaydi. Tabiatda mavjud bo‘lgan har bir organizm ma’lum ekologik vazifani bajaradi va ularning o‘zaro bog‘liqligi umumiy ekologik muvozanatning saqlanishiga xizmat qiladi. Bundan tashqari, biologik xilma-xillik atmosfera tarkibidagi gazlar muvozanatini saqlab turadi, tuproq unumdorligini oshiradi, suv resurslarining tabiiy tozalanishida muhim rol o‘ynaydi hamda inson hayoti uchun qulay ekologik muhit yaratadi.

Shuningdek, biologik resurslar oziq-ovqat mahsulotlari, dorivor vositalar, qishloq xo‘jaligi ekinlari va sanoat xomashyolarining asosiy manbalaridan biri hisoblanadi. Hozirgi kunda farmatsevtika sanoatida qo‘llanilayotgan ko‘plab dori vositalari o‘simlik va hayvonot dunyosidan olinadigan biologik moddalarga asoslanadi. Shu sababli biologik boyliklarning kamayishi ekologik xavfsizlik bilan bir qatorda iqtisodiy barqarorlikka ham salbiy ta’sir ko‘rsatadi.

Biologik xilma-xillikning qisqarishi zamonaviy ekologiyaning eng dolzarb muammolaridan biri hisoblanadi. O‘rmonlarning kesilishi, yer resurslaridan samarasiz foydalanish, sanoat va maishiy chiqindilarning ortishi, suv havzalarining ifloslanishi, global iqlim o‘zgarishi hamda biologik resurslardan nazoratsiz foydalanish natijasida ko‘plab turlar yashash muhiti va oziqa bazasidan mahrum bo‘lmoqda. Ayrim hollarda noqonuniy ovchilik va noyob turlarning yo‘q qilinishi biologik boyliklarning keskin kamayishiga olib kelmoqda.

Tadqiqotlar shuni ko‘rsatadiki, biologik xilma-xillikka tahdid solayotgan omillarning asosiy qismi antropogen xarakterga ega. Inson faoliyati natijasida yuzaga kelayotgan ekologik muammolar tabiiy muvozanatning buzilishiga sabab bo‘lmoqda. Natijada ayrim hududlarda biologik turlar soni kamayib, ekotizimlarning tiklanish imkoniyatlari cheklanmoqda. Bu esa o‘z navbatida iqtisodiy va ijtimoiy muammolarni ham yuzaga keltirmoqda.

Mazkur muammolarni bartaraf etishda ekologik ta’lim muhim pedagogik vosita sifatida namoyon bo‘ladi. Ekologik ta’lim shaxsda tabiat va jamiyat o‘rtasidagi munosabatlar haqidagi ilmiy bilimlarni shakllantirish, ekologik tafakkurni rivojlantirish hamda mas’uliyatli xulq-atvorni qaror toptirishga qaratilgan uzluksiz ta’lim jarayonidir. Uning asosiy maqsadi insonlarda ekologik ong va ekologik madaniyatni shakllantirish orqali atrof-muhitga nisbatan mas’uliyatli munosabatni rivojlantirishdan iborat.

Ekologik ta’limning muhim vazifalari qatoriga ekologik bilimlarni shakllantirish, tabiatga ehtiyotkorona munosabatni tarbiyalash, ekologik muammolarni tahlil qilish ko‘nikmalarini rivojlantirish, tabiatni muhofaza qilish faoliyatiga jalb etish hamda ekologik madaniyatni yuksaltirish kiradi. Ekologik ta’limning samaradorligi faqat nazariy bilimlar berish bilan emas, balki amaliy faoliyat orqali ham ta’minlanadi.

Biologik xilma-xillikni saqlashda ekologik ta’limning o‘rni beqiyosdir. Ekologik ta’lim orqali aholida tabiatni muhofaza qilish zarurati haqidagi tushunchalar shakllanadi, ekologik savodxonlik darajasi oshadi va tabiiy resurslardan oqilona foydalanish madaniyati rivojlanadi. Ta’lim jarayonida o‘quvchilar va talabalar mahalliy flora va fauna bilan yaqindan tanishadilar, yo‘qolib borayotgan turlarni muhofaza qilishning ahamiyatini anglaydilar hamda tabiatni asrashga doir amaliy faoliyatlarda ishtirok etadilar.

Ekologik ta’lim natijasida insonlarda chiqindilarni kamaytirish, qayta ishlash madaniyatini rivojlantirish, tabiiy resurslardan samarali foydalanish va atrof-muhitni muhofaza qilishga qaratilgan faol fuqarolik pozitsiyasi shakllanadi. Ayniqsa, yosh avlodda ekologik madaniyatni shakllantirish biologik xilma-xillikni saqlashning uzoq muddatli va samarali yo‘nalishlaridan biri hisoblanadi.

Maktablar, akademik litseylar, professional ta’lim muassasalari va oliy ta’lim tashkilotlarida ekologik ta’limni samarali tashkil etish muhim ahamiyatga ega. Ekologik loyihalar, dala amaliyotlari, ilmiy kuzatuvlar, ekologik ekspeditsiyalar, tabiatni muhofaza qilish aksiyalari hamda ko‘chat ekish tadbirlari yoshlarning ekologik dunyoqarashini kengaytiradi. Bunday faoliyatlar ekologik bilimlarning amaliyot bilan bog‘lanishiga xizmat qiladi.

Bugungi kunda ekologik ta’limni rivojlantirishda zamonaviy axborot-kommunikatsiya texnologiyalaridan foydalanish ham katta samara bermoqda. Raqamli platformalar, virtual laboratoriyalar, multimedia vositalari va interaktiv xaritalar biologik jarayonlarni chuqurroq o‘rganish imkoniyatini yaratadi. Natijada ta’lim oluvchilar ekologik muammolar mohiyatini yanada chuqurroq anglaydilar va biologik xilma-xillikni muhofaza qilish bo‘yicha amaliy ko‘nikmalarga ega bo‘ladilar.

Xalqaro tajriba shuni ko‘rsatadiki, biologik xilma-xillikni saqlashda jamoatchilik ishtiroki muhim omillardan biri hisoblanadi. Rivojlangan mamlakatlarda ekologik ta’lim faqat ta’lim muassasalari bilan cheklanib qolmay, balki milliy

bog‘lar, qo‘riqxonalar, muzeylar va ekologik markazlar faoliyati orqali ham amalga oshiriladi. Natijada ekologik masalalarda fuqarolarning faolligi ortib, tabiatni muhofaza qilish ishlari samaradorligi oshadi.

O‘zbekiston biologik resurslarga boy mamlakatlardan biri hisoblanadi. Respublikamiz hududida minglab o‘simlik va hayvon turlari uchraydi, ularning ayrimlari endemik va noyob turlar sirasiga kiradi. Biroq urbanizatsiya jarayonlarining jadallashuvi, aholi sonining ortishi, suv resurslariga bo‘lgan talabning kuchayishi va ayrim ekologik muammolar biologik xilma-xillikka salbiy ta’sir ko‘rsatmoqda.

Shu munosabat bilan mamlakatimizda ekologik ta’lim mazmunini zamonaviylashtirish, biologik xilma-xillik masalalarini o‘quv dasturlariga kengroq kiritish, ekologik targ‘ibot ishlarini kuchaytirish va yoshlarni tabiatni muhofaza qilishga qaratilgan loyihalarga keng jalb etish dolzarb vazifalardan biri hisoblanadi. Ayniqsa, raqamli ta’lim resurslaridan samarali foydalanish ekologik bilimlarning sifatini oshirishga xizmat qiladi.

Xulosa

Xulosa qilib aytganda, biologik xilma-xillik tabiatning eng muhim boyliklaridan biri bo‘lib, ekotizimlarning barqarorligi va insoniyat farovonligining asosiy omillaridan hisoblanadi. Biologik xilma-xillikning qisqarishi global ekologik muammolarni yanada kuchaytirishi mumkin. Shu sababli biologik resurslarni muhofaza qilish, ulardan oqilona foydalanish va tabiiy muvozanatni saqlash bugungi kunning muhim vazifalaridan biridir.

Mazkur vazifalarni amalga oshirishda ekologik ta’lim alohida o‘rin tutadi. Ekologik ta’lim orqali insonlarda ekologik bilim, madaniyat, mas’uliyat va tabiatga nisbatan ongli munosabat shakllanadi. Natijada biologik xilma-xillikni saqlashga qaratilgan amaliy faoliyat samaradorligi ortadi. Shuning uchun ta’lim tizimining barcha bosqichlarida ekologik ta’limni takomillashtirish va uning amaliy yo‘nalganligini kuchaytirish biologik xilma-xillikni saqlashning muhim shartlaridan biri sifatida qaralishi lozim.

THE ROLE OF ECOLOGICAL CULTURE IN ENVIRONMENTAL PROTECTION.

Annotation: *The article examines the importance of ecological culture in the modern world for environmental protection, as well as analyzes the impact of environmental problems on societal life. It highlights the essence and main content of nature conservation, along with its key objectives.*

Keywords*: Ecology, Environmental problem, Natural environment, Ozone layer, Aral Sea, Ecological culture.*

Kirish. Hozirgi zamonda ekologik muammolarni bartaraf etish butun insoniyat olamida muhim jihat sifatida qaralmoqda. Ekologik muammolarning yechimi o‘z nomi bilan birga tabiat va tabiatni asrash bilan uzviy bog‘liq. Ya’ni har bir jamiyat a’zosining ongida ekologik madaniyatga bo‘lgan bilimi ham ekologik muammolarni hal etish uchun katta o‘rin egallaydi. Ekologik muammolarni bartaraf etishning eng samarali chorasi sifatida qaralayotgan ekologik madaniyatni shakllantiring butun jahon xalqlarining ongida va qalbida ekologiyani asrashga bo‘lgan hislarni atrof muhitga bo‘lgan muhabbatni uyg‘otish lozim. “Yoshligimizdan bilamizki, ota-onalarimiz hovlini, atrofni pok saqlash kerakligini aytardi. Xalqimiz azaldan tuproqni, suvni, tabiatni muqaddas deb bilgan. “Birni kessang, o‘nni ek” degan dono maqol ham bejiz aytilmagan. Daraxt ekkan odamga uning savobi tegib turadi, deyilgan. Oilada farzand dunyoga kelsa, unga atab nihol ekilgan” deya aytadi muhtaram prezidentimiz Shavkat Mirziyoyev[1] .

Mavzuga oid adabiyotlar tahlili. Inson ekologik madaniyatini shakllantirishning nazariy asoslariga oid ilmiy tadqiqot materiallari, shuningdek, inson ekologik madaniyatiga jamiyat ehtiyojini ortishi [2,3], ekologik madaniyatni shakllantirishda ta'lim-tarbiyaning o‘rni ekologik muammolarning butun jahon aholisiga xavf solayotgani mutaxasislarning e’tiborini tortdi va o‘rganishga turtki berdi. Masalan: ekologik madaniyatni shakllantirishda diniy qadriyatlar va ta’lim tarbiyaning roli B. Omonov, F.Qilichev, B.N.Omonov, G.A.Ochilova, Kh.Sh.Nomozov, Y.KH.Manzarov, B.A.Ochilov [2], suv tanqisligi muammosi ekologik globallashuvga doir manbalar B.omonov, S.Mamashakirov tadqiqotlarida tahlil qilingan. Tahlil natijalarida yoshlar ekologik madaniyatini shakllantirishda milliy va umuminsoniy tamoyillarini ko‘zda tutuvchi, ta'lim-tarbiyaning roliga alohida e'tibor qaratilgan.

Tahlil va natijalar. Ekologik muammolar inson hayotiga salbiy ta'sir ko'rsatadi nafaqat muammo bor mintaqada balki unga qo'shni bo'lgan boshqa mamlakatdagi insonlar hayotiga ham salbiy tasir ko'rsatadi. Shu sababli ham har qanday ekologik muammolar dolzarbligi jahon miqyosigacha chiqib uning yechimini topish globallik xususiyatini hech qachon qo'ldan boy bermaydi. Shu bois, davlatimiz rahbari Birlashgan Millatlar Tashkiloti Bosh Assambleyasining 72-sessiyasida jahon hamjamiyati e'tiborini yana bir bor davrimizning o'tkir muammolaridan biri — Orolbo'yi hududidagi ekologik holatga qaratib, jumladan, bunday dedi: "Bugungi kunda har bir mamlakat bu jarayonning salbiy ta'sirini his etmoqda. Ming afsuski, bunday o'zgarishlar Markaziy Osiyo taraqqiyotiga ham katta xavf tug'dirmoqda"[4]. Darhaqiqat, Orolbo'yi hududlarida sodir bo'layotgan barcha muammolar nafaqat hudud aholisiga, yoki qo'shni davlatlarga balki butun jahon xalqlari uchun ham muhim muammo sifatida qaralmoqda. Aholining yashash tarzi uning so'g'lig'ini ham yomonlashtirishga sabab bo'lmoqda. Orolbo'yi muammosi qanaqadr manoda "inson o'z qo'li bilan yaratgan tabiat falokati" deb qarasak bo'ladi. 1960 yillar Orolbo'yi eng katta dengizlardan biri sifatida qaralgan lekin o'sha davrlarda unga quyiladigan Amudaryo va Sirdaryo daryolarining suvlari SSR siyosati sababli paxta sug'orishga rejasiz tarzda burib yuborilgan. Shu tarzda Orol dengiziga suv yetarli darajada quyilmasdan, dengiz quriy boshlagan.

Hozirgi davrda ekologik muammolar jamiyat hayotidadagi global muammolar sifatida qaralmoqda. Ekologik muammolarni bartaraf etishda eng birinchi navbatda insonlar ongida ekologik madaniyatni shakllantirish katta rol o'ynaydi." Biz tabiatni egallashimiz emas, balki u bilan uyg'unlikda yashashimiz kerak" deydi birinchi prezidentimiz Islom Karimov[5] Ekologik muammolar jamiyat hayotini taraqqiyot bosqichlaridan jadal o'tib borishi sekinlashadi. Bunday muammolar davlat rivojlanishini ham sekinlashtiradi. Bunday muammolar davlat rivojlanishini ham keskin ortga qaytarishga majburlaydi.

Tabiat- borliq. Tabiat bu butun insoniyat hayotidagi barcha ehtiyojlarini ta'minlab beradigan, o'simlik, hayvonot olami hattoki koinot bularning barchasi tabiat hisoblanadi. Jamiayning turli xil tarafdan o'zgarishi tabiatni qaysidir jihatdan kambag'allashishiga olib keladi, tabiatning kambag'allashuvi insonning farovonlashuviga sabab bo'ladi. Natijada insoniyat va tabiat o'rtasidagi munosabatning mutanosibligi izidan chiqadi. Bu esa aynan ekologik madaniyatning obyektiv shart sharoitlari rivojlanishi uchun keng yo'l ochib beradi. Biz qaysidir ma'noda tabiatga nisbatan "Insoniyatning moddiy olami" deb ham ta'rif berilgan. Haqiqatdan ham jamiyat hayoti va rivojlanishi uchun atrof muhit insonlar ehtiyojlarining barchasini qoplab beradi. Insoniyatning kiyinishi ozuqalanishi, hatto sog'lig'i ham mana shu tabiatning qay darajada borliq talabiga javob berishiga bog'liq hisoblanadi. Jamiyatda inson taraqqiyoti, uni har tomonlama rivojlanishi uchun ham atrof muhit katta rol o'ynaydi. ""Yashil iqtisodiyot" texnologiyalarini barcha sohalarga faol joriy etish orqali 2026-yilga qadar iqtisodiyotning energiya samaradorligini 20 foizga oshirish va havoga chiqariladigan zararli gazlar hajmini 20 foizga qisqartirish choralari ko'rilsin."[6] Yashil iqtisodiyot olib borilar ekan jamiyat hayotida eng zarur bo'lgan ekologik masalalarga katta etibor qaratiladi. Aholining har jabhada rivojlantirish uni taraqqiy etishiga olib keladigan masalalar ko'ndalang qo'yiladi.

Ma'naviy-ruhiy tiklanish insonning yerga va uning boyliklariga bo'lgan munosabatini ham o'z ichiga olishi lozim. Sivilizatsiya belgilarini asrab-avaylash qanchalik zarur bo'lsa, qishloq xo'jaligi ming yillar mobaynida butunlay sug'oriladigan dehqonchilikka asoslangan mintaqada yer va suvni asrab-avaylash ham shunchalik muhimdir. Yer, havo, suv va olov (Quyosh) Markaziy Osiyoda qadimdan e'zozlab kelingan, ajdodlarimizning zardushtiylikdan tortib to islomgacha bo'lgan barcha dinlari tomonidan munosib qadrlab kelingan.[6;145-b] Darhaqiqat, islom dini tarqalmasdan avval yurtimizda mavjud bo'lgan zardushrtiylik dinida ham tabiat juda yuksak baholangan. Shuningdek zardushtiylik dinida suv, olov, havo va tuproq toza unsur deb hisoblanib muqaddas sanalgan. Bu to'rt unsurnii bulg'ash eng og'ir jinoyat sifatida qaralgan. Va ular har doim "ezgu fikr, ezgu amal, ezgu so'z'' shiori ostida harakat qilishgan. Jamiyatdagi tum aholi ham zardushtiylik dinida yozilgan qonunlarni inkor qilmasdan tabiatni asrab tabiiy unsur hisoblangan havo suv va tuproqqa aslo ziyon yetkazishmagan. Aynan zardushtiylik dinida dehqonchilik va tabiatga bo'lgan har qanday ehtirom yovuzlikka qarshi kurashishning bir belgisi sifatida qaralgan.

Xulosa. Xulosa qilib aytkanda, ekologik madaniyatni oshirish jahon miqyosida global hisoblangan ko'plab muammolarning yechimi hisoblanadi. Jamiyatda aholi ongini oshirish, ularga ekologik madaniyatning naqadar butun dunyo xalqlari uchun zarur ekanligini chuqurroq anglatish lozim. Shunda ekologiya bilan bog'liq ko'plab muammolar yechim topadi va jamiyatdagi aholining yashash tarzi ham bir muncha osonlashadi.

Aholi ongida ekologik madaniyatni oshirish atrof muhitni muhofaza qilishda katta o'rin egallaydi negaki jamiyat rivoji xalqlar sog'ligi ham hozirgi kunda havoning ifloslanishi, ko'plab zavod va fabrikalardan chiqayotkan zararli tutunlar oqibatida o'zgarib bormoqda. Ekologik ong mana shunday dolzarb vazifalarni anglash ularni tahlil qilish jamiyatga yetqazish va ekologik muammolarga yechim topish va ozroq bo'lsada kelajakda yuzaga kelishi mumkin bo'lgan ekologik vaziyatlarni oldini olishga katta yordam beradi.

GAMMA-NURLANISH TA'SIRIDA SO'LAK BEZLARI SEKRETOR EPITELIYSIDAGI ULTRASTRUKTUR O'ZGARISHLAR VA ERTA APOPTOZ BELGILARINING MORFOLOGIK TAHLILI

Mirzabekov Ismoiljon Adxamjon o'g'li
Isayeva Shohida
Odam fiziologiyasi va HFX kafedrasi katta o'qituvchisi
Ismoiljonmirzabekov@gmail.com

Annotatsiya: *Maqolada tadqiqotda gamma-nurlanish ta'sirida so'lak bezlari sekretor epiteliysida yuzaga keladigan ultrastruktur o'zgarishlar hamda erta apoptoz belgilarining morfologik xususiyatlari tahlil qilindi. Ionlashtiruvchi nurlanishning hujayra organellalari, xususan mitoxondriyalar, endoplazmatik to'r, Golji kompleksi va sekretor granulalar holatiga ta'siri elektron-mikroskopik darajada baholandi. Tadqiqot natijalari gamma-nurlanish sekretor epiteliy hujayralarida sitoplazmatik vakuolizatsiya, mitoxondrial shishish, kristalar destruksiyasi, yadro xromatinining kondensatsiyasi hamda sekretor apparat faoliyatining izdan chiqishiga olib kelishini ko'rsatdi. Morfologik tahlil jarayonida apoptotik jarayonlarning dastlabki bosqichlariga xos bo'lgan yadro membranasi konturining notekislanishi, perinuklear bo'shliqning kengayishi, xromatin marginalizatsiyasi va hujayra hajmining kichrayishi kabi belgilar aniqlanishi mumkinligi asoslandi.*

Kalit so'zlar: *gamma-nurlanish, so'lak bezlari, sekretor epiteliy, ultrastruktura, apoptoz, elektron mikroskopiya, mitoxondriya, radiatsion shikastlanish.*

МОРФОЛОГИЧЕСКИЙ АНАЛИЗ УЛЬТРАСТРУКТУРНЫХ ИЗМЕНЕНИЙ В СЕКРЕТОРНОМ ЭПИТЕЛИИ СЛЮННЫХ ЖЕЛЕЗ ПОД ВОЗДЕЙСТВИЕМ ГАММА-ИЗЛУЧЕНИЯ

Аннотация: *В статье анализируются ультраструктурные изменения и морфологические особенности ранних признаков апоптоза в секреторном эпителии слюнных желез под воздействием гамма-излучения. На уровне электронной микроскопии оценено влияние ионизирующего излучения на состояние клеточных органелл, в частности митохондрий, эндоплазматического ретикулума, комплекса Гольджи и секреторных гранул. Результаты исследования показали, что гамма-излучение вызывает цитоплазматическую вакуолизацию, набухание митохондрий, разрушение кристаллов, конденсацию ядерного хроматина и нарушение работы секреторного аппарата в секреторных эпителиальных клетках. Установлено, что при морфологическом анализе можно обнаружить признаки, характерные для ранних стадий апоптотических процессов, такие как неровность контура ядерной мембраны, расширение перинуклеарного пространства, маргинализация хроматина и уменьшение размера клетки.*

Ключевые слова: *гамма-излучение, слюнные железы, секреторный эпителий, ультраструктура, апоптоз, электронная микроскопия, митохондрии, радиационное повреждение.*

MORPHOLOGICAL ANALYSIS OF ULTRASTRUCTURAL CHANGES IN THE SECRETORY EPITHELIUM OF THE SALIVARY GLANDS UNDER THE INFLUENCE OF GAMMA-RADIATION

Annotation: *The article analyzes the ultrastructural changes and morphological features of early apoptosis signs in the secretory epithelium of the salivary glands under the influence of gamma-radiation. The effect of ionizing radiation on the state of cell organelles, in particular mitochondria, endoplasmic reticulum, Golgi complex and secretory granules, was assessed at the electron microscopic level. The results of the study showed that gamma radiation causes cytoplasmic vacuolization, mitochondrial swelling, crystal destruction, nuclear chromatin condensation, and disruption of the secretory apparatus in secretory epithelial cells. It was established that during morphological analysis, signs characteristic of the early stages of apoptotic processes, such as irregularity of the nuclear membrane contour, expansion of the perinuclear space, chromatin marginalization, and cell size reduction, can be detected.*

Keywords: *gamma radiation, salivary glands, secretory epithelium, ultrastructure, apoptosis, electron microscopy, mitochondria, radiation damage.*

Kirish

Ionlashtiruvchi nurlanishning biologik tizimlarga ta’siri zamonaviy radiobiologiya va eksperimental morfologiyaning dolzarb yo‘nalishlaridan biri hisoblanadi. Xususan, gamma-nurlanish yuqori penetratsion xususiyatga ega bo‘lib, hujayra va to‘qimalarda erkin radikallar hosil bo‘lishini kuchaytiradi hamda oksidlovchi stressning rivojlanishiga sabab bo‘ladi. Ushbu jarayonlar natijasida hujayra membranalari, oqsillar, nuklein kislotalar va subhujayraviy organellalarning strukturaviy yaxlitligi buziladi. Nurlanish ta’siriga sezgir organlar qatorida so‘lak bezlari alohida ahamiyat kasb etadi, chunki ular yuqori metabolik faollikka ega bo‘lgan sekretor epiteliy hujayralaridan tashkil topgan bo‘lib, organizmning og‘iz bo‘shlig‘i homeostazini saqlashda muhim vazifalarni bajaradi.

So‘lak bezlarining radiatsion shikastlanishi klinik amaliyotda, ayniqsa bosh va bo‘yin sohasidagi o‘smalarni radioterapiya qilish jarayonida keng uchraydi. Bunday holatlarda bezlarning funksional faolligi pasayib, kserostomiya, disfagiya, og‘iz bo‘shlig‘i mikrobiotsenozining buzilishi hamda hayot sifatining yomonlashishi kuzatiladi. So‘nggi yillarda olib borilgan tadqiqotlar radiatsion shikastlanishning molekulyar va hujayraviy mexanizmlarini o‘rganishga qaratilgan bo‘lsa-da, sekretor epiteliyning ultrastruktur darajadagi o‘zgarishlari hamda apoptozning dastlabki morfologik belgilariga oid ma’lumotlar hali ham yetarli darajada tizimlashtirilmagan.

Apoptoz ionlashtiruvchi nurlanish ta’sirida yuzaga keladigan asosiy hujayraviy javoblardan biri bo‘lib, to‘qima homeostazini saqlash va genetik jihatdan shikastlangan hujayralarni eliminatsiya qilishda muhim ahamiyatga ega. Biroq apoptozning haddan tashqari faollashuvi sekretor hujayralar sonining kamayishiga, bez parenximasining degenerativ o‘zgarishlariga va funksional yetishmovchilikka olib kelishi mumkin. Shu sababli gamma-nurlanishdan keyin rivojlanadigan ultrastruktur o‘zgarishlarni va apoptozning erta bosqichlarini aniqlash radiatsion shikastlanish patogenezini chuqurroq tushunish imkonini beradi.

Mazkur tadqiqotning maqsadi gamma-nurlanish ta’sirida so‘lak bezlari sekretor epiteliysida yuzaga keladigan ultrastruktur o‘zgarishlarni elektron-mikroskopik darajada baholash hamda erta apoptoz belgilarining morfologik xususiyatlarini aniqlashdan iborat.

Adabiyotlar tahlili

Ionlashtiruvchi nurlanishning biologik to‘qimalarga ta’siri ko‘plab tadqiqotchilar tomonidan o‘rganilgan bo‘lib, gamma-nurlanishning hujayra darajasidagi shikastlovchi ta’siri asosan erkin radikallar hosil bo‘lishi va oksidlovchi stressning kuchayishi bilan bog‘liqligi aniqlangan [1]. Radiatsiya ta’sirida yuzaga keladigan reaktiv kislorod shakllari lipid peroksidlanishi, oqsillar denaturatsiyasi va DNK molekulalarining zararlanishiga olib keladi [2].

So‘lak bezlari radiatsiyaga nisbatan yuqori sezuvchan organlardan biri hisoblanadi. Grundmann va hamkorlari tomonidan o‘tkazilgan tadqiqotlarda bosh-bo‘yin sohasiga radioterapiya qo‘llanilgandan keyin so‘lak bezlarining sekretor faoliyati keskin pasayishi qayd etilgan [3]. Coppes va hamkorlari radiatsiya natijasida asinar hujayralarning funksional buzilishi kserostomiya rivojlanishining asosiy sababi ekanligini ko‘rsatganlar [4].

Elektron mikroskopik tadqiqotlar gamma-nurlanishdan so‘ng sekretor epiteliy hujayralarida ultrastruktur o‘zgarishlar yuz berishini tasdiqlaydi. Stephens va Mortonlar mitoxondriyalarning shishishi, kristalarning parchalanishi hamda endoplazmatik to‘r sisternalarining kengayishini kuzatganlar [5]. Baum va Bodner esa sekretor granulalar sonining kamayishi va Golji apparati tuzilishining buzilishini radiatsion shikastlanishning muhim belgilaridan biri sifatida ta’riflagan [6]. Hujayralarning radiatsiyaga javob reaksiyalaridan biri apoptoz hisoblanadi. Kerr va hamkorlari tomonidan birinchi marta tavsiflangan ushbu jarayon genetik jihatdan boshqariladigan hujayra o‘limi shakli sifatida e’tirof etilgan [7]. Keyingi tadqiqotlarda gamma-nurlanish DNK zanjirlarining uzilishi orqali p53 signal yo‘lini faollashtirishi va apoptotik mexanizmlarni ishga tushirishi aniqlangan [8].

Kumar va Abbasning ma’lumotlariga ko‘ra, apoptozning erta bosqichlarida xromatin kondensatsiyasi, yadro membranasining deformatsiyasi va hujayra hajmining kichrayishi kuzatiladi [9]. Elmore ushbu belgilarni apoptotik jarayonning morfologik markerlari sifatida tavsiflagan [10]. Radiobiologik izlanishlarda mitoxondriyalarning markaziy o‘rni alohida ta’kidlanadi. Green va Reed mitoxondrial membrana o‘tkazuvchanligining ortishi sitoxrom-c ning sitoplazmaga chiqishiga sabab bo‘lishini ko‘rsatganlar [11]. Bu esa kaspazalar kaskadining faollashuvi orqali hujayra o‘limiga olib keladi [12].

So‘nggi yillarda radiatsion shikastlanishlarda oksidlovchi stress va apoptoz o‘rtasidagi bog‘liqlik keng o‘rganilmoqda. Azzam va hamkorlari radiatsiya ta’sirida ROS miqdori ortishi apoptotik signallarning kuchayishiga sabab bo‘lishini aniqlaganlar [13]. Pawlik va Keyomarsi esa radiatsiyadan keyingi hujayraviy javoblar dozaga bog‘liq ravishda kechishini qayd etganlar [14].

Shuningdek, radioprotektiv vositalar yordamida sekretor epiteliy hujayralarini himoya qilish imkoniyatlari ham tadqiq qilinmoqda. Konings va hamkorlari antioksidant preparatlarning radiatsion shikastlanish oqibatlarini kamaytirishda muhim ahamiyatga ega ekanligini ta’kidlaganlar [15].

Mavjud adabiyotlar gamma-nurlanishning so‘lak bezlari sekretor epiteliysida chuqur ultrastruktur o‘zgarishlar va apoptotik jarayonlarni yuzaga keltirishini ko‘rsatadi. Biroq erta apoptotik belgilar hamda ularning ultrastruktur ko‘rinishlari bo‘yicha ma’lumotlar yetarli emasligi ushbu yo‘nalishda qo‘shimcha tadqiqotlar olib borishni talab qiladi.

Tadqiqot metodologiyasi

Tadqiqot gamma-nurlanishning so‘lak bezlari sekretor epiteliysiga ta’sirini ultrastruktur va morfologik jihatdan baholash maqsadida eksperimental sharoitda amalga oshirildi. Tadqiqot obyekti sifatida jinsiy yetilgan laboratoriya kalamushlari (*Rattus norvegicus*) tanlandi. Hayvonlar standart vivariy sharoitida saqlanib, oziqlantirish va parvarishlash xalqaro bioetika talablariga muvofiq olib borildi.

Eksperiment davomida hayvonlar nazorat va tajriba guruhlariga ajratildi. Tajriba guruhi maxsus gamma-nurlanish manbai yordamida bir martalik nurlantirildi. Nurlantirishdan keyin so‘lak bezlari to‘qimalari turli vaqt oralig‘ida olinib, elektron mikroskopik va gistologik tekshiruvlardan o‘tkazildi.

1-jadval

Tadqiqot dizayni va eksperimental guruhlar

Guruh	Hayvonlar soni (n)	Ta’sir turi	Kuzatuv muddati
Nazorat guruhi	10	Nurlantirilmagan	24 soat
Tajriba I	10	2 Gy gamma-nurlanish	24 soat
Tajriba II	10	4 Gy gamma-nurlanish	24 soat
Tajriba III	10	6 Gy gamma-nurlanish	24 soat

So‘lak bezlari namunalari 2,5 % glutaraldegid eritmasida fiksatsiya qilinib, fosfat buferida yuvildi hamda 1 % osmiy tetroksid yordamida postfiksatsiyadan o‘tkazildi. Keyinchalik namunalar spirtlarning o‘suvchi konsentratsiyalarida suvsizlantirilib, epoksid smolasiga joylashtirildi. Ultrayupqa kesmalar ultramikrotom yordamida tayyorlandi va uranilatsetat hamda qo‘rg‘oshin sitrat bilan kontrastlandi.

Ultrastruktur tahlil transmisson elektron mikroskop yordamida amalga oshirildi. Tadqiqot davomida sekretor hujayralarning yadrosi, mitoxondriyalari, endoplazmatik to‘ri, Golji apparati va sekretor granulalaridagi o‘zgarishlar baholandi.

2-jadval

Baholangan ultrastruktur ko‘rsatkichlar

Ko‘rsatkich	Baholash mezoni
Mitoxondriya holati	Shishish, kristalar destruksiyasi
Yadro tuzilishi	Xromatin kondensatsiyasi, marginalizatsiya
Endoplazmatik to‘r	Sisternalarning kengayishi
Golji apparati	Fragmentatsiya darajasi
Sekretor granulalar	Soni va zichligi
Apoptoz belgilari	Apoptotik tanachalar, yadro parchalanishi

Erta apoptoz belgilarini aniqlash maqsadida morfometrik tahlil ham o‘tkazildi. Hujayralarda xromatin kondensatsiyasi, yadro membranasining deformatsiyasi, sitoplazma zichlashishi va apoptotik tanachalarning shakllanishi hisobga olindi.

3-jadval

Morfologik tahlilda qo‘llanilgan mezonlar

Belgilar	Ball tizimi
O‘zgarish kuzatilmagan	0
Kuchsiz o‘zgarish	1
O‘rtacha o‘zgarish	2
Kuchli o‘zgarish	3

Olingan natijalar Microsoft Excel va IBM SPSS Statistics dasturlari yordamida statistik qayta ishlanib, ma’lumotlar M±m ko‘rinishida ifodalandi. Guruhlar o‘rtasidagi farqlar Student t-testi hamda ANOVA usuli orqali baholandi. $p<0,05$ qiymati statistik jihatdan ishonchli deb qabul qilindi.

Natijalar va muhokama

Gamma-nurlanishning so‘lak bezlari sekretor epiteliysiga ta’sirini o‘rganish natijasida hujayra ultrastrukturasida dozaga bog‘liq ravishda rivojlanadigan morfologik va submorfologik o‘zgarishlar aniqlanib, ular sekretor faoliyatning buzilishi hamda apoptotik jarayonlarning faollashuvi bilan tavsiflandi. Nazorat guruhidagi preparatlarda asinar hujayralar normal ultrastruktur tuzilishga ega bo‘lib, yadro membranalari yaxlit, mitoxondriyalar zich kristali va sekretor granulalar bir tekis joylashganligi kuzatildi.

2 Gy dozada nurlantirilgan hayvonlarda sekretor hujayralarning ayrim qismida sitoplazmatik vakuolizatsiya va mitoxondriyalarning yengil shishishi qayd etildi. Biroq hujayralarning umumiy arxitekturasi sezilarli darajada saqlanib qolgan. 4 Gy dozada esa mitoxondriya kristalarining qisman destruksiyasi, endoplazmatik to‘r sisternalarining

kengayishi va Golji apparatining fragmentatsiyasi kuzatildi. Eng yaqqol o‘zgarishlar 6 Gy gamma-nurlanish ta’sirida aniqlanib, sekretor granulalar sonining kamayishi, yadro xromatinining kondensatsiyasi va hujayra membranalarining deformatsiyasi qayd etildi.

4-jadval

Gamma-nurlanish ta’sirida ultrastruktur o‘zgarishlarning ifodalanish darajasi (ballarda, M±m)

Ko‘rsatkich	*Nazorat*	*2 Gy*	*4 Gy*	*6 Gy*
Mitoxondriya shishishi	0,2±0,1	1,1±0,2*	2,0±0,2**	2,8±0,1***
Kristalar destruksiyasi	0,1±0,1	0,8±0,2*	2,1±0,1**	2,9±0,1***

Sekretor granulalar kamayishi	0,3±0,1	1,2±0,2*	2,3±0,1**	3,0±0,1***

Izoh: *p<0,05; **p<0,01; ***p<0,001 nazorat guruhiga nisbatan.

Apoptozning morfologik belgilarini baholash natijasida gamma-nurlanish dozasi ortishi bilan apoptotik o‘zgarishlar soni ham ortib borishi aniqlandi. Xususan, yadro xromatinining periferiyaga siljishi, yadro membranasi notekisligi va apoptotik tanachalar hosil bo‘lish chastotasi tajriba guruhlarida sezilarli ravishda oshdi.

5-jadval

Apoptozning erta morfologik belgilarining uchrash darajasi (%)

Ko‘rsatkich	*Nazorat*	*2 Gy*	*4 Gy*	*6 Gy*
Xromatin kondensatsiyasi	3,4±0,5	14,8±1,3*	29,7±2,1**	48,6±2,7***
Yadro deformatsiyasi	2,8±0,4	11,2±1,0*	24,9±1,8**	42,3±2,5***
Sitoplazma zichlashishi	3,1±0,5	13,5±1,2*	27,6±2,0**	45,7±2,4***
Apoptotik tanachalar	1,5±0,3	6,8±0,8*	15,4±1,5**	31,8±2,1***

Natijalar shuni ko‘rsatdiki, gamma-nurlanishning hujayralarga ta’siri avvalo energiya almashinuvi markazi bo‘lgan mitoxondriyalarda namoyon bo‘ladi. Mitoxondrial membranalar yaxlitligining buzilishi oksidlovchi stress kuchayishiga va apoptotik signal yo‘llarining faollashuviga olib keladi. Mitoxondriya kristalarining parchalanishi ATP sintezi pasayishini ko‘rsatib, sekretor hujayralarning funksional yetishmovchiligi bilan bog‘liq bo‘lishi mumkin.

Aniqlangan natijalar Coppes va hamkorlari hamda Konings va hamkorlarining radiatsion shikastlanish bo‘yicha ma’lumotlari bilan mos keladi. Ularning tadqiqotlarida ham sekretor hujayralarda mitoxondrial destruksiya va sekretor granulalar kamayishi kuzatilgan. Bizning natijalarimiz esa ushbu o‘zgarishlarning apoptotik markerlar bilan uzviy bog‘liqligini ko‘rsatdi. Gamma-nurlanish so‘lak bezlari sekretor epiteliysida ultrastruktur destruktiv o‘zgarishlarni yuzaga keltiradi hamda apoptozning dastlabki bosqichlarini faollashtiradi. O‘zgarishlarning og‘irligi nurlanish dozasi ortishi bilan kuchayib boradi va bu holat bezlarning sekretor funksiyasi pasayishining asosiy patogenetik omillaridan biri hisoblanadi.

Xulosa

O‘tkazilgan tadqiqotlar natijasida gamma-nurlanishning so‘lak bezlari sekretor epiteliysiga sezilarli darajada zarar yetkazishi va hujayra ultrastrukturasida chuqur morfologik o‘zgarishlarni yuzaga keltirishi aniqlandi. Nurlanish ta’sirida mitoxondriyalarning shishishi, kristalar destruksiyasi, endoplazmatik to‘r sisternalarining kengayishi, Golji apparatining fragmentatsiyasi hamda sekretor granulalar sonining kamayishi kuzatildi. Ushbu o‘zgarishlar hujayralarning metabolik va sekretor faoliyati izdan chiqayotganligini ko‘rsatadi.

Gamma-nurlanish dozasi ortishi bilan apoptotik jarayonlarning faollashuvi kuchayib borishi qayd etildi. Xromatin kondensatsiyasi, yadro membranasining deformatsiyasi, sitoplazma zichlashishi va apoptotik tanachalar hosil bo‘lishi kabi belgilar sekretor epiteliy hujayralarida erta apoptozning muhim morfologik markerlari ekanligi aniqlandi. Ayniqsa, 6 Gy dozasida ushbu ko‘rsatkichlarning maksimal darajaga yetishi radiatsion shikastlanishning dozaga bog‘liq xarakterga ega ekanligini tasdiqladi.

Olingan natijalar gamma-nurlanishning so‘lak bezlari to‘qimalarida oksidlovchi stressni kuchaytirishi, mitoxondrial disfunksiyani yuzaga keltirishi va natijada hujayra o‘limi mexanizmlarini faollashtirishini ko‘rsatdi. Bu esa radiatsion sialadenit, kserostomiya va bezlar sekretsiyasi bilan bog‘liq boshqa patologik holatlarning rivojlanishida muhim patogenetik omil hisoblanadi.

Gamma-nurlanish so‘lak bezlari sekretor epiteliysida ultrastruktur destruktiv o‘zgarishlar va apoptozning erta belgilarini yuzaga keltiruvchi asosiy omillardan biri ekanligi aniqlandi. Mazkur tadqiqot natijalari radiatsion shikastlanishning hujayraviy-molekulyar mexanizmlarini chuqurroq tushunishga xizmat qiladi hamda kelgusida radioprotektiv preparatlar va regenerativ terapiya usullarini ishlab chiqish uchun muhim nazariy asos bo‘lib xizmat qilishi mumkin.

Annotatsiya: *Ushbu tadqiqot past dozali gamma nurlanishning (1 va 2 Gr) kalamushlarning quloq oldi, jag‘ va til osti so‘lak bezlaridagi amilolitik faollikka ta’sirini hamda glabridin, pulikarin va rutin bioflavonoidlarining radioprotektorlik xususiyatlarini o‘rganishga bag‘ishlangan. Kalamushlar Co^{60} manbasi yordamida nurlantirilib, bioflavonoidlar nurlanishdan oldin va keyin og‘iz orqali yuborilgan. Natijalar shuni ko‘rsatdiki, gamma nurlanish so‘lak bezlarida amilaza fermenti faolligining sezilarli va dozaga bog‘liq ravishda pasayishiga olib keladi, bu ayniqsa nurlanishdan keyingi 10-20 kunlarda yaqqol namoyon bo‘ladi. Bioflavonoidlarni qo‘llash ushbu salbiy ta’sirni sezilarli darajada kamaytirib, amilolitik faollikni saqlab qolish va uning tiklanishini tezlashtirishga yordam berdi. Eng yuqori radioprotektorlik samaradorligini rutin ko‘rsatdi, undan keyingi o‘rinlarni pulikarin va glabridin egalladi. Olingan ma’lumotlar ushbu bioflavonoidlarni, ayniqsa pulikarin va rutinni, nurlanish ta’sirida so‘lak bezlari funksiyasini himoya qilish uchun istiqbolli tabiiy vositalar sifatida baholashga asos bo‘ladi.*

Kalit so‘zlar: *gamma nurlanish, so‘lak bezlari, amilolitik faollik, radioprotektorlar, bioflavonoidlar, glabridin, pulikarin, rutin, kalamush, oksidlanish stressi.*

УЛЬТРАСТРУКТУРНЫЕ ИЗМЕНЕНИЯ В СЕКРЕТОРНОМ ЭПИТЕЛИИ СЛЮННЫХ ЖЕЛЁЗ ПОД ВОЗДЕЙСТВИЕМ ГАММА-ИЗЛУЧЕНИЯ И МОРФОЛОГИЧЕСКИЙ АНАЛИЗ РАННИХ ПРИЗНАКОВ АПОПТОЗА

Аннотация: Данное исследование посвящено изучению влияния низкодозового гамма-излучения (1 и 2 Гр) на *амилолитическую активность в околоушных, подчелюстных и подъязычных слюнных железах крыс, а также радиопротекторных свойств биофлавоноидов глабридина, пуликарина и рутина. Крысы облучались с использованием источника Co^{60}, биофлавоноиды вводились перорально до и после облучения. Результаты показали, что гамма-излучение приводит к значительному и дозозависимому снижению активности фермента амилазы в слюнных железах, что особенно ярко проявляется на 10–20 сутки после облучения. Применение биофлавоноидов значительно уменьшало это негативное воздействие, способствуя сохранению амилолитической активности и ускорению её восстановления. Наивысшую радиопротекторную эффективность проявил рутин, за ним следовали пуликарин и глабридин. Полученные данные позволяют рассматривать данные биофлавоноиды, особенно пуликарин и рутин, в качестве перспективных природных средств для защиты функции слюнных желёз при воздействии ионизирующего излучения.*

Ключевые слова: *гамма-излучение, слюнные железы, амилолитическая активность, радиопротекторы, биофлавоноиды, глабридин, пуликарин, рутин, крысы, окислительный стресс.*

ULTRASTRUCTURAL CHANGES IN THE SECRETORY EPITHELIUM OF SALIVARY GLANDS UNDER GAMMA IRRADIATION AND MORPHOLOGICAL ANALYSIS OF EARLY APOPTOSIS SIGNS

Abstract: *This study investigates the effect of low-dose gamma radiation (1 and 2 Gy) on amylolytic activity in the parotid, submandibular, and sublingual salivary glands of rats, as well as the radioprotective properties of the bioflavonoids glabridin, pulicarin, and rutin. The rats were irradiated using a Co^{60} source, and the bioflavonoids were administered orally before and after irradiation. The results demonstrated that gamma radiation leads to a significant and dose-dependent decrease in amylase enzyme activity in the salivary glands, particularly evident on days 10–20 post-irradiation. The application of bioflavonoids significantly mitigated this negative effect, helping to preserve amylolytic activity and accelerating its recovery. Rutin exhibited the highest radioprotective efficacy, followed by pulicarin and glabridin. The obtained data provide a basis for evaluating these bioflavonoids, especially pulicarin and rutin, as promising natural agents for protecting salivary gland function under ionizing radiation exposure.*

Keywords: *gamma radiation, salivary glands, amylolytic activity, radioprotectors, bioflavonoids, glabridin, pulicarin, rutin, rats, oxidative stress.*

Rezyume. Ushbu maqolada kalamush quloq oldi, jag‘ va til osti so‘lak bezlarida amilolitik faolligiga 1 va 2-grey (gr) gamma nurlanishga glabridin, pulikarin va rutin bioflavonoidlarining ta’siri aniqlangan. Kalamushlar Terabalt-80 apparati yordamida So60 kvant berib nurlantirilgan. Nurlantirish dozasi 0,86-0,85 Gr/min hamda yutilgan doza miqdori 1 va 2 gr. ni tashkil etgan. Tajribalar kalamushlar nurlanish olgandan keyin va bioflavonoidlar yuborilgandan keyin 1, 3, 10, 20, 30 va 60 kunlarda quloq oldi, jag‘ va til osti so‘lak bezlarida amilolitik faollik o‘rganilgan.

Kirish. So‘nggi yillarda o‘tkazilgan tadqiqotlar shuni ko‘rsatadiki, quyi dozadagi gamma nurlanish to‘qimalarda chuqur morfologik destruksiya chaqirmasa-da, hujayra va molekula darajasida jiddiy funksional buzilishlarni yuzaga keltiradi. Bu jarayonda asosiy nishonlardan biri sifatida kalamushlarning so‘lak bezlari, oshqozon-ichak trakti va me’da osti bezi tomonidan ishlab chiqiladigan hazm fermentlari namoyon bo‘ladi.

Molekular darajada past dozali gamma nurlanishning salbiy ta’siri to‘g‘ridan-to‘g‘ri shikastlashdan ko‘ra, suv radiolizi natijasida hosil bo‘ladigan faol kislorod shakllari va erkin radikallarning keskin ortishi, ya’ni oksidlanish stressi bilan bog‘liq. Erkin radikallar hazm fermentlari bo‘lmish oqsil molekulalarining faol markazlariga hujum qiladi. Zamonaviy adabiyotlarga ko‘ra, me’da osti bezining asosiy fermentlari tarkibidagi oltingugurt saqlovchi aminokislotalar va ularning tiol (-SH) guruhlari radiatsiya oqibatida oksidlanib, destruktiv disulfid (-S-S-) bog‘lamlarini hosil qiladi [Marinov et al., 2026]. Bu esa ferment oqsilining uchlamchi va to‘rtlamchi konformatsiyasini (fazoviy tuzilishini) o‘zgartirib, uning substrat bilan birikish xossasini va katalitik faolligini susaytiradi [Kilicheva, 2025].

Ushbu molekular buzilishlarni bartaraf etishda o‘simliklardan olinadigan polifenol birikmalar – bioflavonoidlar yuqori radioprotektorlik xususiyatini namoyish etmoqda. Zamonaviy tadqiqotlar bioflavonoidlarning himoya ta’sirini bir nechta asosiy molekular mexanizmlar bilan tushuntiradi [Kopjar et al., 2020].

Birinchidan, bioflavonoidlar o‘zlarining kimyoviy tuzilishidagi fenol gidroksil guruhlari hisobiga to‘g‘ridan-to‘g‘ri erkin radikallarni tutib olish xususiyatiga ega. Ular gamma nurlanishdan hosil bo‘lgan toksik radikallarni ferment molekulasiga yetib borguniga qadar zararsizlantiradi va oqsillarning radiatsion denaturatsiyasini to‘sadi [Kopjar et al., 2020; Ahmed et al., 2026].

Ikkinchidan, ushbu moddalar kalamushlarning hazm a’zolari to‘qimalarida endogen (ichki) antioksidant tizimini faollashtiradi. Flavonoidlar ta’sirida hujayra ichidagi antioksidant fermentlarini kodlovchi genlar ekspressiyasi kuchayadi. Bu esa organizmning radiatsiyaga qarshi o‘z himoya kuchini ikki barobarga oshiradi [Li et al., 2025; Kma et al., 2022].

Uchinchidan, bioflavonoidlar hujayra membranalarini barqarorlashtiradi. Masalan, kversetin va yashil choy katexinlari ichak enterotsitlari membranasi lipidlari bilan o‘zaro ta’sirlashib, ularni oksidlanishdan asraydi va hazm fermentlarining tabiiy muhitini saqlab qoladi. Me’da osti bezining atsinar hujayralarida esa bioflavonoidlar endoplazmatik retikulum stressi va radiatsiya tufayli yuzaga keladigan apoptoz (hujayralarning dasturlangan o‘limi) signal yo‘llarini bloklaydi. Bu amilaza va proteazalar sintezi hamda sekresiyasining me’yorda davom etishini ta’minlaydi. [Ahmed N., et al. 2026]. Ko‘plab bioflavonoidlar turli nurlanish ta’sirida bo‘ladigan hazm tizimida bo‘ladigan buzilishlarni farmakologik korreksiyalashi o‘rganilgan bo‘lsada, ammo kalamush quloq oldi, jag‘ va til osti so‘lak bezlarida hamda qondagi amilolitik faolligiga 1 va 2-grey (gr) gamma nurlanishga glabridin, pulikarin va rutin bioflavonoidlarining ta’siri o‘rganilgan.

Tadqiqot usullari va materiallari. Kalamushlarda surunkali tajriba o‘tkazildi. Bu tajribalarda (γ -nurlanishning so‘lak bezlari ferment ajratish faoliyatiga ta’siri o‘rganilgan. Tajribada 175-200 g og‘irlikdagi voyaga yetgan erkak, oq zotsiz kalamushlar ishlatilgan. Kalamushlar kafedra vivariumida saqlangan va karbonsuv, oqsil aralash ozuqa bilan boqilgan. Kalamushlar qafasida doimo suv mavjud bo‘lgan. Tajriba uchun olingan kalamushlar V guruhga ajratilgan:

I guruh, (nazorat). Sog‘lom.	I guruh, (nazorat). Sog‘lom.
II guruh, (tajriba). 1 gr γ –nurlanish.	II guruh, (tajriba). 2 gr γ –nurlanish.
III guruh 1 gr γ –nurlanish+glabridin	III guruh 2 gr γ –nurlanish+glabridin
IV guruh 1 gr γ –nurlanish+pulikarin	IV guruh 2 gr γ –nurlanish+pulikarin
V guruh 1 gr γ –nurlanish+rutin	V guruh 2 gr γ –nurlanish+rutin

Nazorat uchun hech qanday ta’sir ko‘rsatilmagan. Tajribaning II, III, IV va V guruh kalamushlariga «Terabalt-80» apparati yordamida So60 (-kvant berib nurlantirildi. Kalamushlarda so‘lak bezi shikastlanishi modelini yaratish uchun mahalliy (bosh-bo‘yin sohasiga) gamma nurlanish qo‘llaniladi. Nurlantirish yuzasi 20x20 sm, fokus masofasi 80 sm. Nurlantirish dozasi 0,86-0,85 Gr/min. Yutilgan doza miqdori 1 va 2 Gr. Tajriba kalamushlariga glabriddin (50 mg/kg), pulikarin (50 mg/kg) va rutin (50 mg/kg) flavonoidlari gamma nurlanishdan 5 kun oldin va keyin muntazam ravishda,

oshqozon zondi orqali kuniga 1 marta yuborildi. Nurlangan kalamushlar oddiy qafaslarda saqlangan va 1, 3, 10, 20, 30 va 60 sutkadan so‘ng dekapitatsiya qilingan. Undan quloq oldi, jag‘ osti va til osti so‘lak bezlari ajratib olingan. Bezlar og‘irligiga 1:10 nisbatida fiziologik eritma bilan aralashtirilgan va ulardan gomogenat tayyorlangan. Gomogenat filtrlangan va filtratda amilaza, lipaza fermentlari aktivligi va pepsinogen fermenti va umumiy oqsil miqdori aniqlangan. Amilolitik aktivligi Smit Roye usulining A.M. Ugolev modifikasiyasi bo‘yicha [Уголев А.М. 1969] va umumiy oqsil miqdori Louri usulida aniqlangan.

Bu usul kraxmal ferment ta’sirida gidrolizlanganligi natijasida ozayishi va yod kraxmal komponenti rangining kamayishiga asoslangan. Substrat sifatida 0,1% li kraxmal eritmasi (rN-7,2 fosfat buferida) olinadi. Amilolitik aktivlik bir minutda parchalangan milligrammdagi kraxmal hisobida ifodalanadi.

Aniqlash usuli. 1 ml suyultirilgan tekshiriluvchi material (so‘lak bezlari gomogenati) olinadi, unga 3 ml 0,1% kraxmal qo‘shiladi. Yaxshilab aralashtirilgandan so‘ng suv hammomiga 37^0S da 30 minutga qo‘yiladi. Tajribadan avval qator probirkalarga 0,5 ml 3% kaliy yodda tayyorlangan yod eritmasi 1:3 nisbatda suyultirilib, 5 ml suvga aralashtiriladi.

Inkubatsiyadan so‘ng 0,5 ml 1n HCl qo‘shilib fermentativ reaksiya to‘xtatiladi va inkubatsion aralashmadan 1 ml olib tayyorlab qo‘yilgan yod eritmasiga qo‘shiladi. Kraxmal yod bilan kompleks hosil qilib ko‘k rangga kiradi. Kontrolda yuqoridagi yod eritmasiga 1 ml bufer suyuqligi qo‘shiladi. So‘ngra bu eritmalar elektrofotokalorimetrda qizil filtrda suvga qarshi kalorimetriya qilinadi.

Inkubatsiyadan so‘ng

$$\text{Qolgan (x) kraxmal (mg.da)} = \frac{\text{Tajriba ekstinsiyasi} \cdot 3}{\text{Nazorat ekstinsiyasi}}$$

Demak, kraxmalning kamayishi milligrammda quyidagicha aniqlanadi:

3 mg – X mg = Y mg.

Shunday qilib, inkubatsiya vaqti davomida Y mg mikdorida kraxmal gidrolizlangan bo‘ladi.

Ammilaza fermentining 1 faollik birligi sifatida esa, inkubatsiya uchun belgilangan sharoitlarda 1 daqiqa ichida parchalangan kraxmal miqdori (mg/daq) qabul qilinadi.

Olingan natijalar va ularning tahlili. Biz turli dozalardagi gamma nur ta’sir etib tajriba kalamushlarining so‘lak bezlari to‘qimasi va qoni tarkibidagi gidrolitik fermentlarni qanday o‘zgarganligini kuzatdik. Bu o‘zgarishlar berilgan nur dozasiga mosligini, so‘lak bezlari to‘qimasi va qondagi fermentlar o‘zgarishi o‘rtasida bog‘liqlik bor ekanligini aniqladik.

Tadqiqot natijalarining ko‘rsatishicha, 1 Gr dozadagi gamma-nurlanish oq tajriba kalamushlari quloq oldi so‘lak bezining sekretor funksiyasiga sezilarli darajada salbiy ta’sir ko‘rsatdi. Sog‘lom ya’ni nazorat guruhidagi kalamushlarda amilolitik faollik barqaror ravishda yuqori darajada (15.1± 0.41 dan 16.4±0.36 birl/g gacha) saqlanib qolgan bir paytda, faqatgina nurlanishga uchragan 2-guruhda ferment faolligining keskin pasayishi kuzatildi. Nurlanishdan keyingi 1-kundayoq ko‘rsatkich 14.0±0.51 birl/g gacha kamayadi va bu pasayish dinamikasi 10-kunga kelib o‘zining eng quyi nuqtasiga (13.5±0.39 birl/g) yetdi. Ushbu o‘zgarish davri nurlanish natijasida so‘lak bezi hujayralarida (atsinotsitlarda) oksidlanishli stressning rivojlanishi, erkin radikallarning to‘planishi va fermentlarni sintez qiluvchi oqsil tizimlarining shikastlanishi bilan izohlanadi. 20-kundan boshlab (13.8±0.42 birl/g) bezda tabiiy regeneratsiya jarayonlari boshlanadi va 60-kunga kelib ko‘rsatkich 15.5±0.34 birl/g gacha tiklanadi, biroq baribir nazorat darajasidan pastligicha qoladi.

Tajribada og‘iz orqali (peroral), nurlanishdan 5 kun avval va 5 kun keyin qo‘llanilgan bioflavonoidlar (glabridin, pulikarin va rutin) nurlanishning salbiy oqibatlarini kamaytirishda va ferment faolligini tezkor tiklashda yuqori radioprotektorlik xususiyatini namoyon etdi. Bunday qo‘llash sxemasi moddalarning nafaqat nurlanishdan avval to‘qimalarda antioksidant himoya hosil qilishini (profilaktika), balki nurlanishdan keyingi ilk kunlarda rivojlanadigan nurlanish asoratlarini ham faol bartaraf etishini (terapiya) ta’minlagan [**Prasad N.R., 2023**]

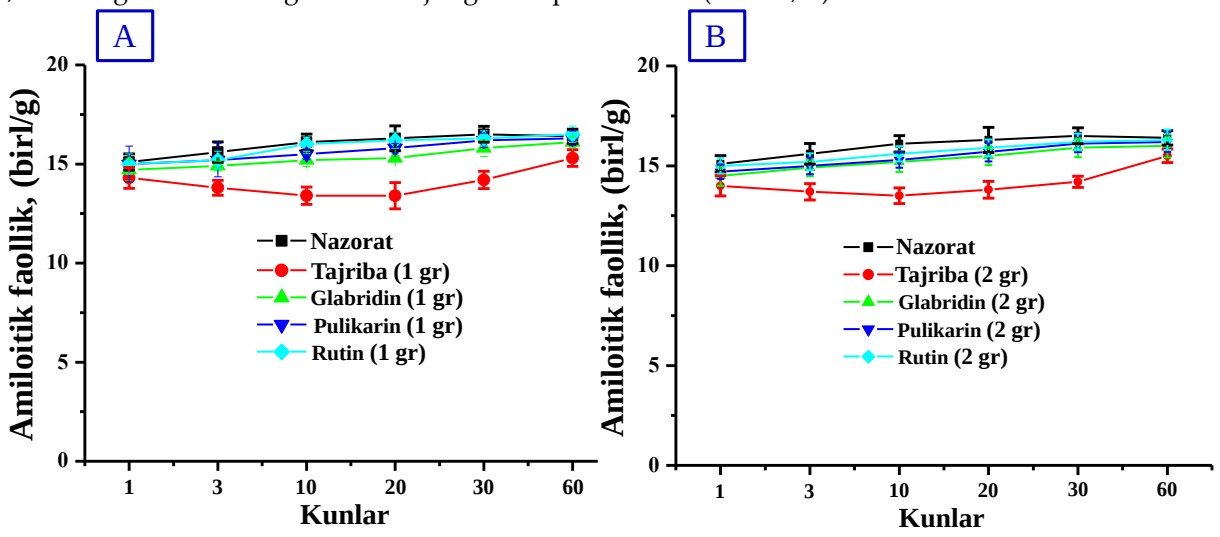
Tadqiqotning dastlabki kunlaridanoq barcha uchta modda amilolitik faollikning keskin tushib ketishiga yo‘l qo‘ymagan. Ayniqsa, etalon radioprotektor hisoblangan rutin bioflavonoidi (5-guruh) 1-kundayoq ko‘rsatkichni 15.0±0.39 birl/g darajada ushlab turib, nazorat qiymatlariga maksimal yaqin natija bergan. Nurlanishning eng og‘ir davri bo‘lgan 10-kunda, rutin yuborilgan kalamushlarda faollik 15.6± 0.38 birl/g ni tashkil etgan, bu esa himoyalanmagan nurlanish guruhiga nisbatan 15.5% ga yuqoridir.

Yangi o‘rganilayotgan bioflavonoidlar – pulikarin va glabridin ham quloq oldi so‘lak bezida amilolitik faolligiga samarali ta’sir ko‘rsatgan. Pulikarin (4-guruh) o‘zining radioprotektorlik samaradorligi bo‘yicha rutindan unchalik orqada qolmagan holda, glabridinga nisbatan ancha faolroq natijalar ko‘rsatdi. Masalan, 10-kunda pulikarin ta’sirida ko‘rsatkich 15.3± 0.39 birl/g ni tashkil etgan bo‘lsa, glabridin guruhida bu qiymat 15.2±0.51 birl/g ga teng bo‘ldi. Tajribaning 20 va 30-kunlariga kelib, pulikarin (tegishlicha 15.7±0.48 va 16.1±0.42 birl/g) va glabridin (15.5±0.46 va 15.9±0.47 birl/g) guruhlarida kalamushlar so‘lak bezi ferment faolligi nazorat ko‘rsatkichlari bilan deyarli tenglashdi (1-rasm, A).

Tajribaning yakuniy bosqichida (60-kun) himoyalangan barcha kalamushlar guruhlarida (3, 4 va 5-guruhlar) amilolitik faollik to‘liq normallashganligi (16.0 dan 16.3 birl/g gacha) va sog‘lom nazorat guruhi darajasiga qaytganligi kuzatildi. Bu holat mazkur bioflavonoidlarni nurlanishdan 5 kun oldin va 5 kun keyin yuborish sxemasi so‘lak bezi to‘qimalarining uzoq muddatli regeneratsiya va proliferatsiya jarayonlarini muvaffaqiyatli faollashtirishidan dalolat beradi. [**Prasad N.R., 2023**].

Navbatdagi tajribamizda oq tajriba kalamushlarining 2 Gr dozadagi gamma-nurlanishi quloq oldi so‘lak bezining sekretor funksiyasiga bioflavonoidlarning ta’siri o‘rganildi. Tadqiqot natijalarining ko‘rsatishicha, oq tajriba kalamushlarining 2 Gr dozadagi gamma-nurlanishi quloq oldi so‘lak bezining sekretor funksiyasiga sezilarli darajada salbiy va davomli ingibirlovchi ta’sir ko‘rsatdi. Sog‘lom nazorat guruhidagi (1-guruh) hayvonlarda amilolitik faollik barqaror ravishda yuqori darajada (15.1±0.41 dan 16.4±0.36 birl/g gacha) saqlanib qolgan bir paytda, faqatgina nurlanishga uchragan 2-guruhda ferment faolligining keskin supressiyasi kuzatiladi. Nurlanishdan keyingi 1-kundayoq ko‘rsatkich 14.3±0.53 birl/g gacha kamayadi va bu pasayish dinamikasi 10–20-kunlar oralig‘ida o‘zining eng quyi nuqtasiga (13.4±0.44 va 13.4±0.66 birl/g) yetib, plato hosil qiladi (1-rasm, B).

Tajribaning 30-kunidan boshlab (14.2±0.44 birl/g) bezda sust tabiiy regeneratsiya jarayonlari kuzatiladi va 60-kunga kelib ko‘rsatkich 15.3±0.42 birl/g gacha tiklanadi, biroq baribir nazorat darajasidan ishonchli ravishda pastligicha qoladi. Tadqiqotning dastlabki 1-3 kunlik muddatlarida barcha uchta modda amilolitik faollikning keskin tushib ketishiga yo‘l qo‘ymagan va ko‘rsatkichlarni 14.7–15.2 birl/g oralig‘ida muvozanatlagan. Nurlanishning eng og‘ir davri bo‘lgan 10–20-kunlarda, mavjud radioprotektor hisoblangan rutin bioflavonoidi (5-guruh) o‘zining maksimal himoya samaradorligini ko‘rsatdi (tegishlicha 16.0±0.35 va 16.2±0.41 birl/g). Bu ko‘rsatkichlar nafaqat nurlanish guruhidan 19.4% va 20.8% ga yuqori, balki sog‘lom nazorat guruhi darajasiga to‘liq mos keladi (1-rasm, B).



3.1-rasm. A. Quloq oldi so‘lak bezida amilolitik faolligiga (birl/g) 1-grey (A) va 2-grey (B) gamma nurlanishning ta’siri. Ordinata o‘qida – fermentning faolligi (birl/g), abssissa o‘qida – tajriba kunlari. *(barcha holatlarda ishonchlilik ko‘rsatkichi, p*<0,05; Nurlantirish do‘zasi 1-grey; 2-grey. n=6).

Pulikarin (4-guruh) o‘zining radioprotektorlik samaradorligi bo‘yicha rutindan unchalik orqada qolmagan holda, glabridinga nisbatan ancha faolroq natijalar ko‘rsatdi. Masalan, 10-kunda pulikarin ta’sirida ko‘rsatkich 15.5±0.26 birl/g ni tashkil etgan bo‘lsa, glabridin guruhida bu qiymat 15.2±0.32 birl/g ga teng bo‘ldi. Pulikarin guruhida 30-kunga kelib (16.2±0.36 birl/g) ferment faolligi nazorat ko‘rsatkichlari bilan to‘liq tenglashdi. Glabridin (3-guruh) nisbatan mo‘tadil faollik ko‘rsatgan bo‘lsa-da, nurlanish guruhiga (2-guruh) nisbatan barcha muddatlarda ferment faolligining ishonchli yuqori bo‘lishini ta’minladi va 60-kunga kelib normal qiymatga (16.1±0.25 birl/g) chiqdi.

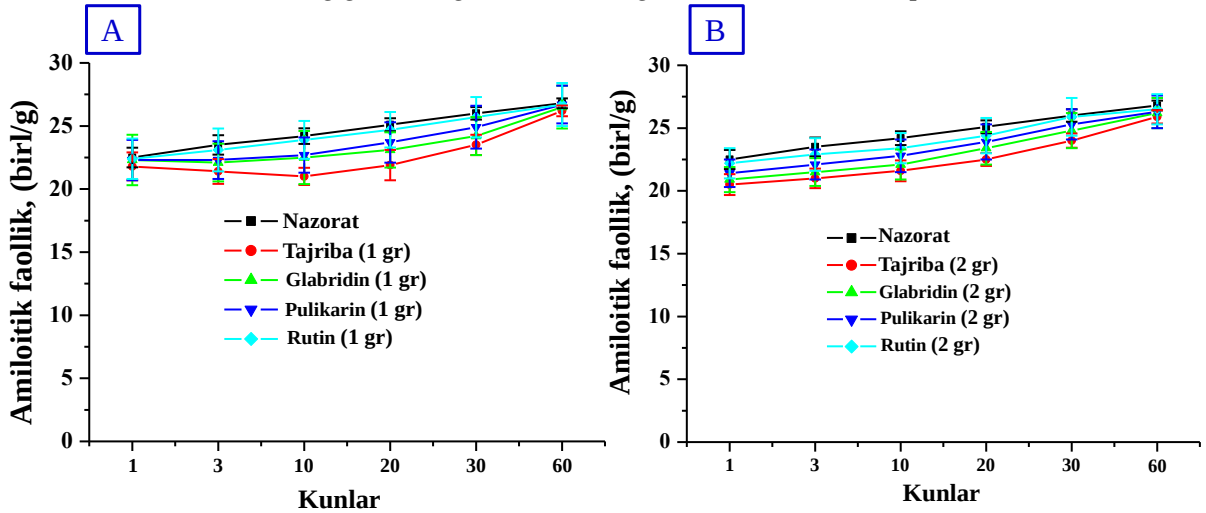
Xulosa qilib aytganda, oq tajriba kalamushlarida olib borilgan tadqiqotda moddalarning quloq oldi so‘lak bezi amilolitik faolligini 1 Gr va 2 Gr gamma-nurlanishdan himoya qilish samaradorligi bo‘yicha quyidagi kamayish qatorini tuzish mumkin: **rutin > pulikarin > glabridin**. Tanlangan 10 kunlik (5 kun avval va 5 kun keyin) peroral qo‘llash sxemasi so‘lak bezi hujayralarini nurlanish shikastlanishlaridan himoya qilishda yuqori samara berdi va pulikarin hamda glabridin moddalarini istiqbolli tabiiy radioprotektorlar sifatida baholashga asos bo‘ladi.

Turli dozalarda γ-nurlantirilgan kalamushlar so‘lak bezi to‘qimasi amilaza fermentining o‘zgarishi berilgan nur dozasiga bog‘liqligi yaqqol ko‘rindi. Yuqorida berilgan diagrammalarda 1, 2 Grey dozalardagi gamma nurlanish tajribaning 3-, 10- va 20-kunlari quloq oldi bezi tarkibidagi amilaza faolligini ma’lum darajada statistik ishonchsiz kamayish kuzatildi.

Gamma nurlantirilgan tajribadagi kalamushlar jag‘ va til osti so‘lak bezlaridagi amilolitik faollikning o‘zgarishi ham deyarli quloq oldi bezidagi kabi bo‘ldi. Tajribada oq kalamushlar organizmiga (1 Gr) dozada gamma nurlanish yuborilganda, jag‘ va til osti so‘lak bezlarining amilolitik faolligida dinamik susayish kuzatildi. Nazorat guruhida ferment faolligi 1-kundagi 22.5±0.78 birl/g dan 60-kunga kelib 26.8±0.39 birl/g gacha fiziologik qonuniyat asosida oshib borgani holda, faqat nurlanish olgan kalamushlarda bu ko‘rsatkich jiddiy ravishda ortda qoldi. Xususan, 1 Gr nurlanish ta’sirida amilolitik faollik 10-kunga kelib o‘zining eng past nuqtasiga 21.0±0.68 birl/g tushdi va sog‘lom nazoratga 24.2±0.62 birl/g nisbatan sezilarli depressiyani namoyon etdi (2-rasm, A). Bu holat radiatsiya ta’sirida bez atsinar hujayralarida lipidlarning pereoksidli oksidlanishi (LPO) jadallashgani va α - amilaza fermentining biosintezi yoki uning molekular strukturasi erkin radikallar tomonidan shikastlangani bilan izohlanadi. Tajribaning 60-kuniga kelib ferment faolligining 26.2±0.43 birl/g gacha ko‘tarilishi organizmning ichki kompensator va regenerativ imkoniyatlari hisobiga kompensatsiya bosqichi boshlanganidan dalolat beradi.

Radiatsiya dozasi 2 Gr gacha oshirilganda so‘lak bezlaridagi destruktiv jarayonlar yanada chuqurroq va ertaroq xarakter kasb etdi. Dastlabki 1-kundayoq amilolitik faollik 20.5±0.83 birl/g gacha pasayib, dozaga bog‘liq ravishda ferment tizimi ingibirlanishga uchraganini ko‘rsatdi. Ushbu dozada patologik susayish uzoq davom etib, hatto 60-kunda ham 25.9±0.53 birl/g sog‘lom nazorat darajasiga 26.8±0.39 birl/g to‘liq yeta olmadi (2-rasm, B). Bu esa 2 Gr dozadagi gamma nurlanish so‘lak bezlarining shira ajratish to‘qimasida chuqurroq funksional va tarkibiy buzilishlarni yuzaga keltirishini isbotlaydi.

Tadqiqotning muhim qismi o‘rganilayotgan bioflavonoidlar - glabridin, pulikarin va mavjud radioprotektor hisoblangan rutinning himoya samaradorligini baholashga qaratildi. Bioflavonoidlarning nurlanishdan 5 kun avval va 5 kun keyin og‘iz orqali yuborilishi so‘lak bezlari hujayralarida oldindan antioksidant to‘siq yaratishga va keyinchalik regeneratsiya jarayonlarini tezlashtirishga xizmat qildi. 1 Gr nurlanish fonida rutin bioflavonoidi eng yuqori radioprotektorlik xususiyatini namoyish etdi. Uning ta’sirida ferment faolligi 10-kundayoq 23.9±1.5 birl/g va 20-kunda 24.7±1.41 birl/g sog‘lom nazorat guruhi ko‘rsatkichlari bilan amalda tenglashdi. Pulikarin va glabridin ham ferment faolligining 10-kundagi keskin pasayish fazasini muvaffaqiyatli bartaraf etdi. Biroq, pulikarin guruhida tiklanish dinamikasi 10-kunda 22.7±1.4 birl/g glabridinga 22.5±2.1 birl/g nisbatan biroz faolroq kechdi (2-rasm, A).



2-rasm. Jag‘ va til osti so‘lak bezida amilolitik faolligiga x 1000 (birl/g) 1-grey (A) va 2-grey (B) gamma nurlanishning ta’siri. Ordinata o‘qida – fermentning faolligi (birl/g) deb olingan, abssissa o‘qida – tajriba kunlari. *(barcha holatlarda ishonchlilik ko‘rsatkichi, -p*<0,05. Nurlantirish do‘zasi 1-grey; 2-grey. n=6).

Yuqori oksidlanish stressi kuzatilgan 2 Gr nurlanish sharoitida polifenol birikmalarning shifobaxsh va korreksiyalovchi ta’siri yanada yaqqolroq namoyon bo‘ldi. Rutin hatto yuqori dozali radiatsiya sharoitida ham 1-kundayoq amilolitik faollikni 22.2±1.2 birl/g darajada ushlab turishga erishdi va ferment destruksiyasiga yo‘l qo‘ymadi. Yangi o‘rganilayotgan pulikarin flavonoidi o‘zining samaradorligi bo‘yicha rutindan keyingi ikkinchi o‘rinni egalladi. Pulikarin ta’sirida 3-kunda 22.1±1.2 birl/g va 10-kunda 22.8±1.3 birl/g qayd etilgan natijalar nurlanish guruhidagi tegishli muddatlardan ancha yuqori bo‘lib, patologik jarayonning surunkali fazaga o‘tishini chekladi. Glabridin esa ushbu patologiyada nisbatan sustroq, ammo barqaror tiklanish samarasini ko‘rsatdi va unda faollik 30-kunga kelib 24.8±1.4 birl/g ni tashkil etdi (2-rasm, B).

Xulosa qilib aytganda, olingan ilmiy natijalar ushbu uchta bioflavonoidning radioprotektorlik ta’siri bo‘yicha rutin > pulikarin > glabridin ketma ketligiga ega ekanligini ko‘rsatdi. Moddalarning bunday tafovutli faolligi ularning kimyoviy tuzilishi, tarkibidagi gidroksil guruhlarining soni va joylashuvi hamda erkin radikallarni tutib qolish potensiali

bilan bevosita bog‘liq. Radiatsiyaga qarshi profilaktika sifatida ushbu tabiiy fenol birikmalar, ayniqsa pulikarin va rutin, so‘lak bezlarining metabolik barqarorligini ta’minlashda yuqori istiqbolga ega.

Annatatsiya. *Ushbu maqolada shahar landshaft arxitekturasida foydalaniladigan manzarali daraxtlarning ksilofag (yog‘ochxo‘r) hasharotlar, xususan, mo‘ylovdor qo‘ng‘izlar (Cerambycidae) bilan zararlanishi tahlil qilinadi. Tadqiqotda manzarali daraxtlarning turli ekologik va fiziologik stress omillar ta’sirida ksilofaglarga moyillik darajasi ko‘rib chiqilgan. Markaziy Osiyo mintaqasida keng tarqalgan va jiddiy iqtisodiy zarar keltiruvchi Chlorophorus faldermanni (Faldermann, 1837) turining morfologik tavsifi, hayot sikli va oziqlanish spektri batafsil yoritilgan. Shuningdek, ksilofag hasharotlarga qarshi kurashda zamonaviy monitoring usullari va integral himoya choralari bo‘yicha tavsiyalar berilgan.*

Kalit so‘zlar*: ksilofaglar, Chlorophorus faldermanni, manzarali daraxtlar, Cerambycidae, bioekologiya, entomofaglar, poya inyeksiyasi, urbanizatsiya.*

ВОСПРИИМЧИВОСТЬ ОКЕАНИЧЕСКИХ ДЕРЕВЬЕВ К ПОВРЕЖДЕНИЯМ, НАНОСИМЫМ КСИЛОФАГОВЫМИ НАСЕКОМЫМИ, И БИОЭКОЛОГИЧЕСКИЙ АНАЛИЗ ВИДА CHLOROPHORUS FALDERMANN (FALDERMANN, 1837)

Аннотация. *В данной статье анализируется повреждение декоративных деревьев, используемых в городской ландшафтной архитектуре, ксилофагными (древоточащими) насекомыми, в частности жуками-усачами (Cerambycidae). В исследовании рассмотрена степень восприимчивости декоративных деревьев к ксилофагам под воздействием различных экологических и физиологических стрессовых факторов. Подробно освещены морфологическое описание, жизненный цикл и спектр питания вида* Chlorophorus faldermanni *(Faldermann, 1837), широко распространённого в регионе Центральной Азии и наносящего значительный экономический ущерб. Также приведены рекомендации по современным методам мониторинга и мерам интегрированной защиты в борьбе с ксилофагными насекомым*

Ключевые слова: *ксилофаги,* Chlorophorus faldermanni*, декоративные деревья, Cerambycidae, биоэкология, энтомофаги, инъекция в ствол, урбанизация.*

SUSCEPTIBILITY OF OCEANIC TREES TO DAMAGE BY XYLOPHAUGIC INSECTS AND BIOECOLOGICAL ANALYSIS OF THE SPECIES CHLOROPHORUS FALDERMANN (FALDERMANN, 1837)

Annotation. *This article analyzes damage to ornamental trees used in urban landscape architecture caused by xylophagous (wood-boring) insects, particularly longhorn beetles (Cerambycidae). The study examines the degree of susceptibility of ornamental trees to xylophages under the influence of various ecological and physiological stress factors. A detailed account is provided of the morphological characteristics, life cycle, and feeding spectrum of* Chlorophorus faldermanni *(Faldermann, 1837), a species widely distributed in Central Asia and responsible for significant economic damage. In addition, recommendations are given on modern monitoring methods and integrated control measures against xylophagous insects*

Keywords: *xylophages,* Chlorophorus faldermanni*, ornamental trees, Cerambycidae, bioecology, entomophages, trunk injection, urbanization.*

Mavzuning dolzarbligi. Global iqlim o‘zgarishi va shahar hududlarining jadallik bilan kengayishi (urbanizatsiya) sun’iy yaratilgan ekotizimlarda manzarali o‘simliklarning salomatligini saqlash masalasini dolzarb qilib qo‘ymoqda. Shahar ko‘kalamzorlashtirish tizimida qo‘llaniladigan daraxtlar nafaqat estetik vazifani bajaradi, balki mikroiqlimni mo‘tadillashtirish, havodagi chang va zaharli gazlarni yutish kabi muhim sanitariya-gigiyenik ahamiyatga

ega. Biroq, noqulay ekologik sharoitlar — havo haroratining ko‘tarilishi, tuproqning zichlashishi va suv tanqisligi daraxtlarning tabiiy immun tizimini zaiflashtiradi. Bunday zaiflashgan daraxtlar uchun eng xavfli dushman ksilofag (yog‘ochxo‘r) hasharotlar hisoblanadi

Muammoning o‘rganish darajasi. Ksilofaglar orasida mo‘ylovdor qo‘ng‘izlar (Cerambycidae oilasi) o‘zining maxfiy hayot tarzi va yetkazadigan zarari bilan ajralib turadi. Ko‘pgina bargli va igna bargli manzarali daraxtlar ushbu guruh vakillari tomonidan zararlanadi. Ushbu guruhning eng faol vakillaridan biri — *Chlorophorus faldermanni* (Faldermann, 1837) bo‘lib, u mintaqamizning issiq iqlimiga mukammal moslashgan. Ilmiy adabiyotlarda, jumladan, N.N. Plavilstshikovning fundamental tadqiqotlarida ushbu tur polifag zararkunanda sifatida qayd etilgan. Bugungi kunda ushbu hasharotning shahar sharoitidagi populyatsiya dinamikasini o‘rganish va unga qarshi ekologik xavfsiz kurash choralarini ishlab chiqish dolzarb ilmiy muammo hisoblanadi.

1-jadval

Manzarali daraxt turlarining ksilofag hasharotlar bilan zararlanish darajasi

№	Daraxt turi (Lotincha nomi)	O‘zbekcha nomi	Zararlanish darajasi (Yuqori/O‘rta/Kuchsiz)	Asosiy zararlanish alomatlari
1	*Acer negundo*	Zarang (Klyon)	Yuqori	Po‘stloq ostidagi chuqur yo‘llar, yog‘och kukuni
2	*Fraxinus excelsior*	Prush (Yasen)	O‘rta	Tanadagi mayda uchish teshiklari, barg sarg‘ayishi
3	*Populus alba*	Oq terak	Yuqori	Tananing chirishi, qurituvchi yo‘llar
4	*Salix alba*	Oq majnuntol	O‘rta	Shoxlarning qurishi, po‘stloq ko‘chishi
5	*Ulmus densa*	Sferik qayrag‘och	Yuqori	Skolitlar va mo‘ylovdor qo‘ng‘izlar yo‘llari
6	*Platanus orientalis*	Sharq chinori	Kuchsiz	Keksa daraxt tanalarining yuza zararlanishi
7	*Quercus robur*	Oddiy eman	Kuchsiz	Yo‘g‘on shoxlardagi mexanik shikastlanishlar

Yuqoridagi jadvaldan ko‘rinib turubdiki ksilofag zararkunandalar barcha daraxtlarga bir xil darajada ta’sir qilmas ekan. Eng yuqori zararlanish *Acer negundo, Populus alba* va *Ulmus uzbekistanica* daraxtlarida kuzatilgan bo‘lsa, *Platanus orientalis* va *Quercus robur* daraxtlarida kucsiz zararlanish kuzatildi.

Chlorophorus faldermanni turi *Cerambycidae* (Mo‘ylovdor qo‘ng‘izlar) oilasining Cerambycinae kenja oilasiga mansub. Ushbu tur o‘zining polifaglik xususiyati va turli iqlimiy mintaqalarga moslashuvchanligi bilan ajralib turadi. Taksonomik jihatdan u *Chlorophorus* turkumining eng faol va zararli vakillaridan biri hisoblanadi. Ushbu tur Xitoydan tortib Rossiyaning janubi va butun Markaziy Osiyo (O‘zbekiston, Tojikiston, Qozog‘iston) bo‘ylab keng tarqalgan. Voyaga yetgan qo‘ng‘izlarning tana tuzilishi ularning kunduzgi hayot tarziga moslashgan. Qo‘ng‘izning uzunligi o‘rtacha 8 mm dan 18 mm gacha o‘zgarib turadi. Erkak individlar urg‘ochilariga nisbatan birmuncha kichikroq, biroq ularning mo‘ylovlari nisbatan uzunroq bo‘ladi. Tananing asosiy foni qora yoki to‘q jigarrang bo‘lib, ustki qanotlari (elytra) o‘ziga xos sarg‘ish-oqish yoki kulrang tukli naqshlar bilan qoplangan. Bu naqshlar turning identifikatsiyasi uchun asosiy diagnostik belgi hisoblanadi. Odatda, ustqanotlarning o‘rta qismida "V" shaklidagi yoki ko‘ndalang chiziqli naqshlar yaqqol ko‘zga tashlanadi. Boshi vertikal yo‘nalgan, mo‘ylovlari 11 bo‘g‘imli bo‘lib, tanasining yarmini yoki uchdan ikki qismini tashkil etadi. Ko‘zlari buyraksimon shaklda bo‘lib, mo‘ylov asosini o‘rab oladi.Ko‘krak qismi (Prothorax): Protoraks shar shakliga yaqin, yon tomonlari yumaloqlangan va zich tuklar bilan qoplangan. Ksilofag hasharotlarning asosiy zarar yetkazuvchi bosqichi ularning lichinkalik davri bo‘lgani sababli, bu davrning morfologik belgilari muhim ahamiyatga ega.

Lichinkasi: Oq yoki sarg‘ish tusda, tana shakli silindrsimon, oyoqsiz (yoki juda kichik so‘yilgan oyoqli). Bosh kapsulasi mustahkam xitinlashgan va to‘q jigarrang rangda bo‘lib, kuchli jag‘ (mandibula) apparati bilan jihozlangan. Bu jag‘lar qattiq yog‘och to‘qimalarini kemirishga moslashgan. Lichinkalar nafaqat tirik daraxtlarning yog‘och qismini kemiradi, balki tayyor yog‘och konstruksiyalar (uy-joylar, ustunlar) ichida ham rivojlanadi. Bu xususiyati uni qurilish materiallari uchun xavfli zararkunandaga aylantiradi.

G‘umbagi: Erkin turdagi g‘umbak bo‘lib, rangi dastlab oqish, rivojlanish jarayonida esa qo‘ng‘iz rangiga yaqinlashib boradi. G‘umbaklik davri daraxtning po‘stloq osti yoki yog‘och qatlamida maxsus tayyorlangan "beshikchalar"da kechadi.

Diagnostik farqlari *C. faldermanni* turini unga yaqin bo‘lgan *C. varius* yoki *C. sartor* turlaridan ajratishda ustqanotlardagi oq chiziqlarning joylashuvi va protoraksning tuklanish darajasiga e’tibor qaratiladi. Faldermann mo‘ylovdorining naqshlari Markaziy Osiyo populyatsiyalarida birmuncha barqaror va ochiq rangli bo‘lishi kuzatilgan.

***Chlorophorus faldermanni* (Faldermann, 1837) turining fenologik rivojlanishi.** Mintaqamiz sharoitida ushbu turning hayot sikli bir va ikki yillik bo‘lishi aniqlandi. Voyaga yetgan qo‘ng‘izlarning (imago) uchishi havo harorati barqaror +22-24°C ga yetganda (aprel oyining oxiri – may boshlari) boshlanadi.

- **Ommaviy uchish davri:** Iyun oyining ikkinchi o‘n kunligidan iyul oyining o‘rtalariga qadar davom etadi. Bu davrda qo‘ng‘izlar asosan soyabonguldoshlar gullari bilan qo‘shimcha oziqlanadi.
- **Tuxum qo‘yish:** Urg‘ochi qo‘ng‘iz o‘z hayoti davomida daraxt po‘stlog‘i yoriqlariga 50 tadan 120 tagacha tuxum qo‘yishi kuzatildi.
- **Zararlanish mexanizmi va uning oqibatlari.** Lichinkalar tuxumdan chiqqandan so‘ng 3-5 kun ichida po‘stloq ostiga kirib boradi. Dastlab ular kambi qatlamini, so‘ngra yog‘ochning o‘zak qismini (ksilema) kemira boshlaydi. *C. faldermanni* lichinkalari tomonidan ochilgan yo‘llarning diametri 4-6 mm ni tashkil etib, ular daraxt poyasini ichkaridan g‘alvirdek qilib yuboradi.): U juda ko‘p turdagi bargli daraxtlarni zararlaydi. Asosan terak (Populus) va tol (Salix) daraxtlariga hujum qiladi. Shuningdek, turang‘il (Tamarix), jiyda (Elaeagnus), qayrag‘och (Ulmus) va nok (Pyrus) daraxtlarida ham uchraydi. Buning oqibatida: Daraxtning suv va mineral moddalar o‘tkazish tizimi buziladi.

Daraxtning mexanik mustahkamligi yo‘qoladi (kuchli shamollarda sinish xavfi ortadi).

Ikkilamchi infeksiyalar (zamburug‘li kasalliklar) kirib borishi uchun qulay sharoit yaratiladi.

Bioekologik moslashuv: *C. faldermanni* mintaqamizning quruq va issiq iqlimiga yuqori darajada adaptatsiya bo‘lgan. Uning ommaviy uchish davri iyun oyining o‘rtalariga to‘g‘ri kelishi va iyun-avgust oylarida faol tuxum qo‘yishi aniqlandi.

Zarar xarakteri: Lichinkalarning yog‘och ichida yashirin hayot kechirishi ularni an’anaviy kimyoviy purkash usullaridan himoya qiladi. Zararlangan daraxtlarda kutilmagan qurish va mexanik sinish holatlari ksilofaglar populyatsiyasining zichligi bilan to‘g‘ridan-to‘g‘ri bog‘liqdir.

Amaliy tavsiyalar . Shahar ko‘kalamzorlashtirish ob’ektlarida ksilofag hasharotlarga qarshi kurash samaradorligini oshirish uchun quyidagilar tavsiya etiladi:

Profilaktika: Erta bahorda (mart-aprel) daraxt poyalarini ohak va maxsus yopishtiruvchi aralashmalar bilan oqlash. Bu usul qo‘ng‘izlarning tuxum qo‘yishiga to‘sqinlik qiladi.

Monitoring: Har yili may oyining boshida feromonli tutqichlar o‘rnatish orqali zararkunanda uchishini nazorat qilish va ommaviy uchish davrida kurash choralarini boshlash.

Innovatsion kurash: Zararlanish darajasi yuqori bo‘lgan (2-3 ball) qimmatbaho manzarali daraxtlar uchun poya inyeksiyasi (endoterapiya) usulini qo‘llash. Bunda tizimli insektitsidlar bevosita daraxtning o‘tkazuvchi to‘qimalariga yuboriladi.

Sanitariya butash: Zararlangan va qurigan shoxlarni noyabr-fevral oylarida kesib tashlash va ularni hududdan olib chiqib, utilizatsiya qilish (yoqish yoki maydalash).

M-39 AVTOMAGISTRAL YO'LI ATROFIDAGI TUPROQLARDA HARAKATCHAN MISNING TARQALISHI

Nematov Xurshid Mamadullayevich
Sharof Rashidov nomidagi Samarqand davlat universiteti tadqiqotchisi
0009-0004-5270-6248
UO'T: 631.4:546.56

Annotatsiya: *Mazkur maqolada M-39 avtomagitral yo'lining Sirdaryo viloyati Sardoba va Oqoltin tumani hududidan o'tuvchi qismida tarqalgan bo'z-o'tloqi tuproqlarida harakatchan shakldagi misning tarqalishi va unga transport vositalaridan chiqadigan chiqindilarining ta'siri bayon etilgan. Olingan natijalarga ko'ra, o'rganilgan tuproqlarda harakatchan misning maksimal miqdori 18,8 mg/kg bo'lib, bu ko'rsatkich mazkur elementning ruxsat etilgan meyori (3 mg/kg) dan 6,3 marta hamda fon ko'rsatkichi (0,9 mg/kg) dan 20,8 marta ko'pdir.*

Kalit so'zlar: *M-39 avtomagistral yo'li, bo'z-o'tloqi tuproqlar, harakatchan mis, ifloslanish, ruxsat etilgan meyor, FON ko'rsatkichi.*

РАСПРЕДЕЛЕНИЕ ПОДВИЖНОЙ МЕДИ В ГРУНТАХ В ЗОНЕ АТРОФИИ АВТОМАГИСТРАЛИ М-39

Аннотация: *В данной статье описано распределение подвижной формы меди в сероземно-луговых почвах на участке автомагистрали М-39, проходящем через территории Сардобинского и Окалтынского районов Сырдарьинской области, а также влияние на него выбросов автотранспортных средств. Согласно полученным результатам, максимальное количество подвижной меди в исследованных почвах составляет 18,8 мг/кг, что в 6,3 раза превышает предельно допустимую концентрацию (ПДК) данного элемента (3 мг/кг) и в 20,8 раза выше фонового показателя (0,9 мг/кг).*

Ключевые слова: *автомагистраль М-39, сероземно-луговые почвы, подвижная медь, загрязнение, предельно допустимая концентрация (ПДК), фоновый показатель.*

DISTRIBUTION OF MOBILE COPPER IN SOILS IN THE ATROPHY OF THE M-39 HIGHWAY

Abstract: *This article describes the distribution of the mobile form of copper in irrigated gray-meadow (seroziem-meadow) soils along the section of the M-39 highway passing through the Sardoba and Akaltyn districts of the Syrdarya region, as well as the impact of motor vehicle emissions on it. According to the obtained results, the maximum content of mobile copper in the studied soils is 18.8 mg/kg, which is 6.3 times higher than the maximum permissible concentration (MPC) of this element (3 mg/kg) and 20.8 times higher than the background level (0.9 mg/kg).*

Keywords: *M-39 highway, gray-meadow soils, mobile copper, contamination, maximum permissible concentration (MPC), background level.*

Kirish: Mis, tirik organizmlar uchun muhim mikroelementlardan biri bo'lib, o'simliklarda kechadigan fotosintez, xlorofil hosil bo'lishi, oqsil metabolizmi, xo'jayra devorining shakllanishi va boshqa bir qator jarayonlarda ishtirok etadi [1]. Qishloq xo'jalik ekinlaridan yuqori va sifatli hosil yetishtirishda tuproq tarkibidagi makro va mikroelementlarni xususan o'simliklar uchun zarur bo'lgan mis miqdorini ham o'rganish muhim ahamiyatga ega. Shuning uchun ham sug'oriladigan tuproqlar tarkibidagi mis miqdorini o'rganish muhim ahamiyatga ega.

Ma'lumki, tuproqlarda misning tarqalishi turli xil omillar, xususan tuproq ona jinsi, suv, o'simlik, tirik organizmlarga bog'liq. Misning tuproqda tarqalishi turli tuproqlarda turlicha bo'lib, turli mineral, organik va orgno-mineral birikmalar shaklida uchraydi. Misning muhim geokimyoviy xususiyati shundaki, u loy minerallari, temir va alyuminiy oksidlari va gidrooksidlari hamda gumus birikmalarining mayda fraksiyalari tomonidan so'riladi. Shuning uchun tuproqdagi misning asosiy qismi turli birikmalar bilan mustahkam birikkan holatda bo'ladi [2].

Tuproqlarning potensial unumdorligi asosan biofil elementlarning umumiy zahirasi bilan belgilanadi. G'arbiy Sibirning janub qismida tarqalgan tuproqlarda mis miqdori 31 mg/kg bo'lib, Markaziy qora tuproqlarga nisbatan (24

mg/kg) ko‘pdir. Bu holat mualliflar tomonidan tuproq hosil qiluvchi jinslar tarkibida misning ko‘pligi bilan izohlanadi [3]. G.P.Gamzikov, A.A.Dayerbayev, Y.D.Orlovaning ta’kidlashicha, Omsk viloyatida tarqalgan turli tuproqlarida mis miqdori quyidagicha: podzol tuproqlarda 7-19, sur tusli o‘rmon tuproqlarida - 12-18, qora tuproqlarda 17-25 mg/kg ni tashkil etadi [4].

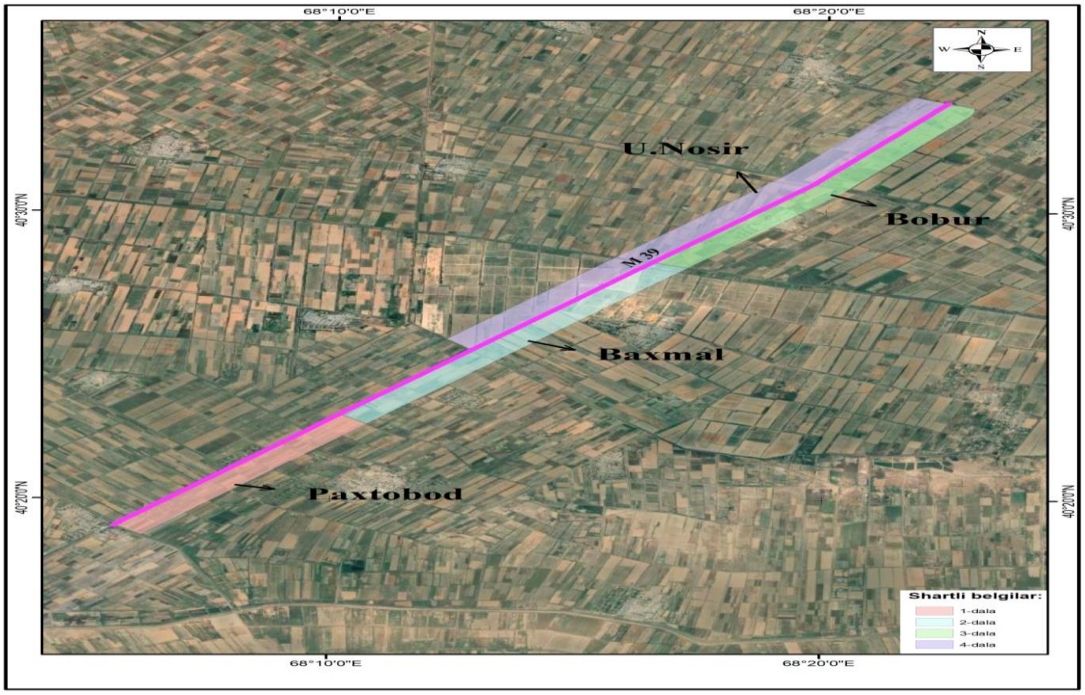
Misning tuproqdagi eng yuqori miqdori geokimyoviy zararlangan va har-xil antropogen ta’sirga uchragan joylarda kuzatiladi. Tuproqning mis bilan zararlanishi bo‘yicha klassifikatsiyasi quyidagicha: <60 mg/kg - zararlanmagan, 60-100 mg/kg - kuchsiz, 100-160 mg/kg - o‘rtacha, va >160 mg/kg -kuchli zararlangan. Misning harakatchan shakli esa mos ravishda quyidagicha: <10, 10-17, 17-25 va > 25 mg/kg [5].

Respublikamizda tarqalgan bir qator tuproqlarda harakatchan shakldagi mis miqdori o‘rganilgan. Masalan, A.Rajabov va B.Bozorov ta’kidlashicha, Urgut tumanidagi tamaki yetishtiriladigan xo‘jaliklarda tarqalgan tog‘-qo‘ng‘ir tuproqlarining yuqori A qatlamida harakatchan mis miqdori 2,3 mg/kg, V1 qatlamda 2,6 mg/kg bo‘lgan bo‘lsa, To‘q tusli bo‘z tuproqlarning yuqori qatlamida 0,6; mg/kg, tipik bo‘z tuproqlarda esa 4,6; mg/kg ni tashkil etgan [6]. Qoraqalpog‘iston respublikasida tarqalgan turli tuproqlarda esa mis 0,4-2,0 mg/kg [7], Zarafshon vohasidagi och tusli bo‘z tuproqlar yuqori qatlamida 0,5-0,6 mg/kg, tipik va o‘tloqi bo‘z tuproqlarda esa mos ravishda 1,5-1,7 va 1,5-2,0 mg/kg ni tashkil etgan [8].

Sug‘oriladigan tuproqlar tarkibidagi harakatchan mis miqdooriga turli omillar ta’sir ko‘rsatadi. Qishloq xo‘jaligida mineral o‘g‘it va pestitsidlardan noto‘g‘ri foydalanish, sanoat korxonalari chiqindilari, transport harakati tuproqdagi harakatchan mis miqdorini oshiradi. Natijada tuproqlarning mis bilan ifloslanishi sodir bo‘ladi. Masalan, Samarqand kimyo kombinati atrofidagi sug‘oriladigan tipik bo‘z tuproqlarda harakatchan shakldagi misning eng ko‘p miqdori 32 mg/kg ni tashkil etgan. Bu ko‘rsatkich kimyo kombinatning g‘arb yo‘nalishida 250 metr uzoqlikdagi tuproqda kuzatilgan. Kombinat atrofidagi tuproqlarda harakatchan misning ko‘p bo‘lishi bevosita chiqindilarning tashlanishi va shamol yo‘nalishi bilan izohlanadi [9].

Tahlil qilingan manbalardan ko‘rinib turibdiki, respublikamiz sharoitida avtomagistral yo‘llar atrofida tarqalgan sug‘oriladigan tuproqlarda harakatchan mis miqdori va unga transport vositalaridan chiqariladigan chiqindilar ta’siri deyarli o‘rganilmagan. Shu maqsadda biz Sirdaryo viloyati hududidan o‘tuvchi M-39 avtomagistral yo‘li atrofida tarqalgan sug‘oriladigan bo‘z-o‘tloqi tuproqlar tarkibidagi harakatchan mis miqdoriga avtomobillar faoliyati natijasida chiqarilgan chiqindilar ta’sirini o‘rgandik.

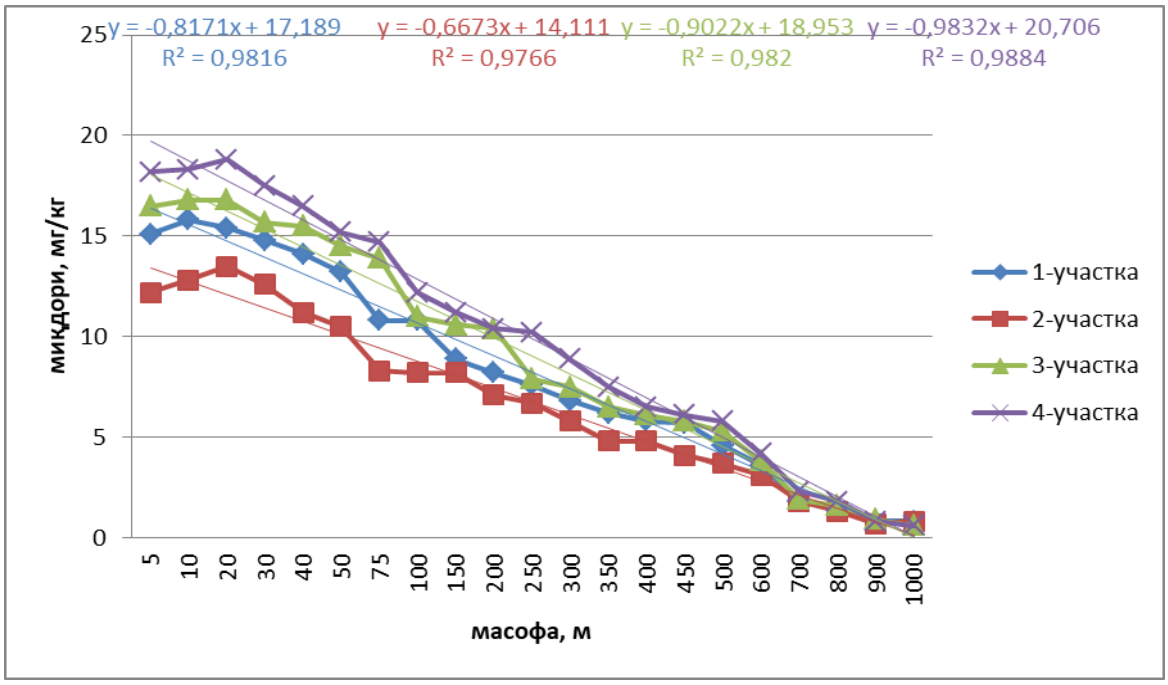
Tadqiqot metodologiyasi: Tuproq tarkibidagi harakatchan mis miqdoriga avtotransport vositalarining ta’sirini o‘rganish maqsadida Sirdaryo viloyatining Sardoba va Oqoltin tumanlari hududidan o‘tuvchi M-39 avtomagistral yo‘li atrofidagi bo‘z-o‘tloqi tuproqlar tarqalgan maydonlardan 4 ta uchastka (dala) (Sardoba tumanidan Paxtaobod va Baxmal, Oqoltin tumanidan Bobur va U.Nosir massivlari) tanlab olindi. Bunda 1 va 2- uchastka Sardoba tumanining Paxtaobod va Baxmal massivlari, 3 va 4 uchastkalar esa Oqoltin tumanining Bobur va U.Nosir massivi dalalari hisoblanadi. Uchastkalarni tanlashda hududning 1:10000 masshtabli tuproq kartasi asos qilib olindi. Tanlangan uchastkalarning 1 tasi Toshkent-Termiz avtomagistral yo‘lining o‘ng tomonida (Oqoltin tumani U.Nosir massivi), qolgan 3 tasi chap tomonida joylashdi (1-rasm).



1-rasm. **Tadqiqot o'tkazilgan hudud karta-sxemasi**

Tadqiqotda tuproq namunalari olish va laboratoriya tahlillari umumqabul qilingan standart uslublarda olib borildi.

Natijalar va ularning muhokamasi: Tajribalarning ko'rsatishicha, avtomobil harakati natijasida chiqarilgan chiqindilar sug'oriladigan bo'z-o'tloqi tuproqlar tarkibidagi harakatchan mis miqdoriga ta'sir ko'rsatgan. Mazkur tuproqlar tarkibida 10 mg/kg va undan ko'p harakatchan mis saqlaydigan tuproqlar 2-uchastkada 55 metr, 1-uchastkada 100 metr, 3-uchastkada 200 metr, 4-uchastkada 250 metr uzoqlikgacha kuzatiladi. 5 mg/kg va undan ko'p harakatchan mis saqlaydigan tuproqlar 2-uchastkada 300 metr, 1-uchastkada 450 metr, 3 va 4 uchastkalarda 500 metr uzoqlikkacha qayd etildi. Harakatchan misning fon miqdoriga yaqin yoki teng bo'lgan tuproqlar avtomobil yo'lidan 850-900 metr masofadan boshlab kuzatildi. Ushbu masofalardan so'ng ba'zi dalalarda fon ko'rsatkichidan kichiq bo'lgan miqdorlar ham aniqlandi.



2-rasm. **M-39 Avtomagistral yo'l atrofidagi tuproqlarda harakatchan mis miqdori**

O'rganilgan tuproqlarda M-39 avtomagistral yo'lidan uzoqlashish bilan harakatchan mis miqdorining kamayib borishi orasida bog'liqliq tahlil etilganda regretsiya tenglamasi (y) yo'nalishi teskari ifodalanadigan to'g'ri chiziq ekanligi ko'rinadi (2-rasm). Uchastkalar bo'yicha R^2-diterminatsiya koefitsiyenti R^2=0,976 (2-uchastka) dan 0,988 (4-uchastka) o'zgarib turdi. R^2-diterminatsiya koefitsiyentiga bog'liq holda korrelyatsiya koeffitsiyenti (r) hisoblanganda uchastkalar bo'yicha r=0,99 atrofida o'zgarishi qayd etildi. Bu holat avtomobil yo'lidan uzoqlashishi bilan harakatchan mis miqdorining kamayishi orasida kuchli bog'liqlik borligini ko'rsatadi.

Tadqiqotlar harakatchan mis miqdori Toshkent-Termiz yo'lining o'ng tomonida tarqalgan tuproqlarda ko'pligini ko'rsatdi (2-rasm). Buning asosiy sababi yuqorida ta'kidlanganidek hududning shamol rejimi bilan izohlanadi. Shuningdek o'rganilgan tuproqlar tarkibidagi harakatchan og'ir metallar miqdoriga, tuproqning mexanik tarkibi, gumus miqdori joyning relyefi hamda mahalliy ahamiyatga ega bo'lgan yo'llar ya'ni dalalar atrofidagi aholi punktlariga olib boruvchi yo'llar ham ta'sir ko'rsatgan.

Xulosa: Demak, M-39 avtomagistral yo'lining Sirdaryo viloyati Oqoltin va Sardoba tumanlari hududidan o'tuvchi qismida tarqalgan bo'z-o'tloqi tuproqlar trasport vositalaridan chiqarilgan chiqindilar ta'sirida harakatchan mis bilan ifloslangan. Eng ko'p ifloslanish asosan yo'ldan 20-25 metr masofagacha bo'lgan hududlarda uchraydi. Bunda, uning maksimal miqdori 18,8 mg/kg ni tashkil etdi. Bu ko'rsatkich mazkur elementning ruxsat etilgan meyori (3 mg/kg) dan 6,3 marta hamda fon ko'rsatkichi (0,9 mg/kg) dan 20,8 marta ko'pdir. Yo'ldan 20-25 metr masofalardan so'ng harakatchan mis miqdori kamayib boradi. Shuningdek, hududda harakatchan misning tarqalishi, shamol yo'nalishi, joyning relyefi va mahalliy ahamiyatga ega bo'lgan yo'llar ya'ni dalalar atrofidagi aholi punktlariga olib boruvchi yo'llar ham ta'sir ko'rsatgan.

FORMATION AND MORPHOLOGICAL STRUCTURE OF NORTHERN LIGHT GRAY SOILS.

Abstract. *This article presents detailed information on the light gray soils distributed in the northern part of the Fergana Valley, the patterns of their distribution, the level of investigation of their geography, the climatic conditions of the research area, the morphological structure of these soils, as well as the regularities of the influence of climatic and anthropogenic factors on their formation and development.*

Keywords: *conglomerate, Kopetdag, gypsum, carbonate, ephemerals, mesophytes, concretions.*

Kirish. O‘z tuproqlar poyasining tuproqlari dastlab F. Middendorf (1887) o‘rgangan bo‘lib, bu tuproqlarni N.A. Dimo “och tuproq” S.S. Neustruyev “bo‘z tuproqlar” deb atashni tavsiya qilingan.

Keyinchalik A.N. Ro‘zanov ko‘p yillik izlanishlar samarasi o‘laroq “O‘rta Osiyo bo‘z tuproqlari” kitobi nashr ettirdi va unga och tusli bo‘z tuproqlarni o‘rnini topib qo‘ydi. Bo‘z tuproqlar poyasining asosiy tuproq tiplari va tipchalari tog‘larning yuksakligi 250–400 metrdan, 1400 metrgacha janubda esa 1500–1600 metr absolyut yuksakliklarida shakillangan. [1, 153-158]

Bo‘z tuproqlar orasida nisbatan yaxshi o‘rganilgani va yaxshi tarqalgani sug‘oriladigan och tusli bo‘z tuproqlar hisoblanadi. Bular sug‘oriladigan avtomorf tuproqlar hisoblanib, cho‘l mintaqasi bilan vertikal poyasning kontakt hududida absolyut yuksakligi 300 metrdan 600 metrgacha bo‘lgan yuksakliklarda ya’ni

Konov etaklari, Mirzacho‘l adirlarida va ayrim konus yoyilmalarida, Zarafshon, Surxondaryo, Vaxsh vodiylarining yuqori terrasalarida, Kopetdog‘ etaklarida va Badhiz yuksakliklarida va shu bilan bir qatorda Farg‘ona vodiysini o‘rab turgan tog‘larning adir mintaqachasida shakllangan holda vodiyning shimoliy adirlarida va konus yoyilmalarida tarqalgan bo‘lib katta-katta maydonlarni egallaydi. Bu tuproqlarda sug‘orish jarayonida yuza qatlamining iqlimi o‘zgaradi, shu bilan bir qatorda tuproqning suv va biologik rejimlari ham o‘zgaradi, agrosug‘orish qatlami hosil bo‘ladi. Och tusli bo‘z tuproqlarning tarqalish hududida relyef qiyaliklari kattaroq ko‘rinishda. Tog‘ etaklari yaqinida relyef yanada to‘lqinli bo‘lib, quruq soy va jarliklarni kesib o‘tadi. Yon bag‘irlari qo‘shni konglomerat tog‘ etaklari va

adirlarning tosh-shag‘alli va mayin jinslar aralashmasidan hamda prolyuvial cho‘kmalardan tashkil topgan bo‘lib, jinslarning tarkibi quyiga tomon og‘irlashib ya’ni maydalanib, mayinlashib boradi.

Tog‘ cho‘kindilarining qalinligi katta va tarkibi qatlamli, qatlamlar ba’zan diagonal, ko‘pincha xanjarsimon tuzilgan. Ular har-xil kattalikdagi va petrografik tarkibdagi shag‘allardan, jinslardan tashkil topgan. Toshlar qum va shag‘allar bilan sepilgan ya’ni to‘yingan. Adirlarda esa to‘rtlamchi davrning Mirzacho‘l va Toshkent yaruslariga mansub bo‘lgan lyosslar va lyossimon jinslar ustida ham hosil bo‘lgan.

Tuproq yuzasi turli kattalikdagi (2–3 sm dan 15–20 sm gacha) toshchalar va shag‘allar bilan qoplangan. Cho‘qqilar bo‘ylab o‘rta va mayda toshlar, vaqtincha oqar suvlari kanallari bo‘ylab katta toshlar, pasttekisliklarda tuproq yuzasi mayin (20–30 sm) tuproq qatlami bilan qoplangan. Yuqoridagi toshlar 10 sm dan 40 sm gacha bo‘lgan qatlamda jigarrang qumloq bilan aralashgan, ayrim hollarda to‘yingan.

Och tusli bo‘z tuproqlar tarqalgan hududlarning iqlimi quruq va issiq, yog‘ingarchilik yiliga 200-300 mm dan oshmaydi. Yog‘inlarning ko‘p qismi qish va bahor oylariga to‘g‘ri keladi. Tuproqning ustki qismi ya’ni 10-15 sm qismigina qish sovuq kelgan yillari muzlaydi, yozda 10 sm chuqurlik qismi ochiq holatda qariyb 65°C gacha, 100 sm chuqurlik qismi esa 25°C gacha issiq holatlari kuzatiladi. [2, 3-40 b]

Qish va bahordagi seryog‘in paytda tuproq ayrim yillarda 1 metr chuqurlikkagacha namlanadi. Tuproqning namligi qish va bahor oylari yuqoridagi 1 metr qatlam dala nam sig‘imi darajasida (20-21 %), bahor oxirida esa (14-15 %), maksimal gigroskopiklik darajasigacha (4-6 %), yuqori gorizontallarda esa so‘lish kayfitsentidan ham past darajasigacha (1-2%) o‘zgaradi. [1, 153-158 b]

Namlashning kontrastligi bahorda efemerli mezofil o‘simliklarning yaxshi rivojlanishiga va mikroorganizmlarning bahorda keng rivojlanishiga olib keladi, ya’ni 1g tuproqda 1.5 mlrd mikroorganizmlar mavjud. Shuning uchun och tusli bo‘z tuproqlar tarqalgan tog‘oldi qiya tekisliklarida efemeroidlar, ulardan keng tarqalgani Calex-pachystylis va qo‘ng‘irbosh, ya’ni Poabulbosa iliq va nam bahor oylarida zich yashab chim hosil qiladi. Yozda esa nam yetishmasligi hisobiga qovjirab qoladi. Efemeroidlar orasida efemerlar keng tarqalgan (Papaver pavonium, Delphinium perscmn, Alyssum desertorum, Malsomliaturcestnica va boshqalar). Gipslashgan skeletli melkozem ustida esa asosan shuvoq siyrak, qo‘ng‘irbosh o‘simliklar assotsiatsiyasi birgalikda o‘sadi.

Och tusli bo‘z tuproqlarda bir metrli qatlamdagi jami biomassa gektariga 8-10 tonnagachani tashkil qiladi. Shunday qilib och tusli bo‘z tuproqlar poyasida efemerli mezofil o‘simliklarning hosil bo‘lishi, mezotermik fazada qalin o‘sib yuqori 10 sm li qatlamda chim hosil qilishi bilan cho‘l mintaqasining siyrak o‘simliklaridan farq qiladi. Qisqa muddatli bahorgi seryog‘in paytda tuproqning yaxshi yuvilmasligi va pastga harakatlanayotgan suvning yuqoriga qarab qayta ko‘tarilishi tuproq yaratilish jarayonida ishtirok etuvchi moddalarning tuproq kesmasi bo‘ylab yaxshi yuvilmasligiga, aniqrog‘i migratsiyasiga olib keladi. Ushbu tuproqlarning morfologik belgilari ham o‘ziga xos bo‘ladi.

Tadqiqot obyekti. Namangan viloyatining Pop tumanida shakllangan yangi o‘zlashtirilgan, turlicha darajada eroziyalangan, tosh-shag‘alli och tusli bo‘z tuproqlar olingan.

Tadqiqotning usullari. Tadqiqotlarda tuproqshunoslikda qabul qilingan V.V.Dokuchayevning morfologik, dala-statsionar, profil usullaridan foydalanilgan.

Tadqiqot natijalari. O‘rganilgan tuproqlar tarqalgan maydonning morfologik tuzulishi quyidagi ko‘rinishga ega.

0-5 sm. Och bo‘z rangli quruq, yengil mexanik tarkibli, tangachasimon, kesaksimon strukturali yengil soz jinslardan iborat, tosh-shag‘allar aralashmasi mavjud, izlar yo‘q, yangi yaralmalar ko‘rinmaydi.

5-16 sm. Och bo‘z rangli, quruq, yengil mexanik tarkibli, ammo yuqoridagi gorizontdan ochroq, ildizlarga nisbatan boy, suvga chidamsiz, kesaksimon strukturali, mayda tosh-shag‘allar uchraydi.

16-55 sm. Och qo‘ng‘ir rangli, uvoq strukturali, o‘rta soz jinslardan iborat, mayda dog‘-dog‘ shaklida karbonatlar, pillaar ko‘rinadi, ildizlar uchraydi, yangi yaralmalar mavjud.

55-87 sm. Yuqoridagi gorizontga nisbatan och qo‘ng‘ir rangli, karbonat dog‘lari bor, uvoqli strukturaga ega, tosh-shag‘allar ko‘p, qo‘shilmasi bor.

87 sm dan quyida. Yuqori qismida karbonatlar sarg‘ich, yumshoq, g‘ovak changsimon, yengil soz, quyida esa gips oq dog‘lari uchraydi, po‘panaklar, konkretsiyalar dog‘ shaklida ko‘rinadi. Keyin qatlam tosh-shag‘alli qattiq jinslardan, ya’ni elyuviy va prolyuviylardan iborat oraliq jins.

Och tusli bo‘z tuproqlarning granulometrik tarkibi o‘zgaruvchan bo‘lib, og‘ir sozdan qumoqqacha o‘zgaradi. Bu holat Pop tumanidagi tuproqlarda ham ko‘rinadi. Bu tuproqning 30-60 sm chuqurligida gidrotermik sharoit tufayli birlamchi minerallarning yemirilishidan sozga aylanish jarayonida sodir bo‘ladi va uni analiz qilish yo‘li bilangina aniqlash mumkin. Shuning uchun bu jarayonni A.H.Rozanov “yashirin sozga aylanish” deb nomlagan. [3, 720 b]

Och tusli bo‘z tuproqlar kolloid zarrachalari ichida eng keng tarqalgani bu Fe va Al li oksidlaridir. Kolloidlarning 30-80 % montmorillonit va nontronit, 10 % gidroslyuda gruppasidagi minerallar, 1-7 % esa kremnezyomlardan iborat. [3, 720 b] Och tusli bo‘z tuproqlarda chimli qatlamda chirindi miqdori oz bo‘lib, u asosan tuproqning granulometrik tarkibiga bog‘liq holda 2 % gacha atrofida bo‘ladi, yuqoridan pastga tomon esa keskin ozayib boradi, tuproq qatlami

chuqurligi esa 70-80 sm ga boradi. Chirindining umumiy zahirasi gektariga 50-60 tonna, yalpi N chimli qatlamda 0.14-0.16 %, quyida 0.1-0.08 %. P-0.24-0.1 %, K ning umumiy zahirasi 1-1.72 % ga teng. Harakatchan P-10 mg/kg dan 40-60 mg/kg gacha, umumiy fosfor 0.1-0.2 % ga teng. [3, 720 b]

Karbonatlar miqdori esa yuqori gorizontdan pastga tomon 15-25 % gacha ortib boradi va ular tuproq yuzasidan toshlarning pastki qismida po‘stloq, mog‘or shaklida so‘ngra soqol ko‘rinishida to‘planadi. Toshlar ostida esa sementlanadi. Bu holat yuqorida morfologik belgilari keltirilgan tuproqlarda ham namoyon bo‘ladi.

Karbonatlar miqdori asosan onalik jinslarga bog‘liq bo‘lib, karbonatsiz jinslar ustida yaratilgan och tusli bo‘z tuproqlarda bu miqdor 0,5 % ni tashkil etadi. Chuqurlik bo‘ylab bazi joylarda gips sezilarli qatlamlargacha yuvilgan. Bahorda sel oqimlari sodir bo‘ladigan qiyaliklarni zich kesib o‘tadigan kichik tekisliklarda, vohalarda tosh va shag‘allarni ko‘rishimiz mimkin.

Xulosa. tariqasida shuni takidlash mimkinki yuqorida morfologik belgilarini o‘rtacha holati keltirilgan tuproqlari bo‘z qo‘ng‘ir tuproqlardan och tusli bo‘z tuproqlarga tomon evolyutsiyalanmoqda.

Abstract: *Heavy metal contamination represents a significant environmental challenge affecting soil microbial communities and their functional activities. Among beneficial soil microorganisms, members of the genus Azotobacter play an important role in maintaining soil fertility through nitrogen fixation, plant growth promotion, and exopolysaccharide (EPS) production. The present study evaluated the effects of $ZnSO_4 \cdot 7H_2O$ and $MnSO_4 \cdot 5H_2O$ on EPS production and biomass accumulation in ten Azotobacter strains originating from different soil habitats, including the Aral Sea region. The strains were cultivated in Ashby's liquid medium supplemented with $ZnSO_4 \cdot 7H_2O$ or $MnSO_4 \cdot 5H_2O$ at concentrations of 0.5, 1.0, and 2.0 mM. Cultures were incubated at 28°C for 5 days, after which EPS and biomass production were determined gravimetrically and expressed as g L^{-1}. The results revealed substantial differences in the responses of the investigated strains to metal stress. Zinc exerted a pronounced inhibitory effect on both EPS synthesis and biomass accumulation, and EPS production was completely suppressed at 2.0 mM $ZnSO_4 \cdot 7H_2O$. In contrast, manganese exhibited a considerably weaker inhibitory effect, allowing sustained bacterial growth and EPS production across the tested concentrations. Several strains, particularly AC1, AC6, AC8, and AC10, maintained measurable EPS production and biomass accumulation under elevated metal concentrations, indicating enhanced tolerance to metal-induced stress. The findings demonstrate the importance of strain-specific adaptive responses and highlight the role of EPS in microbial survival under adverse environmental conditions. The identified metal-tolerant Azotobacter strains may represent promising candidates for future applications in soil restoration, sustainable agriculture, and bioremediation of metal-contaminated environments.*

ВЛИЯНИЕ СТРЕССА ЦИНКА И МАРГАНЦА НА ПРОИЗВОДСТВО ЭКЗОПОЛИСАХАРИДОВ И НАКОПЛЕНИЕ БИОМАССЫ В ШТАММАХ АЗОТОБАКТЕРОВ

Аннотация: *Загрязнение тяжелыми металлами представляет собой серьезную экологическую проблему, влияющую на почвенные микробные сообщества и их функциональную активность. Среди полезных почвенных микроорганизмов представители рода Azotobacter играют важную роль в поддержании плодородия почвы за счет фиксации азота, стимуляции роста растений и производства экзополисахаридов (ЭПС). В настоящем исследовании оценивалось влияние $ZnSO_4 \cdot 7H_2O$ и $MnSO_4 \cdot 5H_2O$ на производство ЭПС и накопление биомассы в десяти штаммах Azotobacter, происходящих из различных почвенных местообитаний, включая регион Аральского моря. Штаммы культивировали в жидкой среде Эшби, дополненной $ZnSO_4 \cdot 7H_2O$ или $MnSO_4 \cdot 5H_2O$ в концентрациях 0,5, 1,0 и 2,0 мМ. Культуры инкубировали при 28°C в течение 5 дней, после чего гравиметрически определяли продукцию ЭПС и биомассы и выражали в г/л. Результаты выявили существенные различия в реакции исследуемых штаммов на металлический стресс. Цинк оказывал выраженное ингибирующее действие как на синтез ЭПС, так и на накопление биомассы, а продукция ЭПС полностью подавлялась при концентрации $ZnSO_4 \cdot 7H_2O$ 2,0 мМ. В отличие от этого, марганец оказывал значительно более слабое ингибирующее действие, обеспечивая устойчивый рост бактерий и продукцию ЭПС при всех исследованных концентрациях. Некоторые штаммы, в частности AC1, AC6, AC8 и AC10, поддерживали измеримое производство ЭПС и накопление биомассы при повышенных концентрациях металлов, что указывает на повышенную устойчивость к стрессу, вызванному металлами. Полученные результаты демонстрируют важность адаптивных реакций, специфичных для каждого штамма, и подчеркивают роль ЭПС в выживании микроорганизмов в неблагоприятных условиях окружающей среды. Выявленные металлоустойчивые штаммы Azotobacter могут представлять собой перспективные кандидаты для будущего применения в восстановлении почв, устойчивом сельском хозяйстве и биоремедиации загрязненных металлами сред.*

Ключевые слова: *Azotobacter; экзополисахариды; накопление биомассы; цинковый стресс; марганцевый стресс; тяжелые металлы; Аральский регион; биоремедиация.*

AZOTOBAKTER SHTAMLARINDA EKZOPOLISAXARID ISHLAB CHIQARISH VA BIOMASSA TO'PLANISHIGA SINK VA MARGANEZ STRESSINING TA'SIRI

Annotatsiya: *Og'ir metallarning ifloslanishi tuproq mikrobial jamoalariga va ularning funktsional faolligiga ta'sir qiluvchi jiddiy ekologik muammodir. Foydali tuproq mikroorganizmlari orasida Azotobacter turkumining vakillari azot fiksatsiyasi, o'simliklarning o'sishini rag'batlantirish va ekzopolisaxarid (EPS) ishlab chiqarish orqali tuproq unumdorligini saqlashda muhim rol o'ynaydi. Ushbu tadqiqotda Orol dengizi mintaqasini o'z ichiga olgan turli tuproq yashash joylaridan kelib chiqqan o'nta Azotobacter shtammida EPS ishlab chiqarish va biomassa to'planishiga $ZnSO_4 \cdot 7H_2O$ va $MnSO_4 \cdot 5H_2O$ ning ta'siri baholandi. Shtammlar Ashby suyuq muhitida $ZnSO_4 \cdot 7H_2O$ yoki $MnSO_4 \cdot 5H_2O$ bilan to'ldirilgan holda 0,5, 1,0 va 2,0 mM konsentratsiyalarda o'stirildi. Kulturalar 28°C da 5 kun davomida inkubatsiya qilindi, shundan so'ng EPS va biomassa ishlab chiqarish gravimetrik ravishda aniqlandi va g L^{-1} sifatida ifodalandi. Natijalar tekshirilgan shtammlarning metall stressiga javoblarida sezilarli farqlarni aniqladi. Rux EPS sinteziga ham, biomassa to'planishiga ham sezilarli inhibitiv ta'sir ko'rsatdi va EPS ishlab chiqarish 2,0 mM $ZnSO_4 \cdot 7H_2O$ da butunlay bostirildi. Aksincha, marganets ancha zaif inhibitiv ta'sir ko'rsatdi, bu esa sinovdan o'tgan konsentratsiyalarda bakteriyalarning barqaror o'sishi va EPS ishlab chiqarilishini ta'minladi. Bir nechta shtammlar, xususan AC1, AC6, AC8 va AC10, yuqori metall konsentratsiyasi ostida o'lchanadigan EPS ishlab chiqarish va biomassa to'planishini saqlab qoldi, bu esa metall keltirib chiqaradigan stressga chidamlilikning oshganligini ko'rsatadi. Topilmalar shtammga xos moslashuvchan javoblarning muhimligini ko'rsatadi va noqulay atrof-muhit sharoitida mikrobial omon qolishdagi EPS rolini ta'kidlaydi. Aniqlangan metallga chidamli Azotobacter shtammlari kelajakda tuproqni tiklash, barqaror qishloq xo'jaligi va metall bilan ifloslangan muhitlarni bioremediatsiya qilishda qo'llanilishi mumkin bo'lgan istiqbolli nomzodlarni ifodalashi mumkin.*

Kalit so'zlar: *Azotobacter; ekzopolisaxaridlar; biomassa to'planishi; rux stressi; marganets stressi; og'ir metallar; Orol dengizi mintaqasi; bioremediatsiya.*

Introduction

The increasing accumulation of heavy metals in agricultural soils has become a major environmental concern due to their persistence, toxicity, and adverse effects on soil microorganisms and plant productivity [1,2]. Although zinc (Zn) and manganese (Mn) are essential micronutrients for living organisms, elevated concentrations may inhibit microbial growth, disrupt cellular metabolism, and reduce soil fertility [1,2]. Among soil microorganisms, members of the genus Azotobacter are recognized as important plant growth-promoting bacteria due to their ability to fix atmospheric nitrogen, synthesize phytohormones, and improve nutrient availability in the rhizosphere [7–9]. In addition to these beneficial properties, Azotobacter strains can produce extracellular polymeric substances, particularly exopolysaccharides (EPS), which contribute to soil aggregation, biofilm formation, and protection against environmental stress [3,4]. Exopolysaccharides play a crucial role in microbial adaptation to adverse environmental conditions. EPS molecules contain functional groups such as hydroxyl, carboxyl, phosphate, and amino groups that can interact with metal ions through adsorption, ion exchange, and complexation mechanisms [10–13]. As a result, EPS-producing microorganisms are often more tolerant to heavy metal stress than non-producing strains [10,11]. Previous studies have demonstrated that bacterial EPS can bind and immobilize various metal ions, thereby reducing their toxicity to microbial cells and improving microbial survival under stressful conditions [11–13]. Several investigations have highlighted the role of Azotobacter spp. in heavy metal immobilization and bioremediation processes [7,10,11]. The production of EPS is considered one of the major adaptive mechanisms that enables bacteria to withstand unfavorable environmental conditions, including salinity, drought, and heavy metal contamination [4,10,18]. Therefore, the evaluation of EPS synthesis under metal stress may provide important information regarding the resistance potential of different bacterial strains. The Aral Sea region is considered one of the most environmentally degraded ecosystems in Central Asia. The desiccation of the Aral Sea has resulted in severe soil salinization, dust storms, biodiversity loss, and contamination of surrounding ecosystems [15–17]. Microorganisms inhabiting these environments are continuously exposed to multiple abiotic stresses and may possess unique physiological adaptations that enhance their survival [16,17]. Consequently, strains isolated from the Aral Sea region represent valuable biological resources for the development of environmentally sustainable technologies.

The aim of the present study was to evaluate the effects of different concentrations of $ZnSO_4 \cdot 7H_2O$ and $MnSO_4 \cdot 5H_2O$ on exopolysaccharide production and biomass accumulation in ten Azotobacter strains originating from different soil habitats, including the Aral Sea region. The study further sought to identify strains exhibiting enhanced tolerance to metal stress and elevated EPS-producing capacity.

2.Materials and Methods

2.1. Bacterial strains. Ten Azotobacter strains originating from different soil habitats of Uzbekistan were used in this study. The strains were designated as follows: AC1 (Aral 2020), AC2 (Aral 2018), AC3 (Zindon), AC4 (Yozyovon), AC5 (peanut rhizosphere), AC6 (Aral 2024), AC7 (long-term stored soil), AC8 (Aral Sea bed, 30–60 cm depth), AC9 (Namangan 20), and AC10 (Aral Sea rhizosphere). The strains were maintained in the microbial culture collection of the laboratory and routinely cultivated on Ashby's nitrogen-free medium prior to experimental use.

2.2. Culture conditions and heavy metal treatments.The influence of zinc and manganese on exopolysaccharide (EPS) production and biomass accumulation was investigated using Ashby's liquid medium. Zinc and manganese were supplied in the form of $ZnSO_4 \cdot 7H_2O$ and $MnSO_4 \cdot 5H_2O$, respectively. For each metal source, four experimental treatments were established:

- Control (without metal supplementation)
- 0.5 mM
- 1.0 mM
- 2.0 mM

Erlenmeyer flasks containing 100 mL of sterile medium were inoculated with the respective bacterial strains and incubated at 28°C for 5 days. After incubation, cultures were processed for EPS and biomass determination.

2.3. Determination of exopolysaccharide production. Following cultivation, bacterial cultures were centrifuged to separate cells from the culture supernatant. Exopolysaccharides were recovered from the supernatant by alcohol precipitation. The resulting precipitate was collected and dried to constant weight. EPS production was expressed as grams per liter (g L^{-1}) based on the culture volume.

2.4. Determination of biomass accumulation Bacterial biomass was obtained by centrifugation of the culture broth. The recovered cell pellet was dried to constant weight and the biomass yield was determined gravimetrically. The obtained values were converted to grams per liter (g L^{-1}).

2.5. Data analysis The obtained EPS and biomass values were recorded and compared among strains and metal concentrations. The results are presented as measured values expressed in g L^{-1}.

Results

3.1. Effect of $ZnSO_4 \cdot 7H_2O$ on exopolysaccharide production. The production of exopolysaccharides by Azotobacter strains varied considerably depending on zinc concentration (Figure 1).

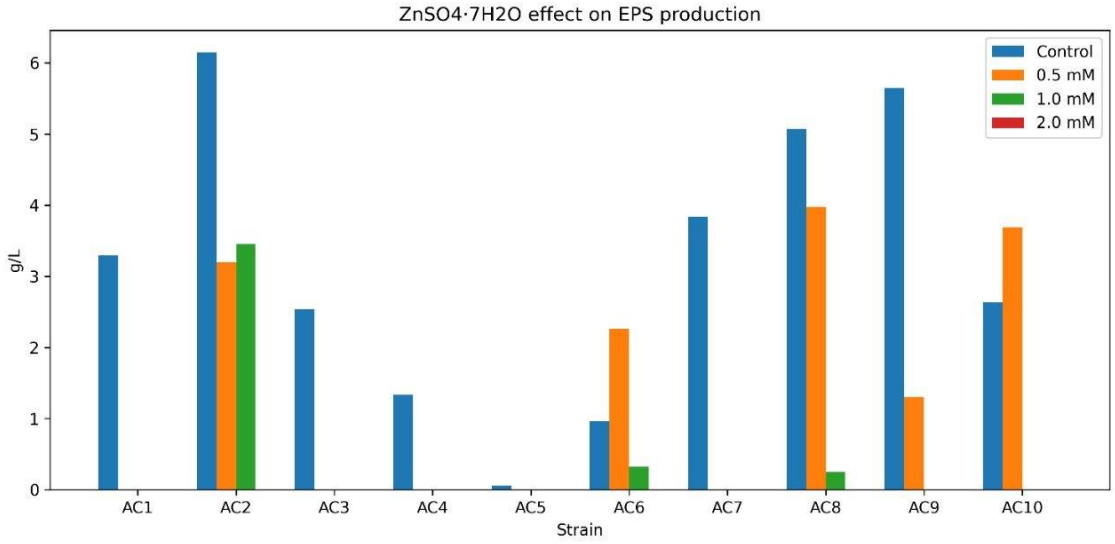

Figure 1. Effect of $ZnSO_4 \cdot 7H_2O$ concentrations (0, 0.5, 1.0 and 2.0 mM) on exopolysaccharide (EPS) production by Azotobacter strains cultivated in Ashby's medium for 5 days at 28°C. Values are expressed as g L^{-1}.

Under control conditions, EPS production ranged from 0.056 to 6.152 g L^{-1}. The highest EPS yield was observed in strain AC2 (6.152 g L^{-1}), followed by strains AC9 (5.648 g L^{-1}) and AC8 (5.072 g L^{-1}). The addition of $ZnSO_4 \cdot 7H_2O$ generally reduced EPS synthesis in most strains. At a concentration of 0.5 mM $ZnSO_4 \cdot 7H_2O$, EPS production remained detectable in strains AC2, AC6, AC8, AC9 and AC10, whereas no measurable EPS production was observed in the remaining strains. The highest EPS production at this concentration was recorded for strain AC8 (3.978 g L^{-1}). Further increasing the zinc concentration to 1.0 mM resulted in a substantial decline in EPS production. Only a few strains retained the ability to synthesize detectable amounts of EPS, with AC2 showing the highest value (3.454 g L^{-1}). At 2.0 mM

$ZnSO_4 \cdot 7H_2O$, EPS production was completely inhibited in all tested strains. These results indicate that zinc exerted a strong inhibitory effect on EPS synthesis, with marked differences in tolerance among the studied strains.

3.2. Effect of $ZnSO_4 \cdot 7H_2O$ on biomass accumulation. The influence of $ZnSO_4 \cdot 7H_2O$ on biomass accumulation is presented in Figure 2.

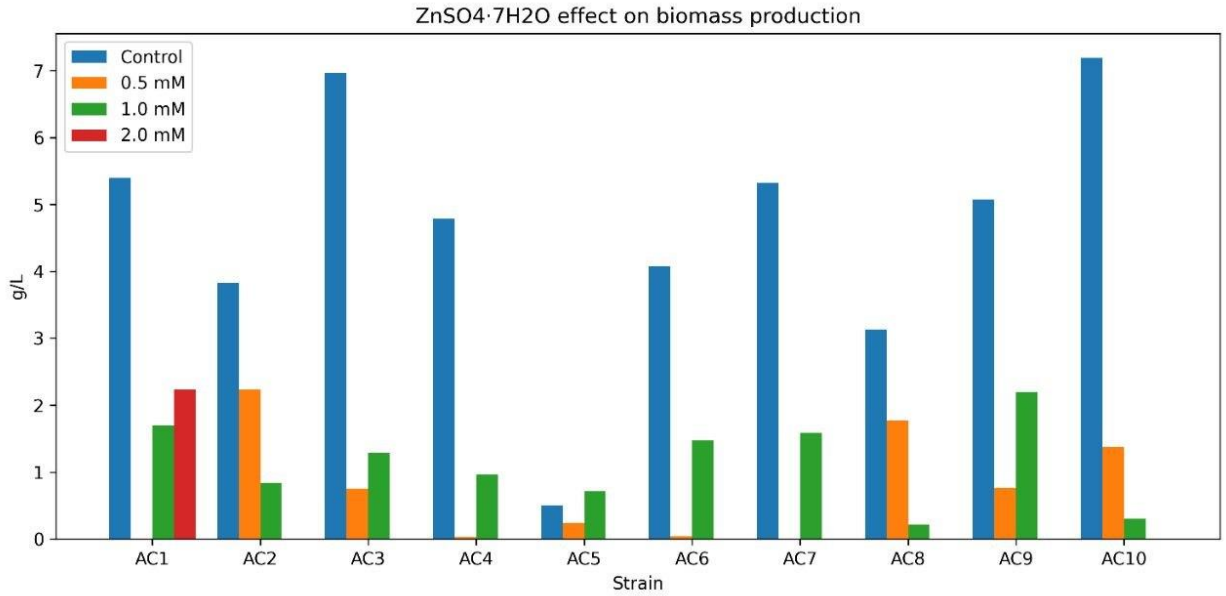

Figure 2. Effect of $ZnSO_4 \cdot 7H_2O$ concentrations (0, 0.5, 1.0 and 2.0 mM) on biomass accumulation by Azotobacter strains cultivated in Ashby's medium for 5 days at 28°C. Values are expressed as g L^{-1}.

Under control conditions, biomass production ranged from 0.500 to 7.196 g L^{-1}. The highest biomass yield was observed in strain AC10, followed by AC3 and AC1. Exposure to zinc stress resulted in a considerable reduction in biomass accumulation in most strains. At 0.5 mM $ZnSO_4 \cdot 7H_2O$, several strains maintained growth, although biomass values were substantially lower than those recorded under control conditions. At 1.0 mM $ZnSO_4 \cdot 7H_2O$, measurable biomass production was still observed in most strains. The highest biomass accumulation at this concentration was recorded in strain AC9 (2.20 g L^{-1}), whereas lower values were observed in AC8 and AC10. At the highest tested concentration (2.0 mM), growth was severely restricted. Detectable biomass accumulation was observed only in strain AC1 (2.23 g L^{-1}), while biomass production was not detected in the remaining strains. The obtained results demonstrate that zinc stress significantly affected bacterial growth and that strain AC1 exhibited the highest tolerance to elevated Zn concentrations.

3.3. Effect of $MnSO_4 \cdot 5H_2O$ on exopolysaccharide production. The influence of $MnSO_4 \cdot 5H_2O$ on EPS production is presented in Figure 3.

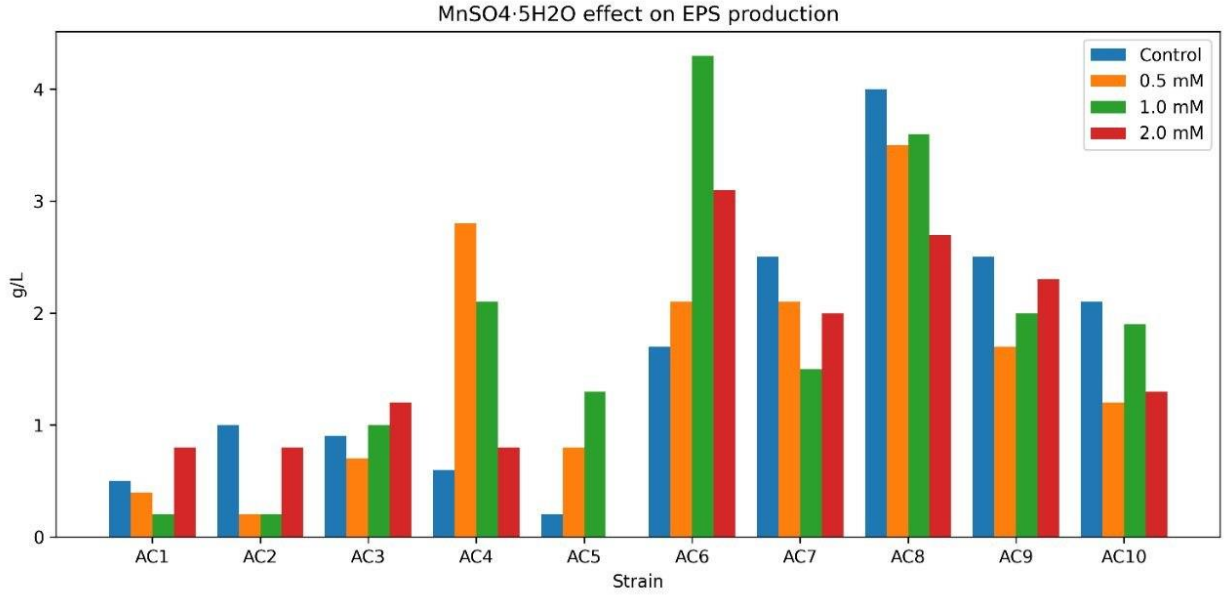

Figure 3. Effect of $MnSO_4 \cdot 5H_2O$ concentrations (0, 0.5, 1.0 and 2.0 mM) on exopolysaccharide (EPS) production by Azotobacter strains cultivated in Ashby's medium for 5 days at 28°C. Values are expressed as g L^{-1}.

In contrast to zinc, manganese did not completely inhibit EPS synthesis and, in some cases, appeared to stimulate exopolysaccharide production. Under control conditions, EPS production ranged from 0.20 to 4.00 g L^{-1}, with strain AC8 exhibiting the highest EPS yield. At 0.5 mM $MnSO_4 \cdot 5H_2O$, most strains maintained active EPS synthesis. The highest value was recorded for AC8 (3.5 g L^{-1}), followed by AC4 (2.8 g L^{-1}), AC6 (2.1 g L^{-1}), and AC7 (2.1 g L^{-1}). At 1.0 mM $MnSO_4 \cdot 5H_2O$, EPS production increased in several strains compared with the control treatment. The highest EPS yield was observed in strain AC6 (4.3 g L^{-1}), while AC8, AC4, AC9, and AC10 also demonstrated considerable EPS production. These findings suggest that moderate manganese concentrations may promote exopolysaccharide synthesis in certain Azotobacter strains. Even at the highest tested concentration (2.0 mM), EPS production remained detectable in nearly all strains. The greatest EPS accumulation was recorded in strain AC6 (3.1 g L^{-1}), followed by AC8 (2.7 g L^{-1}), AC9 (2.3 g L^{-1}), and AC7 (2.0 g L^{-1}). Only strain AC5 failed to produce detectable EPS at this concentration. Overall, manganese exerted a substantially weaker inhibitory effect on EPS synthesis than zinc and supported sustained exopolysaccharide production across a broad range of concentrations.

3.4. Effect of $MnSO_4 \cdot 5H_2O$ on biomass accumulation. The effect of $MnSO_4 \cdot 5H_2O$ on biomass accumulation is shown in Figure 4.

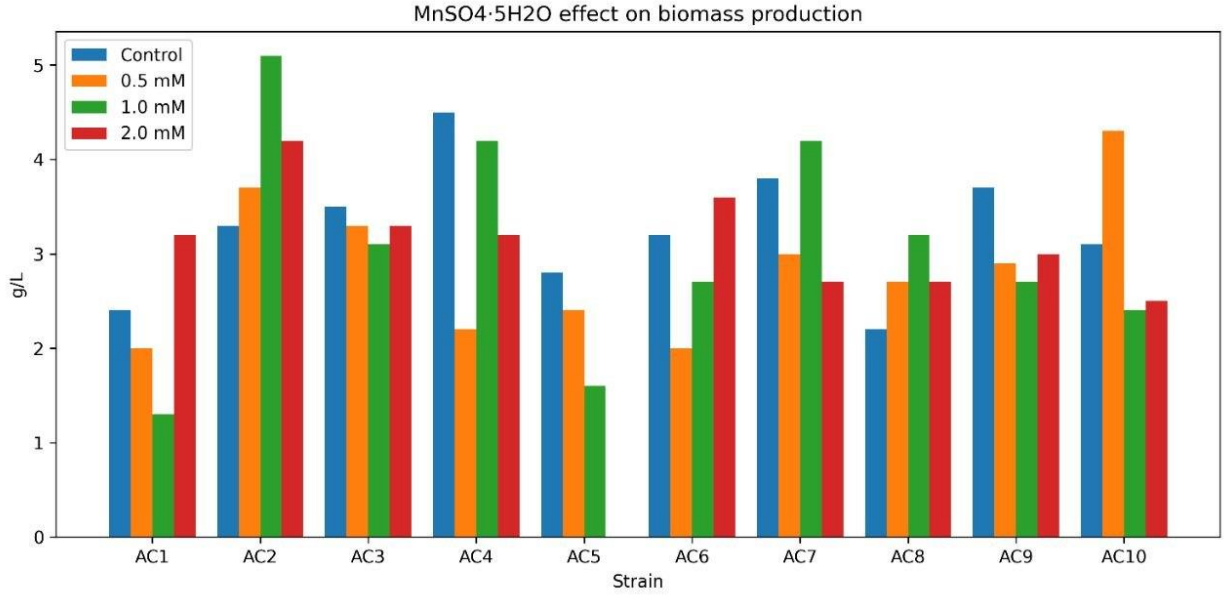

Figure 4. Effect of $MnSO_4 \cdot 5H_2O$ concentrations (0, 0.5, 1.0 and 2.0 mM) on biomass accumulation by Azotobacter strains cultivated in Ashby's medium for 5 days at 28°C. Values are expressed as g L^{-1}.

Under control conditions, biomass production varied between 2.2 and 4.5 g L^{-1}, with strain AC4 showing the highest biomass yield. Following manganese supplementation, most strains maintained active growth. At 0.5 mM $MnSO_4 \cdot 5H_2O$, biomass values remained comparable to or slightly higher than those observed in the control treatment. The highest biomass accumulation was recorded for strain AC10 (4.3 g L^{-1}). At 1.0 mM $MnSO_4 \cdot 5H_2O$, biomass production increased in several strains. The greatest value was observed in strain AC2 (5.1 g L^{-1}), followed by AC4 (4.2 g L^{-1}) and AC7 (4.2 g L^{-1}). These results indicate that moderate manganese concentrations did not adversely affect bacterial growth. At 2.0 mM $MnSO_4 \cdot 5H_2O$, most strains continued to exhibit measurable biomass accumulation. The highest biomass yield was observed in strain AC2 (4.2 g L^{-1}), whereas biomass production was not detected in strain AC5. Nevertheless, the majority of strains retained substantial growth capacity under elevated manganese concentrations. The obtained results demonstrate that manganese was considerably less inhibitory to bacterial growth than zinc. Several strains maintained both EPS production and biomass accumulation across all tested $MnSO_4 \cdot 5H_2O$ concentrations, indicating a higher level of tolerance to manganese stress.

Detailed EPS and biomass values obtained under different metal concentrations are presented in Tables 1 and 2.

Table 2. Effect of $MnSO_4 \cdot 5H_2O$ on EPS and biomass production

Discussion

The present study demonstrated that $ZnSO_4 \cdot 7H_2O$ and $MnSO_4 \cdot 5H_2O$ exerted different effects on EPS production and biomass accumulation in the investigated Azotobacter strains. Overall, zinc exhibited a stronger inhibitory effect than manganese, particularly at higher concentrations, where a marked reduction in both bacterial growth and exopolysaccharide synthesis was observed. The inhibitory effect of zinc on microbial metabolism has been reported by several authors. Although zinc is an essential micronutrient involved in numerous enzymatic processes, excessive concentrations may disrupt membrane integrity, interfere with protein synthesis, and induce oxidative stress, ultimately leading to reduced microbial growth [1,2]. In the present study, EPS production was completely suppressed in all strains at 2.0 mM $ZnSO_4 \cdot 7H_2O$, indicating that elevated zinc concentrations exceeded the tolerance limits of the investigated strains. Exopolysaccharides are known to play an important role in microbial adaptation to environmental stress. EPS matrices contain negatively charged functional groups capable of binding metal ions, thereby reducing their direct interaction with bacterial cells [10–13]. The persistence of EPS production in strains AC2, AC6, AC8, and AC10 under zinc stress suggests that these strains may possess more efficient protective mechanisms against metal toxicity. Similar observations have been reported for other EPS-producing bacteria exposed to heavy metals, where enhanced EPS synthesis contributed to increased metal tolerance and survival [10,11]. In contrast to zinc, manganese had a relatively limited inhibitory effect on both EPS production and biomass accumulation. Several strains maintained active growth and EPS synthesis even at 2.0 mM $MnSO_4 \cdot 5H_2O$. Moreover, increased EPS production was observed in some strains at intermediate manganese concentrations, particularly in strain AC6. Since manganese is an essential trace element involved in enzyme activation, antioxidant defense, and cellular metabolism, moderate concentrations may support bacterial physiological processes rather than inhibit them [2]. This may explain the relatively high biomass and EPS values observed under manganese treatment. Considerable variation among strains was observed throughout the study. Such differences are likely associated with the ecological origin of the isolates and their adaptive capabilities. Strains originating from the Aral Sea region, including AC1, AC6, AC8, and AC10, generally demonstrated greater tolerance to metal stress compared with several isolates from other habitats. The Aral Sea region is characterized by multiple environmental stressors, including salinity, drought, and contamination by various pollutants [15–17]. Long-term exposure to these conditions may have promoted the selection of microorganisms possessing enhanced stress-resistance

mechanisms. The ability of certain strains to maintain biomass production and EPS synthesis under elevated metal concentrations highlights their potential importance for environmental applications. EPS-producing Azotobacter strains may contribute to metal immobilization in contaminated soils, improve soil structure, and support plant growth under adverse environmental conditions [7,10,11]. Therefore, the strains identified as relatively tolerant in the present study may represent promising candidates for future investigations focusing on bioremediation and sustainable agricultural practices.

Conclusion

The present study demonstrated that $ZnSO_4 \cdot 7H_2O$ and $MnSO_4 \cdot 5H_2O$ exerted distinct effects on EPS production and biomass accumulation in Azotobacter strains originating from different soil habitats. Zinc exhibited a pronounced inhibitory effect on both bacterial growth and exopolysaccharide synthesis, particularly at higher concentrations, whereas manganese was generally less toxic and allowed sustained metabolic activity in most strains. Considerable variability was observed among the investigated strains, indicating the presence of strain-specific mechanisms of adaptation to metal stress. Several isolates, particularly AC1, AC6, AC8, and AC10, maintained measurable biomass production and EPS synthesis under elevated metal concentrations, suggesting enhanced tolerance to adverse environmental conditions. The results further support the important role of exopolysaccharides in bacterial adaptation to heavy metal stress. The ability of selected strains to continue producing EPS under metal exposure may contribute to metal binding, detoxification, and cellular protection, thereby improving survival in contaminated environments. Overall, the investigated Azotobacter strains represent a valuable microbial resource with potential applications in soil restoration, sustainable agriculture, and bioremediation of metal-affected environments. Future studies should focus on the characterization of EPS composition, evaluation of metal-binding capacity, and molecular mechanisms underlying heavy metal tolerance in the most resistant strains.

REGENERATIV BUG'DOY YETISHTIRISHDA AZOTABAKTERIYALAR SHTAMMLARINING UGLEVODLAR MIQDORIGA TA'SIRI

Mehmonova Nilufar Alijon qizi
Guliston davlat universiteti, Agrobiotexnologiyalar va biokimyo ilmiy tadqiqot instituti tayanch doktoranti
E-mail: mehmonovanilufar6@gmail.com
Ergasheva Farog'at Sheraliyevna
Guliston davlat universiteti, dotsenti

Annotatsiya: *Ushbu maqolada regenerativ bug'doy yetishtirishda azotabakteriyalarning uglevodlar miqdoriga ta'sirini o'rganishga doir ma'lumotlar o'rin olgan. Tadqiqot obyekti sifatida kuzgi hosil (Triticum L.) va aestivum L.) va qattiq (Tríticum dúrum) bug'doy turlariga mansub genotiplar va azotabakterialar B. Licheniformis, B. Subtilis va B. Megateriumlarning shtammlaridan tayyorlangan eritmalar olingan. Uglevodlar miqdori hosil bug'doyning naychalashda o'rtacha 10.2% ni boshoqlashda 12.2% ni, qattiq bug'doyda tegishli ravishda: 10.7% va 11.51% ni tashkil etgan. Regenerativ bug'doy yetishtirishda mazkur bakteriyalarning 1:5 nisbatli organizmlaridan boshoqlash fazasida foydalanish tavsiya etilgan. Bu bakteriyalar ta'sirida nazoratga nisbatan uglevodlar miqdori 29-30% ga oshganligi aniqlangan.*

Kalit so'zlar: *azotobakterialar, shtamm, yumshoq, qattiq bug'doy , regenerativ mahsulot yetishtirish, uglevodlar miqdori, naychalash, boshoqlash fazalar.*

EFFECT OF AZOTOBACTER STRAINS ON CARBOHYDRATE CONTENT IN REGENERATIVE WHEAT CULTIVATION

Abstract: *This article presents data on the effect of azotobacteria on carbohydrate content in regenerative wheat cultivation. The research objects included genotypes belonging to winter soft wheat (Triticum aestivum L.) and durum wheat (Tríticum dúrum) species, as well as solutions prepared from strains of Bacillus licheniformis, Bacillus subtilis, and Bacillus megaterium. The carbohydrate content in soft wheat averaged 10.2% at the stem elongation stage and 12.2% at the heading stage, while in durum wheat it reached 10.7% and 11.51%, respectively. In regenerative wheat cultivation, the use of these bacterial organisms at a 1:5 ratio during the heading stage is recommended. Under the influence of these bacteria, carbohydrate content increased by 29–30% compared to the control.*

Keywords: *azotobacteria, strain, soft wheat, durum wheat, regenerative crop production, carbohydrate content, stem elongation stage, heading stage.*

ВЛИЯНИЕ ШТАММОВ АЗОТОБАКТЕРИЙ НА СОДЕРЖАНИЕ УГЛЕВОДОВ ПРИ РЕГЕНЕРАТИВНОМ ВОЗДЕЛЫВАНИИ ПШЕНИЦЫ

Аннотация: *В данной статье представлены данные о влиянии азотобактерий на содержание углеводов при регенеративном возделывании пшеницы. Объектами исследования служили генотипы мягкой озимой пшеницы (*Triticum aestivum *L.) и твёрдой пшеницы (*Triticum durum*), а также растворы, приготовленные на основе штаммов Bacillus licheniformis, Bacillus subtilis и Bacillus megaterium. Содержание углеводов в мягкой пшенице в среднем составило 10,2% в фазе выхода в трубку и 12,2% в фазе колошения, тогда как у твёрдой пшеницы соответствующие показатели составили 10,7% и 11,51%. При регенеративном возделывании пшеницы рекомендуется применение данных бактериальных штаммов в соотношении 1:5 в фазе колошения. Под воздействием этих бактерий содержание углеводов увеличилось на 29–30% по сравнению с контрольным вариантом.*

Ключевые слова :*азотобактерии, штамм, мягкая пшеница, твёрдая пшеница, регенеративное земледелие, содержание углеводов, фаза выхода в трубку, фаза колошения.*

Kirish

Aholini oziq-ovqat mahsulotlariga bo‘lgan talabini qondirish hozirgi kunning muhim masalaridan biri bo‘lib qolmoqda. Bu aholi soni va uning sifatli mahsulotga bo‘lgan talabning ortib borishi bilan bog‘liq.

Adabiyotlar tahlili

Bu o‘rinda regenerativ qishloq xo‘jaligi (*Regenerative agriculture RA*) mahsuldorlikni tejash va aholini oziq-ovqat mahsulotlarga bo‘lgan talabini qondirishda barqaror tizim sifatida e'tirof etilgan[1,2]. Chunki regenerativ qishloq xo‘jaligining asosiy funktsiyalari tabiiy resurslardan samarali foydalanish, noqulay iqlim sharoitlariga o‘simliklarni moslashtirish, bioxilma-xillikni, tuproq unumdorligini saqlash, ekologik toza mahsulot yetishtirish, ekosistemani barqarorligini ta’minlashdan iborat[3,4,5,10,11].

O‘simlikning o‘sishi va rivojshlanishi uchun qulay sharoitni yaxshilash regenerativ mahsulot yetishtirishda muhim ahamiyatga ega. Ushbu jarayonning mahsuli uglevodlar miqdori bilan ham baholanadi. Chunki uglevodlar o‘simliklarni o‘sishi va rivojlanishi uchun zarur bo‘lgan asosiy energiya manba hisoblanadi. Shu bilan birga uglevodlar o‘simliklarning stressga chidamligini baholovchi mezon sifatida ham e’tirof etilgan. Masalan, azotabakteriyalar (*Bacillus subtilis)* tayyorlangan biologik preparatlar ta’sirida o‘simliklarda qand miqdori va ularni stressga chidamliligi ortgan [6]. B.Subtilis bakteriya inokulyatsiya qilingan bug‘doy o‘simliklari azotli o‘g‘itning yuqori me’yoriga chidamliligini oshirgan[7]. *Bacillus megaterium o‘simliklarda glukoza, fruktoza, qand miqdori hamda ularning qurg‘ochilikka hamda og‘ir metallarga boyligini oshirgan[8]. Bacillus licheniformis endofit bakteriyalardan bo‘lib o‘simliklarning fiziolog holatini va uglevodlar metobolizmini yaxshilash bilan ularning stressga chidamlilikni oshirgan.* [9]. Qurg‘oqchilikka chidamli o‘simliklarda eruvchan uglevod 1,13-1,63 mg/% ni tashkil etgan bo‘lsa mezofitlarda -0,64-1,20 mg% tashkil etgan[10]. Sovuq havoning ta'sirida raps o‘simligida qand miqdori 8, fruktoza 13, glyukoza 39 martaga ortganligi aniqlangan[11].

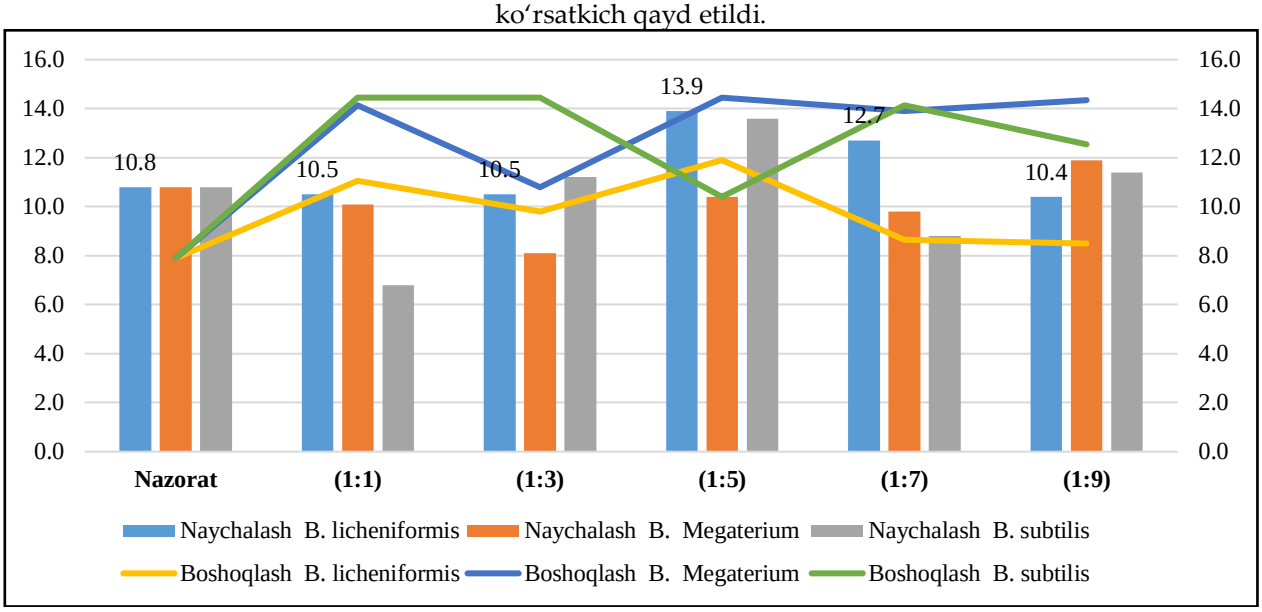
Umuman olganda, regenerativ mahsulot yetishtirish qishloq xo‘jaligida o‘ziga xos yondashuv bo‘lib, birinchi navbatda tuproq unumdorligini oshirish, tabiiy resurslardan samarali foylalanish, noqulay iqlim sharoiti ta'sirini kamayish va insonlarni sifatli mahsulot bilan ta'minlash hamda iqtisodiy barqarorlikni yaxshilashga yo‘naltirilgan barqaror tizim sifatida e’tirof etilgan [1]. Bu o‘rinda boshoqli don ekinlari, jumladan, bug‘doy oziq-ovqat tizimining asosi hisoblanadi. Lekin, sug‘oriladigan, sho‘rlanishga moyil bo‘lgan tuproq iqlim bug‘doydan regenerativ mahsulot yetishtirishda azotabakteriyalar o‘rni o‘rganilmagan. Mazkur tadqiqotni o‘tkazishdan asosiy maqsad, bug‘doy yetishtirishda azotabakteryalar uglevodlar miqdoriga ta’sirini o‘rganishdan iborat.

Tadqiqot obyekti . Tadqiqot obyekti sifatida kuzgi hosil (Triticum aestivum L) va qattiq (Tríticum dúrum) bug‘doy turlariga mansub genotiplar olindi. Tadqiqot Guliston davlat universiteti qoshidagi Agrobiotexnalogiya va biokimyo ilmiy tatqiqot instituti va Don va dukkakli ekinlar ilmiy tadqiqot instituti Sirdaryo tajriba stansiyasi maydonida olib borildi. Uglevodlar miqdori refraktometri HANNA Instruments HI96800 uskunasi yordamida aniqlandi. Birlamchi ma'lumotlarni statistik tahlil qilishda SPSS-17 dasturidan foydalanildi.

Natijalar va ularning tahlili

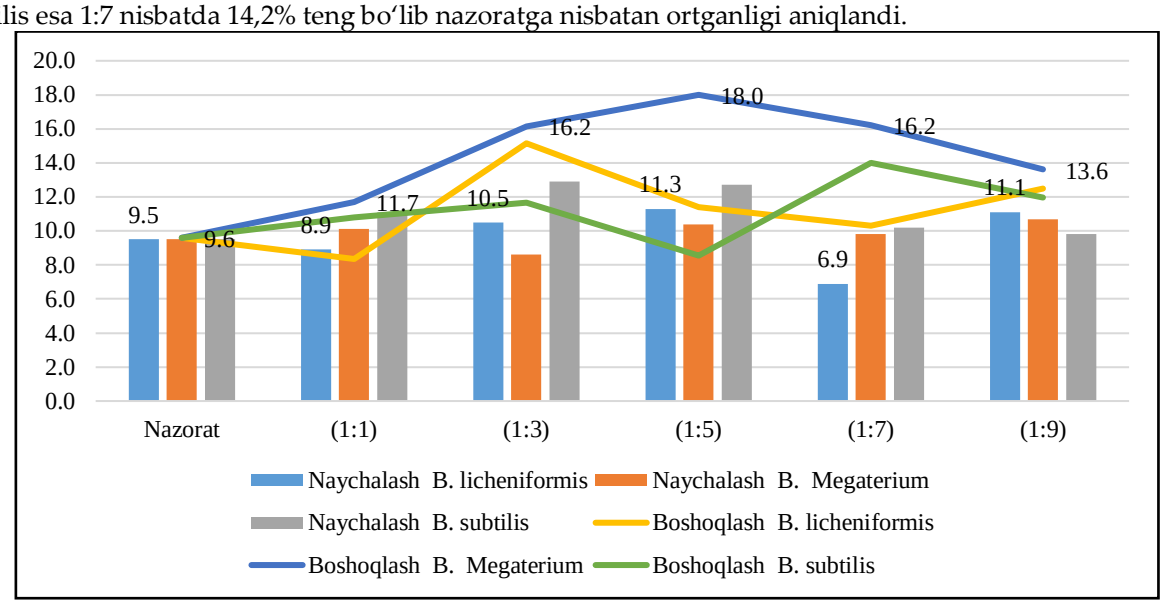
Olingan natijalar shuni ko‘rsatdiki, uglevodlar miqdoriga bakteriya shtammlari va ulardan tayyorlangan eritmalar ta’sir qildi. B. Licheniformis bakteriyaning 1:1 nisbatli erimasida uglevod miqdori 8,9% ga teng bo‘lgan bo‘lsa nazoratda 9,5% ni tashkil etdi. Eritma nisbati 1:3 teng bo‘lganida uglevod miqdori 10,5%, 1:5-11,3%, 1:7-6,9 va 1:9-11,1% ga teng bo‘ldi. Ushbu malumotlardan, bakteriya nisbati 1:5 bo‘lganida uglevodlar miqdori ortganligi aniqlandi. B.Megaterium bakteriya ta'sirida ham aynan shunday natija kuzatildi. Eritma nisbati 1:7 bo‘lganida uglevod miqdori kamayib (9,8%) 1:9 ortdi (10,7%). B.Subtilis bakteriyasining ta’siri 1:3 va 1:5 nisbatlar boshqalarga nisbatan yuqori bo‘lib 12.9 va 12.7% ni tashkil etdi. Boshoqlash fazasida B. Licheniformis bakterisining 1:3 nisbatda uglevodlar miqdori 15,2% ni(*nazoratda 9,6%)* bo‘lgan bo‘lsa B. Megaterium 1:5 nisbatda 18,0% *B. Subtilis* -1:7 teng 14,0% ni tashkil etib nazoratga nisbatan yuqori

ko‘rsatkich qayd etildi.



1-rasm Kuzgi yumshoq bug‘doy uglevodlar miqdoriga bakteriya shtammlarining ta’siri fazalar kesimida.

Qattiq bug‘doyning naychalash fazasida B. Licheniformis bakteriya shtammlarining turli darajali eritmalarida uglevodlar miqdori o‘zgardi(2-rasm). Mazkur bakteriyaning 1:1 nisbatli eritmasida uglevod miqdori 10,5%ni(*nazoratda 10,8%*) tashkil etgan bo‘lsa, 1:3-10,5, 1:5-13,9% 1:7-12,7 va 1:9-10,4% ni tashkil etdi. Ushbu ma'lumotlardan 1:5 nisbatli eritmada nazoratga nisbatan uglevod miqdori 3,1% ortganligini ko‘rsatdi. B. Megaterium bakteriyasida ham aynan natija eritma nisbati 1:5 teng bo‘lganida yuqori ko ‘rsatkich (10.4%) aniqlangan bo‘lsa B.Subtilis -13.6% ni tashkil etdi. Boshoqlash fazasida uglevodlar miqdori B.Licheniformis 1:5 nisbatida 11,9% (*nazoratda 7,9%),* B. Megaterium 14,5% va B. Subtilis esa 1:7 nisbatda 14,2% teng bo‘lib nazoratga nisbatan ortganligi aniqlandi.



2-rasm Kuzgi qattiq bug‘doy uglevodlar miqdoriga bakteriya shtammlarining ta'siri fazalar kesimida.

Yuqoridagi ma'lumotlar, bakteriyalar va ularning eritma nisbatlari uglevodlar miqdoriga ta'sir etdi. Yumshoq bug‘doyda B. Licheniformis bakteriyaning ta'siri eritma nisbati 1:5, boshoqlashda mazkur bakteriyaning 1:3 nisbatli eritmasi uglevodlar miqdoriga ta'siri ortganligi qayd etildi. Qattiq bug‘doyda ham mazkur bakteriyaning 1:5 nisbatli eritmasi ta'sirida ko‘proq uglevodlar sintezlanganligi aniqlandi. Ushbu ma'lumotlardan, uglevodlar miqdoriga nafaqat eritma nisbatlari balki navlarga ham bog‘liq ekanligini ko‘rish mumkin. Bunday holatda ko‘p o‘lchamli statistik tahlil usullaridan foydalanish maqsadga muvofiq. Shundan kelib chiqib faktorli tahlil usulidan foydalanildi. Tahlil natijalari shuni ko‘rsatadiki, yumshoq bug‘doyda naychalash fazasida eritma nisbatlari orasida 1:3 bo‘yicha faktor yuklamasi (1.509) va 1:5 da 0.932) teng bo‘ldi (1-jadval). Demak mazkur eritmalarda bakteriyalarning faolligi oshdi va uglevodlar mikdori ko‘proq sintezi bo‘ldi. Bu bakteriya va o‘simliklar o‘rtasida ijobiy hamkorlik yuzaga kelganligini ko‘rsatdi.

Boshoqlash fazasida ham o‘simliklarda uglevodlar miqdorining faolligi 1:3 nisbatda ortdi. Boshoqlash fazasida yuqori nisbatli eritmalarda uglevodlar sintezining ortishi bu mazkur fazada o‘sish va rivojlanishning yanada jadallashganligi bilan bog‘liq bo‘ldi.

1-jadval.

Uglevodlar miqdoriga bakteriya shtammlari eritmalarining ta’siri bo‘yicha faktor tahlil natijalari

1:9	0.060	**1525**	-0.627	0.069	-0.673	-1,327

Qattiq bug‘doyda 1:5 nisbatli eritmalarda bakteriyalarning faolligi oshganligi qayd etildi. Buni mazkur nisbatda faktor yuklamasi yuqori (1.761) bo‘lganligidan ham ko‘rish mumkin. Boshoqlash fazasida ham shunday natija qayd etildi. Faqat birinchi omil bo‘yicha emas ikkinchi faktor bo‘yicha uning yuklamasi (1.726) boshqalarga nisbatan yuqori bo‘ldi. 1-jadval ma'lumotlari asosida bakteriyalar tanlandi (2-jadval). Jadvaldagi ma'lumotlardan B. Licheniformis va B. Subtilis bakteriyalarning birinchi faktor bo‘yicha yuklamalari 0.660 va 0.915 teng bo‘ldi. Demak, yumshoq bug‘doy da mazkur bakteriyalarning 1:3 ,1:5 nisbatli eritmalarida uglevodlar miqdori oshdi. Ayniqsa B. Subtilis tasiri kuchli bo‘ldi. Bu mazkur bakteriyaning uglevodlar sinteziga ta’siri B. Megaterium nisbatan kuchli ekanligini ko‘rsatdi. Boshoqlash fazasida birinchi faktor bo‘yicha B. Licheniformis 0.848 , B. Megaterium(0.845) va B. Subtilis(0.430) teng bo‘ldi. Bu bakteriyalardan B. Licheniformis, B. Megaterium ta'siri o‘zaro o‘xshash ekanligi aniqlandi.

2-jadval

Uglevodlar miqdoriga bakteriyalarning fazalar kesimida ta'siri bo‘yicha faktor yuklamalari

Bakteriyalar	*Naychalash*			*Boshoqlash*		
	1	*2*	*3*	*1*	*2*	*3*
Yumshoq bug‘doy (**Triticum aestivum** L.)						
B. licheniformis	**0.660**	0.667	-0.345	**0.848**	-0.221	-0.481
B. Megaterium	-0.429	**0.848**	0.310	**0.845**	-0.238	0.479
B. subtilis	**0.915**	-0.083	0.395	0.430	0.903	0,008
Qattiq bug‘doy (Triticum dúrum)						
B. licheniformis	**0.810**	-0.298	0.505	**0.729**	0.631	0.266
B. Megaterium	0.235	**0.957**	0.168	**0.894**	-0.007	-0.448
B. subtilis	**0.849**	0.019	-0.529	**0.738**	-0.614	0.279

Qattiq bug‘doy da naychalash fazasida B. Licheniformis (0.810) va B.Subtilis (0.849) bakteriyalarning yuklamalari yuqori bo‘ldi. Bu mazkur bakteriyalar ayniqsa B. Subtilis bakteriyasini faollashtirdi.

Boshoqlash fazasida B. Licheniformis 0,729, B. Megaterium -0,894 va B. Subtilis -0,738 teng bo‘ldi. Ushbu ma'lumotlardan mazkur bakteriyalar uglevodlar sinteziga ta’siri bo‘yicha o‘zaro o‘xshash bo‘ldi.

Umuman olganda, kuzgi bug‘doyning o‘sish i va rivojlanishiga azotobakteriyalari shtammlarini va ularning nisbatlari ta'sir qildi. Ko‘p o‘lchamli statistik tahlil natijalari shuni ko‘rsatdiki, naychalash fazasida yumshoq bug‘doy genotiplarida B. Licheniformis va B. Subtilis bakteriyalarning 1:3 nisbatli eritmalar. ta'sirida hamda B. Megaterium bakteriyaning 1:5 nisbatli eritmasida uglevodlar sintezi ortganligi aniqlandi. Buni birlamchi ma’lumotlardan ham ko‘rish mumkin. B. Licheniformis va B. Subtilis1:3 nisbatda uglevodlar miqdori tegishli ravishda 0,5% 12,9% (nazoratda 9,5%) tashkil etgan bo‘lsa B.Megaterium 1:5 nisbatli nisbatida 10,4% ni tashkil etdi. Demak , B. Licheniformis va B.Subtilis bakteriyalarga nisbatan B. Megaterium bakteriyasining ta'sir darajasi kuchli bo‘ldi. Boshoqlash fazasida bakteriyalar

o‘rtasida farq kuzatildi. B. Licheniformis bakteriyalarining 1:3 nisbatli nisbatda uglevodlar sintez ortgani (15,2%) (nazoratda 9,6%), B. Megaterium1:5 -18.0% va B. Subtilis-1:7- 14,0% da tashkil etdi. Ushbu ma'lumotlardan boshoqlash fazasida bakteriyalar eritma nisbatlari o‘rtasida farq kuzatildi. B. Licheniformis bakteriyalarining 1:3 nisbatli eritmasida uglevodlar sintezi ortgan bo‘lsa B. Megaterium va B. Subtilis bakteriyalarning 1:5 nisbatlarida shunday natija qayd etildi.

Qattiq bug‘doyda eritma nisbati 1:5 bo‘lganida uglevodlar sintezi faollashganligi aniqlandi. Buni birlamchi ma'lumotlardan ko‘rish mumkin. B.Licheniformisning 1:5 eritmasida uglevod miqdori 13,9% (nazoratda 10,8%) B.Megaterium-10,4%, B. Subtilis-13,6% ni tashkil etgan bo‘lsa boshoqlashda ham mazkur nisbatda uglevodlar miqdori faollashdi.

Yuqoridagi ma'lumotlardan, bakteriyalarning uglevodlar miqdoriga ta'siri ularning turlari va eritma nisbatlariga bog‘liq ekanligi aniqlandi. Regenerativ bug‘doy yetishtirishda azotabakteriyalardan foydalanish maqsadga muvofiq deb topildi. Mazkur bakteriyalarning optimal nisbatlari ta’sirida bug‘doy o‘simliklarida uglevodlar miqdorining ortganligi bu o‘sishi va rivojlanishi uchun qulay sharoitni yaratganligidan dalolat berib, regenerativ mahsulot yetishtirishning muhim aspektlaridan e’tirof etildi.

Xulosa

1. Kuzgi yumshoq bug‘doyning naychalash fazasida uglevodlar miqdori o‘rtacha 10.2% ni boshoqlashda -12.2% ni, qattiq bug‘doyda tegishli ravishda:10.7 va 11.51% ni tashkil etgan.

2. Bug‘doy genotiplarida B. Licheniformis, B. Subtilis va B. Megaterium- bakteriyalarning 1:5 nisbatli eritmalarida uglevodlar sintezi oshganligi aniqlangan.

3. Boshoqlash fazasida B. Licheniformis, B. Subtilis va B. Megaterium bakteriyalardan foydalanilganida nazoratga nisbatan uglevodlar miqdori 29-30% ga ortganligi aniqlangan va regenerativ mahsulot yetishtirishda foydalanish tavsiya etilgan.

Annotatsiya. *Maqolada Kversetin flavonoidi va uning hosilasini aorta qon tomiri silliq muskullariga vazorelaksant ta’sir mexanizmlarini o‘rganilgan, standart ozuqa va suv bilan ta’minlangan sharoitda ko‘paytirilgan, sog‘lom oq, zotsiz erkak kalamushlarning (150–200 gr.) aorta qon tomirlariga kversetin flavanoidi ta’sirini o‘rganildi va Kversetin flavonoidi antigipoksant ta’sirga ega bo‘lib aorta pereparati gipoksiya sharoitida kam miqdordagi dozada ham gipoksiyaga samarali ta’sir ko‘rsatishi aniqlandi.*

Kalit so‘zlar*: kversetin flavonoidi, sitoplazmatik reticulum, gipoksiya, vazorelaksant ta’sir, aorta qon tomiri.*

ИЗУЧЕНИЕ ВАЗОРЕЛАКСАНТНОГО ЭФФЕКТА ФЛАВОНИДА КВЕРЦЕТИНА И ЕГО ПРОИЗВОДНЫХ НА ГЛАДКИЕ МЫШЦЫ АОРТЫ

Аннотация. *В статье изучаются механизмы вазорелаксантного действия флавоноида кверцетина и его производных на гладкие мышцы аортального кровеносного сосуда. Было изучено влияние флавоноида кверцетина на аортальные кровеносные сосуды здоровых белых нелинейных самцов крыс (150–200 г), выращенных в условиях стандартного питания и воды. Установлено, что флавоноид кверцетин обладает антигипоксическим действием и эффективно влияет на гипоксию даже в низких дозах в условиях подготовительной гипоксии аорты.*

Ключевые слова: *флавоноид кверцетин, цитоплазматический ретикулум, гипоксия, вазорелаксирующий эффект, аортальный кровеносный сосуд.*

STUDY OF THE VASORELEAXANT EFFECT OF THE FLAVONID QUERCETIN AND ITS DERIVATIVES ON AORTIC SMOOTH MUSCLE

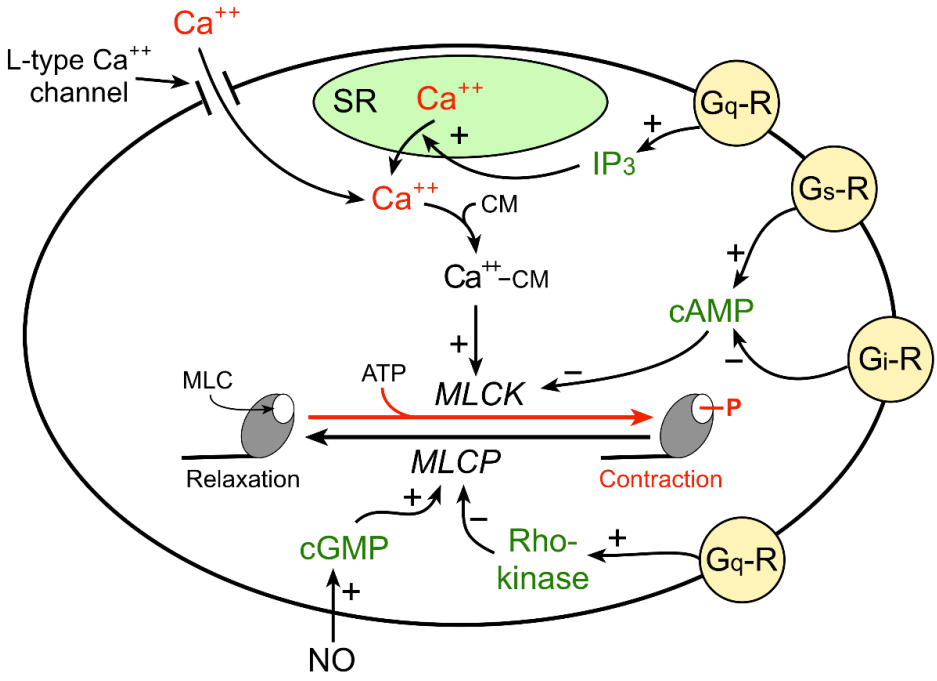
Abstract. *The article studies the mechanisms of vasorelaxant action of quercetin flavonoid and its derivatives on the smooth muscles of the aortic blood vessel. The effect of quercetin flavonoid on the aortic blood vessels of healthy white, outbred male rats (150–200 gr.) raised under conditions of standard food and water was studied. It was found that quercetin flavonoid has an antihypoxant effect and effectively affects hypoxia even in low doses under conditions of aortic preparative hypoxia.*

Keywords: *quercetin flavonoid, cytoplasmic reticulum, hypoxia, vasorelaxant effect, aortic blood vessel.*

Kirish. Silliq mushak - ichak, bachadon va oshqozon kabi ichi bo‘sh organlarning devorlarida joylashgan to‘qimalarning bir turi. Bundan tashqari, yurak-qon tomir tizimining arteriyalari va tomirlarini o‘z ichiga olgan o‘tish yo‘llarining devorlarida silliq mushaklarni topishingiz mumkin. Bu turdagi beixtiyor chiziqsiz mushak siydik, nafas olish va jinsiy tizimlar yo‘llarida ham uchraydi. Bunga qo‘shimcha ravishda, siz ko‘zlardagi silliq mushaklarni topishingiz mumkin, bu erda u irisning o‘lchamini va linzalarning shaklini o‘zgartiradi. Terida shuningdek, sovuq harorat yoki qo‘rquvga javoban sochlarning ko‘tarilishiga imkon beruvchi silliq mushak mavjud. Silliq mushak hujayrasining qalinligi 3-10 mkm, uzunligi 20-200 mkm [1]. Yurak va qon tomir sistemasi organizmning eng muhim sistemalaridan biri hisoblanadi. Yurak va qon tomir sistemasining markaziy organi bu yurak hisoblanadi. Yurak mushak a’zo bo‘lib, qonning kichik va katta qon aylanish tizimlarida qonning ritmik harakatini amalga oshiradi. U ko‘krak qafasining oldingi ko‘ks oralig‘ida joylashgan. Ko‘proq qismi chap tomonda joylashgan. O‘rta hisobda erkaklarda 300 gr, ayollarda 250 grni tashkil qiladi. Yurakda 4 kamera (o‘ng va chap qorincha, o‘ng va chap bo‘lmacha) mavjud. Chap qorincha va chap

bo‘lmacha orasida 3 tavaqali, o‘ng bo‘lmacha va o‘ng qorincha o‘rtasida 2 tavaqali klapan joylashgan. Chap qorincha bilan aorta qon tomiri o‘rtasida hamda o‘ng qorincha bilan o‘pka arteriyalari o‘rtasida qonni bir tomonlama xarakatini ta’minlovchi yarimoysimon klapanlar joylashgan. Aorta – odam va hayvonlar organizmidagi eng katta, uzun yagona qon tomiri [2].

Adabiyotlar tahlili. Silliq muskul hujayralari qisqarishining molekulyar mexanizmlari. Silliq muskullar asosiy strukturaviy va funktsional element hisoblanib, u qon tomirlari, nafas olish va oshqozon-ichak trakti yo‘llari va siydik ajratish sistemasida keng tarqalgan. Qon tomirlarining tonusini ko‘plab omillar belgilaydi, ulardan Ca^{2+} ionlari muhim rol o‘ynaydi. SMH sitozolida Ca^{2+} kontsentratsiyasini ortishi hujayra ichida kechadigan qator jarayonlarning triggeri hisoblanib, SMni qisqarishiga olib keladi. Hujayra ichidagi Ca^{2+} miqdori hujayra tashqarisidan Ca^{2+} ni kirishi va uni sarkoplazmatik retikulum (SR)dan chiqishi hisobiga ortadi [3]. Sitozolda Ca^{2+} ni ortishi uni kalmodulin bilan bohlanishini stimullaydi va konformatsion o‘zgarishlar sodir bo‘ladi. Masalan, SMHning mediatorlar yoki gormonlar bilan chaqirilgan qisqarishini ham hujayra ichidan, ham hujayra tashqarisidagi depodan kiradigan Ca^{2+} ionlari ta'minlaydi. SMH Ca^{2+} kirishining eng o‘rganilgan yo‘li L-tipidagi Ca^{2+}-kanallari hisoblanadi. Bundan tashqari Ca^{2+} Ca^{2+}-kanallari orqali ham kiradi. Shu sababli SMH da qo‘zg‘alish va qisqarish jarayonlarining uyg‘unligi – elektromexanik va farmokomexanik mexanizmlar orqali amalga oshadi [4]. Elektromexanik qisqarishda membrana depolirizatsiyasi amalga oshib, bunda potentsialga bog‘liq bo‘lgan Ca^{2+}-kanali aktivlashadi, hujayraning tashqarisidan sarkoplazmaga Ca^{2+} kiradi. Natijada Ca^{2+} ning miqdori 500-700 nM (nanomol) gacha ortib ketadi va qisqarish amalga oshadi. Elektromexanik qisqarishda membrana potentsiali ostsillyatsiya bilan xarakterlanadigan fazali SMHda asosiy rol o‘ynaydi. Membrana potentsialining bunday xarakteri potentsialga bog‘liq Ca^{2+}-kanallarini sinxron aktivatsiyasini va yuqori chastotali, hamda yuqori amplitudali Ca^{2+} signalini ta'minlaydi. Farmokomexanik qisqarish membrana potentsialini o‘zgarishiga bog‘liq bo‘lmaydi. Bu holda hujayra ichidagi Ca^{2+} miqdori asosan Ca^{2+} ionlarini hujayra ichidagi depolardan chiqishi va uni plazmalemmadagi retseptor orqali boshqariluvchi va zapas-operirlovchi Ca^{2+}-kanallaridan kirishi hisobiga ortadi. Bunda agonist bilan retseptorning o‘zaro ta'siri natijasida hujayra ichidagi Ca^{2+} miqdori avval tez, lekin vaqtincha oshadi. Bu uni hujayra ichidagi depolardan chiqishiga bog‘liqdir. Keyinchalik hujayra ichidagi Ca^{2+} miqdori sekin, lekin barqaror ortishi bilan almashinadi [5]. Bu esa hujayra tashqarisidan Ca^{2+} ni kirishiga bog‘liqdir. Silliq muskul hujayrasida Ca^{2+} ning birlamchi retseptorlaridan biri universal Ca^{2+} bog‘lovchi oqsil – kalmodulin (KM) hisoblanadi. Kalmodulin yurak va skelet muskullarining Ca^{2+}ning retseptori bo‘lgan troponin S ning gomologi hisoblanadi [6]. Lekin undan farqi shuki, kalmodulin har doim ham aktiv holda bo‘lmaydi. Silliq muskul hujayrasining asosiy qisqaruvchi regulyatori bu miozinning yengil zanjiridagi Ca^{2+}-kalmodulinga bog‘liq kinazadir. Uning yagona substrati massasi 20 kD keladigan miozinning yengil zanjiridir. Fosforlanishi aktinni aktivlovchi Mg ATFaza orqali amalga oshadi va o‘zining teskari komformatsiyali filamentini tuzadi. SMH qisqarishida miozinning yengil zanjiri kinazasining ishtiroki ko‘p ishlarda yoritilgan bo‘lib, ularda Ca^{2+} kontsentratsiyasining ortishi, miozin yengil zanjirining fosforillanishi va qisqarishning tezligi va kuchi o‘rtasidagi korrelyatsiyalar ochib berilgan. Ma'lum bo‘lishicha, miozin yengil zanjirining 40% fosforillanishi SM tolalari qisqarishini maksimal rivojlanishi uchun yetarlidir. SMH sarkoplazmasida Ca^{2+} kontsentratsiyasining tinchlik darajasigacha tiklanishi natijasida kalmodulin miozin yengil zanjiri kinazasi kompleksidan ajraladi, va u inaktivlashadi, miozin miozin yengil zanjirining fosfatazasi bilan defosforillanadi, aktindan ajraladi va muskul bo‘shashadi. Miozin yengil zanjirining fosforillanishi natijasida uning molekulasida strukturaviy o‘zgarishlar ro‘y beradi, jumladan, fosfat kiritilgan joydan uzoqlikda. Silliq muskullarning qisqarishi va bo‘shashishi mexanizmlarida miozinning fosforillanish-defosforillanish jarayonlarining markaziy o‘rin egallashi isbotlangan (1-rasm) [7, 8].



1-rasm. Qon tomir silliq muskullarinig qisqarish mexanizmi.

Tadqiqot metadologiyasi. Tajribalar O‘zMU huzuridagi Biofizika va biokimyo instituti vivariyasida standart ozuqa va suv bilan ta'minlangan sharoitda ko‘paytirilgan, sog‘lom oq, zotsiz kalamushlarda (150–200 gr.) amalga oshirildi.

Kalamush aorta qon tomir silliq muskulining izometrik qisqarish faolligi standart uslub (mexanografiya) yordamida qayd qilindi.

Tajriba hayvonlari dislokatsion uslubda jonsizlantirilib, jarrohlik yo‘li bilan ko‘krak qafasi ochildi va aorta qon tomiri ajratib olinib, Krebs–Xenzeleyt fiziologik eritmasi quyilgan Petri chashkasi muhitida yog‘ to‘qimalaridan tozalandi. Aorta preparati uzunligi ~3–4 mm o‘lchamdagi halqa shaklida kesib olindi va tajriba yacheykasiga (5 ml) mahkamlangan maxsus ilgakka va ikkinchi tomonidan Grass FT–03 (Grass Instrument, AQSh) izometrik kuch o‘lchash qurilmasiga bog‘landi (1–rasm).

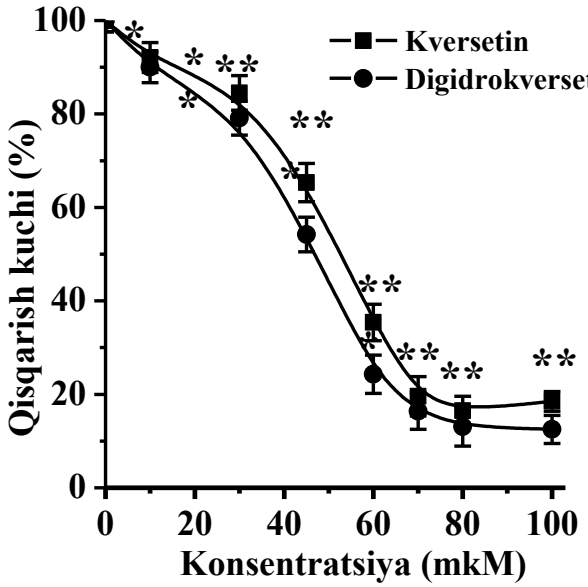
Eksperimental yacheyka (5 ml) maxsus rezervuar orqali Krebs–Xenzelayt fiziologik eritmasi bilan sirkulyatsiyalanadi va fiziologik eritmaning harorati doimiyligi termostat yordamida ta'minlanadi. Shuningdek, eritma 95%–O_2; 5%–CO_2 tarkibli gazlar aralashmasi bilan aeratsiyalanadi. Eksperimental yacheykaga mahkamlangan aorta qon tomir prepartining qisqarish faolligi Grass FT–03 mexanotroni (Grass Instrument, AQSh) va signal kuchaytirgich qurilma orqali Endim 621.02 (Rossiya) qurilmasi yordamida qayd qilinadi.

Quyidagi 2-rasmda kalamush aorta qon tomir silliq muskul preparatining izometrik sharoitda qisqarish faolligini qayd qilish qurilmasining umumiy sxematik ko‘rinishi keltirilgan.

2–rasm. Kalamush aorta qon tomir silliq muskul preparatining izometrik sharoitda qisqarish faolligini qayd qilish qurilmasining umumiy sxematik ko‘rinishi.

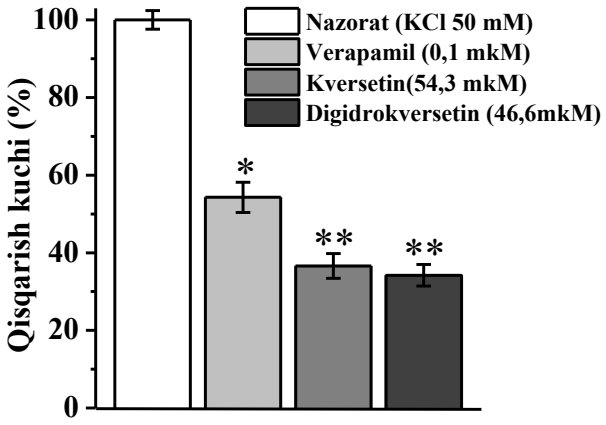
Tajriba yacheykasida doimiy ravishda quyidagi kimyoviy tarkibga ega bo‘lgan Krebs–Xenzeleyt fiziologik eritmasi sirkulyatsiyalandi (mM hisobida): NaCl – 118; KCl – 4,8; $MgSO_4$ – 1,2; KH_2PO_4 – 1,2; $CaCl_2$ – 2,5; $NaHCO_3$ – 25; glyukoza – 11 (pH=7,4). Shuningdek, fiziologik eritma tarkibi karbogen (O_2–95% va SO_2–5%) bilan aeratsiyalandi, harorat doimiyligi (t=+37±0,5°C) termostat yordamida ta'minlandi. Dastlab, kalamush aorta preparati 1 gr=9,8 mN kuchlanish berish asosida, ~45–60 minut davomida me'yoriy elektromexanik faollik qayd qilinishga qadar inkubatsiyalandi.

Tahlillar va natijalar. Tahlillar va olingan natijalar shuni ko‘rsatdiki, polifenollar konsentratsiyaga bog‘liq holatda (10 – 100 mkM) kuchli relaksant ta’sirga ega ekanligi aniqlandi. Jumladan, Kversetin 10 mkM konsentratsiyada aorta preparati qisqarish faolligi amplitudasini nazoratga nisbatan 7,9±3,2%ga susaytirishi aniqlandi, shuningdek, 100 mkM konsentratsiyada bu qiymat 85,8±3,1%ni tashkil qilishi qayd qilindi. Ushbu tajribalarni Digidrokversetin bilan takrorlaganimizda 10mkM konsentaratsiyasi aorta preparati qisqarish faolligini 10±3,3%ga 100 mkM konsentratsiyada esa 83,9±3,2%ni tashkil qilishi aniqlandi. Ushbu polifenollar KCl (50 mM) yordamida chaqirilgan qisqarish faolligini yarim maksimal (IS50) ingibirlovchi konsentratsiyasi 54,3 va 46,6 mkM ni tashkil etdi (3.1-rasm)



3-rasm. KCl (50mM) bilan chaqirilgan kalamush aortasi silliq muskul preparatlarning qisqarishiga Kversetin va Digidrokversetin flavonoidlarining ta’siri. Ordinata o‘qida – aorta preparatining KCl (50 mM) yordamida chaqirilgan qisqarish kuchi, 100% deb hisoblangan, abssissa o‘qida – Kversetin va Digidrokversetin flavonoidlarining konsentratsiyasi (mkM) ifodalangan. Barcha holatlarda *p<0,05, **p<0,01; n=5-6).

Navbatdagi tajribalarimizda polifenollarning relaksant ta’sirini potensialga bog‘liq Ca^{2+}-kanallari bilan bog‘liqligini taqqoslash uchun ushbu kanallarning maxsus blokatori verapamil bilan o‘zaro ta’siri o‘rganildi [Iwamoto Kita; 63–66-b.]. Ushbu tajribalarda KCl (50mM) bilan chaqirilgan aorta preparatlarini yarim maksimal qisqarishini keltirib chiqaradigan verapamil konsentratsiyasi (0,1 mkM) dan foydalanildi. Inkubatsiya muhitida verapamil (0,1 mkM) hamda Kversetin (54,3 mkM) va Digidrokversetin (46,6 mkM) (EC50) mavjud sharoitda KCl (50 mM) bilan chaqirilgan aorta preparatlari qisqarishiga ta’siri solishtirilganda ushbu polifenollar aorta qisqarish faolligini qo‘shimcha ravishda 11,9±4,1% va 15,8±3,8% ga susaytirishi qayd qilindi (4-rasm).



4-rasm Kversetin va Digidrokversetinning va Ca^{2+}-kanali blokatori -verapamil (YES50) KCl (50mM) yordamida chaqirilgan aorta preparatlari qisqarishiga o'zaro ta'siri. Ordinata o'qida – aorta silliq muskul preparatining KCl (50 mM) yordamida chaqirilgan qisqarish kuchi, 100% deb hisoblangan. Barcha holatlarda *p<0,05, **p<0,01; n=4-5).

Olingan natijalar ushbu polifenollar kofein ta'sirida yuzaga keltirilgan qisqarish kuchiga relaksant ta'siri SR dan chiquvchi Ca^{2+} miqdori kamayishi bilan bog'liqligini ko'rsatadi. Kversetin flavonoidi va uning hosilasini kuchli relaksant ta'sirga ega bo'lib SMH lari ichki Ca^{2+} miqdorini [Ca^{2+}]i kamaytirishi tajribalarimizda aniqlandi.

Xulosa. Kversetin va digidrokversetin flavonoidlari kuchli relaksant ta'sirga ega bo'lib, buning natijasida silliq muskul hujayralari [Ca^{2+}]i miqdorining kamayishi va natijada silliq muskullarning bo'shashishi yuzaga keladi.

Flavonoidlarning relaksant ta'sir mexanizmi $Ca^{2+}{}_L$– kanallarini bloklanishi natijasida yuzaga kelayotgan jarayon bo'lib, bunda flavonoidlarning ta'siri plazmalemmadagi [Ca^{2+}]i miqdorini kamayishiga sabab bo'ladi.

Kversetin hosilalarini aniqlash, ularni ilmiy tadqiqot usullari yordamida sintez qilinib,dori vositasida keng ommaga namoyon qilish orqali erta o'lim, insult, yurak ishemiyasi, yurak-qon tomir kaslliklarini oldini olish kabi yutuqlarga erishish mumkin.

Annotatsiya: *Mazkur maqolada O‘zbekiston Respublikasi “Qizil Kitobi”ning 2019-yilgi nashriga kiritilgan yalpizdoshlar (Lamiaceae) oilasi vakillarining zamonaviy holati, tarqalishi va himoya maqomi 2009-yilgi nashr bilan solishtirilgan va tahlil qilingan. Tadqiqot obyekti sifatida Qizil kitobdagi Lamiaceae oilasiga mansub endemik va kamyob turlar tanlab olindi. Tahlillar shuni ko‘rsatadiki, antropogen omillar, jumladan, yaylovlardan noto‘g‘ri foydalanish va iqlim o‘zgarishi ushbu oila vakillarining tabiiy populyatsiyalariga jiddiy xavf solmoqda. Maqolada turlarning taksonomik tarkibi, ularning geografik tarqalishi va populyatsiya zichligini saqlab qolish bo‘yicha tavsiyalar keltirilgan. Tadqiqot natijalari O‘zbekiston florasini muhofaza qilish strategiyasini takomillashtirishda muhim ahamiyat kasb etadi.*

Kalit so‘zlar: *Lamiaceae, Qizil Kitob, endemik turlar, floristik tahlil, tabiatni muhofaza qilish, O‘zbekiston florasi.*

ФЛОРИСТИЧЕСКИЙ АНАЛИЗ ПРЕДСТАВИТЕЛЕЙ СЕМЕЙСТВА LAMIACEAE НА ОСНОВЕ «КРАСНОЙ КНИГИ» РЕСПУБЛИКИ УЗБЕКИСТАН (2019)

Аннотация: *В данной статье сравнены и проанализированы современное состояние, распространение и охранный статус представителей семейства яснотковых (Lamiaceae), включенных в Красную книгу Республики Узбекистан 2019 года, с изданием 2009 года. В качестве объекта исследования были выбраны эндемичные и редкие виды семейства Lamiaceae, занесенные в Красную Книгу. Статье представлены таксономический состав видов, их географическое распространение и рекомендации по поддержанию плотности популяции. Результаты исследования имеют важное значение для совершенствования стратегии охраны флоры Узбекистана.*

Ключевые слова: *Lamiaceae, Красная Книга, эндемичные виды, флористический анализ, охрана природы, флора Узбекистана.*

FLORISTIC ANALYSIS OF REPRESENTATIVES OF THE LAMIACEAE FAMILY BASED ON THE “RED BOOK” OF THE REPUBLIC OF UZBEKISTAN (2019)

Abstract: *This article compares and analyzes the current status, distribution and conservation status of the family Lamiaceae, included in the Red Book of the Republic of Uzbekistan 2019, with the 2009 edition. The endemic and rare species of the family of Lamiaceae, listed in the Red Book, were selected as the object of the study. The article presents the taxonomic composition of the species, their geographical distribution, and recommendations for maintaining population density. The results of the study are important for improving the strategy of protecting the flora of Uzbekistan.*

Keywords: *Lamiaceae, Red Data Book, endemic species, floristic analysis, nature conservation, flora of Uzbekistan.*

Kirish

O‘zbekiston florasi o‘zining xilma-xilligi va endemizm darajasi bilan Markaziy Osiyo mintaqasida alohida o‘rin tutadi. Yalpizdoshlar (Lamiaceae) oilasi o‘zining efir moyli, dorivor va ozuqaviy xususiyatlari bilan ajralib turadi. So‘nggi yillarda antropogen ta’sir, yerlarning o‘zlashtirilishi va global iqlim o‘zgarishlari natijasida ko‘plab o‘simlik turlari yo‘qolib borish xavfi ostida qolmoqda. 2019-yilgi O‘zbekiston Respublikasi Qizil kitobi bu borada eng muhim me’yoriy hujjat hisoblanadi. Ushbu tadqiqotning maqsadi Qizil kitobga kiritilgan yalpizdoshlar oilasi vakillarining zamonaviy holatini floristik tahlil qilish, ularning tarqalish hududlaridagi xavf omillarini aniqlash va muhofaza qilish

bo‘yicha ilmiy xulosalar berishdan iborat. Tadqiqot dolzarbligi shundaki, ushbu oilaga mansub turlarning genofondini saqlab qolish nafaqat ekologik, balki iqtisodiy va farmatsevtik ahamiyatga ham ega. O‘rganish jarayonida turlarning taksonomik tarkibi va ularning himoya maqomlari (IUCN mezonlari asosida) tahlil qilindi.

O‘zbekiston Respublikasi Qizil kitobining 2019-yilgi nashrida yalpizdoshlar oilasi vakillarining floristik tahlil metodologiyasi va natijalari

Tadqiqotda kompleks floristik tahlil usullari, shu jumladan, adabiyotlar tahlili, gerbariy materiallari va 2019-yilgi ‘‘Qizil Kitob’’ ma’lumotlari bazasidan foydalanildi. Tahlil jarayonida Lamiaceae oilasiga mansub turlarning tarqalish areallari, o‘sish sharoitlari va ularga tahdid solayotgan asosiy omillar (populyatsiya zichligi, yashash muhitining buzilishi) ko‘rib chiqildi. Shuningdek, GIS texnologiyalari yordamida turlarning tarqalish xaritalari tahlil qilindi. Ma’lumotlarni tizimlashtirishda Excel va SPSS dasturiy ta’minotlaridan foydalanilib, oila vakillarining oilalararo va turkumlararo nisbati aniqlandi [1].

Ushbu tadqiqotda O‘zbekiston Respublikasi ‘‘Qizil Kitob’’ining 2019-yilgi nashrida keltirilgan yalpizdoshlar (Lamiaceae) oilasi vakillarining floristik xususiyatlarini o‘rganish uchun kompleks ilmiy yondashuv qo‘llanildi. Tadqiqotning metodologik asosini zamonaviy botanika, sistematika va ekologiya fanlarida keng qo‘llaniladigan usullar tashkil etdi. Avvalo, mavzu bo‘yicha mavjud ilmiy adabiyotlar, jumladan ‘Qizil kitob materiallari, botanika darsliklari va ilmiy maqolalar tahlil qilinib, undagi ma’lumotlar tizimli ravishda umumlashtirildi. Bu jarayonda har bir turning ilmiy tavsifi, tarqalish areali, ekologik xususiyatlari hamda muhofaza maqomi alohida e’tibor bilan o‘rganildi. Shuningdek, tadqiqot davomida taqqoslash metodidan foydalanilib, yalpizdoshlar oilasiga mansub turlar o‘zaro solishtirildi, ularning ekologik moslashuv xususiyatlari va geografik tarqalishidagi o‘xshash hamda farqli jihatlar aniqlashtirildi. Floristik tahlil asosida ushbu oilaga mansub turlarning hududlar bo‘yicha tarqalishi, endem va kamyob turlar ulushi, shuningdek, ularning ekologik guruhlarga mansubligi aniqlab chiqildi. Mazkur yondashuv o‘simliklarning tabiiy muhitdagi o‘rni va ahamiyatini chuqurroq baholash imkonini berdi [2].

Bundan tashqari, statistik tahlil usullari yordamida yalpizdoshlar oilasiga oid turlar soni, ularning ‘‘Qizil Kitob’’dagi ulushi va muhofaza darajasi miqdoriy ko‘rsatkichlarda ifodalandi. Olingan natijalar ilmiy asoslangan holda umumlashtirilib, ularning aniqligi va ishonchliligini oshirishga xizmat qildi. Tadqiqot jarayonida sistematik (taksonomik) yondashuv ham qo‘llanilib, o‘simliklar urug‘ va tur darajasida tasniflandi hamda ularning botanika tizimidagi o‘rni aniq belgilandi.

Ekologik tahlil orqali esa yalpizdoshlar oilasi vakillarining yashash muhiti, iqlim va tuproq sharoitiga moslashuvi, shuningdek, antropogen omillar ta’siri baholandi. Ayniqsa, inson faoliyati natijasida yuzaga kelayotgan salbiy omillar va ularning o‘simliklar populyatsiyasiga ta’siri alohida tahlil qilindi. Shu tariqa, qo‘llanilgan metodlar majmui tadqiqot mavzusini har tomonlama yoritish, yalpizdoshlar oilasi vakillarining hozirgi holatini baholash hamda ularni muhofaza qilish bo‘yicha ilmiy asoslangan xulosalar chiqarish imkonini berdi.

Tahlillar shuni ko‘rsatdiki, 2019-yilgi O‘zbekiston Respublikasi ‘‘Qizil Kitob’’iga Lamiaceae oilasining bir qator vakillari kiritilgan bo‘lib, ularning aksariyati tog‘ va tog‘oldi hududlarida tarqalgan. Xususan, *Eremostachys*, *Phlomis* va *Ziziphora* turkumlari vakillari alohida e’tibor talab qiladi. Tadqiqot jarayonida aniqlanishicha, ushbu o‘simliklarning 65% qismi endemik turlar hisoblanadi. Natijalar shuni ko‘rsatadiki, eng ko‘p tahdid ostida bo‘lgan turlar asosan G‘arbiy Tyan-Shan va Pomir-Olay tog‘ tizimlarida uchraydi. Masalan, *Phlomoides* turkumiga mansub turlarning populyatsiya zichligi so‘nggi o‘n yillikda 25-30% ga kamaygan. Bu holat asosan chorva mollarining haddan tashqari ko‘p boqilishi va dorivor o‘simlik sifatida tartibsiz yig‘ib olinishi bilan bog‘liq. Shuningdek, ma’lumotlar bazasi tahlili shuni ko‘rsatdiki, himoya qilinadigan hududlardagi turlar populyatsiyasi barqaror bo‘lsa-da, ulardan tashqaridagi hududlarda turlar diversifikatsiyasi sezilarli darajada pasaygan [3].

Yalpizdoshlar (Lamiaceae) oilasi o‘simliklar dunyosida muhim o‘rin egallovchi, keng tarqalgan va biologik jihatdan xilma-xil guruhlardan biri hisoblanadi. Ushbu oilaga mansub o‘simliklar asosan efir moylariga boyligi, dorivor xususiyatlari hamda ekologik moslashuvchanligi bilan ajralib turadi. O‘zbekiston hududida yalpizdoshlar oilasi vakillari turli tabiiy-geografik zonalarda, xususan, tog‘li, adir va yarim cho‘l hududlarida keng tarqalgan bo‘lib, ular mahalliy flora tarkibining ajralmas qismi sanaladi.

Mazkur oilaga mansub ayrim turlar O‘zbekiston Respublikasi “Qizil Kitob”ining 2019-yilgi nashriga kiritilgan bo‘lib, bu ularning tabiiy populyatsiyasi kamayib borayotganini ko‘rsatadi. Ushbu holat asosan antropogen omillar, jumladan, yerlarning o‘zlashtirilishi, ortiqcha chorvachilik bosimi, o‘simliklarning nazoratsiz yig‘ilishi hamda iqlim o‘zgarishlari bilan bog‘liqdir. Natijada ayrim turlar o‘zining tabiiy yashash muhitini yo‘qotib, yo‘qolib ketish xavfi ostida qolmoqda [1].

Floristik nuqtai nazardan qaralganda, yalpizdoshlar oilasi vakillarining tarqalishi hududning iqlimiy va tuproq sharoitlariga bevosita bog‘liqdir. Ayniqsa, tog‘li hududlar ushbu oilaning ko‘plab endem va relikt turlari uchun muhim areal hisoblanadi. Bu esa mazkur hududlarning biologik xilma-xillikni saqlashdagi ahamiyatini yanada oshiradi. Shu bilan birga, ayrim turlar tor ekologik ixtisoslashuvga ega bo‘lib, faqat ma’lum sharoitlarda o‘sishi mumkin, bu esa ularning zaifligini kuchaytiradi.

Shunday qilib, yalpizdoshlar oilasi vakillarining floristik tahlili ularning tarqalish qonuniyatlarini aniqlash, ekologik xususiyatlarini baholash va muhofaza choralarini ishlab chiqishda muhim ilmiy ahamiyatga ega. Bu esa o‘z navbatida O‘zbekiston florasining noyob va kamyob turlarini saqlab qolish hamda ularni kelajak avlodlarga yetkazishda muhim asos bo‘lib xizmat qiladi.

Olingan natijalar shuni ko‘rsatadiki, O‘zbekistonda yalpizdoshlar oilasini muhofaza qilishda tizimli yondashuv talab etiladi. ‘‘Qizil Kitob’’dagi ma’lumotlar o‘simliklarning hozirgi holatini aks ettirsa-da, iqlim o‘zgarishi ta’siri yanada chuqurroq o‘rganilishi lozim. Muhokama davomida aniqlanishicha, in-situ (tabiiy muhitda) saqlash bilan bir qatorda, *ex-situ* (botanika bog‘larida) sharoitida genofondni saqlab qolish ustuvor vazifa bo‘lishi kerak. Boshqa tadqiqotchilarning (masalan, Tojibaev et al., 2020) fikrlariga tayanib aytish mumkinki, endemik turlarning tarqalish areallarini qat’iy qo‘riqxona yoki buyurtmaxona hududlariga kiritish zarur. Shuningdek, mahalliy aholi o‘rtasida dorivor o‘simliklarni yig‘ish madaniyatini oshirish va ularni madaniy holda yetishtirishni rag‘batlantirish muhim ekologik yechim hisoblanadi. Tahlil qilingan ma’lumotlar Lamiaceae vakillarining nafaqat floristik tarkibini, balki ularning ekotizimdagi funksional rolini ham belgilab beradi [2].

Xulosa

O‘zbekiston Respublikasi Qizil kitobning 2009-yilgi va 2019-yilgi nashrlari ma’lumotlarini solishtirganda, yalpizdoshlar (Lamiaceae) oilasi vakillari sonida ma’lum o‘zgarishlar kuzatiladi va bu o‘zgarishlar umumiy holda kamayishdan ko‘ra nisbatan ko‘payish tendensiyasini ko‘rsatadi.

Masalan, 2009-yilgi nashrda uchragan turlar qatoriga *Salvia submutica, Salvia lilacinocoerulea, Scutellaria adenostegia, Phlomis thapsoides, Nepeta olgae* kabi turlar kiritilgan bo‘lsa, 2019-yilgi nashrda bu ro‘yxat kengayib, ularga qo‘shimcha ravishda *Salvia komarovii, Salvia margaritae, Phlomis alatavica, Dracocephalum adylovii, Ziziphora pedicellata* kabi kamyob va tor arealli turlar ham kiritilgan. Ayrim turlar (masalan, *Salvia submutica, Nepeta olgae*) ikkala nashrda ham saqlanib qolgan bo‘lsa-da, ularning muhofaza maqomi ayrim hollarda yuqoriroq xavf kategoriyasiga o‘tkazilgan.

Raqamlar orqali ifodalaganda, 2009-yilda yalpizdoshlar oilasi vakillarining umumiy ulushi “Qizil Kitob”dagi o‘simliklarning taxminan 3–4 % ini tashkil etgan bo‘lsa, 2019-yilga kelib bu ko‘rsatkich 5–6 % ga yaqinlashgan. Bu esa nafaqat yangi turlar kiritilganini, balki mavjud turlarning tabiiy populyatsiyasi qisqarib borayotganini ham bildiradi. Ayniqsa, tog‘ va tog‘oldi hududlarida tarqalgan *Salvia, Scutellaria, Phlomis va Dracocephalum* avlodlariga mansub turlar antropogen bosim (chorvachilik, o‘simliklarni yig‘ish, yerlarning o‘zlashtirilishi) tufayli sezilarli darajada kamayib bormoqda.

O‘zbekiston Respublikasi “Qizil Kitobi” (2019) asosida o‘tkazilgan floristik tahlil shuni ko‘rsatadiki, yalpizdoshlar oilasi vakillari mintaqa ekotizimi uchun muhim komponent hisoblanadi. Tadqiqot davomida aniqlangan xavf omillari, xususan, antropogen bosim va iqlimiy o‘zgarishlar ushbu turlarning yo‘qolib ketish xavfini kuchaytirmoqda.

Xulosa qilib aytganda, “Qizil Kitob”ga kiritilgan turlarni saqlab qolish uchun: ularning yashash joylarida monitoringni kuchaytirish, endemik turlarning urug‘ banklarini yaratish, aholi o‘rtasida ekologik ta’lim-tarbiya orqali ekologik madaniyatni rivojlantirish zarur. Kelgusidagi tadqiqotlar ushbu o‘simliklarning molekulyar-genetik xususiyatlarini o‘rganish va ularni iqlimga moslashuvchanligini baholashga qaratilishi maqsadga muvofiqdir. Mazkur ish O‘zbekiston florasini asrab-avaylashda ilmiy asoslangan tavsiyalar majmuasini boyitishga xizmat qiladi.

SUG‘ORILADIGAN O‘TLOQI TUPROQLARNING EKOLOGIK-MELIORATIV HOLATI VA DEGRADATSIYA JARAYONLARINI AGROIQLIMIY OMILLAR ASOSIDA BAHOLASH (NUKUS TUMANI MISOLIDA)

Turdaliyev Jamolbek Mo‘minaliyevich
Tuproqshunoslik va agrokimyoviy tadqiqotlar istituti, b.f.f.d. (PhD), katta ilmiy xodim
Jumabaeva Ayzada Azatbaevna
Berdaq nomidagi Qoraqalpoq davlat universiteti, 1-bosqich tayanch doktoranti
UDK 631.459:631.6:551.58

Annotatsiya: *Maqolada Nukus tumani sug‘oriladigan o‘tloqi tuproqlarining ekologik-meliorativ holati va degradatsiya jarayonlari agroiqlimiy omillar bilan bog‘liq holda baholangan. Tadqiqotda Tuproqshunoslik va agrokimyoviy tadqiqotlar instituti hamda uning hududiy bo‘linmalari tomonidan 2016 va 2024 yillarda o‘tkazilgan tuproq sho‘rlanish kartogramalarini tuzish ma’lumotlari hamda 2016-2025 yillarga oid agroiqlimiy ko‘rsatkichlardan foydalanilgan. Tadqiqot hududida o‘rtacha yillik havo harorati 14,0 °C, yillik yog‘ingarchilik miqdori 8,7 mm va havoning nisbiy namligi 48% ni tashkil etganligi aniqlandi. Hisoblangan gidrotermik koeffitsientning (GTK) vegetatsiya davridagi qiymatlari 0,024-0,349 oralig‘ida bo‘lib, hududning o‘ta qurg‘oqchil agroiqlimiy sharoitga mansubligini ko‘rsatdi. Tadqiqot natijalariga ko‘ra sho‘rlanmagan yerlar ulushi kamayib, turli darajada sho‘rlangan maydonlar salmog‘i ortganligi aniqlandi. Bu holat tuproq degradatsiyasi jarayonlarining faollashganligini ko‘rsatadi.*

Kalit so‘zlar. *degradatsiya, sho‘rlanish, o‘tloqi tuproqlar, ekologik-meliorativ holat, gidrotermik koeffitsient, agroiqlimiy omillar, sug‘oriladigan yerlar, Nukus tumani.*

ОЦЕНКА ЭКОЛОГИЧЕСКИ-АМЕЛИОРАТИВНОГО СОСТОЯНИЯ И ПРОЦЕССОВ ДЕГРАДАЦИИ ПОЧВ ОХЛАЖДАЕМЫХ ПАСТБИЩ НА ОСНОВЕ АГРОКЛИМАТИЧЕСКИХ ФАКТОРОВ (НА ПРИМЕРЕ НУКУССКОГО РАЙОНА)

Аннотация: *В статье оценивается эколого-амелиоративное состояние и процессы деградации почв орошаемых пастбищ Нукусского района в связи с агроклиматическими факторами. В исследовании использованы данные картограмм засоленности почв, составленных Институтом почвоведения и агрохимических исследований и его региональными отделениями в 2016 и 2024 годах, а также агроклиматические показатели за 2016-2025 годы. Было установлено, что среднегодовая температура воздуха на исследуемой территории составляла 14,0 °C, годовое количество осадков — 8,7 мм, а относительная влажность — 48%. Значения расчетного гидротермального коэффициента (ГТК) в течение вегетационного периода находились в диапазоне 0,024-0,349, что указывает на принадлежность территории к крайне засушливым агроклиматическим условиям. По результатам исследования, доля незасоленных земель уменьшилась, а доля участков с различной степенью засоленности увеличилась. Это свидетельствует об активации процессов деградации почв.*

Ключевые слова. *деградация, засоление, луговые почвы, экологическое и мелиоративное состояние, гидротермический коэффициент, агроклиматические факторы, орошаемые земли, район Нукус.*

ASSESSMENT OF THE ECOLOGICAL-AMELIORATE STATE AND DEGRADATION PROCESSES OF IRRIGATED GRASSLAND SOILS BASED ON AGRO-CLIMATE FACTORS (ON THE EXAMPLE OF NUKUS DISTRICT)

Annotation: *The article assesses the ecological-ameliorative state and degradation processes of irrigated grassland soils of Nukus district in relation to agro-climatic factors. The study used data from the soil salinity cartograms compiled by the Institute of Soil Science and Agrochemical Research and its regional departments in 2016 and 2024, as well as agroclimatic indicators for 2016-2025. It was determined that the average annual air temperature in the study area was 14.0 °C, the annual precipitation was 8.7 mm, and the relative humidity was 48%. The values of the calculated hydrothermal coefficient (HTC) during the growing season were in the range of 0.024-0.349, indicating that the area belongs to extremely arid agroclimatic conditions. According to the results of the*

study, the share of non-saline lands decreased, and the share of areas with varying degrees of salinity increased. This indicates the activation of soil degradation processes.

Keywords. *degradation, salinity, grassland soils, ecological and reclamation status, hydrothermal coefficient, agroclimatic factors, irrigated lands, Nukus district.*

Kirish. Butun dunyoda tuproqlar degradatsiyasi, shoʻrlanish, qurgʻoqchilk va choʻllanish kabi bir qancha muommolar yuzaga kelmoqda, BMT maʼlumotlariga koʻra, dunyo boʻyicha qariyb 1,4 milliard gektar yer maydoni (jami yer resurslarining 10 foizidan ortigʻi) shoʻrlanishga duchor boʻlgan, iqlim inqirozi va antropogen taʼsir natijasida yana bir milliard gektar yer degradatsiya xavfi ostida qolmoqda [1].

Bugungi kunda Aholi sonining ortib borishi, oziq-ovqat mahsulotlariga boʻlgan talabning oshishi hamda iqlim oʻzgarishi sharoitida mavjud sugʻoriladigan yerlarning meliorativ holatini yaxshilash muhim ahamiyat kasb etmoqda. Ayniqsa, qurgʻoqchil va yarim qurgʻoqchil iqlim sharoitiga ega hududlarda joylashgan hududlarda tuproq shoʻrlanishi qishloq xoʻjaligi ishlab chiqarishining asosiy cheklovchi omillaridan biri hisoblanadi.

Tuproq shoʻrlanishi – bu tuproq profilida oʻsimliklarning normal oʻsishi va rivojlanishiga salbiy taʼsir koʻrsatuvchi miqdorda suvda eruvchan tuzlarning toʻplanishi natijasida yuzaga keladigan murakkab fizik-kimyoviy jarayondir. Tuproqda tuzlarning ortib borishi suv-fizik xossalarning yomonlashishiga, oziqa elementlarining oʻzlashtirilish darajasining pasayishiga va natijada ekinlar hosildorligining keskin kamayishiga olib keladi [2, 3].

Tadqiqot obyekti va uslublari. Tadqiqot obyekti sifatida Qoraqalpogʻiston Respublikasi Nukus tumanida joylashgan “Kattiagar” massivi sugʻoriladigan oʻtloqi tuproqlar tanlandi. Tadqiqotda Tuproqshunoslik va agrokimyoviy tadqiqotlar instituti tomonidan, 2016 va 2024 yillarda tuzilgan tuproq shoʻrlanish kartogrammalari hamda Qoraqalpogʻiston Respublikasi Gidrometeorologiya xizmati markazi 2016-2025 yillarga oid agroiqlimiy maʼlumotlaridan foydalanildi. Tuproqlarning ekologik-meliorativ holati shoʻrlanish darajasi koʻrsatkichlari asosida baholandi. Tuproq degradatsiyasining asosiy mezoni sifatida shoʻrlanish darajasining oʻzgarishi qabul qilindi. Tuproq namunalarida elektr oʻtkazuvchanlik (EC), suvli soʻrim tarkibidagi oson eruvchi tuzlar va asosiy ionlar miqdori standart usullar asosida aniqlandi [4]. Agroiqlimiy sharoitlarni tavsiflashda oʻrtacha oylik havo harorati, yogʻingarchilik miqdori, havoning nisbiy namligi hamda G.T. Selyaninov usuli [5] boʻyicha hisoblangan gidrotermik koeffitsient (GTK) koʻrsatkichlaridan foydalanildi. GTK hisoblashda oʻrtacha oylik havo harorati 10 °C dan yuqori boʻlgan vegetatsiya davri (aprel–oktyabr) maʼlumotlari asos qilib olindi..

Tadqiqot natijalari. Oʻzbekiston Respublikasida sugʻoriladigan yerlarning katta qismi turli darajada shoʻrlanishga uchragan boʻlib, ayniqsa Qoraqalpogʻiston Respublikasi va Xorazm viloyati hududlarida ushbu muammo yanada yaqqol namoyon boʻlmoqda. Bu hududlar Orol dengizi inqirozi taʼsirida shakllangan murakkab ekologik vaziyat, yuqori bugʻlanish, kam yogʻingarchilik va sizot suvlarining minerallashganligi bilan tavsiflanadi.

Nukus tumani Qoraqalpogʻiston Respublikasining Gʻarbda Xoʻjayli, shimoli-gʻarbda Amudaryo orqali Qanlikoʻl tumani, sharqda Qoraoʻzak, shimoli-sharqda Kegeyli, shimolda esa Boʻzatov tumanlari, janubi-sharqda Amudaryo tumani bilan chegaradosh joylashgan. Hududda yoz oylarida havo haroratining yuqori boʻlishi, yogʻingarchilik miqdorining kamligi va havoning nisbiy namligining pastligi bugʻlanish jarayonlarining keskin ortishiga sabab boʻladi.

Tadqiqot hududining agroiqlimiy sharoitlarini tavsiflash maqsadida 2016-2025 yillarga oid meteorologik ma'lumotlar tahlil qilindi. Natijalarga koʻra oʻrtacha yillik havo harorati 14,0 °C ni tashkil etdi. Eng yuqori harorat iyul oyida (30,7 °C), eng past harorat esa yanvar oyida (-1,6 °C) kuzatildi. Yillik oʻrtacha yogʻingarchilik miqdori 8,7 mm ni tashkil etib, uning asosiy qismi bahor va kuz oylariga toʻgʻri keldi. Yoz oylarida yogʻingarchilikning 2,3-4,4 mm gacha kamayishi hududda namlik tanqisligini kuchaytiradi. Havoning oʻrtacha nisbiy namligi 48% ni tashkil etgan boʻlib, iyun-avgust oylarida 28-31% gacha pasaygan (1-jadval). Bu esa bugʻlanish intensivligining ortishiga va tuproqlarda tuzlarning toʻplanishiga qulay sharoit yaratadi.

1-jadval.

Qoraqalpogʻiston Respublikasi Gidrometeorologiya xizmati markazi 2016-2025 yillarga oid agroiqlimiy maʼlumotlari

Iqlim ma`lumotlari	Oylar												10 yillik oʻrtacha
	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	
Oʻrtacha oylik va yillik havo harorati, °C	-1,6	1,0	8,1	16,7	23,3	28,4	30,7	27,3	20,1	11,9	4,5	-2,4	**14,0**

O‘rtacha oylik va yillik yog‘ingarchilik miqdori, mm	5,3	9,9	16,7	17,5	17,3	4,4	2,3	2,5	5,5	8,6	7,1	6,8	**8,7**
O‘rtacha oylik va yillik havoning nisbiy namligi, %	77	67	54	41	35	28	29	31	35	46	58	72	**48**

Tadqiqot hududining agroiqlimiy sharoitlarini baholashda G.T. Selyaninov tomonidan tavsiya etilgan gidrotermik koeffitsient (GTK) usulidan foydalanildi. Ushbu ko‘rsatkich hududning namlik bilan ta’minlanganlik darajasini tavsiflash hamda qurg‘oqchilik darajasini baholash imkonini beradi. GTK yog‘ingarchilik miqdori va faol haroratlar yig‘indisi o‘rtasidagi nisbatni ifodalab, quyidagi formula asosida hisoblandi:

$$GTK = \frac{P}{01\ x\ \Sigma T} \qquad (1)$$

Bunda,

P – yog‘ingarchilik miqdori, mm;

0,1 – Selyaninov tomonidan kiritilgan tuzatish koeffitsienti;

ΣT – o‘rtacha sutkalik harorati 10 °C dan yuqori bo‘lgan davrdagi faol haroratlar yig‘indisi, °C.

GTK hisoblashda o‘rtacha oylik havo harorati 10 °C dan yuqori bo‘lgan davri (aprel-oktyabr) ma’lumotlaridan foydalanildi. Gidrotermik koeffitsientning qiymatlari agroiqlimiy sharoitlarning namlik bilan ta’minlanganlik darajasini tavsiflashda muhim mezon hisoblanadi. GTK qiymati 1,0 dan yuqori bo‘lganda hudud namlik bilan yaxshi ta’minlangan, 0,7-1,0 oralig‘ida yetarli namlangan, 0,4-0,7 oralig‘ida qurg‘oqchil, 0,2-0,4 oralig‘ida juda qurg‘oqchil hamda 0,2 dan past bo‘lganda o‘ta qurg‘oqchil agroiqlimiy sharoit sifatida baholanadi.

Qoraqalpog‘iston Respublikasi Gidrometeorologiya markazining 2016-2025 yillarga oid ma’lumotlari asosida olib borilgan hisob-kitoblar natijasida GTK qiymatlari aprel oyida 0,349, may oyida 0,240, iyun oyida 0,052, iyul oyida 0,024, avgust oyida 0,030, sentyabr oyida 0,090 va oktyabr oyida 0,233 ni tashkil etdi.

Olingan natijalar ko‘ra barcha oylarida GTK qiymatlari 0,4 dan past bo‘lganligini ko‘rsatdi. Ayniqsa, iyun-avgust oylarida ushbu ko‘rsatkichning 0,024-0,052 oralig‘ida bo‘lishi hududda namlik tanqisligi nihoyatda yuqori ekanligini ko‘rsatadi. Bu davrda havo haroratining 27,3-30,7 °C gacha ko‘tarilishi va yog‘ingarchilik miqdorining 2,3-4,4 mm gacha kamayishi natijasida bug‘lanish jarayonlari keskin kuchayadi (2-jadval).

2-jadval.

Nukus tumani agroiqlimiy sharoitining gidrotermik koeffitsient (GTK) bo‘yicha baholash natijalari

Oylar	**IV**	**V**	**VI**	**VII**	**VIII**	**IX**	**X**
O‘rtacha oylik havo harorati, °C	16,7	23,3	28,4	30,7	27,3	20,1	11,9
Yog‘ingarchilik miqdori, mm	17,5	17,3	4,4	2,3	2,5	5,5	8,6
Faol haroratlar yig‘indisi (ΣT), °C	500,7	721,4	852,0	952,9	847,2	603,9	369,8
GTK	**0,349**	**0,240**	**0,052**	**0,024**	**0,030**	**0,090**	**0,233**
Agroiqlimiy tavsifi	**Juda qurg‘oqchil**		**O‘ta qurg‘oqchil**				**Juda qurg‘oqchil**

Yuqori harorat va namlik tanqisligi sharoitida sizot suvlari tarkibidagi eruvchan tuzlarning kapillyar ko‘tarilishi jadallashadi. Natijada tuproqning ustki qatlamlarida tuzlar to‘planishi kuchayib, ikkilamchi sho‘rlanish va degradatsiya jarayonlari rivojlanishi uchun qulay sharoit vujudga keladi. Ayniqsa, sug‘oriladigan o‘tloqi tuproqlarda bunday jarayonlar ekologik-meliorativ holatning yomonlashishiga va qishloq xo‘jaligi ekinlari hosildorligining pasayishiga olib keladi.

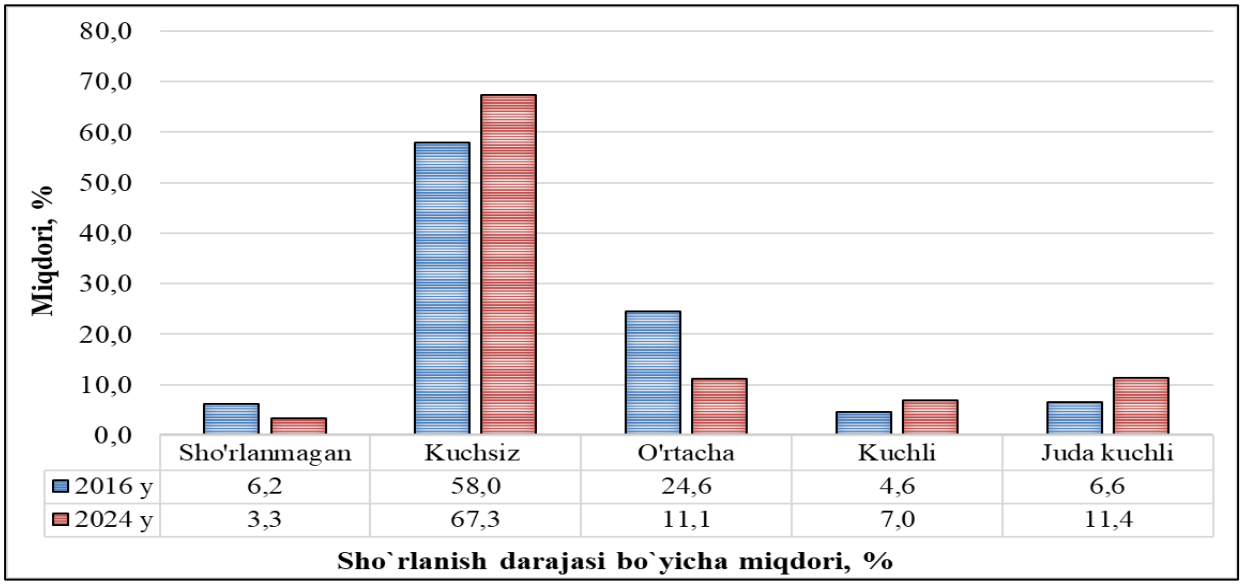
Shunday qilib, GTK bo‘yicha olingan natijalar Nukus tumani hududining o‘ta qurg‘oqchil agroiqlimiy sharoitga mansubligini ko‘rsatdi. Hududda kuzatilayotgan yuqori harorat, kam yog‘ingarchilik va past namlik ko‘rsatkichlari tuproq degradatsiyasi jarayonlarining kuchayishiga ta’sir etuvchi asosiy tabiiy omillar hisoblanadi.

Nukus tumani Amudaryo deltasining quyi qismida joylashgan bo‘lib, relefi asosan tekisliklardan iborat. Hudud tuproqlari asosan sug‘oriladigan o‘tloqi tuproqlar bilan ifodalanadi. Tadqiqot natijalariga ko‘ra Kattagar massivi sug‘oriladigan yerlar maydoni 2016 yilda 2022,4 gektarni tashkil qilgan bo‘lsa, Kadastr Agentligi 2024 yil 1-yanvar yer fondi ma`lumotlarida 2024 yilga kelib 2613,8 gektarni tashkil qilgan.

Tadqiqot hududi hisoblangan Kattagar massivi sug‘oriladigan yerlarining 2016 va 2024 yillardagi sho‘rlanish holati tahliliga ko‘ra sho‘rlanish jarayonlarida sezilarli o‘zgarishlar yuz berganligini ko‘rsatdi.

Tahlily natijalarga ko‘ra massivda sho‘rlanmagan yerlar ulushi 2016 yildagi 6,2% dan 2024 yilda 3,3% gacha kamaygan. Shu bilan birga kuchsiz sho‘rlangan yerlar ulushi 58,0% dan 67,3% gacha ortgan. O‘rtacha sho‘rlangan tuproqlar ulushi 24,6% dan 11,1% gacha kamaygan bo‘lsada, kuchli sho‘rlangan yerlar ulushi 4,6% dan 7,0% gacha va juda kuchli sho‘rlangan yerlar ulushi 6,6% dan 11,4% gacha oshganligi qayd etildi (1-rasm).

1-rasm. **Kattagar massivi sug‘oriladigan yerlari tuproqlarining sho‘rlanish darajasi dinamikasi (2016-2024 yy.)**



Tadqiqot davrida jami sho‘rlangan yerlar salmog‘i 93,8% dan 96,7% gacha ortgan. Ayniqsa, kuchli va juda kuchli sho‘rlangan maydonlarning ortishi tuproqlarning ekologik-meliorativ holati yomonlashayotganligini hamda degradatsiya jarayonlari jadallashayotganligini ko‘rsatadi.

Tadqiqot natijalarini tahlili shuni ko‘rsatdiki, Kattagar massivi sug‘oriladigan yerlarida sho‘rlanish jarayonlarining kuchayishi hududning agroiqlimiy sharoitlari bilan chambarchas bog‘liq. Nukus tumani keskin kontinental va qurg‘oqchil iqlim sharoitiga ega bo‘lib, yoz oylarida havo haroratining yuqori bo‘lishi hamda yog‘ingarchilik miqdorining keskin kamayishi kuzatiladi.

Harorat 10 °C dan yuqori bo‘lgan davrida gidrotermik koeffitsient qiymatlarining 0,024-0,349 oralig‘ida bo‘lishi hududda namlik tanqisligi yuqori ekanligini ko‘rsatdi. Ayniqsa, iyun–avgust oylarida GTK qiymatlarining 0,1 dan ham past bo‘lishi bug‘lanish jarayonlari yog‘ingarchilik miqdoridan bir necha barobar ustunligini ifodalaydi.

Bunday sharoitda sizot suvlari tarkibidagi eruvchan tuzlarning kapillyar ko‘tarilishi jadallashadi. Natijada tuproqning ustki qatlamlarida tuzlar to‘planib, ikkilamchi sho‘rlanish jarayonlari rivojlanadi. Tadqiqot hududida sho‘rlanmagan yerlar ulushining kamayishi va kuchli hamda juda kuchli sho‘rlangan maydonlar salmog‘ining ortishi ushbu jarayonlarning amaliy ifodasi hisoblanadi.

Sho‘rlanishning kuchayishi tuproqning suv-fizik xossalarini yomonlashtiradi, agregat holatini buzadi hamda o‘simliklarning oziqlanish sharoitini cheklaydi. Natijada sug‘oriladigan o‘tloqi tuproqlarning ekologik-meliorativ holati yomonlashib, degradatsiya jarayonlari jadallashadi. Shu sababli tadqiqot hududida sho‘rlanishga qarshi meliorativ tadbirlarni takomillashtirish, suvdan oqilona foydalanish va monitoring ishlarini muntazam olib borish muhim ahamiyat kasb etadi.

YOG'DA ERIYDIGAN VITAMINLAR VA ULARNING XOSSALARI

Yuldasheva Muhlisa Muhammadjon qizi
Qo'qon universiteti Andijon filiali
muhlisayoldasheva533@gmail.com.

Annotatsiya: *Vitaminlarning kimyoviy tuzilishi va xossalari hisoblanadi. Ular tabiatda juda keng tarqalgan hamda organizm uchun muhim ahamiyatga ega. Bu maqolada vitaminlarni organizmda tutgan o'rni, ahamiyati haqida to'xtalib o'tildi. Vitaminlarning organizmdagi funksiyalarini o'rganish, vitamin yetishmovchiligida kelib chiqadigan kasalliklar, vitaminlarning tabiatda tarqalishi ilmiy asosda yoritib berildi. Organizmda uchraydigan yog'da eriydigan vitaminlar va ularning vazifalari turli ilmiy manbalar orqali o'rganildi.*

Kalit so'zlar*: vitamin, yog'da eriydigan vitaminlar, gipovitaminoz, gipervitaminoz, yo'gda eriydigan vitaminlar.*

ЖИРОРАСТВОРИМЫЕ ВИТАМИНЫ И ИХ СВОЙСТВА

Аннотация*: Химическое строение и свойства витаминов имеют большое значение. Они широко распространены в природе и играют важную роль в организме человека. В данной статье рассмотрены роль и значение витаминов в организме. Научно освещены функции витаминов в организме, заболевания, возникающие при недостатке витаминов, а также распространение витаминов в природе. На основе различных научных источников изучены жирорастворимые витамины, встречающиеся в организме, и их функции.*

Ключевые слова: *витамины, жирорастворимые витамины, гиповитаминоз, гипервитаминоз, жирорастворимые витамины.*

FAT-SOLUBLE VITAMINS AND THEIR PROPERTIES

Abstract: *The chemical structure and properties of vitamins are of great importance. They are widely distributed in nature and play an essential role in the human body. This article discusses the role and significance of vitamins in the organism. The functions of vitamins in the body, diseases caused by vitamin deficiency, and the distribution of vitamins in nature are scientifically explained. Fat-soluble vitamins found in the body and their functions were studied based on various scientific sources.*

Keywords*: vitamins, fat-soluble vitamins, hypovitaminosis, hypervitaminosis, fat-soluble vitamins.*

Vitaminlar tirik organizmda har xil biokimyoviy va fiziologik jarayonlar me'yorida o'tib turishini ta'minlaydigan moddalardir. Vitaminlar oz miqdorda bo'lishiga qaramasdan, moddalar almashinuvi jarayoniga kuchli ta'sir etadigan biologik aktiv modda bo'lganligi sababli ularning nomi ko'pincha davolash xususiyatlariga qarab va fiziologik ta'sirlariga qarab berilgan, hamda ularni lotin alifbosining ayrim harflari bilan belgilash qabul qilingan.

A vitamini. Retinol A vitamini (antikseroftalmik vitamin). A vitaminini o'rganish 1882 yildan boshlangan, chunki shu yili rus vrachi M. V. Savelev shabko'rlik kasalini davolash uchun biror xil yog', ayniqsa baliq yog'i iste'mol qilsa yetarli bo'lishligini aytib o'tgan.

A vitamini—siklik (halqali) to'yinmagan bir atomli spirtdir. Uning kimyoviy tuzilishini birinchi bo'lib shveysariyalik olim Karrer 1931 yilda aniqlagan.

A vitamini molekulasining asosida Vionon halqasi yotib, unga ikki molekula dien karbonvodorod izopren qoldig'i va birlamchi spirt gruppasiga ega bo'lgan yon zanjirlar birikkandir.

O'simliklarda A vitaminiga aylanadigan uch xil karotin bo'lib, bular, β va g karotinlaridir. Ayniqsa g karotin ahamiyatli hisoblanadi, chunki uning har bir molekulasidan hayvon va inson organizmlarida ikki molekula A vitamini hosil bo'ladi, a va g karotinlardan esa bir molekuladan A vitamini hosil bo'ladi. Dastlabki paytlarda karotinlarning A vitaminiga aylanishi asosan jigarda yuz beradi deb hisoblanar edi, lekin keyingi vaqtlarda karotinlarning A vitaminiga aylanishi asosan ichak devorlarida yuz berishi aniqlangan. Lekin karotinlarning ichak yoki jigardan boshqa organlarda ham A vitaminiga aylanishi mumkinligi to'g'risida ma'lumotlar bor, g — karotinning A vitaminiga aylanishi dioksigenaza (avvallari karotinaza fermenti parchalaydi deb aytilardi) fermenti tomonidan amalga oshiriladi. A. A.

Dmitrovskiy birinchi bo‘lib, 1987 yilda karotinning vitaminga aylanishi suv kislorodi hisobidan emas, balki molekulyar kislorod ta’sirida bo‘lib o‘tishini isbotlagan va natijada avvalo A vitaminining aldegid shakli (retinal)- xosil bo‘lishini ko‘rsatadi keyin retinal esa NAD tarkibli qaytarilgan degidroge-naza fermenti ta’sirida ya’ni $NADN_2$ ta’sirida qaytarilgandan keyin retinolga aylanadi. Bu reaksiyalar qaytar reaksiyalardir, ya’ni ular bir-biriga aylanib turadi.

Karotindioksigenaza fermenti molekulasida temir ioni va tiol gruppasi bo‘lib, u glutation sfingomielin, o‘t kislotalari tomonidan aktivlantiriladi. Oksigenaza fermenti dastlab kalamushlar, keyin dengiz cho‘chqasi, jo‘ja, baliqlar (chuchuk suvdagi) kabilarning ichak devorlari shilimshiq qavatidan ajratib olingan.

Ingichka ichakning shilimshik qavat hujayralarida retinolni retinat kislotasiga oksidlantiradigan retinoloksidaza fermenti ham borligi aniklangan. Retinat kislotasi boshqa to‘qimalarda ham hosil bo‘lishi mumkin. Retinatning retinat kislotasiga aylanishi uchun ham molekulyar kislorod sarf bo‘ladi. Retinolning retinat kislotasiga aylanishi mumkinligini dastlab 1961 yilda A. A. Dimitrovskiy ko‘rsatgan. Ba’zi hayvonlarda (qoramol, yilqi, parranda) karotinning bir qismi o‘zgarmasdan qonga so‘riladi va shuning uchun ham karotin ular organizmining turli qismlarida (sutda, to‘qimalarda) bo‘lishi aniqlangan. Lekin quyon, kenguru, jirafa, cho‘chqa, echki va qo‘y kabilarning sutida karotin bo‘lmasligi aniqlangan. Demak bunday hayvonlarning ichak devorlari orqali karotin so‘rilib qonga o‘ta olmaydi. Har xil ozuqalardagi karotinning so‘rilishi (o‘zlashtirilishi) ham har xildir. Masalan, ingliz olimi Xennixning 1970 yilgi ma’lumotlariga ko‘ra, ko‘pchilik hayvonlarda karotinning 20—30 % i qonga so‘riladi, suli silosi karotinining 30—50 % i, beda silosi karotinining 34—62 % i, makka silosi karotinining 49 % i o‘zlashtiriladi. Karotinning o‘zlashtirilishi o‘simlik vegetatsiya davriga ham bog‘liq bo‘ladi. Masalan, makka pishib yetilgan davrlarida karotin miqdori ham kam bo‘ladi va undagi karotin deyarli o‘zlashtirilmaydi. Odamlarda karotin umuman yaxshi o‘zlashtiriladi (98% gacha), quyonlarda esa qiyin o‘zlashtiriladi. Hatto uning 75 % i axlat bilan chiqarib yuboriladi. Qoramollarda qabul qilingan karotinning o‘rtacha 50 % i axlat bilan chiqib ketadi.

Karotinning o‘zlashtirilishiga har xil ozuqalar ham har xil ta’sir etadi. Masalan, to‘la qiymatli oqsillar (kazeinogen) to‘la qiymatli bo‘lmagan (zein) oqsiliga nisbatan ko‘proq karotinning o‘zlashtirilishiga ta’sir etadi.

Umuman ozuqada oqsil kam bo‘lsa-yu, lekin karotin ko‘p bo‘lsa, u yaxshi so‘rilmaydi. Ozuqa tarkibida yog‘ qancha kam bo‘lsa, karotinning so‘rilishi ham va uning A vitaminiga aylanishi ham shunchalik qiyinlashadi. Paxta va soya moylari karotinning so‘rilishi va uning A vitaminga aylanishiga tokoferrollar (E vitamini) juda yaxshi ta’sir etadi. Bundan tashkari tokoferollar A vitamini uchun antioksidantdir. Karotinning A vitaminiga aylanishida nitrit va nitratlarning salbiy ta’sir yetishi ham aniqlangan.

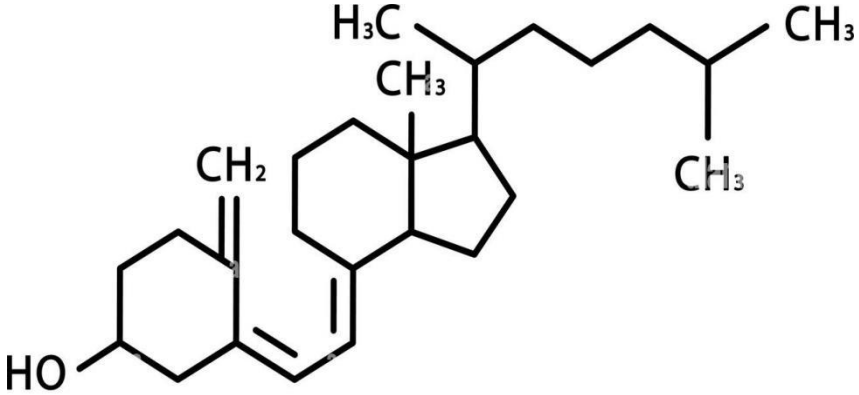
Bunday ma’lumotlarni aniqlashga, qoramollarda hosil bo‘lib turadigan A vitaminiga nisbatan avitaminozni o‘rganish sabab bo‘ladi. Ozuqada nitrat va nirit mikdori 0,5—1,5 % atrofida bo‘lganda karotinning o‘zlashtirilishi juda pasayadi va hatto karotin parchalana boshlaydi.

Tajribalar natijasida shu narsa aniqlandiki, A vitamini xilomikronlar (mayda yog‘ tomchilari) bilan birgalikda ichak devorlaridan o‘tib, limfa suyuqliklariga qo‘shiladi va ko‘krak qon tomirlari orqali butun tana qon tomirlariga o‘tadi. A vitamini asosan jigarda efir birikmalari holida to‘planadi. U qon plazmasidagi — globulin oqsili bilan qisman birikkan holda bo‘ladi. Lekin retinolni ko‘pincha o‘ziga biriktirib oluvchi oqsilning maxsus turi prealbumin bilan hosil qilgan kompleks birikma holida u kerakli joylarga, ya’ni hujayra va to‘qimalarga etkaziladi.

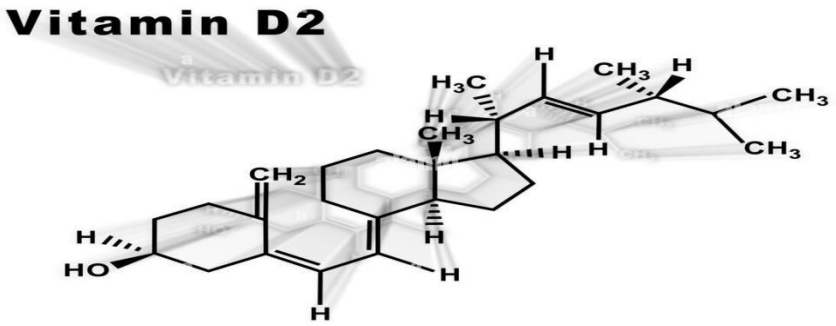
D gurux vitaminlari Bu guruhga kiradigan vitaminlar antiraxitik vitaminlardir. Odam va hayvon organizmida D vitaminining Yetishmasligi raxit kasalligining kelib chiqishiga olib keladi.

Hayvon organizmida D, D_1 D_2 va D_3 vitamini uchrab, ulardan eng ahamiyatlilari D_2 va D_3 vitaminidir. Ular bir-birlaridan tarkiblariga kiruvchi uglevodorod zanjirlarining tuzilishi bilan farq qiladi.

D_3 vitamini o‘z -o‘zicha biologik aktiv modda emas. Lekin u, biologik aktiv birikma sifatida tan olinadigan, gormonal aktivlikka ega bo‘lgan (jigar va buyrakda sintezlanadigan) 1,2,5—digidroksixolekalsiferol deb ataluvchi kimyoviy birikmani sintezlanishida ishtirok etishligi aniqlangan. Buning uchun D vitaminlar ikki bosqichda, ya’ni avvalo jigarda, keyin buyrakda gidroksillanadi va hosil bo‘lgan 1,25 digidroksixolekalsiferol suyak to‘qimalarida kalsiy va fosforlarning o‘zlashtirilishini ta’minlaydi.



Vitamin D3
$C_{27}H_{44}O$



E Vitamini (tokoferol) E vitamini (tokoferol) ko‘payish yoki antisteril vitamin ham deb yuritiladi. Oq sichqon va kalamushlar ustida tajriba o‘tkazilib, ularni uzoq muddatgacha sun’iy tayyorlangan sut bilan boqish natijasida ularning ko‘payish qobiliyatlari yo‘qolganligi sezilgan. Urg‘ochilarida homiladorlik kuzatilmagan. Oziqa tarki-biga har xil yashil o‘simliklar va bug‘doy qo‘shish natijasida ko‘payish o‘z me’yoriga yetganligi kuzatilgan. By tajribani 1922 yilda Bishop va Ivens degan olimlar o‘tkazib, ular ozuqa tarkibida qandaydir ko‘payishga yordam beradigan modda bo‘lishi kerakligini aniqladilar buni E vitamini deb belgiladilar.

E vitamini yoki tokoferollar (a , β va) tabiatda o‘simliklarda, ayniqsa texnik o‘simlik moylarida, hamda yashil o‘simliklarda ko‘proq bo‘ladi. Tokoferol a, β va g — izomer holatlarda bo‘lishini va ularning molekulyar tarkibi $C_{29}H_{49}OH$ dan iborat ekanligini 1936 yilda Ivens va Emmerson nomli olimlar aniqlaganlar. a, β va g — tokoferollar yuqori molekulali geterotsiklik spirtlar bo‘lib, ular kimyoviy tuzilishi jihatidan siklik yadrosidagi metil guruhlarining soni va joylashgan o‘rinlariga qarab bir-birlaridan farq qiladilar. Bularning ichida eng faoli a — tokoferoldir. Uning kimyoviy tuzilishini 1937 yilda Ferren-gols aniqlagan bo‘lib, uning molekulasi aromatik halqa va izoprem bo‘limlaridan tashkil topgan uzun yon zanjirdan iboratdir.

E vitamini modda almashinuvida, ya’ni biologik oksidlanishning «v» va «s» sitoxromlari orasida elektronlar va protonlarning tashilishida ishtirok etadi degan ma’lumotlar bor. E vitamini yog‘simon sarg‘ish suyuqlik bo‘lib, tez oksidlanadi, yorug‘lik ta’sirida tez buziladi, ya’ni biologik faolligini tez yo‘qotadi.

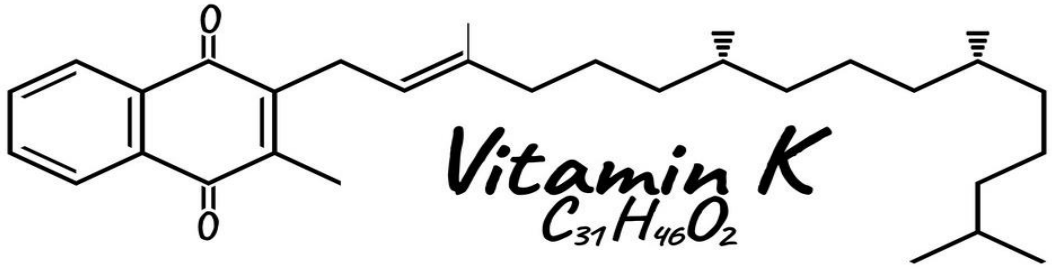
Tokoferollar o‘simliklarda sintezlanadi. Ular asosan urug‘larda bo‘ladi (bug‘doy, guruch donida) va moylarda (kungaboqar, makka, paxta, soya, guruch, nasha, palma va h.z.o da). Hamda o‘simliklar yashil qismlarda (salat, shpinat).Hayvonlarda tokoferol yetishmasligi faqat bepushtlikga keltirmasdan, mushak to‘qimalari, tomir va nerv sistemasi zararlanishiga keltiradi. Uning ta’sir mexanizmi antioksidant ta’siri bilan bog‘langan membrana lipidlarda to‘yinmagan yog‘ kislotalarining qoldiqlarini oksidlashuvini oldini olishga, hamda fermentlar biosinteziga ta’sir qilish, ayniqsa ular gem qurilishida qatnasha oladigan bo‘lsa. Insonlarda gipavitaminoz E kam uchraydi va sutkalik talab (5 mg bolalarda 10-25mg katta yoshlilarda ayniqsa homilador va emizadigan ayollarda) to‘g‘ri ovqatlanganda organizm o‘zi qondiriladi.

K vitamini (filloxinon) Hozirgi vaqtda fanda ikki xil K_1 va K_2 vitaminlari ma'lum. Bu vitaminlar birinchi marotaba 1939 yilda bedadan va chirigan baliq unidan sof holatda ajratib olingan. K1 vitamini oddiy sharoitda sarg'ish rangli, yog'simon modda bo'lib, suvda erimaydi. Qizdirishga ancha chidamlidir. K_2 vitamini esa sarik rangli kristall modda bo'lib, suvda erimaydi, yog'da va organik erituvchi-larda yaxshi eriydi. Qizdirishga chidamsiz.

K vitaminining elementar tarkibi $C_{31}H_{46}O_6$ dan iborat bo'lib, kimyoviy tuzilishi jihatidan naftaxinon halqasiga birikib kelayotgan bir nechta izopren karbonvodorod zanjiridan iboratdir. Biri ikkinchisidan karbon-vodorod zanjirining tuzilishi bilan farq qiladi. K_1 vitamini, K_2 vitaminiga nisbatan 2 barobar kuchli faollik xususiyatiga ega.

Barcha hayvonlarning yashil o'simliklardan tashkil topgan oziqa va ichak mikroflorasi K vitaminiga bo'lgan ehtiyojni to'liq ta'minlashi mumkin, antigemoragik vitaminning eng boy manbalari o'simliklardir (beda, kashtan daraxtining bargi, karam, yangi unayotgan bug'doy maysalari va h.k.). Hayvon organizmida esa jigar, qon plazmasi, suyak iligi va ayniqsa cho'chqaning jigari K vitaminiga boydir. Qonning ivish mexanizmi keyingi yillarda (1970 yillar) aniqlangan. K vitamini qon plazmasi oqsili bo'lgan protrombin kabi oqsillarning jigarda doimo yetarli miqdorda hosil bo'lib turishi uchun kerak. Protrombin qonning ivishini amalga oshiradigan trombin fermentiga aylanishi, u esa qon plazmasi oqsili fibrinogenning erimaydigan tolasimon oqsil fibringa aylanishiga ta'sir etadi va eritrotsitlarni qamrab olib, qonni ivitadi.

K vitamini molekulasi tuzilishi asosan bitsiklik birikma naftoxinon halqasidan va unga birikkan har xil uzunlikdagi izopren zanjirlaridan iboratdir. (K_1 vitamini molekulasi filloxinon hamda 4 ta izopren, K_2 molekulasi esa menaxinon va 6 ta izoprenlarking bnrikishidan tashkil topgan). K_1 vitamini, K_2 vitaminiga nisbatan bir necha bor kuchli ta'sirga egadir.



K vitamini singari fiziologik ta'sirga ega bo'lgan ba'zi sun'iy preparatlar ham mavjud. Bunday preparatlardan biri 1942 yilda akademik A. V. Palladii va M. M. SHemyakinlar tomonidan sintez qilingan vikasol hisoblanadi. Menadion ham sun'iy preparatlardan biridir. Bu preparatlar jarrohlik operatsiyalari paytida ishlatiladi.

K_1 vitamini sariq moysimon suyuqlik moddadir, u havo kislorodi va harorat ta'siriga chidamlidir. Ishqorlar va quyosh nuri ta'sirida tez buziladi. K_2 vitamini sariq kristall modda bo'lib, u yanada chidamsizdir. Ozuqalar bilan qabul qilingan K vitamini o't kislotalari ishtirokida ichakdan qonga oson so'riladi. Keyingi ma'lumotlarga ko'ra K vitamini oqsil sintezidan tashqari, tuzilishi jixatidan u bixinonga o'xshash bo'lganligi tufayli to'qimalarning, ayniqsa ichki organlarning silliq muskullari hujayralari — mitoxondriyalarida oksidlanish va qaytarilish reaksiyalarida, ya'ni biologik oksidlanish ximizmi zanjirida elektronlarni tashish, oksidlanish yo'li bilan fosforlanish reaksiyalarida ishtirok etadi.

Tabiatda K vitaminga teskari (karama-qarshi) ta'sir yetish xususiyatiga ega bo'lgan kimyoviy birikmalar ham borligi ma'lum. Bularga: dikumarol, tromeksan, diftiokol hamda..chirigan beda, xashak tarkibida uchraydigan bis oksikumarin kabi birikmalarni ko'rsatish mumkin. Bularning ichida eng kuchlisi dikumaroldir. Qonga uning 1 mg yuborilsa, u qonni ivish xususiyatini ta'minlovchi protrombin oqsili miqdorini 30 % ga kamaytirib yuboradi. Natijada qon kapillyarlarining mustahkamligi yo'qolib, yorilib qon quyilish holatlari ro'y beradi va hayvonni halokatga olib kelishi mumkin.

Yog'da eruvchi vitaminlar esa yog'da va boshqa xil organik erituvchilarda yaxshi erish xususiyatiga ega bo'lib, organizmda yog'li birikmalar holatida ma'lum bir miqdorda to'planib turib, keyin sekinlik bilan organizm ehtiyoji uchun sarflanadi. Kimyoviy nuqtai nazardan vitaminlar quyi molekulyar biorgegulyatorlar sinfiga kiradi. Vitaminlar oziq-ovqat bilan kerakli miqdorda kiritilishi lozim, chunki organizm biosintez hisobidan o'zini ehtiyojini qoplay olmaydi. Organizm faoliyati uchun zarur bo'lgan noorganik tuzlar, mikroelementlar, energiya manbalari vitaminlar qatoriga kiritilmaydilar. Almashtirib bo'lmaydigan aminokislotalar ham vitaminlar qatoriga kiritilmaydi. Ayrim vitaminlar tashqi omillar ta'sirida organizmda hosil bo'lishi ham mumkin. Masalan, D-vitamini UB nurlari ta'sirida, A-vitamini esa karotinlardan.

Gipovitamonoz va avitaminozda yosh organizm o'sishi sekinlashadi, tana og'irligi tushaboshlaydi, apetit

kamayadi, ish qobiliyati kuchli susayadi, kuchsizlanish sodir bo‘ladi, sustavlarda og‘riq paydo bo‘ladi, ichak qorinda hazm qilish yomonlashadi. Ko‘pincha gipovitaminozni charchoq, gripp kasallari bilan almashtiradilar

Organizmning vitaminlarga talabi infeksion kasallarda, kuyganda, suyak singanda va yaralanganda oshadi. Vitaminlar yara va kuyganlarni, suyaklarni tez birikishiga, tezroq tuzalishiga sababchi bo‘ladi. Ta’siri bo‘yicha ular bir birini to‘ldiradilar. Vitaminlar ovqat tarkibida yetishmaganda yoki ularning hazm qilinishi buzilganda odam organizmida turli noxush o‘zgarishlar vujudga keladi.

Annotatsiya *Qashqadaryo viloyatida o'tkazilgan tadqiqot davomida Odonata turkumining Anisoptera kenja turkumiga mansub Libellulidae oilasi vakillarining tarqalishi o'rganilib, ularning sistematik tahlili amalga oshirildi. Tadqiqot natijalariga ko'ra, mazkur oilaga mansub jami 3 ta kenja oila, 4 ta avlod va 10 ta tur hududda tarqalganligi aniqlandi. Avlodlar kesimida tahlil qilinganda, Libellulinae Rambur, 1842 kenja oilasiga 1 ta tur, Orthetrum Newman, 1833 avlodiga 4 ta tur, Crocothemis Brauer, 1868 avlodiga 1 ta tur hamda Sympetrum Newman, 1833 avlodiga 4 ta tur mansubligi qayd etildi.*

Kalit so'zlar: *ninachi, dominant, insecta, odonata, Anisoptera, Libellulidae, Orthetrum Newman, Crocothemis, Sympetrum, Orthetrum albistylum, Orthetrum Sabina, Sympetrum pedemontanum.*

ФАУНИСТИЧЕСКИЙ СОСТАВ И РАСПРОСТРАНЕНИЕ ПРЕДСТАВИТЕЛЕЙ СЕМЕЙСТВА Libellulidae В КАШКАДАРЬИНСКОЙ ОБЛАСТИ

Аннотация: *В ходе исследований, проведённых в Кашкадарьинской области, было изучено распространение представителей подотряда Anisoptera отряда Odonata, относящихся к семейству Libellulidae, а также выполнен их систематический анализ.Согласно результатам исследования, на территории региона выявлено всего 3 подсемейства, 4 рода и 10 видов, относящихся к данному семейству. При анализе на уровне родов установлено, что 1 вид относится к подсемейству Libellulinae Rambur, 1842, 4 вида — к роду Orthetrum Newman, 1833, 1 вид — к роду Crocothemis Brauer, 1868 и 4 вида — к роду Sympetrum Newman, 1833.*

Ключевые слова: *стрекоза, доминант, insecta, odonata, Anisoptera, Libellulidae, Orthetrum Newman, Crocothemis, Sympetrum, Orthetrum albistylum, Orthetrum Sabina, Sympetrum pedemontanum.*

FAUNISTIC COMPOSITION AND DISTRIBUTION OF REPRESENTATIVES OF THE LIBELLULIDAE FAMILY IN THE KASHKADARYA REGION

Abstract: *Research conducted in the Kashkadarya Region examined the distribution of representatives of the suborder Anisoptera of the order Odonata, belonging to the family Libellulidae, and conducted a systematic analysis. The study revealed three subfamilies, four genera, and ten species belonging to this family in the region. When analyzed at the genus level, it was established that 1 species belongs to the subfamily Libellulinae Rambur, 1842, 4 species belong to the genus Orthetrum Newman, 1833, 1 species to the genus Crocothemis Brauer, 1868, and 4 species to the genus Sympetrum Newman, 1833.*

Keywords: *dragonfly, dominant, insecta, odonata, Anisoptera, Libellulidae, Orthetrum Newman, Crocothemis, Sympetrum, Orthetrum albistylum, Orthetrum Sabina, Sympetrum pedemontanum.*

Kirish. Hasharotlar yer yuzida eng keng tarqalgan hayvonlar guruhlaridan biri bo'lib, deyarli barcha ekotizimlarda uchraydi. Ularning bunday keng tarqalganligi bioxilma-xilligining ham nihoyatda yuqori bo'lishiga sabab bo'lgan. Ayniqsa, qadimgi hasharotlar qatoriga kiruvchi ninachilar (Odonata turkumi) o'zining yuqori darajadagi morfologik ixtisoslashuvi bilan boshqa hasharotlardan ajralib turadi. Ular kuchli uchish qobiliyati, murakkab ko'z

tuzilishi va yirtqich hayot tarzi bilan ekotizimda muhim o‘rin egallaydi. Bugungi kunda, ninachilarning dunyo faunasida 40 ga yaqin oila, 6650 ta turi fanga ma’lum. Ular eng qadimgi hasharotlar hisoblanib 300 mln. yil oldin Toshko‘mir davrida paydo bo‘lgan [3].

Ninachilar (Odonata turkumi) amfibiont hasharotlar qatoriga kirib, ularning ontogenezida muhitlar almashinuvi yaqqol namoyon bo‘ladi: imagolari havo muhitida faol hayot kechirsa, lichinkalari suv ekotizimlariga moslashgan holda rivojlanadi. Mazkur xususiyat ninachilarning ekologik moslashuvchanligini belgilab, ularni turli biogeotsenozlarda muhim komponent sifatida namoyon etadi. Ular rivojlanishining barcha bosqichlarida yirtqichlik xususiyatiga ega bo‘lib, trofik zanjirlarda yuqori pog‘onalardan birini egallaydi. Ninachilar biogeotsenozlarda moddalar va energiya almashinuvida faol ishtirok etadi.

Xususan, ular qishloq va o‘rmon xo‘jaligida zararkunanda hasharotlar populyatsiyasini tabiiy ravishda tartibga soluvchi biologik omil sifatida katta ahamiyatga ega. Shu bilan birga, ninachilar suv va quruqlik ekotizimlarining ekologik holatini baholashda bioindikator sifatida keng qo‘llaniladi, chunki ularning ayrim turlari atrof-muhitdagi o‘zgarishlarga, ayniqsa suv sifati va ifloslanish darajasiga nisbatan sezgir hisoblanadi.[1.2,3,5]

Biroq ninachilarning xo‘jalik ahamiyati faqat ijobiy jihatlar bilan cheklanmaydi. Ularning lichinkalari baliqchilik xo‘jaliklarida baliq chavoqlari bilan oziqlanishi natijasida ma’lum darajada zarar yetkazishi, shuningdek, yosh baliqlar bilan ozuqa uchun raqobatlashishi mumkin. Bundan tashqari, ayrim hollarda ninachilar parazit gelmintlar rivojlanish zanjirida oraliq xo‘jayin sifatida ishtirok etib, yovvoyi va uy qushlarida gelmintoz kasalliklarining tarqalishiga sabab bo‘lishi ehtimoli mavjud. Ninachilar oziq resurslariga bo‘lgan ehtiyoj va ekologik omillarga bog‘liq holda sezilarli masofalarga migratsiya qilish xususiyatiga ega. Ushbu migratsiyalar ularning populyatsiya dinamikasi, areal kengayishi hamda ekotizimlar o‘rtasidagi trofik aloqalarning shakllanishida muhim rol o‘ynaydi.

Tadqiqot metodologiyasi. Tadqiqot jarayonida zoologik, entomologik, morfologik, gidrobiologik hamda morfometrik usullar kompleks qo‘llanildi. Dala tadqiqotlari 2020–2024-yillar davomida, asosan bahor, yoz va kuz fasllarida olib borildi.

Tadqiqot hududi sifatida Qashqadaryo viloyatining 14 ta tumani qamrab olinib, turli tipdagi suv havzalari va ularga tutash biotoplardan materiallar yig‘ildi. Xususan, sekin oqadigan va turg‘un suv havzalari — ko‘llar, soylar hamda irrigatsiya tarmoqlari (zovur, ariq, kanal va boshqalar) asosiy kuzatuv obyektlari sifatida tanlandi. Biomateriallarni yig‘ish ekspeditsion-marshrut usulida, Dedyuxin usuli asosida amalga oshirildi.

Ninachilar imagosining tur tarkibini aniqlash va kolleksiya materiallarini tayyorlashda Fasulati, Xaritonov, Suxachyova hamda Lyabzina metodikalaridan foydalanildi. Dala jarayonlarini hujjatlashtirishda dala kundaligi yuritilib, tadqiqot nuqtalarining geografik koordinatalarini aniqlash uchun GPS navigatorlardan foydalanildi. Namunalar yig‘ish ishlari entomologik tutqichlar yordamida suv havzalari qirg‘oqlari, ko‘llar, ariqlar va ekin maydonlari hududlarida olib borildi. Ninachi turlarini aniqlashda Kazenas (2014) hamda Subramanian (2005) tomonidan ishlab chiqilgan aniqlagichlardan foydalanildi. Shuningdek, ninachilarning taksonomiyasi va nomenklaturasi wikimedia, wikipedia, Global biologik xilma-xillik (GBIF) xalqaro ma’lumotlar bazalari asosida aniqlashtirildi. [2,7,8,9,12,13]

Natijalar va muhokama. Qashqadaryo viloyatida olib borilgan tadqiqotlar natijasida Odonata turkumiga mansub, Anisoptera kenja turkumiga oid hamda Libellulidae oilasiga kiruvchi jami 10 ta tur aniqlangan. Mazkur turlar tizimli (sistematik) jihatdan tahlil qilinib, ularning morfologik va taksonomik xususiyatlari o‘rganildi. Quyidagi jadvalda Libellulidae oilasiga mansub 10 ta turning sistematik tasnifi keltirilgan. Tadqiqot natijalariga ko‘ra, Qashqadaryo viloyati hududida mazkur oilaga kiruvchi turlar 2 ta kenja oila va 4 ta avlod mansubligi aniqlandi.

Bu holat hududdagi Odonata turkumining Anisoptera kenja turkumiga oid vakillarining taksonomik xilma-xilligini hamda ekologik moslashuv darajasini ifodalaydi (1-jadval).

				Sympetrum striolatum (Charpentier, 1840)

Bundan tashqari, aniqlangan turlarning Qashqadaryo viloyati hududida tarqalish areallari belgilandi hamda ularning geografik koordinatalari qayd etildi. Bundan tashqari ninachilarning turli mintaqalarda uchrashi aniqlandi va kooleksiya materiallar tayyorlandi.[14,15,16]

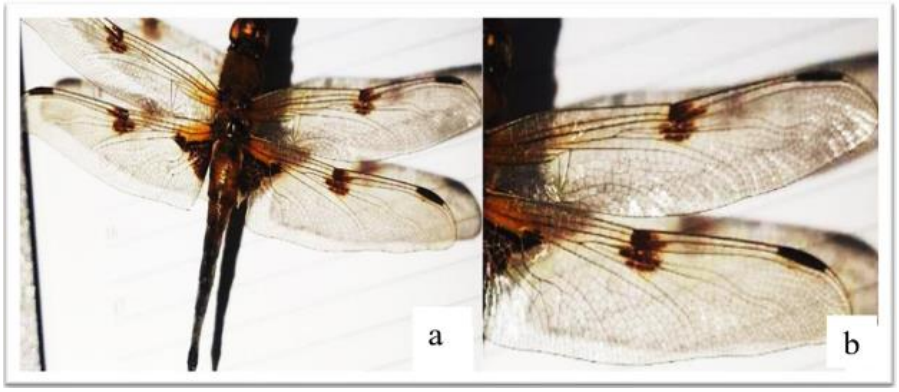
Oila: Libellulidae (Rambur, 1842)

Kenja oila: Libellulinae Rambur, 1842

Avlod: *Libellula* Linnaeus, 1758

1. *Libellula quadrimaculata* Linnaeus, 1758

Aniqlangan joyi va muddati: Qashqadaryo viloyati, G‘uzor tumani, 1 ♀, 3 ♂, 38°36'21"N, 66°16'55"E, Kasbi tumanida, 3 ♂, N 38°36′50.10", E 65°42′08.09" koordinata nuqtalaridan aniqlangan (15.05.2021).



1-rasm. *Libellula quadrimaculata* Linnaeus, 1758: a-umumiy ko‘rinishi; b-qanotlarining ko‘rinishi.

Oila: Libellulidae (Rambur, 1842)

Kenja oila: Libellulinae Rambur, 1842

Avlod: *Orthetrum* Newman, 1833

2. *Orthetrum albistylum* (Selys, 1842)

Aniqlangan joyi va muddati: Qashqadaryo viloyati, Qarshi tumani 2 ♂, 1 ♀, 38°50′42.39″N 65°56′54.13″E, G‘uzor tumani 3 ♂, 1 ♀, 38°50′45.93″N 66°04′45.01″E, Yakkabog‘ tumanida 4 ♂, 1 ♀, 39°02′36.21″N 66°50′20.36″E koordinata nuqtalaridan aniqlangan (03.06.2021).

3.Orthetrum brunneum (Fonscolombe, 1837)

Aniqlangan joyi va muddati: Qashqadaryo viloyati, Koson tumani 2 ♂, 1 ♀, 624 m 39°02′39.96″N 65°41′13.19″E, Qarshi tumani 3 ♂, 1 ♀, 38°50′42.39″N 65°56′54.13″E, G‘uzor tumani 4 ♂, 1 ♀, 38°50′45.93″N 66°04′45.01″E. (16.07.2022).

4. *Orthetrum cancellatum* Linnaeus, 1758

Aniqlangan joyi va muddati: Qashqadaryo viloyati, G‘uzor tumani 2 ♂, 1 ♀, 38°50′45.93″N 66°04′45.01″E, Yakkabog‘ tumanida 3 ♂, 1 ♀, 39°02′36.21″N 66°50′20.36″E koordinata nuqtalaridan aniqlangan (06.07.2021).

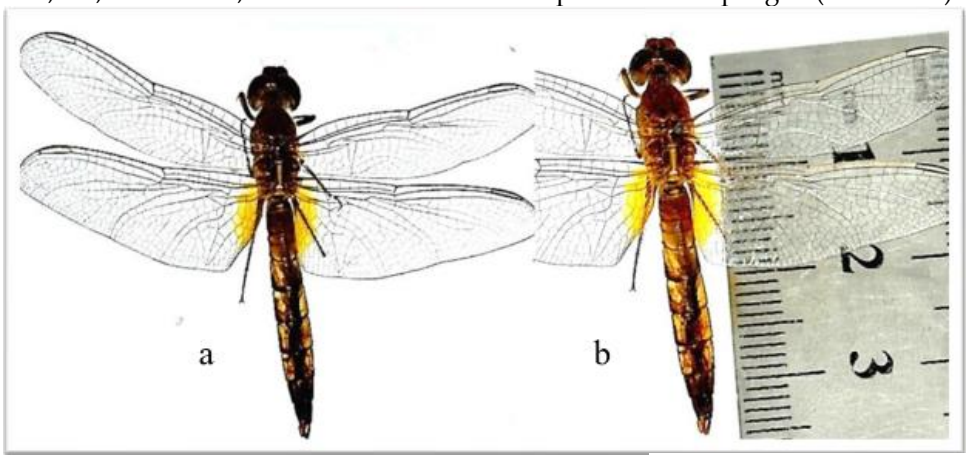
38°50′42.39″N 65°56′54.13″E, Qamashi tumanida 3 ♂, 1 ♀, 38°56'01"N, 66°14'39"E koordinata nuqtalaridan aniqlangan (16.08.2022).

Kenja oila: Sympetrinae Tillyard, 1917

Avlod: *Crocothemis* Brauer, 1868

6.*Crocothemis erythraea (Brullé, 1832*)

Aniqlangan joyi va muddati: Qashqadaryo viloyati, Qarshi tumani 2 ♂, 1 ♀, 38°50′42.39″N 65°56′54.13″E, Qamashi tumanida 3 ♂, 1 ♀, 38°56'01"N, 66°14'39"E koordinata nuqtalaridan aniqlangan (16.08.2022).



2-rasm. *Crocothemis erythraea* (Brullé, 1832): *a*-umumiy ko‘rinishi;b-hasharotning uzunligi

***Avlod: Sympetrum* Newman, 1833**

7. ***Sympetrum flaveolum* (Linnaeus, 1758)**

Aniqlangan joyi va muddati: Qashqadaryo viloyati, Yakkabog‘ tumani 4 ♂, 1 ♀, 39°01′19.78″N 66°47′07.64″E koordinata nuqtalaridan aniqlangan (07.06.2022).

8. *Sympetrum meridionale* (Selys, 1841)

Aniqlangan joyi va muddati: Qashqadaryo viloyati, G‘uzor tumani 2 ♂, 1 ♀, 38°23'19"N, 66°01'25"E, Qamashi tumani 3♂, 1♀, 38°56'01"N, 66°14'39"E, Koson tumani 4 ♂, 1 ♀, 39°02′39.96″N 65°41′13.19″E, Qarshi tumanida 5 ♂, 1 ♀, 38°50′42.39″N 65°56′54.13″E koordinata nuqtalaridan aniqlangan (10.07.2021).

9 *Sympetrum pedemontanum* (Müller in Allioni, 1766)

Aniqlangan joyi va muddati: Qashqadaryo viloyati, Kasbi tumani 2 ♂, 1 ♀, 38°23'19"N, 66°01'25"E, Qamashi tumani 3 ♂, 1 ♀, 38°56'01"N, 66°14'39"E Yakkabog‘ tumanida 4 ♂, 1 ♀, 39°01′19.78″N 66°47′07.64″E koordinata nuqtalaridan aniqlangan (30.08.2022).

10. Sympetrum striolatum (Charpentier, 1840)

Aniqlangan joyi va muddati: Qashqadaryo viloyati, Koson tumani. 3 ♂, 1 ♀, 39°02′39.96″N 65°41′13.19″E, Qamashi tumani 3 ♂, 1 ♀, 38°52′03.95″N 66°19′26.39″E, Yakkabog‘ tumanida 4 ♂, 1 ♀, 39°01′19.78″N 66°47′07.64″E koordinata nuqtalaridan aniqlangan (07.06.2022).

Yig‘ilgan materiallar asosida Anisoptera kenja turkumiga Libellulidae oilasiga mansub 10 turi Qashqadaryo viloyatining barcha agrotsenozlarida uchrashini ko‘rishimiz mumkin. Umumiy turlar soniga ko‘ra asosan Libellulinae Rambur, 1842 avlodiga 10%, *Orthetrum* Newman, 1833 avlodiga 40% , *Crocothemis* Brauer, 1868 10%, *Sympetrum* Newman,1833 esa 40% ko‘rsatgichga ega ekanligini ko‘rishimiz mumkin

Xulosa va takliflar. Ninachilar Odonata turkumi vakillari bo‘lib, amfibiont (ikki xil muhitda yashovchi) hasharotlar hisoblanadi. Ular ontogenezining lichinka bosqichida hayotining asosiy qismini suv muhitida o‘tkazadi. Shu sababli ninachi turlarining hududlar bo‘yicha tarqalishidagi tafovutlar bevosita ekologik omillar, jumladan gidrologik sharoit, flora va fauna tarkibi hamda iqlim xususiyatlari bilan chambarchas bog‘liqdir. Tadqiqotlar shuni ko‘rsatdiki, ninachilarning turli ekologik muhitlarga, xususan inson faoliyati natijasida shakllangan sun’iy suv biotoplariga moslashuv darajasi yuqori hisoblanadi. Shu nuqtai nazardan, Qashqadaryo viloyatida olib borilgan kuzatishlar davomida ninachilar tur tarkibining o‘zgarishida antropogen omillarning sezilarli ta’siri aniqlanib, ularning tur soni dinamikasiga bevosita ta’sir ko‘rsatishi qayd etildi. Natijalar tahlili shuni tasdiqladiki, tabiiy suv ekotizimlari yaxshi saqlangan hududlarda, xususan Yakkabog‘ tumani, Qamashi tumani va G‘uzor tumanida ninachi turlarining ko‘pligi va ularning dominantligi kuzatildi. Shu bilan birga, antropogen ta’sir ostida shakllangan suv inshootlari mavjud hududlarda, jumladan Qarshi tumani va Koson tumanida ham ninachilar turlarining nisbatan keng tarqalganligi aniqlanib, ularning ekologik plastiklik darajasi yuqoriligini ko‘rsatdi.

AYRIM MANZARALI XONA O'SIMLIKLARINING BIOLOGIK XUSUSIYATLARI

Zokirjonova Hilola Zokirjonovna
Samarqand davlat veterinariya meditsinasi,
chorvachilik va biotexnologiyalar
universiteti mustaqil tadqiqotchisi
E-mail: zokirjonova1994@gmail.com

Annotatsiya. *Hozirgi kunda xona o'simliklari ekologik, sanitariya-gigiyenik va estetik jihatdan muhim ahamiyat kasb etadi. Ular interyer dizaynining ajralmas qismi bo'lish bilan birga, havoni tozalash, namlikni me'yorlashtirish hamda insonning ruhiy-emotsional holatiga ijobiy ta'sir ko'rsatishi bilan ham ahamiyatlidir. Ushbu maqolada Araucaria heterophylla, Ficus elastica, Aglaonema* va *Cycas revoluta kabi ayrim mashhur xona o'simliklarining kelib chiqishi, morfologik tuzilishi, fiziologik xususiyatlari, ekologik talablari va ko'payish usullari tahlil qilingan. Olingan ma'lumotlar manzarali xona o'simliklarini samarali parvarishlash va interyer ko'kalamzorlashtirishda muhim ilmiy-amaliy ahamiyatga ega.*

Kalit so'zlar. *Xona o'simliklari, biologik va ekologik xususiyatlar, Araucaria heterophylla, Ficus elastica, Aglaonema, Cycas revoluta, dorivor, manzarali, estetik muhit.*

БИОЛОГИЧЕСКИЕ СВОЙСТВА НЕКОТОРЫХ ДЕКОРАТИВНЫХ КОМНАТНЫХ РАСТЕНИЙ

Аннотация. *В настоящее время комнатные растения имеют большое экологическое, санитарно-гигиеническое и эстетическое значение. Они являются неотъемлемой частью дизайна интерьера, а также важны для очищения воздуха, регулирования влажности и положительного влияния на психоэмоциональное состояние человека. В данной статье анализируются происхождение, морфологическая структура, физиологические характеристики, экологические требования и способы размножения некоторых популярных комнатных растений, таких как* Araucaria heterophylla, Ficus elastica, Aglaonema *и* Cycas revoluta***.*** ***Полученные*** *данные имеют большое научное и практическое значение для эффективного ухода за декоративными комнатными растениями и озеленения интерьеров.*

Ключевые слова: *комнатные растения, биологические и экологические свойства, Araucaria heterophylla, Ficus elastica, Aglaonema, Cycas revoluta, декоративные растения, озеленение интерьеров, эстетическая среда.*

BIOLOGICAL PROPERTIES OF SOME LANDSCAPE HOUSE PLANTS

Annotation: *Houseplants currently have important ecological, sanitary, and aesthetic significance. They are an integral part of interior design and also contribute to air purification, humidity regulation, and the improvement of the psycho-emotional state of humans. This article analyzes the origin, morphological features, physiological characteristics, environmental requirements, and propagation methods of several popular houseplants, such as Araucaria heterophylla, Ficus elastica, Aglaonema, and Cycas revoluta. The obtained results have important scientific and practical significance for the effective care of ornamental houseplants and interior landscaping.*

Key words: *indoor plants, biological and ecological properties, Araucaria heterophylla, Ficus elastica, Aglaonema, Cycas revoluta, ornamental plants, interior landscaping, aesthetic environment.*

Kirish

Hozirgi kunda manzarali xona o'simliklari inson yashash va ish muhitining muhim tarkibiy qismiga aylangan. Ular interyerning estetik ko'rinishini yaxshilash bilan bir qatorda, havoni tozalash, namlikni me'yorlashtirish hamda qulay mikroiqlim yaratishda muhim ekologik ahamiyat kasb etadi. Shu sababli xona o'simliklarining biologik xususiyatlarini o'rganish, ularni to'g'ri parvarishlash va ko'paytirish usullarini takomillashtirish dolzarb ilmiy-amaliy masalalardan biri hisoblanadi. Xona o'simliklari turli ekologik sharoitlarga moslashgan bo'lib, ularning o'sishi va rivojlanishi yorug'lik, harorat, namlik hamda tuproq tarkibi kabi abiotik omillarga bevosita bog'liq. Ayrim o'simliklar yuqori namlikka talabchan bo'lsa, boshqalari soyaga yoki quruq sharoitga chidamliligi bilan ajralib turadi. Shu jihatdan

Araucaria heterophylla, Ficus elastica, Aglaonema va Cycas revoluta kabi manzarali o‘simliklarning biologik va ekologik xususiyatlarini ilmiy asosda tahlil qilish muhim ahamiyatga ega.

So‘nggi yillarda ushbu o‘simliklarni ko‘paytirishda an’anaviy vegetativ usullar bilan bir qatorda mikroklonal ko‘paytirish texnologiyalaridan ham foydalanish kengaymoqda. Mazkur usul qisqa muddatda sog‘lom va genetik jihatdan bir xil ko‘chatlar olish imkonini beradi hamda manzarali o‘simliklarni sanoat miqyosida ko‘paytirishda istiqbolli yo‘nalishlardan biri hisoblanadi [1].

Ekologik talablariga ko‘ra, *Araucaria* yorug‘, ammo to‘g‘ridan-to‘g‘ri quyosh nuri tushmaydigan joylarni afzal ko‘radi. Harorat 16-22°C oralig‘ida bo‘lishi optimal hisoblanadi. Qishda esa biroz salqin muhit (10-15°C) foydali bo‘ladi. Sug‘orish mo‘tadil bo‘lishi kerak-tuproq doimo biroz nam holda saqlanishi zarur [2].

Ko‘payishi asosan urug‘ orqali amalga oshadi. Vegetativ ko‘paytirish usullari mavjud bo‘lsa-da, ular kam samarali va amaliyotda kam qo‘llaniladi.

Araucaria heterophylla Norfolk oroli uchun endemik tur bo‘lib, juda chiroyli doimiy yashil ignabargli daraxt, o‘ziga xos xususiyatlari tufayli botaniklar, bog‘bonlar va o‘simlik ixlosmandlarida katta qiziqish uyg‘otgan. So‘nggi yillarda ushbu o‘simlikning shifobaxsh xususiyatlari ham aniqlanib, etnobotanik tadqiqotchilar turli izlanishlar olib bormoqda [3]. *Araucariya* o‘simligining bargi, po‘stlog‘i, hamda tanasidan ajraladigan smolasi bir qator farmakologik faolliklarga ega hisoblanadi. Jumladan, ular yallig‘lanishga, yaralarga, viruslarga, mikroblarga qarshi, asab tizimini himoya qiluvchi va antidepressant ta’sir ko‘rsatishi aniqlangan. O‘simlikning turli qismlarida flavonoidlar, seskviterpenlar va fenilpropanoidlar kabi ko‘plab fitokimyoviy moddalar aniqlangan [4].

Nora l. El-Tantawy va boshqa tadqiqotchilar tomonidan ayrim manzarali xona o‘simliklaridan ajratib olingan ekstraktlar tibbiyotda davolovchi vosita sifatida ishlatilishi haqida ma’lumotlar keltirilgan bo‘lib jumladan: *Araucariya* smolasi ekstrakti toksoplazmaga qarshi sezilarli darajada faol ekanligini ham qayd etilgan [5].

Ficus elastica Moraceae oilasi *Ficus* turkumiga mansub hisoblanadi. Ushbu o‘simlik manzarali va doimiy yashil xona o‘simliklari qatoriga kirib, “rezina daraxti” nomi bilan ham mashhurdir [6].

Ficus elastica ning tabiiy tarqalish hududi Janubiy va Janubi-Sharqiy Osiyo mamlakatlari hisoblanadi. Tabiiy sharoitda tropik va subtropik iqlim sharoitida keng tarqalgan bo‘lib, bugungi kunda dunyoning ko‘plab hududlarida manzarali xona o‘simligi sifatida yetishtiriladi [7]. O‘simlik yirik, qalin va yaltiroq barglarga ega bo‘lib, barglarining uzunligi 20–30 sm gacha yetishi mumkin. Barg plastinkasi silliq va to‘q yashil rangda bo‘lib, yorug‘likni yaxshi qabul qilishga moslashgan. Yosh barglar dastlab qizg‘ish rangli qobiq bilan o‘ralgan holda rivojlanadi. O‘simlikning kimyoviy tarkibi o‘rganilganda tik o‘suvchi poyasi va barglarida sutsimon modda saqlashi va bundan tashqari flavonoidlar, fenollik birikmalar, terpenoidlar va alkoloidlarning uchrashi aniqlangan. Barglarini maydalab tayyorlangan kompresslar bo‘g‘im og‘riqlarida, teridagi ochiq yaralarni tuzatishda poya va barglaridan ajratib olingan lateks yara yuzasida himoya qatlam hosil qilib yaralarning bitishiga yordam beradi. Tadqiqot natijalarining ko‘rsatishicha ficus turkumi barg ekstraktlari bakteriya va zamburug‘larga qarshi biologik faollikni namoyon qilishi hada halq tabobatida revmatizm, artrit kabi kasalliklarda og‘riq qoldiruvchi tasirga ham ega ekanligi aniqlangan [8].

Ficus elastica asosan qalamcha usulida ko‘paytiriladi. Ushbu usul sodda va samarali bo‘lib, qalamchalar suvda yoki nam substratda tez ildiz hosil qiladi. Vegetativ ko‘paytirish natijasida ona o‘simlikning biologik xususiyatlari saqlanib qoladi [9].

Aglaonema Araceae oilasiga mansub ko‘p yillik manzarali o‘simlik bo‘lib, tropik xona o‘simliklari guruhiga kiradi. Ushbu turkum 20 dan ortiq turlarni o‘z ichiga oladi hamda dekorativ barglari sababli dunyo bo‘ylab keng tarqalgan [10]. *Aglaonema* ning tabiiy tarqalish hududi Janubi-Sharqiy Osiyoning tropik hududlari hisoblanadi. U asosan Malayziya, Indoneziya, Filippin va Tailandning nam tropik o‘rmonlarida uchraydi. Mazkur o‘simlik asrlar davomida Osiyo mamlakatlarida omad va farovonlik ramzi sifatida yetishtirib kelingan [11].

Aglaonema ning barglari keng, qalin va dekorativ ko‘rinishga ega bo‘lib, turiga qarab yashil, kumushsimon, sariq, oq yoki qizg‘ish naqshlar bilan ajralib turadi. Barglarining rang-barangligi ushbu o‘simlikning asosiy manzarali xususiyati hisoblanadi. Poyasi qisqa bo‘lib, ayrim hollarda tuproq ostida joylashgan bo‘ladi. Aglaonema tibbiyotda dorivor o‘simlik sifatida ishlatilmaydi, chinki barg ekstraktlari tarkibida kaltsiy oksalat tuz bo‘lib u tetiga va shilliq qavatga salbiy ta’sir qiladi. Shunday bo‘lsada barglarida fenolik birikmalar, flavonoidlar mavjud bo‘lib, ular erkin radikallarni neytrallashga yordam beradi. Bu xususiyat hujayralarni oksidlovchi stressdan himoya qilishda muhim axamiyatga ega. Bu xona o‘simligining yana bir muhim xususiyati fitoremediatorligi bo‘lib, formaldegid, benzol toluol, ksilol kabi xavfli zaxarli organik uchuvchan moddalarni neytrallaydi. Bu tur yorug‘lik yetarli bo‘lmgan sharoitlarda ham o‘sa olishi aniqlangan [12].

Cycas revoluta tashqi ko‘rinishidan palma daraxtiga o‘xshash bo‘lsa-da, biologik jihatdan ochiq urug‘li o‘simliklar guruhiga kiradi. Barglari uzun, patsimon va qattiq tuzilishga ega bo‘lib, markaziy poyadan shaklida rivojlanadi. Sekin o‘suvchi o‘simlik bo‘lib, yil davomida kam miqdorda yangi barg hosil qiladi. Shu sababli u uzoq umr ko‘ruvchi

manzarali o‘simliklar qatoriga kiradi. Bu tur qadimiy relikt o‘simlik hisoblanib Yaponiya va Sharqiy Osiyo hududlarida tarqalgan, hozirda tropik va subtropik mamlakatlarda xona o‘simligi sifatida o‘stiriladi [13].

Ushbu o‘simlik urug‘ hamda yon kurtaklari orqali ko‘paytiriladi. Urug‘ orqali ko‘paytirish uzoq vaqt talab qilsa, vegetativ usul nisbatan tezroq natija beradi.

Araucaria heterophylla fiziologik jihatdan sekin o‘suvchi o‘simlik hisoblanadi. Uning fotosintez jarayoni ignabarglari orqali amalga oshadi, bu esa keng bargli o‘simliklarga qaraganda kamroq intensivlikka ega. Shu sababli uning o‘sish sur’ati ham past bo‘ladi. Bu o‘simlik havodagi namlikka juda talabchan bo‘lib, quruq muhitda barglari qurib qolishi mumkin. Bu turning vatani Tinch okeanidagi Norfolk oroli hisoblanadi. Hozirgi kunda subtropik va tropik hududlarda yopiq xonalarda xona o‘sinligi sifatida keng yetishtiriladi. Bu tur doim yashil qatlam-qatlam, nafis va simmetrik

ko‘rinishdagi shox-shabbasi tufayli manzarali o‘simlik sifatida qadrlanadi. Ayniqsa katta xonalar, ofislar va yopiq bog‘larni bezashda keng foydalaniladi. Havoni namligini taminlashda muhim axamiyatga ega hisoblanadi [13].

Tadqiqot natijalari va muhokamalar

Tadqiqot davomida manzarali xona o‘simliklarining biologik, ekologik va dekorativ xususiyatlari J.A. Vardanyan (2017) metodikasi asosida modifikatsiya qilingan 5 balli shkala yordamida baholandi. Baholashda o‘simliklarning ekologik ahamiyati, biologik moslashuvchanligi, dorivorlik xususiyati, parvarish qulayligi, ko‘paytirish samaradorligi hamda estetik va dekorativ jihatdan qimmati asosiy mezon sifatida olindi. Olingan natijalarga ko‘ra o‘simliklar umumiy ball yig‘indisi asosida 4 ta guruhga ajratildi: I — past (20 ballgacha), II — o‘rtacha (21–25 ball), III — yuqori (26–30 ball) va IV — juda yuqori (31 ball va undan yuqori) [22].

Kompleks baholash natijalariga ko‘ra *Ficus elastica*, *Aglaonema*, *Sansevieria trifasciata* hamda *Aloe vera* ekologik

O‘simlik turlari	**Manzaradorlik darajasi**	**Ekologik ahamiyati**	**Biologik moslashuvchanligi**	**Dorivorlik xususiyati**	**Parvarish qulayligi**	**Ko‘paytirish samaradorligi**	**Estetik va dekorativ**	**Umumiy ball**	**Baholash darajasi**

Philodendron Pink Princess	5	3	4	1	4	4	5	26	Yuqori
Cycas revoluta	5	3	4	2	3	3	5	25	Yuqori
Calathea orbifolia	5	4	3	1	3	3	5	24	O‘rtacha
Anthurium andraeanum	5	3	3	1	3	3	5	23	O‘rtacha
Orchidaceae spp.	5	3	2	1	2	2	5	20	O‘rtacha

ahamiyati, biologik moslashuvchanligi va estetik jihatdan qimmati yuqori bo'lganligi sababli juda yuqori baholandi (1-jadval). *Spathiphyllum wallisii*, *Chlorophytum comosum*, *Araucaria heterophylla*, *Dracaena marginata*, *Zamioculcas zamiifolia*, *Monstera deliciosa* hamda *Philodendron Pink Princess* turlarida yuqori manzaradorlik va yaxshi biologik moslashuvchanlik kuzatildi.

1-jadval

Manzarali xona o'simliklarining biologik va dekorativ xususiyatlarini kompleks baholash natijalari (J.A.Vardanyan. 2017)

1-rasm. Xona o'simliklari

A- Ficus elastica, B- *Cycas revolute*, D-*Aglaonema* cv. Silver Bay, E- *Araucaria heterophylla*

Ficus elastica kuchli fotosintez qobiliyatiga ega o'simliklardan biri hisoblanadi. U havodagi formaldegid va benzol kabi zararli moddalarni yutish xususiyati bilan ekologik jihatdan muhim ahamiyat kasb etadi. Barglarining qalin tuzilishi suvni ma'lum darajada saqlash imkonini beradi, bu esa o'simlikning nisbatan qurg'oqchilikka chidamliligini oshiradi. O'simlik yorug'likni yaxshi ko'radi, biroq to'g'ridan-to'g'ri quyosh nuri barglarning kuyishiga sabab bo'lishi mumkin. Uning o'sishi uchun 18-25°C harorat optimal hisoblanadi. Namlik o'rtacha bo'lishi kerak, barglarini muntazam nam mato bilan artib turish o'simlikning normal fiziologik holatini saqlashga yordam beradi [8].

Cycas revoluta, *Calathea orbifolia*, *Anthurium andraeanum* va *Orchidaceae* vakillarida dekorativ xususiyatlar yuqori bo'lishiga qaramay, biologik moslashuvchanligi hamda parvarish talabchanligi sababli o'rtacha baholash ko'rsatkichlari qayd etildi [14].

Olingan natijalar biologik moslashuvchanligi yuqori bo'lgan manzarali xona o'simliklari yopiq interyer sharoitida istiqbolli ekanligini ko'rsatdi.

Tadqiqot obyekti sifatida tanlab olingan *Araucaria heterophylla*, *Ficus elastica*, *Aglaonema* hamda *Cycas revoluta* turlarining xona sharoitiga moslashuvchanligi, ekologik ahamiyati va manzaradorlik darajasi tahlil qilindi. Olingan natijalarga ko'ra ayrim turlarning havoni tozalash, namlikni me'yorlashtirish hamda estetik muhit yaratishdagi ahamiyati yuqori ekanligi aniqlandi (1-rasm).

Cycas revoluta yorug'likni yaxshi ko'radi va to'g'ridan-to'g'ri quyosh nuri tushadigan sharoitda ham normal rivojlana oladi. O'simlikni me'yoridan ortiq sug'orish tavsiya etilmaydi, chunki ortiqcha namlik ildiz tizimining chirishiga sabab bo'lishi mumkin [15]. Shu bois nisbatan quruq va yaxshi yoritilgan muhit uning o'sishi uchun qulay hisoblanadi.

Aglaonema ning eng muhim biologik xususiyatlaridan biri-uning past yorug'lik sharoitida ham yashay olishidir. Bu xususiyat uni ofislar va quyosh nuri kam tushadigan xonalar uchun maqbul o'simlikka aylantiradi. Fotosintez jarayoni past intensivlikda ham samarali amalga oshadi. Namlik bu o'simlik uchun muhim omillardan biridir. U yuqori namlikni afzal ko'radi, shu sababli barglariga suv purkash tavsiya etiladi. Harorat 20-27°C oralig'ida asosan vegetativ usulda-poya qalamchalari va ildiz qismlarini bo'lish orqali ko'paytiriladi [16].

Cycas revoluta Cycadaceae oilasiga mansub qadimiy ochiq urug‘li o‘simliklardan biri hisoblanadi. Ushbu o‘simlik ko‘pincha “tirik qazilma” deb ataladi hamda manzarali xona o‘simligi sifatida keng yetishtiriladi. Uning tabiiy tarqalish hududi Yaponiya va Janubi-Sharqiy Osiyo mamlakatlari hisoblanadi [17].

Tadqiqotlar *Araucaria* turlarining smolasi va efir moylarining fitokimyoviy va farmakologik xususiyatlarini o‘rganish hozirgi kunda katta qiziqishning ortishiga sabab bo‘lmoqda [18]. Ushbu o‘simlik qadimdan tish og‘rig‘ini davolashda ham qo‘llanilgan [19]. *Araucariya* smolasi oshqozon yarasiga qarshi (antiulserogen) hamda sitotoksik ta’sir ko‘rsatishi aniqlangan bo‘lib, u ko‘krak bezi va yo‘g‘on ichak saratoniga qarshi doxorubitsinga teng darajadagi sitotoksiklikni namoyon etishi aniqlangan [20].

Araucariaceae oilasiga mansub *Araucaria* turkumi doimiy yashil ignabargli manzarali daraxtlari bilan mashhurdir. Bu turkumning 19 ta turi bo‘lib, ular asosan janubiy yarim sharning ayrim hududlardagina tarqalgan. Uning tabiiy tarqalish hududi Tinch okeanidagi Norfolk oroli hisoblanadi. Tabiiy sharoitda bu o‘simlik juda baland-hatto 60 metrga yetishi mumkin, ammo xona sharoitida uning o‘sishi cheklangan bo‘lib, odatda 1-2 metr atrofida bo‘ladi. Bu o‘simlikning eng diqqatga sazovor xususiyati uning simmetrik tuzilishidir. Shoxlari qatlam-qatlam bo‘lib joylashadi va har bir qatlam bir-biridan aniq ajralib turadi [21]. Bu esa unga juda chiroyli piramidasimon shakl beradi. Yosh o‘simliklarda barglar yumshoq, ignasimon va och yashil rangda bo‘ladi. Vaqt o‘tishi bilan ular qattiqlashib, rang jihatdan to‘q yashil tusga kiradi.

Xulosa.

Tadqiqotda *Ficus elastica*, *Aglaonema*, *Cycas revoluta va Araucaria heterophylla* kabi manzarali xona o‘simliklarining biologik, ekologik hamda dekorativ xususiyatlari tahlil qilingan.

Baholash natijalariga ko‘ra *Ficus elastica* va *Aglaonema* biologik moslashuvchanligi, ekologik ahamiyati, parvarish qulayligi hamda yuqori dekorativligi bilan yuqori ko‘rsatkichlarni namoyon etgan. *Araucaria heterophylla* va *Cycas revoluta* relekt tur bo‘lib o‘ziga xos manzaradorligi, ilmiy-amaliy ahamiyati hamda ayrim dorivor va fitokimyoviy xususiyatlari bilan qimmatli hisoblanadi.

Bu turlar o‘rtasida yorug‘lik, harorat va namlikka bo‘lgan talablarning farqlanishi ularni parvarishlashda individual yondashuvni talab qiladi. Olingan natijalarga asoslanib manzarali xona o‘simliklarini tez va intensiv ko‘paytirishda zamonaviy *in vitro* usullardan foydalanish dolzarbligini ko‘rsatadi.

Annotatsiya: *Tritikale navlarida barg sathi shakllanishiga turli azot me'yorlarining ta'siri o'rganildi. Tadqiqot davomida Odissey va Sardor navlarida o'simlikning o'sish va rivojlanish fazalarida barg sathining o'zgarishi tahlil qilindi. Olingan natijalar azotli o'g'itlar me'yorining ortishi barg sathi kattalashishiga va o'simlikning fotosintetik faoliyati kuchayishiga ijobiy ta'sir ko'rsatishi aniqlandi. Eng yuqori ko'rsatkichlar yuqori azot me'yorlari qo'llanilgan variantlarda kuzatildi. Tadqiqot natijalari tritikale yetishtirishda optimal azot me'yorlarini belgilash va yuqori hosildorlikka erishishda muhim.*
Kalit so'zlar: *Tritikale, barg sathi, azotli o'g'itlar, fotosintez, o'sish va rivojlanish, hosildorlik, Odissey navi, Sardor navi.*

ВЛИЯНИЕ НОРМ АЗОТА НА ФОРМИРОВАНИЕ ЛИСТОВОЙ ПОВЕРХНОСТИ У СОРТОВ ТРИТИКАЛЕ

Аннотация: *В данной статье изучено влияние различных норм азота на формирование листовой поверхности у сортов тритикале. В ходе исследования был проведён анализ изменений листовой поверхности у сортов Одиссей и Сардор в различные фазы роста и развития растений. Полученные результаты показали, что увеличение норм азотных удобрений положительно влияет на расширение листовой поверхности и усиление фотосинтетической активности растений. Наиболее высокие показатели были отмечены в вариантах с повышенными нормами азота. Результаты исследования имеют важное значение для определения оптимальных норм азота и достижения высокой урожайности при возделывании тритикале.*
Ключевые слова: *тритикале, листовая поверхность, азотные удобрения, фотосинтез, рост и развитие, урожайность, сорт Одиссей, сорт Сардор.*

THE EFFECT OF NITROGEN RATES ON LEAF AREA FORMATION IN TRITICALE VARIETIES

Abstract: *This article studied the effect of different nitrogen rates on leaf area formation in triticale varieties. During the research, changes in leaf area during the growth and development stages of Odissey and Sardor varieties were analyzed. The obtained results showed that increasing nitrogen fertilizer rates had a positive effect on the enlargement of leaf area and enhancement of the photosynthetic activity of plants. The highest indicators were observed in the variants with high nitrogen rates. The research results are important for determining optimal nitrogen rates and achieving high yield in triticale cultivation.*
Keywords: *Triticale, leaf area, nitrogen fertilizers, photosynthesis, growth and development, productivity, Odissey variety, Sardor variety.*

Kirish

Tritikale (*Triticosecale*)-bug'doy va javdarni chatishtirish yo'li bilan inson tomonidan olingan don ekini [6].Tritikale o'z-o'zidan changlanadigan boshoqli ekin. Shotlandiya olimi Stiven Uilson bug'doyni changlatish orqali birinchilardan bo'lib tritikale o'simligini hosil qildi. Bug'doy (*Triticum*) va javdar (*Secale*) ni ilmiy nomlarining qisman birikmasidan Tritikale nomi kelib chiqqan [2].

Tritikale – noqulay omillarga chidamli, kasalliklarga va yuqori haroratga, noqulay tuproq hamda iqlimga tez moslashuvchan ekindir [3]. Tritikalening naychalash fazasi nisbatan ertaroq bo'lishi va uning ildizlarining tuproqdan suv olish qobiliyati qurg'oqchilikka nisbatan yuqori chidamlilikni ta'minlashi mumkin [1].

Tritikale qishloq xo'jaligida asosan yem-xashak, unli mahsulotlar va yashil ozuqa sifatida qo'llaniladi [1]. Tritikale donidan chorva va parrandalar ratsioniga 50 % ga odatiy ozuqalarni o'rniga almashtirish tavsiya etiladi [4].

Tritikale yashil massasining yuqori miqdordagi karotinoid va shakar moddasi uni chorva uchun to‘yimli ozuqaga aylantiradi. Bir qator davlatlarda Ispaniya, Vengriya, Polsha, Kanada va AQSH da tritikale yaylov o‘simligi sifatida yetishtiriladi [5].

Adaboyotlar tahlili va metodologiya

Tritikalening yetishtirish agrotexnologiyasi, seleksiyasi va urug‘chilik sohasida xorijiy va MDH davlatlarining bir guruh olimlari M.Bartnik (1991), St.Dobreva (2016), M.Dumbrava (2016), S.Bielsky (2019), M.Mergoum (2004), Zillinsky F.J. (1985) tomonidan izlanishlar olib borilgan. MDH mamlakatlarida B.B.Boronchixin (2019), N.P.Shishlova (2018), T.A.Goryanina (2017), S.A.Gorchin (2012), X.M.Nazranov (2011), S.V.Goncharov (1999), A.I.Graboves (2000) kabi olimlar tomonidan turli tadqiqot ishlari olib borilgan.

Tajriba ob’yekti sifatida tritikalening Sardor va Odissey navlari olindi. Tajriba Samarqand viloyati sharoitida o‘tkazildi. Barg sathi A.A.Nichiporovich usulida aniqlandi.

Natijalar va Muhokama

Tritikale navlarida barg sathining shakllanishi qo‘llanilgan azotli o‘g‘it me’yorlariga hamda o‘simlikning o‘sish va rivojlanish fazalariga bog‘liq holda sezilarli darajada o‘zgarib borgan. Tadqiqot natijalari shuni ko‘rsatdiki, har ikkala navda ham vegetatsiyaning dastlabki bosqichlaridan boshlab barg sathi asta-sekin ortib, eng yuqori ko‘rsatkich gullash fazasida kuzatildi. Keyingi fazalarda, ayniqsa don pishish va vegetatsiya oxiriga kelib barg sathining kamayishi qayd etildi.

Odissey navida barg sathining shakllanishi vegetatsiya davomida izchil ortib borib, eng yuqori ko‘rsatkich gullash fazasida kuzatildi. Tuplanish fazasida barg sathi nazorat variantida 218,3 sm²/tupni tashkil etgan bo‘lsa, azotli o‘g‘it me’yorlarining oshirilishi natijasida ushbu ko‘rsatkich 252,6 sm²/tupgacha ortdi. Keyingi rivojlanish bosqichlarida ham barg sathining o‘sish sur’ati saqlanib qoldi. Naychalash fazasida barg sathi nazorat variantidagi 442,2 sm²/tupdan $N_{300}P_{210}K_{150}$variantida 477,1 sm²/tupgacha yetib, azotning vegetativ organlar rivojlanishiga ijobiy ta’sir ko‘rsatganligini namoyon etdi. Boshoqlash fazasida barg sathi yanada kengayib, nazorat variantida 486,1 sm²/tupni, eng yuqori o‘g‘it me’yorida esa 523,3 sm²/tupni tashkil etdi. Gullash fazasida barg apparati maksimal rivojlanish darajasiga yetib, barg sathi nazorat variantidagi 538,5 sm²/tupdan 581,3 sm²/tupgacha ortdi. Don pishish fazasida barglarning qarishi va assimilatsion faoliyatning pasayishi natijasida barg sathi kamayib, variantlar bo‘yicha 287,7–319,5 sm²/tup oralig‘ida qayd etildi. Vegetatsiya oxirida esa ushbu ko‘rsatkichlar 176,4–203,6 sm²/tupni tashkil etib, yuqori azot me’yorlari qo‘llangan variantlarda barglarning yashovchanligi uzoqroq saqlanib qolganligi aniqlandi.

Tritikale navlarining barg sathining hosil bo‘lishi sm²/tup

Variantlar	Tuplanish	Naychalash	Boshoqlash	Gullash	Don pishish	Vegetatsiya oxiri
Odissey navi						
Nazorat o‘g‘itsiz	218,3	442,2	486,1	538,5	287,7	176,4
$N_{150}P_{105}K_{75}$	231,7	454,9	494,6	551,1	293,4	183,6
N_{200} $P_{140}K_{100}$	239,9	459,1	501,2	559,4	299,8	188,1
N_{250} $P_{175}K_{125}$	246,1	468,8	511,4	568,2	308,3	196,7
N_{300} $P_{210}K_{150}$	252,6	477,1	523,3	581,3	319,5	203,6
Sardor navi						
Nazorat o‘g‘itsiz	209,5	438,6	479,3	531,6	282,2	171,6
$N_{150}P_{105}K_{75}$	223,6	447,5	488,1	542,4	288,8	177,9
N_{200} $P_{140}K_{100}$	229,1	453,2	496,4	549,2	295,5	185,2
N_{250} $P_{175}K_{125}$	235,7	464,4	503,2	553,3	304,6	191,1
N_{300} $P_{210}K_{150}$	247,3	473,9	518,1	571,1	315,4	198,7

Sardor navida bu ko‘rsatkich pastroq bo‘lib, tuplanish fazasida barg sathi nazorat variantida 209,5 sm²/tupni tashkil etgan bo‘lsa, azotli o‘g‘itlarning ortib borishi hisobiga bu ko‘rsatkich 247,3 sm²/tupgacha ko‘paydi. Naychalash fazasida barg sathi nazorat variantidagi 438,6 sm²/tupdan $N_{300}P_{210}K_{150}$ variantida 473,9 sm²/tupgacha ortib, vegetativ o‘sishning jadallashganligini ko‘rsatdi. Boshoqlash fazasida barg sathi 479,3 sm²/tupdan 518,1 sm²/tupgacha yetib, azot bilan ta’minlangan o‘simliklarda barg apparati faolroq rivojlanganligi kuzatildi. Gullash fazasida eng yuqori ko‘rsatkichlar qayd etilib, barg sathi nazorat variantida 531,6 sm²/tupni, $N_{300}P_{210}K_{150}$ variantida esa 571,1 sm²/tupni tashkil etdi. Don pishish fazasiga kelib barg sathi tabiiy ravishda kamayib, variantlar bo‘yicha 282,2–315,4 sm²/tup oralig‘ida bo‘ldi. Vegetatsiya oxirida esa barg sathi 171,6–198,7 sm²/tupgacha pasaydi, biroq azotning yuqori me’yorlari qo‘llangan variantlarda barglarning faol holati nazoratga nisbatan uzoqroq saqlanib qoldi.

Xulosa

Tadqiqot natijalari shuni ko‘rsatdiki, azotli o‘g‘it me’yorlarining oshirilishi Odissey va Sardor tritikale navlarida barg sathining kengayishiga ijobiy ta’sir ko‘rsatdi. Har ikkala navda ham barg sathi vegetatsiya davomida ortib borib, eng yuqori ko‘rsatkich gullash fazasida kuzatildi, keyingi fazalarda esa tabiiy ravishda kamaydi. Eng katta barg sathi $N_{300}P_{210}K_{150}$ variantida qayd etilib, Odissey navida 581,3 sm²/tup, Sardor navida esa 571,1 sm²/tupni tashkil etdi. Odissey navining barg sathi ko‘rsatkichlari Sardor naviga nisbatan yuqoriroq bo‘lib, uning fotosintetik salohiyati va azotdan foydalanish samaradorligi yuqori ekanligini ko‘rsatdi. Demak, azotli o‘g‘itlarni optimal me’yorlarda qo‘llash barg apparatining yaxshi rivojlanishini ta’minlab, yuqori hosildorlikni shakllantirish uchun muhim omil hisoblanadi.

Аннотация. *В работе исследована способность экстрактов биомассы пяти изолятов эндофитных грибов, выделенных из лекарственных растений, ингибировать термическую денатурацию бычьего сывороточного альбумина. Предварительный скрининг противовоспалительной активности проведён методом теплового гемолиза эритроцитов. Установлено, что все экстракты проявляют высокую белковостабилизирующую активность в диапазоне от 66,5% до 71,1%. Наибольший эффект (71,1%) показал изолят Mg2 из ромашки аптечной, сопоставимый с аспирином (70%). Подтверждено наличие универсальных механизмов противовоспалительного действия у отобранных эндофитных грибов.*

Ключевые слова: *эндофитные грибы, ингибирование денатурации альбумина, бычий сывороточный альбумин, противовоспалительная активность, термическая денатурация, ромашка аптечная.*

INVESTIGATION OF THE ABILITY OF ACTIVE ENDOPHYTIC FUNGI TO INHIBIT ALBUMIN DENATURATION

Abstract. *The study investigated the ability of biomass extracts from five endophytic fungal isolates derived from medicinal plants to inhibit thermal denaturation of bovine serum albumin. Preliminary anti-inflammatory activity screening was performed using the erythrocyte thermal hemolysis method. All extracts exhibited high protein-stabilizing activity ranging from 66.5% to 71.1%. The highest effect (71.1%) was shown by isolate Mg2 from chamomile, comparable to aspirin (70%). The presence of universal anti-inflammatory mechanisms in the selected endophytic fungi was confirmed.*

Keywords: *endophytic fungi, inhibition of albumin denaturation, bovine serum albumin, anti-inflammatory activity, thermal denaturation, chamomile.*

FAOL ENDOFITIK ZAMBURLARNING ALBUMIN DENATURASIYASINI INHIB QILISH QOBILLIGINI TEKSHIRISH

Annotatsiya: *Tadqiqotda dorivor o'simliklardan olingan beshta endofit zamburug' izolatlaridan olingan biomassa ekstraktlarining sigir zardobidagi albuminning termal denaturatsiyasini inhibe qilish qobiliyati o'rganildi. Dastlabki yallig'lanishga qarshi faollik skriningi eritrotsitlarning termal gemoliz usuli yordamida o'tkazildi. Barcha ekstraktlar 66,5% dan 71,1% gacha bo'lgan yuqori oqsilni barqarorlashtiruvchi faollikni namoyish etdi. Eng yuqori ta'sir (71,1%) romashkadan olingan Mg2 izolati bilan ko'rsatildi, bu aspirin bilan taqqoslanadigan (70%). Tanlangan endofit zamburug'larida universal yallig'lanishga qarshi mexanizmlarning mavjudligi tasdiqlandi.*

Kalit so'zlar: *endofit zamburug'lari, albumin denaturatsiyasini inhibe qilish, sigir zardobidagi albumin, yallig'lanishga qarshi faollik, termal denaturatsiya, romashka.*

Альбумины — семейство глобулярных белков, растворимых в воде и слабых солевых растворах. Бычий сывороточный альбумин (БСА, англ. Bovine Serum Albumin, BSA) — один из наиболее изученных и широко используемых в лабораторной практике белков [1]. Денатурация — процесс потери нативной (природной) пространственной конформации белка под воздействием внешних факторов (температура, pH, химические агенты, механическое воздействие). При денатурации разрушаются нековалентные связи (водородные, гидрофобные, ионные, Ван-дер-Ваальсовы), но ковалентные связи (пептидные, дисульфидные мостики) сохраняются. [2]

Эндофитные грибы – это чрезвычайно интересная группа организмов, которая подробно изучается в настоящее время различными группами исследователей. Как следует из названия, эндофитные грибы живут

внутри тканей растений. Как правило, растение при этом не имеет симптомов заболевания, что отличает эти грибы от паразитов. Принято считать, что активное изучение эндофитов начинается с 1977 года, когда выходит статья, посвященная отравлениям коров [3]. Выяснилось, что в траве, которой питались коровы, бессимптомно присутствовали грибы, вырабатывающие ядовитые алкалоиды. С тех пор уже более тридцати лет эндофитные грибы злаков служат, наряду с лишайниками и микоризой, ещё одним примером мутуалистических отношений грибов и растений. Преимущественно, это анаморфные виды рода Neotyphodium, которые живут в ассоциации с различными видами злаков. Мицелий гриба обычно пронизывает почти всю надземную часть растения, не разрушая его клетки. Изучение истории вопроса показало, что ассоциация злаков с грибами, не вызывающими симптомов поражения и придающими хозяину токсичные свойства, была известна очень давно. Ранее эндофиты просто не привлекали такого пристального внимания. Сейчас эндофиты известны не только для злаков, но и для многих других растений [4], но лидирующее положение в плане как изученности, так и интенсивности изучения по-прежнему занимает указанная выше группа. Данная работа посвящена теоретическим аспектам взаимоотношений эндофитных грибов злаков с растениями-хозяевами и является результатом обобщений как различных литературных данных, так и собственного материала. Поскольку ассоциацию эндофит-растение принято считать мутуалистической, для начала следует немного разобраться с терминологией, с которой все оказывается не так просто.

Сами понятия симбиоз и мутуализма возникли еще XIX веке [5], но, несмотря на это, их часто продолжают смешивать. Упрощенно говоря, симбиоз – это совместное существование, которое может быть мутуалистическим или нет, а мутуализм – это взаимовыгодное существование, которое может быть симбиотическим или не симбиотическим. Наиболее известно определение, предложенное Одумом еще полвека назад [6]. В его учебнике вводятся типы отношений между популяциями, обозначаемые знаками +, - и 0. Мутуализм там дается как тип взаимодействия, при котором связь популяций благоприятна для роста и выживания обеих, причем в естественных условиях ни одна из них не может существовать без другой. Такое определение, при всей красоте и четкости, имеет несколько подводных камней, которые достаточно легко заметить, но преодолеть которые достаточно сложно. Во-первых, все приводимые типы взаимодействий даются только для популяций, в то время как далее начинается разговор о взаимодействии особей. В последующих работах тоже достаточно часто все переводится на взаимодействие двух конкретных организмов [7].

Одной из наиболее ценных особенностей эндофитных грибов является их способность продуцировать широкий спектр вторичных метаболитов — биологически активных соединений, которые не участвуют напрямую в росте и размножении, но играют ключевую роль в экологических взаимодействиях. Эти соединения синтезируются под контролем специализированных биосинтетических кластеров генов (BGCs) и обладают огромным структурным разнообразием. [8].

Ингибирование денатурации альбумина отражает способность исследуемых соединений стабилизировать белковую структуру и предотвращать её структурные изменения под воздействием стрессовых факторов, таких как повышение температуры. Таким образом, данный тест дополняет модель теплового гемолиза, позволяя оценить влияние исследуемых веществ как на клеточные мембраны, так и на белковые компоненты [9].

Метод получения экстрактов эндофитных грибов

Чистые монокультурные изоляты эндофитных грибов культивируются на жидкую питательную среду Чапек-Докс при оптимальных температурных и временных условиях. Питательную среду с эндофитными грибами ставят в орбитальный шейкер на 7 дней при комнатной температуре со скоростью 120 об/мин [10]. С учётом большого объёма биомассы и крупными размерами клеток (с учётом мицелия) выделение биомассы эндофитных грибов проводилось путём фильтрования через перфорированные (сетчатые) фильтры. Образец биомассы трижды взвешивали в эксикаторе, а затем высушивали при 105 °C в сушильном шкафу. Влажность биомассы определяли путем ее охлаждения в эксикаторе при комнатной температуре. Для выделения вторичных метаболитов из биомассы эндофитных грибов 5 г биомассы гомогенизировали в гомогенизаторе до получения однородного гомогената, затем перенесли в коническую колбу и добавили 25 мл растворителя этилацетат. Смесь перемешивали при комнатной температуре на шейкере со скоростью 180 об/мин. Затем смесь фильтровали через бумажный фильтр, и для удаления водной фазы добавляли Na_2SO_4 в концентрации 40 мкг/мл. После этого смесь упаривали насухо на вакуумном испарителе и растворяли в 1 мл диметилсульфоксида (ДМСО). Полученный экстракт использовали в качестве исходного раствора и хранили при температуре +4 °C [11].

Метод определения ингибирования денатурации белка.

Для проведения анализа реакционную смесь готовили следующим образом: к 2,5 мл 1% раствора бычьего альбумина, приготовленного на дистиллированной воде, добавляли 0,5 мл экстрактов грибов. В качестве положительного контроля использовали аспирин. Значение pH реакционной смеси доводили до 5,5 с использованием 1 н. раствора HCl. Полученные смеси инкубировали при температуре 37 °C в течение 20 минут,

после чего подвергали нагреванию при 60 °C в течение 10 минут [10]. Процесс денатурации останавливали путём охлаждения образцов. Оптическую плотность измеряли при длине волны 560 нм с использованием ультрафиолетового спектрофотометра. Процент ингибирования денатурации белка рассчитывали по следующей формуле:

$$Pecentage\ inhibition = (Abs_{control} - Abs_{sample})\ X\ 100 / Abs_{control}$$

Для проведения эксперимента использовали стандартный протокол, включающий инкубацию раствора альбумина с исследуемыми экстрактами при заданных температурных условиях с последующей спектрофотометрической регистрацией степени денатурации. В качестве референтного препарата применяли аспирин, что позволило сопоставить активность исследуемых образцов с известным нестероидным противовоспалительным средством [11] (таблица 1).

Таблица 1

Ингибирование денатурации альбумина

№	Список растений	Название изолятов	Биомасса изолята на 1 л суспензии (гр)	Влажность %	Экстракт (гр)	Процент ингибирования денатурации альбумина
1	Мята перечная (*Mentha piperita*)	Yp1	10±0,29	81±0,31	2±0,38	69.2±0,42%
2	Ромашка аптечная (*Matricaria chamomilla*)	Mg2	17,1±0,14	85±0,27	4±0,36	71.1±0,44%
3	Сельдерей пахучий (*Apium graveolens*)	Sb1	15,2±0,17	78±0,16	3±0,41	69±0,47%
4	Солодка голая (*Glycyrrhiza glabra*)	Shi1	3±0,28	83±0,13	2±0,38	66.5±0,36%
5	Чеснок (*Allium sativum*)	SApi1	12,5±0,22	79±0,28	3±0,39	70.4±0,31%
6	Аспирин					70±0,12%
7	ДМСО					-

Результаты

Анализ результатов ингибирования денатурации бычий сывороточный альбумин показал, что отобранные на предыдущем этапе изоляты эндофитных грибов сохраняют высокую противовоспалительную активность и в данной модели. Значения ингибирования варьировали в узком диапазоне — от 66.5±0,36% до 71.1±0,44% что указывает на целенаправленный отбор наиболее активных образцов после теста теплового гемолиза эритроцитов.

Наибольшая активность была зафиксирована у изолята Mg2, выделенного из ромашки аптечной (*Matricaria chamomilla*), — 71.1±0,44%, что практически соответствует или незначительно превышает уровень, характерный для контрольного препарата аспирин. Сопоставимые значения продемонстрировали изоляты SApi1 (*Allium sativum*) — 70.4±0,31%, Yp1 (*Mentha piperita*) — 69.2±0,42% и Sb1 (*Apium graveolens*) — 69±0,47%, что свидетельствует о выраженной способности данных образцов стабилизировать белковую структуру при термическом воздействии.

Несколько более низкие, но всё ещё высокие показатели наблюдались у изолята Shi1 (*Glycyrrhiza glabra*) — 66.5±0,36%. Несмотря на некоторое снижение активности по сравнению с лидирующими образцами, данные значения существенно превышают уровень условного контроля и указывают на выраженный противовоспалительный потенциал.

Подтверждена высокая биологическая активность отобранных изолятов эндофитных грибов, среди которых наибольший интерес представляют Mg2 (*Matricaria chamomilla*), SApi1 (*Allium sativum*) и Yp1 (*Mentha piperita*). Полученные данные позволяют рассматривать данные образцы как перспективные источники природных противовоспалительных соединений и обосновывают необходимость их дальнейшего детального фитохимического и фармакологического изучения.

Заключение

Экстракты эндофитных грибов из лекарственных растений эффективно ингибируют термическую денатурацию бычьего сывороточного альбумина (66,5–71,1%), не уступая аспирину (70%). Наибольшую активность проявил изолят Mg2 из ромашки аптечной. Полученные результаты подтверждают противовоспалительный потенциал эндофитных грибов и обосновывают целесообразность их дальнейшего изучения для создания природных противовоспалительных препаратов.

Аннотация: *Воспалительные заболевания остаются одной из главных проблем клинической медицины. Поиск эффективных и безопасных противовоспалительных средств природного происхождения является актуальной задачей. В данной работе представлен сравнительный анализ мембраностабилизирующей активности 15 видов лекарственных растений, оценённой по проценту ингибирования гемолиза эритроцитов in vitro.*

Ключевые слова: *лекарственные растения, противовоспалительное действие, ингибирование гемолиза, мембраностабилизирующая активность, Allium sativum, Capsicum annuum, Glycyrrhiza glabra.*

COMPARATIVE ANALYSIS OF MEMBRANE-STABILIZING ACTIVITY OF MEDICINAL PLANTS

Abstract: *Inflammatory diseases remain a major challenge in clinical medicine. The search for effective and safe anti-inflammatory agents of natural origin is a pressing issue. This paper presents a comparative analysis of the membrane-stabilizing activity of 15 medicinal plant species, assessed by the percentage of erythrocyte hemolysis inhibition in vitro.*

Keywords: *medicinal plants, anti-inflammatory activity, hemolysis inhibition, membrane-stabilizing activity, Allium sativum, Capsicum annuum, Glycyrrhiza glabra.*

DORIVOYI O'SIMLIKLARNING MEMBRAN STABILIZATSIYA QILISH FAOLIYATINING QISQORI TAHLILI

Annotatsiya: *Yallig'lanish kasalliklari klinik tibbiyotda katta muammo bo'lib qolmoqda. Tabiiy kelib chiqishi samarali va xavfsiz yallig'lanishga qarshi vositalarni izlash dolzarb masala hisoblanadi. Ushbu maqolada 15 ta dorivor o'simlik turining membranani stabilizatsiya qilish faolligining qiyosiy tahlili keltirilgan bo'lib, ular in vitro sharoitida eritrotsitlar gemolizining inhibisyon foizi bilan baholanadi.*

Kalit so'zlar: *dorivor o'simliklar, yallig'lanishga qarshi faollik, gemoliz inhibisyoni, membranani stabilizatsiya qilish faolligi, Allium sativum, Capsicum annuum, Glycyrrhiza glabra.*

Воспаление – сложная защитно-приспособительная реакция организма на повреждение, однако его хронические формы лежат в основе многих заболеваний (артриты, дерматиты, воспалительные заболевания кишечника и др.) [1]. Традиционные нестероидные противовоспалительные препараты (НПВП) эффективны, но часто вызывают побочные эффекты (гастропатии, нефротоксичность). В связи с этим возрастает интерес к лекарственным растениям – источникам биологически активных веществ с мягким противовоспалительным действием и высокой безопасностью [2].

В народной медицине многие из перечисленных растений издавна применяются для снятия воспалений различного происхождения: мята перечная и ромашка аптечная в виде чаёв и настоев уменьшают воспаление слизистых желудочно-кишечного тракта и дыхательных путей; сок алоэ настоящее и настойка календулы используются для заживления ран и купирования кожных воспалений; перец острый, несмотря на жгучесть, в малых дозах стимулирует кровообращение и помогает при воспалении суставов и мышц; чёрный виноград и семена аниса применяют при воспалительных заболеваниях бронхов и лёгких; отвар грецкого ореха и сельдерея пахучего пьют при подагре и ревматизме; шиповник собачий — известное средство против воспаления мочевыводящих путей и как общеукрепляющее при лихорадках; чеснок, базилик душистый, солодка голая и шалфей лекарственный активно используются при воспалительных процессах в полости рта, глотки и бронхов (полоскания, ингаляции, отвары); настой верблюжьей колючки (*Alhagi sparsifolia*) в восточной народной медицине

считается эффективным при воспалении геморроидальных узлов, мочевого пузыря и кишечника. Таким образом, практически каждое растение из перечня обладает собственным спектром противовоспалительного действия, что делает их незаменимыми в традиционных рецептах при самых разных недугах [3].

Одним из ключевых механизмов противовоспалительного эффекта многих фитосоединений является стабилизация биологических мембран, предотвращение высвобождения лизосомальных ферментов и, как следствие, снижение медиаторов воспаления. Удобной *in vitro* моделью для оценки такой активности служит тест ингибирования гемолиза эритроцитов, индуцированного гипотоническим раствором или тепловым шоком. Чем выше процент ингибирования гемолиза, тем более выражены мембраностабилизирующие свойства образца, коррелирующие с противовоспалительной активностью [4].

Цель настоящей работы – на основе экспериментальных данных (процент ингибирования гемолиза) провести сравнительный анализ противовоспалительного потенциала 15 широко распространённых и доступных лекарственных растений.

Объекты исследования.

В работе использованы стандартизированные водно-спиртовые экстракты (70% этанол) из надземных и подземных частей следующих растений (таблица 1). Идентификация сырья подтверждена ботанически.

Метод получение экстрактов растений

Подготовка экстрактов растений. Растительный порошок экстрагировали с ДМСО. После экстракции растворитель отгоняли в роторном испарителе, а экстракты хранили в эксикаторе по методике Хазалина и др. с модификациями Ланга и др. [5]. Метод Хазалина в оригинальной версии обычно предполагает щелочной гидролиз растительного сырья с последующим осаждением белковой фракции, однако в контексте получения общей биомассы или микробного белка эта схема может быть менее эффективна из-за потерь углеводов. Модификация Ланга направлена на улучшение выхода биомассы за счет двухстадийной обработки: сначала мягкий кислотный гидролиз для деструкции лигно-целлюлозного комплекса и перевода гемицеллюлоз в растворимые сахара, а затем нейтрализация и ферментативная осахаривание целлюлозы с использованием целлюлазных комплексов. Это позволяет максимизировать количество редуцирующих сахаров в гидролизате, которые в дальнейшем служат субстратом для культивирования дрожжей или других продуцентов белка, тем самым увеличивая конечный выход сырой биомассы по сравнению с традиционным прямым щелочением.

Метод определения ингибирования гемолиза.

Тест проводили на цельной крови здоровых доноров (n=5). Эритроциты трижды отмывали изотоническим раствором NaCl, затем готовили 2% суспензию. В пробирки вносили 0,5 мл экстракта растения (концентрация 100 мкг/мл), добавляли 1 мл 2% суспензии эритроцитов и доводили гипотоническим раствором NaCl (0,3%) до 4 мл. Инкубировали 30 мин при 37°C, центрифугировали и измеряли оптическую плотность супернатанта при 560 нм. Контроль гемолиза – пробирки с эритроцитами без экстракта [6]. Процент ингибирования гемолиза вычисляли по формуле:

$$Percentage\ inhibition = (Abs_{control} - Abs_{sample})\ X\ 100 / Abs_{control}$$

Каждое растение исследовали в трёх повторностях.

Результаты

Полученные данные приведены в (таблице 1). Растения расположены в порядке убывания процента ингибирования гемолиза.

Таблица 3.1.1

Список растений с противовоспалительной активностью

№	Список растений	Процент ингибирования гемолиза
1	Мята перечная (*Mentha piperita*)	63±0,35%
2	Ромашка аптечная (*Matricaria chamomilla*)	60.1±0,21%
3	Алоэ настоящее (*Aloe vera*)	32±0,45%
4	Пеларгония ароматная (*Pelargonium graveolens*)	29.7±0,27%
5	Перец острый (*Capsicum annuum*)	62±0,19%
6	Чёрный виноград (*Vitis vinifera*)	45.4±0,15%
7	Семена аниса (*Pimpinella anisum*)	41.7±0,45%
8	Грецкий орех (*Juglans regia*)	3.3±0,31%
9	Сельдерей пахучий (*Apium graveolens*)	45.3±0,22%
10	Шиповник собачий (*Rosa canina*)	16.4±0,46%
11	Чеснок (*Allium sativum*)	65.8±0,15%
12	Базелик душистий (*Ocimum basilicum*)	53.1±0,39%

13	Солодка голая (*Glycyrrhiza glabra*)	59.8±0,33%
14	Шалфей лекарственный (*Salvia officinalis*)	55±0,38%
15	Верблюжья колючка (*Alhagi sparsifolia*)	40.2±0,26%
16	Аспирин	70±0,12%
17	ДМСО	–

Как видно из таблицы, разброс активности очень широк – от 65.8±0,15% до 3.3±0,31%. Выделяются 5 растений с показателем выше 60% (чеснок, перец, солодка, мята, ромашка). Умеренную активность (50–60%) демонстрируют шалфей, чёрный виноград, базелик. Низкий уровень (<20%) – шиповник и грецкий орех.

Чеснок (*Allium sativum*) – лидер по ингибированию гемолиза (65.8±0,15%). Его противовоспалительные свойства связывают с серосодержащими соединениями (аллицин, ахоен), которые ингибируют циклооксигеназу и липоксигеназу, снижают синтез простагландинов и лейкотриенов [7]. Кроме того, чеснок модулирует активность NF-κB – ключевого регулятора воспаления. Перец острый (*Capsicum annuum*) – 62±0,19%. Активное вещество капсаицин, воздействуя на TRPV1-рецепторы, вызывает десенситизацию болевых путей и уменьшает выделение субстанции P – медиатора нейрогенного воспаления. Парадоксально, но в низких дозах капсаицин проявляет мощное противовоспалительное действие, что подтверждается высоким процентом мембраностабилизации. Солодка голая (*Glycyrrhiza glabra*) – 59.8±0,33% [8]. Глицирризиновая кислота и её агликон (глицирретиновая кислота) обладают кортикостероидоподобным действием – подавляют фосфолипазу A2 и продукцию провоспалительных цитокинов. Этим объясняется высокая эффективность солодки при аллергических и хронических воспалениях. Базилик душистый (*Ocimum basilicum*) – 53.1±0,39%. Богат эфирными маслами (эвгенол, линалоол) и флавоноидами (производные лютеолина, апигенина). Эвгенол ингибирует активность COX-2, а флавоноиды – стабилизируют мембраны тучных клеток, предотвращая дегрануляцию и выброс гистамина [9].

Группа, включающая шалфей, виноград, мяту и ромашку. Их действие типично для многих лекарственных растений умеренного пояса: дитерпены (шалфей), проантоцианидины (виноград), ментол и розмариновая кислота (мята), хамазулен и матрицин (ромашка). Показатель 50–65% свидетельствует о хорошем противовоспалительном потенциале, что согласуется с многовековым опытом применения этих растений при воспалительных процессах в полости рта, ЖКТ и верхних дыхательных путях.

Заключение

Проведённое исследование позволило объективно ранжировать 15 лекарственных растений по степени ингибирования гемолиза – показателю, коррелирующему с противовоспалительной активностью. Установлено, что наиболее выраженными мембраностабилизирующими свойствами обладают экстракты чеснока, острого перца, солодки, мяты и ромашки. Эти растения могут служить основой для создания фитопрепаратов для лечения воспалительных заболеваний, требующих мягкого и длительного действия. Сравнительно низкая активность шиповника и грецкого ореха в данном тесте не отрицает их других полезных свойств, но указывает на иные механизмы противовоспалительного действия.

Аннотация: *данной работе представлен научный обзор применения ультразвука в медицине. Терапевтическое действие ультразвука обусловлено механическим, тепловым, химическими факторами. Дозированным пучком ультразвука можно провести мягкий массаж сердца, легких и других органов и тканей. Применения ультразвука в хирургии. Используется способность фокусированного ультразвука высокой интенсивности вызывать локальные разрушения в тканях механические колебания ультразвуковой частоты используются в хирургических инструментах типа лезвий, пил, механических наконечников.*

Ключевые слова: *ультразвукового скальпель, ударно-волновая литотрипсия, фонофорез, микромассаж, лимфодренаж.*

TIBBIYOTDA ULTRASAVTOSHNI QO'LLASH

Annotatsiya: *Ushbu maqolada tibbiyotda ultratovushdan foydalanishning ilmiy sharhi keltirilgan. Ultratovushning terapevtik ta'siri mexanik, issiqlik va kimyoviy omillar bilan belgilanadi. Dozalangan ultratovush nurlari yurak, o'pka va boshqa organlar va to'qimalarni yumshoq massaj qilish uchun ishlatilishi mumkin. Ultratovushning jarrohlikda qo'llanilishi. Yuqori intensivlikdagi fokuslangan ultratovushning mahalliy to'qimalarga zarar yetkazish qobiliyatidan foydalaniladi; ultratovush chastotasidagi mexanik tebranishlar pichoqlar, arra va mexanik qo'l asboblari kabi jarrohlik asboblarida qo'llaniladi.*

Kalit so'zlar: *ultratovushli skalpel, zarba to'lqini litotripsiyasi, fonoforez, mikromassaj, limfa drenaji.*

PRIMENENIE ULTRASOUND V MEDITINE

Abstract: *This paper presents a scientific review of the use of ultrasound in medicine. The therapeutic effects of ultrasound are determined by mechanical, thermal, and chemical factors. A dosed ultrasound beam can be used to gently massage the heart, lungs, and other organs and tissues. Applications of ultrasound in surgery. The ability of high-intensity focused ultrasound to cause localized tissue damage is exploited; mechanical vibrations at ultrasonic frequencies are used in surgical instruments such as blades, saws, and mechanical handpieces.*

Keywords: *ultrasonic scalpel, shock wave lithotripsy, phonophoresis, micromassage, lymphatic drainage*.

Основателем диагностического ультразвука считается австрийский невролог, психиатр К.Т. Дьюссик, впервые применивший ультразвук с диагностической целью. Он определял местонахождение опухолей головного мозга с помощью измерения интенсивности прохождения ультразвуковой волны сквозь череп, по аналогии с дефектоскопом металлов. В 50-60-е годы американцы впервые пытаются использовать ультразвук в медицине. Во второй половине XX века учёные – исследователи Генри Хугес, Кельвин, Боттомли и Баярд изготовили металлический дефектоскоп, а Том Браун с Яном Дональдом разработали первую в мире контактную ультразвуковую машину (прибор, который дифференцировал твёрдые и кистозные опухоли). Кроме этого, Ян Дональд исследовал клинические области использования ультразвука (были проведены первые исследования опухолей, твёрдой и кистозной). В 1955 году японские ученые Сатомура и Нимура, исследовали с помощью ультразвукового сканера работу клапанов сердца и пульсацию периферических сосудов [1,2]. Помимо широкого использования для диагностики ультразвук применяется в медицине (в том числе регенеративной) в лечебных целях, поскольку обладает следующими свойствами:

- противовоспалительным, рассасывающим действиями;

• анальгезирующим, спазмолитическим действиями;

• кавитационным усилением проницаемости кожи.

При этом используется комбинированный метод лечения – фонофорез, при котором на ткани вместо обычного геля для ультразвуковой эмиссии (применяемого, например, при УЗИ – ультразвуковом исследовании) наносится лечебное вещество. Ультразвук способствует лечебному веществу глубже проникать в ткани.

Применение ультразвука в хирургии. Можно выделить две основные области применения ультразвука в хирургии. В первой из них используется способность фокусированного ультразвука высокой интенсивности (англ. High Intensity Focused Ultrasound, HIFU) вызывать локальные разрушения в тканях, а во второй механические колебания ультразвуковой частоты используются в хирургических инструментах для ультразвуковой резки биологических тканей.

Разрушение опухолей, дробление камней в мочевых путях, сваривание мягких тканей, сваривание костей (ультразвуковой остеосинтез), наложение ультразвуковых колебаний на хирургические инструменты (скальпели, пилки, иглы) уменьшает болевые ощущения, оказывает кровоостанавливающее и стерилизующее действия. Электромеханический ультразвуковой излучатель использует явление обратного пьезоэлектрического эффекта. Ярко выраженными пьезоэлектрическими свойствами обладают такие кристаллические диэлектрики, как кварц, сегнетова соль и др. Скорость распространения ультразвука и звука в средах одинаковы (в воздухе v =340 м/с, в воде и мягких тканях v=1500 м/с). Однако высокая интенсивность и малая длина ультразвуковых волн порождают ряд специфических особенностей. При распространении ультразвука в веществе происходит необратимый переход энергии звуковой волны в другие виды энергии, в основном в теплоту. Это явление называется поглощением звука.

Применение ультразвука в косметологии. Многофункциональные косметологические аппараты, генерирующие ультразвуковые колебания с частотой до 1 МГц, применяются для регенерации клеток кожи и стимуляции в них метаболизма. С помощью ультразвука осуществляется микромассаж клеток, улучшается микроциркуляция крови и лимфодренаж. В результате повышается тонус кожи, подкожных тканей и мышц. Ультразвуковой массаж способствует выделению биологических активных веществ, ликвидирует спазм в мышцах, в результате чего разглаживаются морщины, подтягиваются ткани лица и тела. С помощью ультразвука осуществляется наиболее глубокое введение косметических средств и препаратов в кожу, а также выводятся из нее токсины. Приготовление смесей с помощью ультразвука. Широко применяется ультразвук для приготовления эмульсий – однородных смесей из жидкостей, которые не образуют молекулярный раствор (не растворяемы друг в друге). Если две такие жидкости (например, масло и воду) слить в одну мензурку и подвергнуть воздействию ультразвуком, то в мензурке образуется эмульсия – мелкая взвесь масла в воде. Данный процесс происходит благодаря кавитации, начинающейся при превышении определенных порогов интенсивности излучения ультразвука (вода – 1 Вт/см2, масло – 4 Вт/см2). Эмульсии широко используются в современной промышленности – лакокрасочной, фармацевтической и др.

Терапевтическое применение ультразвука в медицине. Ультразвук, используемый в терапии, обладает выраженным обезболивающим, спазмолитическим, противовоспалительным, противоаллергическим и общетонизирующим действием, он стимулирует крово- и лимфообращение, процессы регенерации тканей. Благодаря этому ультразвуковая терапия нашла широкое применение в клинике внутренних болезней, в артрологии, дерматологии, отоларингологии и др. Еще в середине XX века ученые заметили, что пораненное ухо кролика быстрее заживает, если три раза по 5 минут обработать его ультразвуком с частотой, немного превышающей порог чувствительности (при $\nu > 20$ кГц). В тканях при этом увеличивается обмен веществ, усиливается синтез белков и нуклеиновых кислот, повышается проницаемость клеточных мембран. УЗ малой интенсивности (менее 1 Вт/см2) способствует активизации внутриклеточных процессов в тканях (биосинтез белка, образование биологически активных веществ, усиление активности ферментов и т.п.). Терапевтические дозы оказывают болеутоляющее, сосудорасширяющее, противовоспалительное, рассасывающее действия, стимулируют восстановление поврежденных органов и тканей, включая некоторые виды терапии злокачественных новообразований. Малыми дозами осуществляют массаж сердца, легких, мышечных тканей, как гладких, так и скелетных. Ультразвуковая терапия эффективна при заболеваниях внутренних органов (хронический бронхит, бронхиальная астма, язвенная болезнь желудка и двенадцатиперстной кишки, хронический колит, холецистит, пиелонефрит, панкреатит).

Таким образом, широкое внедрение ультразвуковых аппаратов в клиническую практику существенно расширяет возможности врачей, позволяя оперативно и эффективно решать как диагностические, так и терапевтические задачи.

Annotatsiya: *Maqolada Chotqol tizmasida tarqalgan kamyob Allium viridiflorum Pobed. senopopulyatsiyalarining morfologik o‘zgaruvchanligi, ontogenetik strukturasi, demografik ko‘rsatkichlari va vitalitet holati tahlil qilindi. Tadqiqotlar davomida turning ikki senopopulyatsiyasi ajratildi. Ularning biri markazlashgan, ikkinchisi chap tomonlama ontogenetik spektrga ega ekanligi aniqlandi. Har ikkala senopopulyatsiya delta–omega klassifikatsiyasiga ko‘ra yosh tipga mansub bo‘lib, vitalitet ko‘rsatkichlari bo‘yicha muvozanat holatidagi populyatsiyalar sifatida baholandi.*

Kalit so‘zlar: *Allium viridiflorum, kamyob tur, senopopulyatsiya, morfologik o‘zgaruvchanlik, ontogenetik spektr, vitalitet, Chotqol tizmasi.*

МОРФОЛОГИЧЕСКАЯ ИЗМЕНЧИВОСТЬ, ОНТОГЕНЕТИЧЕСКАЯ СТРУКТУРА И ВИТАЛИТЕТ ЦЕНОПОПУЛЯЦИЙ ALLIUM VIRIDIFLORUM POBED.

Аннотация: *В статье проанализированы морфологическая изменчивость, онтогенетическая структура, демографические показатели и виталитетное состояние ценопопуляций редкого вида Allium viridiflorum Pobed., распространенного в пределах Чаткальского хребта. В ходе исследований выделены две ценопопуляции вида. Установлено, что одна из них характеризуется центрированным, другая — левосторонним онтогенетическим спектром. Согласно классификации «дельта–омега», обе ценопопуляции относятся к молодому типу, а по виталитетным показателям находятся в равновесном состоянии.*

Ключевые слова: *Allium viridiflorum, редкий вид, ценопопуляция, морфологическая изменчивость, онтогенетический спектр, виталитет, Чаткальский хребет.*

MORPHOLOGICAL VARIABILITY, ONTOGENETIC STRUCTURE AND VITALITY OF COENOPOPULATIONS OF ALLIUM VIRIDIFLORUM POBED.

Annotation: *The article analyzes morphological variability, ontogenetic structure, demographic parameters and vitality status of coenopopulations of the rare species Allium viridiflorum Pobed. distributed in the Chatkal Range. Two coenopopulations of the species were identified during the study. One population was characterized by a centered ontogenetic spectrum, while the other showed a left-sided spectrum. According to the delta–omega classification, both coenopopulations belong to the young type, and their vitality indicators indicate a balanced population state.*

Key words: *Allium viridiflorum, rare species, coenopopulation, morphological variability, ontogenetic spectrum, vitality, Chatkal Range.*

Введение

Усиление антропогенного воздействия на природные экосистемы обусловливает необходимость целенаправленного изучения редких, эндемичных и уязвимых видов растений, а также фитоценозов, в состав которых они входят [1]. В современных условиях сокращение биологического разнообразия является одной из наиболее актуальных проблем природоохранной биологии. Особое значение приобретают исследования популяционного состояния редких видов, их адаптивных возможностей и устойчивости к изменяющимся условиям среды.

Одним из информативных подходов при оценке состояния редких растений является анализ морфологической изменчивости. Вариабельность морфологических признаков отражает степень адаптации особей к локальным экологическим условиям и позволяет оценить потенциал сохранения вида в естественных местообитаниях [2]. Наряду с этим важное значение имеет изучение онтогенетической структуры, поскольку соотношение возрастных состояний в популяции характеризует процессы самоподдержания, возобновления и перспективы дальнейшего развития вида [5, 6].

Allium viridiflorum Pobed. относится к редким видам с узким ареалом распространения. На территории Узбекистана вид известен из Наманганской области, в пределах Чаткальского хребта, в окрестностях села Поромон. Отдельные сведения касаются распространения, систематического положения и факторов, влияющих на состояние вида в условиях климатических изменений [9, 10]. Однако популяционно-биологические особенности *A. viridiflorum* до настоящего времени изучены недостаточно.

Целью настоящего исследования является оценка морфологической изменчивости, онтогенетической структуры, демографических параметров и виталитетного состояния ценопопуляций *Allium viridiflorum* в условиях Чаткальского хребта.

Анализ литературы

Изучение редких видов растений в последние годы всё чаще проводится с использованием комплексного популяционного подхода. Морфологические признаки рассматриваются как чувствительные индикаторы реакции растений на экологические и антропогенные факторы. Показано, что изменение морфологических параметров у редких видов может отражать реакцию популяций на климатические изменения и трансформацию местообитаний [3, 4].

Онтогенетическая структура является одним из ключевых показателей демографического состояния популяции. Она отражает соотношение ювенильных, имматурных, виргинильных, генеративных и сенильных особей, позволяя оценить интенсивность возобновления, устойчивость и перспективы развития популяции [5–8]. Для редких видов с ограниченным ареалом данный подход имеет особое значение, поскольку даже небольшие изменения в численности молодых или генеративных особей могут существенно повлиять на долгосрочную сохранность популяции.

Представители рода *Allium* L. характеризуются широким экологическим диапазоном и встречаются от пустынных местообитаний до высокогорных поясов [11–13]. Большинство видов рода светолюбивы и чаще встречаются в открытых сообществах с невысоким проективным покрытием [14]. В фитоценозах виды рода *Allium* чаще выступают в качестве ассектаторов и сравнительно редко становятся доминантами или содоминантами [15, 16].

Для представителей рода *Allium* характерна стресс-толерантная стратегия. При ухудшении условий произрастания у них может снижаться морфологическая целостность, однако при усилении стрессового воздействия активируются компенсаторные механизмы, обеспечивающие относительную устойчивость растений к неблагоприятным экологическим и ценотическим факторам [17–21]. Это делает изучение морфологической изменчивости и виталитетного состояния ценопопуляций *A. viridiflorum* особенно актуальным.

Методология исследования

Исследования проводились в пределах Чаткальского хребта, где были выделены две ценопопуляции *Allium viridiflorum*. Первая ценопопуляция расположена в 2–3 км к северу от села Поромон. Растительное сообщество участка представлено разнотравно-полынным фитоценозом. Общее проективное покрытие составляет 35–40 %. На участке отмечены бессистемный выпас скота и использование прилегающих территорий под богарное земледелие, что оказывает заметное антропогенное воздействие на естественный растительный покров. Вторая ценопопуляция также расположена в пределах Чаткальского хребта. Она приурочена к разнотравно-эремурусово-кустарниковому фитоценозу. Общее проективное покрытие составляет 40–45 %. Для оценки морфологической изменчивости изучались следующие признаки: высота растения, длина листа, ширина листа и длина генеративного побега. Для каждого признака определялись среднее значение, ошибка среднего, коэффициент вариации и показатель фитоценотической пластичности. Изменчивость оценивалась по шкале: очень низкая — до 7 %, низкая — 7–12 %, средняя — 13–20 %, высокая — 21–40 % [20, 21]. Онтогенетическая структура изучалась по возрастным состояниям: j — ювенильные, im — имматурные, v — виргинильные, g1 —

молодые генеративные, g2 — средневозрастные генеративные, g3 — старые генеративные, s — сенильные особи [7, 22]. Демографическое состояние оценивалось по индексам восстановления, старения, индивидуального оптимума, эффективности, экологической плотности, а также по индексам Δ и ω [18]. Виталитетная структура определялась по соотношению особей высокого, среднего и низкого жизненного состояния [21].

Анализ и результаты

Ценопопуляции *Allium viridiflorum* выявлены в открытых горных фитоценозах с невысоким общим проективным покрытием. Первая ценопопуляция испытывает более выраженное антропогенное воздействие, связанное с выпасом скота и использованием земельных участков для земледелия. Эти факторы могут оказывать механическое воздействие на подземные органы растений, нарушать структуру почвенного покрова и снижать эффективность семенного возобновления.

Во второй ценопопуляции антропогенная нагрузка выражена слабее. Наличие кустарникового компонента и разнотравно-эремурусовой структуры сообщества создает более стабильные условия для сохранения отдельных возрастных групп вида.

Анализ биометрических показателей показал, что морфологические признаки *A. viridiflorum* в изученных ценопопуляциях характеризуются различной степенью изменчивости. В первой ценопопуляции наиболее высокий коэффициент вариации отмечен по ширине листа — 28,9 %. Данный показатель относится к высокой изменчивости и может отражать неоднородность условий произрастания, а также влияние антропогенных факторов. Наименьшая изменчивость в первой ценопопуляции установлена по высоте растения — 3,89 % и длине генеративного побега — 5,7 %. Во второй ценопопуляции резких колебаний морфологических признаков не выявлено. Низкая изменчивость отмечена по длине листа — 10,2 % и ширине листа — 8,1 %, тогда как длина генеративного побега характеризовалась средней изменчивостью — 14,2 %. Средний коэффициент вариации признаков изменялся от 7,59 до 18,5 %, что указывает на низкий и средний уровень морфологической вариабельности (таблица 1).

Таблица 1

Коэффициент изменчивости и фитоценотическая пластичность морфологических признаков *Allium viridiflorum*

Показатели, см	1 ЦП $X \pm S_x$ CV	2 ЦП $X \pm S_x$ CV	$CV_{ср}$	I_p
Высота растений	19,2±0,8 3,89	16,4±0,8 11,3	7,59	0,14
Длина листа	13,0±0,4 8,42	13,5±0,5 10,2	9,31	0,03
Ширина листа	2,0±0,2 28,9	2,5±0,1 8,1	18,5	0,2
Длина генеративного робега	17,6±0,4 5,7	14,0±0,8 14,2	9,95	0,2

Примечание: X±Sx — среднее значение и ошибка среднего; CV — коэффициент вариации; CVср — средний коэффициент вариации; Ip — индекс фитоценотической пластичности.

Наиболее пластичными признаками оказались ширина листа и длина генеративного побега, для которых показатель Ip составил 0,20. Наименьшая пластичность установлена по длине листа — 0,03. Это свидетельствует о том, что длина листа является более стабильным признаком, тогда как ширина листа и длина генеративного побега сильнее реагируют на изменение условий произрастания.

В онтогенезе *Allium viridiflorum* выделены семь возрастных состояний: ювенильное, имматурное, виргинильное, молодое генеративное, средневозрастное генеративное, старое генеративное и сенильное [7, 22]. В первый год развития растения проходят стадии проростка и ювенильного состояния. На второй год особи переходят в имматурное состояние, на третий год — в виргинильное. Генеративный период начинается, как правило, на 4–5-й год и может продолжаться 8–12 лет в зависимости от экологических условий [22].

Первая ценопопуляция характеризуется центрированным онтогенетическим спектром. Она является полночленной и одновершинной. Максимальная доля приходится на средневозрастные генеративные особи — 31,81 %. Преобладание генеративных растений указывает на наличие устойчивого генеративного ядра, однако недостаточная представленность молодых возрастных групп может в дальнейшем ограничивать интенсивность возобновления.

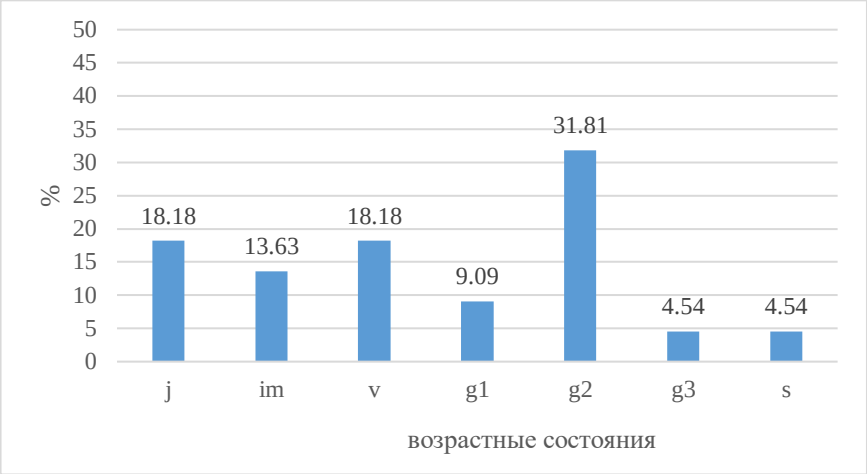

Рисунок 1. Центрированный онтогенетический спектр *Allium viridiflorum*

Вторая ценопопуляция имеет левосторонний онтогенетический спектр. Основной максимум приходится на ювенильные особи, доля которых составляет 38,8 %. Это указывает на наличие семенного возобновления. Вместе с тем переход молодых особей в последующие возрастные состояния может быть ограничен каменисто-щебнистым субстратом, недостаточной влагообеспеченностью и неравномерным распределением осадков. Накопление виргинильных и средневозрастных генеративных особей связано с продолжительностью этих онтогенетических состояний. В условиях недостаточно благоприятной среды виргинильные растения могут длительное время сохраняться без перехода к генеративному развитию. Такая особенность характерна для луковичных растений и отражает их адаптивную стратегию в нестабильных местообитаниях [19, 22].

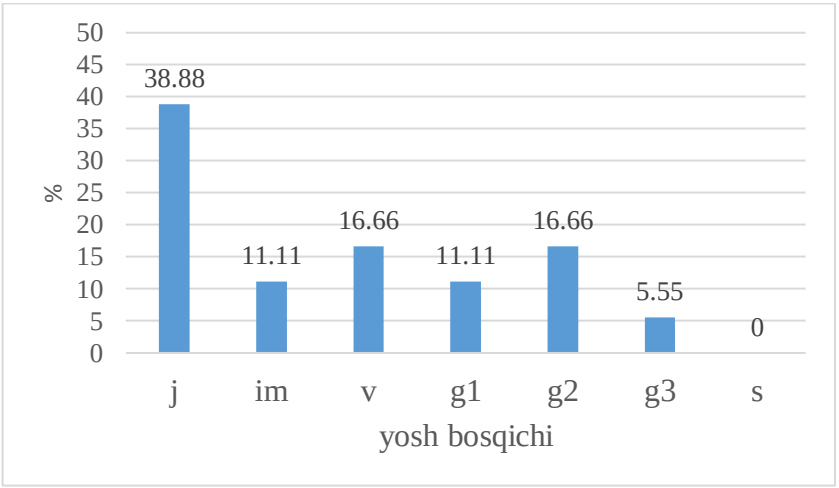

Рисунок 2. Левосторонний онтогенетический спектр *Allium viridiflorum*

Общая численность особей в исследованных ценопопуляциях была низкой и составила 18–22 растения. Плотность особей изменялась от 0,9 до 1,1 растения на 1 м², экологическая плотность — от 1,12 до 1,46. Индекс восстановления варьировал от 1,11 до 2,0. Индекс старения был очень низким и составил 0–0,04, что связано с отсутствием или слабой представленностью сенильных особей (таблица 2).

Таблица 2. **Демографические показатели ценопопуляций *Allium viridiflorum***

№ ЦП	I_t	I_q	I_{io}	I_{se}	Плотность, 1 м²	R_{ecol}	ω	Δ	Число особей, шт	Тип ЦП
1	1,11	, 04	0,71	11,8	1,1	1,46	0,54	0,29	22	молодая
2	2,0	0	0,66	7,38	0,9	1,12	0,41	0,18	18	молодая

Примечание: It — индекс восстановления; Iq — индекс старения; Iio — индекс индивидуального оптимума; Ise — индекс эффективности; Recol — экологическая плотность; ω — индекс эффективности; Δ — возрастной индекс.

Согласно классификации Л.А. Животовского, обе ценопопуляции относятся к молодому типу [18]. Это подтверждается низкими значениями возрастного индекса Δ и сравнительно невысокими значениями ω. Молодой тип популяций отражает наличие потенциала к дальнейшему развитию, однако малочисленность особей повышает уязвимость вида к антропогенным и экологическим воздействиям.

Виталитетный анализ показал, что в первой ценопопуляции доля особей высокого жизненного состояния составила 0,5, среднего — 0,3, низкого — 0,2. Во второй ценопопуляции доля особей высокого виталитета составила 0,4, среднего — 0,3, низкого — 0,3. Индекс виталитета изменялся от 0,9 до 1,0, а показатель качества популяции — от 0,62 до 0,71 (таблица 2).

Таблица 2.

Виталитетные показатели ценопопуляций *Allium viridiflorum*

ЦП	Виталитет по классам, %			IVC	IQ	Тип виталитета ЦП
	a	b	c			
1	0,5	0,3	0,2	0,9	0,62	0.5<I_Q>1 muvozanatda
2	0,4	0,3	0,3	1,0	0,71	0.5<I_Q>1 muvozanatda

Примечание: a — особи высокого виталитета; b — особи среднего виталитета; c — особи низкого виталитета; IVC — индекс виталитета; IQ — показатель качества популяции.

Обе ценопопуляции по виталитетным показателям относятся к равновесному типу. Это свидетельствует о сохранении жизненного потенциала вида в исследованных местообитаниях. Однако наличие особей низкого виталитета, особенно во второй ценопопуляции, а также малая общая численность растений указывают на необходимость постоянного мониторинга состояния вида.

Заключение

В пределах Чаткальского хребта выявлены две ценопопуляции редкого вида *Allium viridiflorum*. Они приурочены к открытым горным фитоценозам с общим проективным покрытием 35–45 %. Первая ценопопуляция испытывает более выраженное антропогенное воздействие, связанное с выпасом скота и использованием земель под богарное земледелие.

Морфологическая изменчивость вида в исследованных ценопопуляциях находится в пределах низкого и среднего уровней. Наиболее вариабельным признаком является ширина листа, особенно в первой ценопопуляции. Наибольшая фитоценотическая пластичность отмечена по ширине листа и длине генеративного побега.

Онтогенетическая структура ценопопуляций различается: первая ценопопуляция имеет центрированный, вторая — левосторонний спектр. По классификации «дельта–омега» обе ценопопуляции относятся к молодому типу. Это указывает на наличие потенциала возобновления, однако низкая численность особей ограничивает устойчивость популяций.

Виталитетный анализ показал, что обе ценопопуляции находятся в равновесном состоянии. Несмотря на это, узкий ареал, малочисленность, каменисто-щебнистые почвы, выпас скота и антропогенная трансформация местообитаний являются основными факторами риска для сохранения *Allium viridiflorum*. Для поддержания природных популяций вида необходимы регулярный мониторинг, ограничение выпаса в местах произрастания и предотвращение распашки участков, где сохраняются ценопопуляции данного редкого вида.

Аннотация. *Сахарный диабет является одним из наиболее распространённых хронических неинфекционных заболеваний и представляет значимую медико-социальную проблему глобального масштаба. Проведённый анализ данных по населению города Ургенча свидетельствует о высоком уровне охвата профилактическими медицинскими осмотрами и позволяет оценить структуру заболеваемости. Установлено относительно равномерное распределение пациентов по полу с незначительным преобладанием мужчин. Анализ динамики за последние годы выявил тенденцию к росту числа пациентов, что указывает на неблагоприятное развитие эпидемиологической ситуации. Статистическая информация получена на базе центральной поликлиники города Ургенча и подвергнута аналитической обработке.*

Ключевые слова: *сахарный диабет, эпидемиология, распространённость, профилактические осмотры, Ургенч, неинфекционные заболевания.*

PREVALENCE OF DIABETES IN THE CITY OF URGENCH

Abstract. *Diabetes mellitus is one of the most common chronic non-communicable diseases and represents a significant medical and social problem on a global scale. An analysis of Urgench population data demonstrates high coverage of preventive medical examinations and allows us to assess the incidence structure. A relatively even distribution of patients by gender was established, with a slight predominance of men. An analysis of the dynamics over recent years revealed an upward trend in the number of patients, indicating an unfavorable development of the epidemiological situation. Statistical information was obtained from the Urgench Central Polyclinic and subjected to analytical processing.*

Key words: *diabetes mellitus, epidemiology, prevalence, preventive examinations, Urgench, non-communicable diseases.*

URGANCH SHAHRIDA QANDLI DIABETNING TARQALISHI

Annotatsiya. *Qandli diabet eng keng tarqalgan surunkali yuqumsiz kasalliklardan biri bo'lib, global miqyosda muhim tibbiy va ijtimoiy muammo hisoblanadi. Urganch aholisi ma'lumotlarini tahlil qilish profilaktik tibbiy ko'riklarning yuqori darajada qamrovini ko'rsatadi va bizga kasallanish tuzilmasini baholash imkonini beradi. Bemorlarning jinsi bo'yicha nisbatan teng taqsimlanishi aniqlandi, erkaklar esa biroz ustunlik qildi. So'nggi yillardagi dinamika tahlili bemorlar sonining o'sish tendentsiyasini aniqladi, bu epidemiologik vaziyatning noqulay rivojlanishidan dalolat beradi. Statistik ma'lumotlar Urganch markaziy poliklinikasidan olindi va analitik ishlov berildi.*

Kalit so'zlar: *qandli diabet, epidemiologiya, tarqalish, profilaktik ko'riklar, Urganch, yuqumsiz kasalliklar.*

Введение. Сахарный диабет представляет собой хроническое метаболическое заболевание, характеризующееся повышением уровня глюкозы в крови вследствие недостаточной секреции инсулина или нарушения его действия [4,5]. Заболевание сопровождается нарушением углеводного, жирового и белкового обмена и может приводить к поражению различных органов и систем организма [3,7].

По данным Всемирной организации здравоохранения, число пациентов с сахарным диабетом в мире постоянно увеличивается [8]. На сегодняшний день более 650 миллионов человек страдают данным заболеванием. Рост распространённости диабета связан с изменением образа жизни, урбанизацией, снижением физической активности и увеличением распространённости ожирения [1,2].

В Республике Узбекистан проблема сахарного диабета также приобретает всё большую актуальность. В последние годы наблюдается увеличение числа пациентов, состоящих на диспансерном учёте. Это требует разработки эффективных мер профилактики и ранней диагностики заболевания [5,6].

Материалы и методы

Исследование проводилось на основе анализа статистических данных профилактических медицинских осмотров населения города Ургенча.

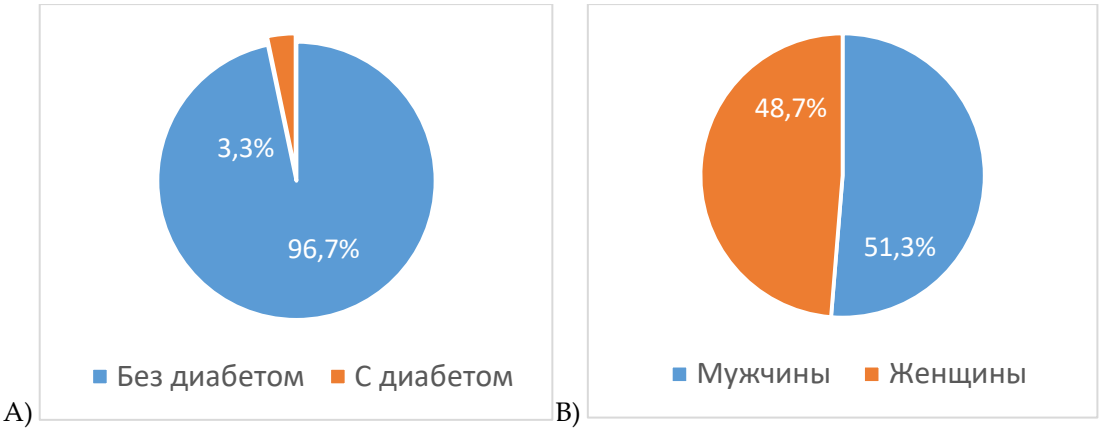
В ходе исследования использовалось следующие методы: статистический анализ медицинских данных; эпидемиологический анализ распространённости заболевания; сравнительный анализ показателей заболеваемости по полу возрастным группам, анализ годовой динамики заболеваемости за период 2020-2025 годов, а также распределение пациентов по возрастным группам.

Общая численность населения составила 159087 человек. Профилактические медицинские осмотры прошли 158153 человека, что составляет 99,4 % населения. Общее количество пациентов составило 35 794 человека. Среди них мужчины - 18 093 человека (51,3 %), женщины - 17 701 человек (48,7 %).

Распространённость сахарного диабета среди населения составила 3,3 %, тогда как 96,7 % населения не имеют данного заболевания. Все эти статистические результаты получены из центральный поликлинике Ургенча.

Результаты исследования

Анализ полученных данных показал, что сахарный диабет является достаточно распространённым заболеванием среди населения города Ургенча. Распространённость сахарного диабета среди населения составила 3,3 %, тогда как 96,7 % населения не имеют данного заболевания. Среди пациентов наблюдается небольшое преобладание мужчин.



A) B)

A) диаграмма: Распространённость сахарного диабета среди населения Ургенча.

B) диаграмма: Распределение сахарного диабета по полу.

Возрастная структура

Анализ распространённости сахарного диабета по возрастным группам показал значительное увеличение частоты заболевания с возрастом.

Возраст	Мужчина	Женщина
18-29	2,3%	2,2%
30-44	12%	11,8%
45-59	9,6%	9,4%
≥60	27,4%	25,3%

Наиболее высокий уровень распространённости заболевания наблюдается среди лиц старше 60 лет.

Годовая динамика

	2020	2021	2022	2023	2024	2025
мужчины	2050	2081	2213	2360	2459	2706
женщины	2002	2032	2117	2257	2357	2569

Полученные данные свидетельствуют о постепенном увеличении числа пациентов в течение последних лет. Полученные результаты свидетельствуют о необходимости усиления профилактических мероприятий, направленных на раннее выявление и предупреждение развития сахарного диабета.

Заключение. Проведённое исследование показало, что сахарный диабет является распространённым заболеванием среди населения города Ургенча.

Основные выводы исследования: распространённость сахарного диабета составляет 3,3 % населения; среди пациентов наблюдается незначительное преобладание мужчин (51,3 %); за период 2020-2025 годов отмечается устойчивый рост числа пациентов; наиболее высокая распространённость заболевания наблюдается среди лиц старше 60 лет.

Полученные результаты подчеркивают необходимость дальнейшего совершенствования системы профилактики и ранней диагностики сахарного диабета.

Annotation: *Collembola are an important component of soil mesofauna, actively participating in the decomposition of organic matter, the formation of soil structure and the regulation of the activity of microorganisms. This thesis is devoted to the study of the patterns of distribution, species diversity and population density of collembola in the soils of the vineyards of the Khorezm region, as well as to the assessment of their ecological significance in the stability of the agroecosystem. The study analyzes the relationship between the density of collembola and factors such as soil moisture, organic matter content and salinity, as well as their population dynamics under agrotechnical influences. The data obtained substantiate the possibility of using collembolas as bioindicators in assessing the quality of vineyard soils.*
Keywords: *Collembola, vineyard, soil mesofauna, bioindicator, binocular microscope.*

РАСПРОСТРАНЕНИЕ И ЭКОЛОГИЧЕСКОЕ ЗНАЧЕНИЕ КОЛЛЕМБОЛ В ПОЧВАХ ТУГАЙНЫХ ЭКОСИСТЕМ (НА ПРИМЕРЕ ХОРЕЗМСКОЙ ОБЛАСТИ)

Аннотация: *Коллемболы являются важной составляющей почвенной мезофауны, активно участвующей в разложении органического вещества, формировании структуры почвы и регулировании активности микроорганизмов. Данная диссертация посвящена изучению закономерностей распространения, видового разнообразия и плотности популяции коллембол в почвах виноградников Хорезмской области, а также оценке их экологического значения для стабильности агроэкосистемы. В исследовании анализируется взаимосвязь плотности коллембол с такими факторами, как влажность почвы, содержание органического вещества и соленость, а также динамика их популяции под воздействием агротехнических факторов. Полученные данные подтверждают возможность использования коллембол в качестве биоиндикаторов при оценке качества почв виноградников.*
Ключевые слова: *Коллемболы, виноградник, почвенная мезофауна, биоиндикатор, бинокулярный микроскоп.*

INTRODUCTION

In conditions of intensive agriculture, the assessment of soil biological activity has become one of the key tasks of modern ecology. Collembolans (Collembola) are small arthropods that permanently inhabit the soil and play an important role in detritus decomposition, soil structure formation, and nitrogen cycling [2]. It has been proven that their population parameters respond rapidly and measurably to agro-technical impacts and soil pollution.

In the Khorezm region, the ecological consequences of the Aral Sea crisis-such as increased soil salinization, wind erosion, and salt dust transport pose a serious threat to the biological diversity of agroecosystems. At the same time, no specific studies have been conducted on the soil mesofauna of vineyard ecosystems in this region, particularly on collembolans.The aim of the study is to identify the species composition of collembolans in vineyard soils of the Khorezm region, assess their population density, and substantiate their potential use as bioindicators of soil quality.

RESEARCH OBJECT AND METHODS

The research materials were collected from vineyard agrocenoses in January, February, and March 2026 in the "Zuhra Dono" farm located in the "Oydin Hayot" neighborhood of Khonqa district, Khorezm region. Soil samples were taken from the 0–10 cm, 10–20 cm, and 20–30 cm soil layers of agrocenoses.Soil samples were collected from designated field points, placed into plastic bags, and labeled with identification tags. The labels contained information such as sampling date, location name, type of agrocenosis or natural ecosystem, soil layer, and other relevant data. To study the

species composition and ecology of collembolans from the above-mentioned areas, sampling was carried out using route and stationary methods to analyze spatial distribution and seasonal dynamics. Collembolans were extracted from soil samples using the widely accepted Berlese–Tullgren apparatus. Taxonomic identification (family, genus, or species level) of collembolans mounted on permanent slides was performed using a DN-300M 18×100 binocular microscope. Species identification was carried out based on specialized collembolan identification keys. Particular attention was paid to morphological characteristics during species determination. All analyses were conducted using transmitted-light microscopes on prepared specimens.

RESULTS

As a result of the conducted research, four collembolan species belonging mainly to the families Onychiuridae, Isotomidae, and Hypogastruridae were identified: *Folsomia sexoculata* (Tullberg, 1871), *Supraphorura furcifera* Börner, 1901, *Metaphorura affinis* Börner, 1902, and *Hypogastrura tullbergi* Bourlet, 1839. From the soil samples collected during the winter months (January–February) and the spring month (March), a total of 188 collembolan individuals were extracted and prepared as permanent slides. Among them, 40 individuals of *Folsomia sexoculata*, 49 individuals of *Supraphorura furcifera*, 52 individuals of *Metaphorura affinis*, and 47 individuals of *Hypogastrura tullbergi* were identified.

Folsomia sexoculata (Tullberg, 1871):the body length reaches up to 2.0 mm. The body coloration is dark brown, grey, and violet. The body shape is cylindrical and slender. The simple eyes are arranged as 3+3. The postantennal organ is narrow and elongated.The first antennal segment is long and covered with two shorter ventropical sensory setae. The body is densely covered with short and erect macrosetae forming a compact covering. The maxilla consists of at least four lamellae and two apical teeth.The body surface is densely covered with short hairs. On the second and third thoracic segments, macrosetae and short sensory setae are present in the anterodorsolateral region, along with 1+1 prelabral setae. The second and third abdominal segments of the thorax also bear clusters of sensory setae.

Supraphorura furcifera Börner, 1901 Morphological characteristics: The body length is 1.3 mm. Eyes are absent. The body coloration is whitish. The furcula is bifurcated, forming a two-branched structure. The body is cylindrical in shape. This species is found under plant litter. It was first described in 1901 by the German zoologist Karl Börner.

Metaphorura affinis Börner, 1902 Morphological characteristics: The body size ranges from 0.7 to 1.5 mm. Eyes are 2+2 or absent. The body is relatively slender and whitish in colour. On abdominal segments I–IV, short and sparse setae are present, and in some cases, slightly larger setae may occur. The cuticular granulation is weakly developed. Granules are more pronounced on the dorsal surface of the head and on the terminal abdominal segment.The antennal organ consists of two thick cylindrical sensilla, three prominent protective papillae, and 3–4 protective setae. The dorsal sensillum of the antennal organ bears a terminal opening on the third antennal segment. The fourth antennal segment possesses a long sensory sensillum (gustatory organ) and an apical vesicle (feeding-related structure on the cephalic region). The antennal organ is located in a deep depression.Claws are toothless. The empodium is almost absent or extremely reduced. The sixth abdominal segment bears two anal setae of moderate length located on a papilla-like structure.

Hypogastrura tullbergi Bourlet, 1839 Morphological characteristics: The body length is 1.5 mm. The body coloration ranges from bluish-grey to dark blue-violet. The anterior part of the body and legs are usually pigmented. Granulation is evenly distributed across the body surface. Between the setae of the fifth abdominal segment, 10–16 granules are present.The fifth abdominal segment bears no more than eight setae. The setae are barely distinguishable, thin and short, while the abdominal segment is relatively elongated and in some cases slightly angular. The sensilla are comparatively longer.

Table 1

Statistical data by months and soil layers

Depth of soil layer (cm)	January	February	March	Total (individuals)	Average (individuals)
0–10 cm	4	34	14	52	17.3
10–20 cm	13	33	23	69	23.0
20–30 cm	5	38	24	67	22.3
Total	22	105	61	188	62.7

Note: n — number of extracted collembolans (individuals); the average was calculated based on three-month values.

Table 2

Total number of collembolans by months

Indicator	January	February	March
Total (individuals)	**22**	**105**	**61**
Average (individuals)	**7.3**	**35.0**	**20.3**
Share (%)	**11.7%**	**55.9%**	**32.4%**

• February was the month with the highest number of collembolans, with 105 individuals (56% of the total 188)

• January showed the lowest abundance, with 22 individuals. This is associated with low temperature and moisture conditions in winter.

• The 10–20 cm soil layer contained the highest number of collembolans, with 69individuals.

• The 0–10 cm soil layer showed the lowest abundance, with 52 individuals. It was observed that collembolans preferred the middle soil layer.

CONCLUSION

In the vineyard soils of the Khorezm region, during the winter and spring seasons, four collembolan species belonging to three families were recorded. From the family Onychiuridae, the following two species were identified: *Supraphorura furcifera* (Börner, 1901) with 49 individuals and *Metaphorura affinis* (Börner, 1902) with 52 individuals. From the family Isotomidae, 40 individuals of *Folsomia sexoculata* (Tullberg, 1871) were recorded, while from the family Hypogastruridae, 47 individuals of *Hypogastrura tullbergi* (Bourlet, 1839) were identified.

CITRUS LIMON (L.) OSBECK GENOTIPLARIDA FOTOSINTETIK PIGMENTLAR MIQDORINING QIYOSIY TAHLILI

To'lqinova Xadicha Shuxrat qizi
Azimov Abdulaxat Abdujabbarovich
O'zbekiston Respublikasi Fanlar akademiyasi Genetika va o'simliklar eksperimental biologiyasi instituti 111208, Toshkent viloyati, Qibray tumani, Yuqori-Yuz ko'chasi, 266-uy.
xadichatolqinova@gmail.com

Annotatsiya. *Ushbu maqolada Citrus limon (L.) Osbeck genotiplarida fotosintetik pigmentlar miqdorini aniqlash va ularning fiziologik holatini baholash natijalari keltirilgan. Tadqiqot obyekti sifatida Meyer, Toshkent F1, Tosh DAU, F2 Yubileniy, Meduza, Turon va Yangi Toshkent genotiplari tanlab olindi. O'simlik barglaridan pigmentlarni ajratib olishda Lichtenthaler metodi, xlorofill A, xlorofill B va karotinoidlar miqdorini hisoblashda esa spektrofotometrik tenglamalardan foydalanildi. Olingan natijalar limon genotiplari orasida fotosintetik pigmentlar miqdori bo'yicha sezilarli farqlar mavjudligini ko'rsatdi. Turon genotipi xlorofill A va umumiy xlorofill miqdorining yuqoriligi bilan ajralib, kuchli fotosintetik faollikka ega istiqbolli shakl sifatida baholandi. Meyer genotipida karotinoidlar miqdorining yuqori bo'lishi uning fotoprotektiv va antioksidant himoya salohiyati kuchliroq bo'lishi mumkinligini ko'rsatadi. Toshkent F1 genotipi xlorofill B miqdorining yuqoriligi bilan alohida e'tiborga loyiq bo'lib, uning yorug'likni yig'uvchi pigment tizimi yaxshi rivojlangan bo'lishi ehtimolini bildiradi. Tosh DAU va Meduza genotiplarida esa pigmentlar miqdori nisbatan past bo'lib, bu ularning fotosintetik apparati sustroq rivojlangan bo'lishi mumkinligini anglatadi. Umuman olganda, fotosintetik pigmentlar miqdorini aniqlash limon genotiplarining fiziologik faolligi, moslashuvchanligi va stress omillariga chidamlilik salohiyatini dastlabki baholashda muhim mezon bo'lib xizmat qiladi.*

Kalit so'zlar: *Citrus limon L., limon genotiplari, xlorofill A, xlorofill B, karotinoidlar, fotosintez, pigmentlar, stressga chidamlilik.*

COMPARATIVE ANALYSIS OF PHOTOSYNTHETIC PIGMENT CONTENT IN GENOTYPES OF CITRUS LIMON (L.) OSBECK

Abstract. *This article presents the results of determining the content of photosynthetic pigments and assessing their physiological state in genotypes of Citrus limon (L.) Osbeck. The Meyer, Toshkent F1, Tosh DAU, F2 Yubileniy, Meduza, Turon, and Yangi Toshkent genotypes were selected as the research objects. Lichtenthaler's method was used to extract pigments from the plant leaves, and spectrophotometric equations were used to calculate the amounts of chlorophyll A, chlorophyll B, and carotenoids. The obtained results showed significant differences in the amount of photosynthetic pigments among the lemon genotypes. The Turon genotype, distinguished by its high chlorophyll A and total chlorophyll content, was evaluated as a promising form with strong photosynthetic activity. The high carotenoid content in the Meyer genotype suggests a stronger photoprotective and antioxidant defense potential. The Toshkent F1 genotype is particularly noteworthy for its high chlorophyll B content, suggesting a well-developed light-harvesting pigment system. In the Tosh DAU and Meduza genotypes, however, pigment levels are relatively low, which suggests that their photosynthetic apparatus may be less developed. Overall, determining the amount of photosynthetic pigments serves as an important criterion for the preliminary assessment of the physiological activity, adaptability, and stress tolerance potential of lemon genotypes.*

Keywords*: Citrus limon L., lemon genotypes, chlorophyll A, chlorophyll B, carotenoids, photosynthesis, pigments, stress tolerance.*

СРАВНИТЕЛЬНЫЙ АНАЛИЗ СОДЕРЖАНИЯ ФОТОСИНТЕТИЧЕСКИХ ПИГМЕНТОВ В ГЕНОТИПАХ CITRUS LIMON (L.) OSBECK

Аннотация. *В данной статье представлены результаты определения содержания фотосинтетических пигментов и оценки их физиологического состояния у генотипов Citrus limon (L.) Osbeck. В качестве объектов исследования были выбраны генотипы «Мейер», «Тошкент F1», «Тош DAU», «Юбилей F2», «Медуза», «Турон» и «Янги-Тошкент». Для*

извлечения пигментов из листьев растений использовался метод Лихтенталера, а для расчета содержания хлорофилла a, хлорофилла b и каротиноидов — спектрофотометрические уравнения. Полученные результаты показали значительные различия в количестве фотосинтетических пигментов среди генотипов лимона. Генотип «Турон», отличающийся высоким содержанием хлорофилла A и общего хлорофилла, был оценен как перспективный сорт с высокой фотосинтетической активностью. Высокое содержание каротиноидов в генотипе «Мейер» свидетельствует о более сильном фотозащитном и антиоксидантном потенциале. Генотип «Тошкент F1» особенно примечателен высоким содержанием хлорофилла B, что позволяет предположить, что его система светособирающих пигментов, вероятно, хорошо развита. Однако в генотипах «Тош ДАУ» и «Медуза» уровни пигментов относительно низкие, что позволяет предположить, что их фотосинтетический аппарат, возможно, менее развит. В целом определение содержания фотосинтетических пигментов служит важным критерием для предварительной оценки физиологической активности, адаптивности и потенциала стрессоустойчивости генотипов лимона.

Ключевые слова: *Citrus limon L., генотипы лимона, хлорофилл A, хлорофилл B, каротиноиды, фотосинтез, пигменты, стрессоустойчивость.*

Kirish.

Sitrus ekinlar Rutaceae oilasiga kiruvchi Aurantioideae (noranja) kenja turiga mansub o‘simliklardir. Sitrus avlodining tabiiy areali janubi-sharqiy Osiyoning juda keng tropik va subtropik hududlarini qamrab oladi. Sitrus o‘simliklarning kelib chiqishi murakkab hisoblanadi. Qadimiy sitrus turlari spontan duragaylanish yo‘li bilan kelib chiqqan bo‘lishi mumkin. Sitrus o‘simliklarini ming yillardan buyon etishtirib kelish mobaynida amalga oshgan somatik mutatsiya, tabiiy va sun’iy tanlash ham muhim hisoblanadi.Sitrus ekinlar kelib chiqqan eng asosiy markaz Shimoliy Hindiston va Shimoliy Birmada joylashgan. Aynan shu erda Sitrus avlodiga mansub yovvoyi turlarning eng ko‘p qismi uchraydi: C.macroptera; C.latipes C.aurantifolia, C.medica L.[1].

Global miqyosda sitrus o‘simliklari meva madaniyatining eng yuqori ishlab chiqarish sohalaridan biri bo‘lib, 2016 yilda sitrus mevalar exporti 123 million tonnadan oshdi. Sitrus bozori odatda apelsin, mandarin va limon ishlab chiqarishga bo‘linadi. 2018 yilda dunyodagi eng yirik ishlab chiqaruvchilar Braziliya va Xitoy bo‘lib, mos ravishda 17 va 10 million tonna apelsin export qilgan. Ispaniya dunyoning eng yaxshi ishlab chiqaruvchilari qatoriga kiradi (FAOSTAT, 2019 yil oktabr) va 2018 yilda 4 million tonna apelsin ishlab chiqarilgan. Ispaniya, Xitoydan (19 million tonna) keyin ikkinchi o‘rinda turadi va o‘z mahsulotlarining 50% dan ko‘prog‘ini eksport qilish bo‘yicha dunyodagi yetakchi eksportchi hisoblanadi [2].

Sitrus iqtisodiy jihatdan muhim meva ekinidir, chunki u meva sifatida ham, sharbat sifatida ham keng qo‘llaniladi [3]. Bu ko‘p yillik o‘simlik bo‘lib, asosan Xitoy, Braziliya, Hindiston, AQSh, Meksika, Ispaniya va Italiyada etishtiriladi [4].

Iqlim o‘zgarishi tufayli biz hozirgi kunda global isish natijasida yuzaga keladigan sovuq va issiqlik to‘lqinlari kabi yangi abiotik stress muammolariga duch kelishga majburmiz. Sovuq va past harorat tufayli yo‘qotishlar bizni bunday stressga javobning fiziologik, gormonal va molekulyar mexanizmlarini, ayniqsa, ma’lum ob-havo sharoitlariga yaxshi moslashgan sitrus mevalari kabi tropik va subtropik ekinlarda yo‘qotishlarga duch kelishga majbur qiladi. Sovuq stressga bo‘lgan javoblarning ko‘pchiligi sitruslarda ham saqlanib qoldi [7].

Iqlim o‘zgarishi ob-havoning o‘zgarishini keltirib chiqarmoqda, bu esa kuchli qurg‘oqchilik, sovuq to‘lqinlar va ortiqcha yog‘ingarchilik tufayli botqoqlanishga olib keladi. Shuning uchun abiotik stresslarga nisbatan chidamli yangi ekinlarni olish uchun yangi takomillashtirish dasturlarining ahamiyati muhim. Abiotik stressga qarshi o‘simliklarni yetishtirish dasturlari juda murakkab, chunki ular ko‘plab mexanizmlarni o‘z ichiga oladi [8]. Sitrus navlari qurg‘oqchilik stressidan kuchli ta’sirlanadi, chunki qurg‘oqchilik stressiga duch kelgandan so‘ng sitrus hosildorligi, o‘sishi va hosildorligi pasayadi [6]. Shu bilan birga, bir nechta qurg‘oqchilikka chidamli navlar, shuningdek, bu stressga qarshi tura oladigan, kindik apelsin va trifoliate apelsin haqida Bhusual va boshqalar ma’lumotlar bergan[5].

Sitrus urug‘i sovuq stressga sezgir bo‘lgan bir qator tropik va subtropik turlarni o‘z ichiga oladi, bu esa sitrusning global tarqalishini ma’um kengliklarda cheklaydi va katta iqtisodiy yo‘qotishlarga olib keladi [8]. Sitrus dunyodagi eng iqtisodiy ahamiyatga ega mevali daraxt ekinlaridan biri. Muayyan chegaralardan tashqari, noqulay ob-havo sharoiti natijasida daraxt ekinlarining yo‘qolishi yoki meva sifatining yomonlashishi shunchalik muhimki, har qanday sitrus mevasini ishlab chiqarish imkonsiz yoki foydasiz bo‘lishi mumkin. Muzlash harorati sitrus yetishtirish uchun eng cheklovchi omillardan biridir. 0ºC dan past haroratlar hujayralararo muz kristallarining shakllanishiga olib keladi, bu esa suvsizlanishga olib keladi va daraxtlarga zarar etkazadi. Yosh sitrus novdalarini o‘ldiradigan chegara harorati -12ºC, lekin sitrus turlarining sovuqqa chidamliligi sezilarli darajada farq qilishi hammaga ma’lum [8].

Fotosintez o‘simliklardagi eng haroratga sezgir fiziologik jarayonlardan biri sifatida tanilgan. Shuning uchun fotosintezning harorat reaksiyasi va uning aklimatizatsiyasi ostida bo‘lgan fiziologik jarayonlarni tushunish qishloq

xo‘jaligi va atrof-muhit uchun muhimdir. Ko‘pgina o‘simliklar fotosintez xususiyatlarini haroratga qarab o‘sish ehtiyojlariga moslashtira oladi [9].

Fototizim II (PSII) tilakoid membranalarda shikastlanishi mumkin bo‘lgan eng sezgir komponentdir. Abiotik stressning asosiy natijasi PSIIni fotoinhibisyonga moyil qilishdir [10]. Aslida, 0 ° C dan yuqori haroratga duchor bo‘lgan sitrus barglari hech qanday o‘zgarish kuzatilmaydi. Biroq, ularning fototizimlari xlorofil floresans texnikasi (CFI) bilan o‘rganilganda, fototizim II ning shikastlanishi aniqlanadi

Material va metodlar

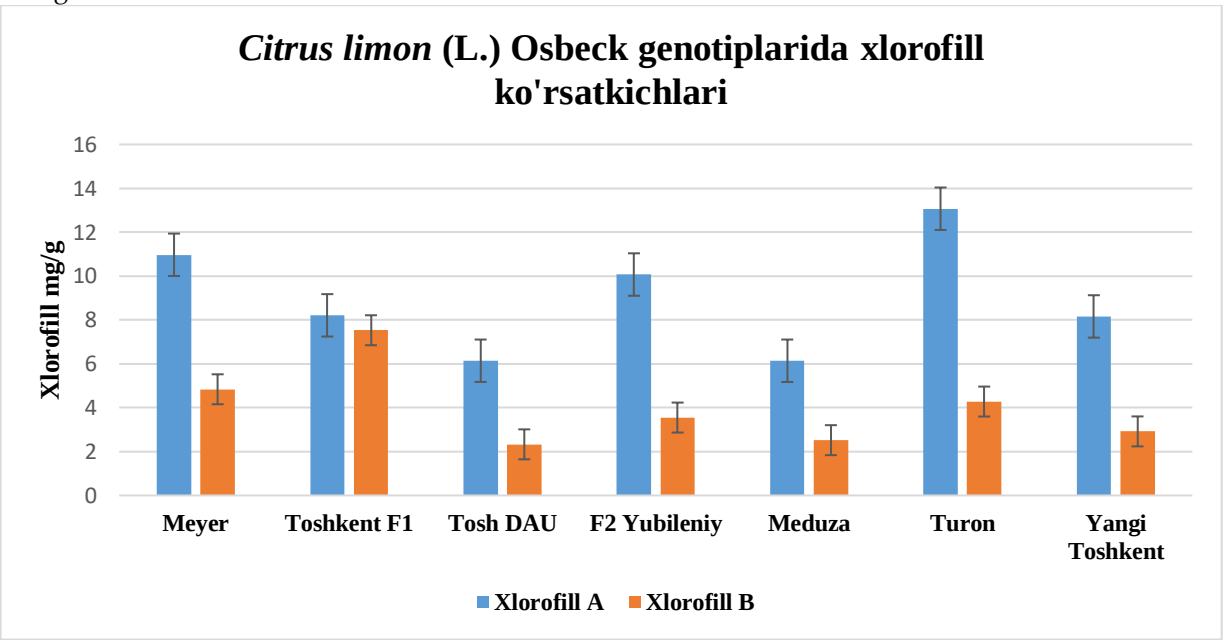
Tadqiqot obyekti sifatida Citrus limon (L.) Osbeck genotiplaridan Meyer, Toshkent F1, Tosh DAU, F2 Yubileniy, Meduza, Turon va Yangi Toshkent navlari olindi.

Pigmentlarni o‘simlik bargidan ajratib olish uchun Lichtenthaler (1987/1988) metodidan foydalanildi [11].

Pigmentlar miqdori Sumanta et al. (2014) tomonidan keltirilgan spektrofotometrik tenglamalar asosida hisoblandi [12].

Natijalar.

1-diagramma



Jadval natijalari limon genotiplari orasida fotosintetik pigmentlar miqdori bo‘yicha aniq farqlar mavjudligini ko‘rsatadi. Xlorofill A, xlorofill B va karotinoidlar miqdorining genotiplar kesimida turlicha bo‘lishi ularning fotosintetik apparati rivojlanish darajasi, yorug‘lik energiyasidan foydalanish samaradorligi hamda stress omillariga moslashuv salohiyati bir xil emasligini bildiradi. Fotosintetik pigmentlar o‘simliklarning fiziologik holatini baholashda muhim ko‘rsatkichlardan biri hisoblanadi, chunki ular barglarda kechadigan fotosintez jarayonining intensivligi, assimilatsion faollik va tashqi muhit omillariga javob reaksiyalari bilan bevosita bog‘liq.

Tahlil qilingan genotiplar orasida Turon genotipi xlorofill A hamda umumiy xlorofill miqdori bo‘yicha eng yuqori natijani namoyon etdi. Xlorofill A fotosintez jarayonida asosiy pigmentlardan biri bo‘lib, yorug‘lik energiyasini qabul qilish va uni fotosintetik reaksiya markazlariga uzatishda muhim rol o‘ynaydi. Shu sababli Turon genotipida xlorofill A miqdorining yuqori bo‘lishi uning fotosintetik faolligi nisbatan kuchli ekanligini ko‘rsatadi. Bundan tashqari, ushbu genotipda xlorofill A/B nisbatining yuqori bo‘lishi fotosintetik reaksiya markazlari faoliyatining yaxshi shakllanganligi va barg to‘qimalarida yorug‘lik energiyasidan samarali foydalanish imkoniyati yuqoriligidan dalolat berishi mumkin. Bu holat Turon genotipini fiziologik jihatdan faol va istiqbolli genotiplardan biri sifatida baholash imkonini beradi.

Meyer genotipi esa karotinoidlar miqdori bo‘yicha eng yuqori ko‘rsatkichga ega bo‘ldi. Karotinoidlar o‘simliklarda nafaqat yordamchi fotosintetik pigment sifatida, balki muhim himoya komponenti sifatida ham xizmat qiladi. Ular ortiqcha yorug‘lik energiyasini neytrallash, erkin radikallar hosil bo‘lishini kamaytirish va oksidlanish stressining salbiy ta’sirini yumshatishda ishtirok etadi. Shu nuqtayi nazardan, Meyer genotipida karotinoidlar miqdorining yuqori bo‘lishi uning noqulay muhit omillariga, ayniqsa sovuq stressi, kuchli yorug‘lik va oksidlovchi jarayonlarga nisbatan himoya mexanizmlari yaxshi rivojlangan bo‘lishi mumkinligini ko‘rsatadi. Bu genotipning stress sharoitida nisbatan barqaror fiziologik holatni saqlab qolish salohiyati yuqori bo‘lishi ehtimoldan xoli emas.

Toshkent F1 genotipi xlorofill B miqdori bo‘yicha boshqa genotiplardan ustunligi bilan ajralib turadi. Xlorofill B yordamchi pigment bo‘lib, yorug‘likni yutish spektrini kengaytiradi va yig‘ilgan energiyani xlorofill A ga uzatadi. Ushbu genotipda xlorofill B miqdorining yuqori bo‘lishi yorug‘likni yig‘uvchi antenna komplekslari yaxshi rivojlanganligini

ko‘rsatishi mumkin. Bu xususiyat ayniqsa yorug‘lik sharoiti o‘zgaruvchan bo‘lgan muhitda yoki nisbatan past yoritilish sharoitida moslashuvchanlik belgisi sifatida qaraladi. Biroq Toshkent F1 genotipida xlorofill A/B nisbatining past bo‘lishi xlorofill B ulushi nisbatan yuqori ekanligini bildiradi. Bu holat bir tomondan yorug‘likni tutish imkoniyatining kengayganligini ko‘rsatsa, boshqa tomondan fotosintetik reaksiya markazlari va antenna pigmentlari o‘rtasidagi nisbat o‘ziga xos ekanligini anglatadi. Shuning uchun ushbu genotipning fotosintetik samaradorligini aniq baholash uchun qo‘shimcha fiziologik ko‘rsatkichlar, jumladan xlorofill floresensiyasi, fotosintez intensivligi, gaz almashinuvi va stress sharoitidagi pigmentlar dinamikasini o‘rganish maqsadga muvofiq bo‘ladi.

Tosh DAU va Meduza genotiplari esa xlorofill A, umumiy xlorofill miqdori hamda karotinoidlar bo‘yicha nisbatan past ko‘rsatkichlarga ega bo‘ldi. Bu natija ushbu genotiplarda fotosintetik apparatning rivojlanish darajasi boshqa genotiplarga nisbatan sustroq bo‘lishi mumkinligini ko‘rsatadi. Xlorofill miqdorining pastligi barglarning yorug‘lik energiyasini qabul qilish va undan foydalanish imkoniyatini cheklashi mumkin. Karotinoidlar miqdorining nisbatan kam bo‘lishi esa ularning fotoprotektiv va antioksidant himoya salohiyati pastroq bo‘lishi ehtimolini bildiradi. Shu sababli Tosh DAU va Meduza genotiplari noqulay ekologik omillar, xususan sovuq, kuchli yorug‘lik yoki oksidlanish stressi ta’sirida nisbatan sezuvchanroq bo‘lishi mumkin.

Umuman olganda, jadval ma’lumotlari asosida Turon genotipi yuqori fotosintetik faollikka ega bo‘lgan genotip sifatida, Meyer genotipi esa kuchli fotoprotektiv va antioksidant himoya salohiyatiga ega shakl sifatida ajralib turadi. Toshkent F1 genotipi xlorofill B miqdorining yuqoriligi bilan alohida e’tiborga loyiq bo‘lib, uning yorug‘likni yig‘uvchi pigment tizimi yaxshi rivojlangan bo‘lishi mumkin. Tosh DAU va Meduza genotiplari esa pigmentlar miqdorining pastligi sababli fotosintetik faolligi nisbatan cheklangan va stress omillariga sezuvchanroq genotiplar sifatida baholanishi mumkin. Shu bois, limon genotiplarini fiziologik jihatdan baholashda pigmentlar miqdorini aniqlash ularning mahsuldorlik, moslashuvchanlik va stressga chidamlilik salohiyatini dastlabki baholash uchun muhim mezon bo‘lib xizmat qiladi.

Xulosa.

Ushbu jadval natijalariga asoslanib, limon genotiplari orasida Turon va Meyer genotiplari eng istiqbolli shakllar sifatida alohida ajralib turadi. Ularning fotosintetik pigmentlar bo‘yicha yuqori ko‘rsatkichlarga ega bo‘lishi ushbu genotiplarning fiziologik jihatdan faol, moslashuvchan va seleksiya ishlari uchun qimmatli boshlang‘ich material bo‘lishi mumkinligini ko‘rsatadi. Turon genotipi, avvalo, xlorofill A va umumiy xlorofill miqdorining yuqoriligi bilan ajralib turadi. Bu holat uning fotosintetik apparati yaxshi rivojlanganligini, barglarida yorug‘lik energiyasini qabul qilish va undan organik moddalar sintezi uchun foydalanish imkoniyati yuqori ekanligini ko‘rsatadi. Xlorofill A fotosintez jarayonining asosiy pigmenti hisoblanganligi sababli, uning yuqori miqdori Turon genotipida fotosintetik faollik kuchli kechishi mumkinligidan dalolat beradi. Shu bois ushbu genotip yuqori assimilatsion salohiyatga ega bo‘lgan istiqbolli shakl sifatida baholanishi mumkin. Meyer genotipi esa karotinoidlar miqdorining yuqoriligi bilan boshqa genotiplardan ustunlik qiladi. Karotinoidlar fotosintez jarayonida yordamchi pigmentlar sifatida ishtirok etish bilan birga, o‘simlik hujayralarini oksidlanish stressidan himoya qilishda ham muhim ahamiyatga ega. Ayniqsa sovuq, kuchli yorug‘lik, qurg‘oqchilik yoki boshqa noqulay ekologik omillar ta’sirida karotinoidlar fotoprotektiv va antioksidant himoya tizimining muhim tarkibiy qismi sifatida namoyon bo‘ladi. Shuning uchun Meyer genotipida karotinoidlar miqdorining yuqori bo‘lishi uning stress omillariga nisbatan chidamlilik salohiyati kuchliroq bo‘lishi mumkinligini ko‘rsatadi. Toshkent F1 genotipi ham alohida e’tiborga loyiq bo‘lib, u xlorofill B miqdorining yuqoriligi bilan ajralib turadi. Xlorofill B yorug‘likni yig‘uvchi antenna komplekslarining muhim pigmenti hisoblanadi va yorug‘lik energiyasini xlorofill A ga uzatishda ishtirok etadi. Ushbu genotipda xlorofill B miqdorining yuqori bo‘lishi uning yorug‘likni qabul qilish spektri kengroq ekanligini va o‘zgaruvchan yorug‘lik sharoitlariga ma’lum darajada moslashgan bo‘lishi mumkinligini bildiradi. Shu sababli Toshkent F1 genotipi fotosintetik pigmentlar tizimining o‘ziga xosligi bilan ilmiy qiziqish uyg‘otadi. Aksincha, Tosh DAU va Meduza genotiplari xlorofill A, umumiy xlorofill hamda karotinoidlar miqdori bo‘yicha nisbatan past natija ko‘rsatgan. Bu esa ularning fotosintetik apparati boshqa genotiplarga nisbatan sustroq rivojlangan bo‘lishi mumkinligini anglatadi. Pigmentlar miqdorining pastligi o‘simlikning yorug‘lik energiyasidan foydalanish samaradorligi, fotosintetik faolligi va stress omillariga qarshi himoya imkoniyatlari cheklangan bo‘lishi ehtimolini ko‘rsatadi. Umuman olganda, jadval ma’lumotlari shuni ko‘rsatadiki, Turon genotipi yuqori fotosintetik faolligi bilan, Meyer genotipi esa karotinoidlarning kuchli to‘planishi va ehtimoliy stressga chidamlilik salohiyati bilan istiqbolli hisoblanadi. Toshkent F1 genotipi xlorofill B miqdorining yuqoriligi sababli alohida o‘rganishga loyiq bo‘lsa, Tosh DAU va Meduza genotiplari pigmentlar miqdori bo‘yicha nisbatan past ko‘rsatkichlarga ega bo‘lgan shakllar sifatida baholanadi.

TO‘QIMACHILIK MATERIALLARIGA TABIIY ANTIBAKTERIAL MODDALAR BILAN ISHLOV BERISH JARAYONIDA UNING KOLORISTIK KO‘RSATKICHLARINI O‘ZGARISHI

Nabiyeva Iroda Abdusamatovna
Toshkent to‘qimachilik va yengil sanoat institute, texnika fanlari doktori, professor,
A’zamjonova Saodat Shavkat qizi
Toshkent to‘qimachilik va yengil sanoat instituti, tayanch doktorant,

Annotatsiya. *Mazkur maqolada paxta tolali matoga tabiiy antibakterial moddalar bilan ishlov berish jarayonida uning koloristik ko‘rsatkichlarini o‘zgarishi tahlil qilingan. Tadqiqotda an’anaviy kimyoviy apretlarni atrof-muhitga salbiy ta’sirini kamaytirish maqsadida, ularga alternativ ekologik toza tabiiy antibakterial moddalar – Crocus sativus va Juniperus spp. kabi mahalliy o‘simliklardan ajratib olingan rang beruvchi ekstraktlar qo‘llanilgan. Shuningdek, tabiiy antibakterial moddalarning tolaga mustahkam birikishini ta’minlash uchun polivalent metall tuz – CuSO4 mordant sifatida ishlatilgan. Namunalarning antibakterial xususiyatini oshirish maqsadida Zingiber (Zanjabil) bilan ishlov berilgan.*

Kalit so‘zlar: *tabiiy antibakterial moddalar, polivalent metall tuzlar, CIELAB rang modeli, rang intensivlik, kolorimetrik tahlil, o‘simlik ekstrakti, rang koordinatasi.*

ИЗМЕНЕНИЕ КОЛОРИСТИЧЕСКИХ ПОКАЗАТЕЛЕЙ ТЕКСТИЛЬНЫХ МАТЕРИАЛОВ В ПРОЦЕССЕ ОБРАБОТКИ НАТУРАЛЬНЫМИ АНТИБАКТЕРИАЛЬНЫМИ ВЕЩЕСТВАМИ

Аннотация. *В данной статье проанализированы изменения колористических показателей хлопчатобумажной ткани в процессе обработки натуральными антибактериальными веществами. В исследовании с целью снижения негативного воздействия традиционных химических аппретов на окружающую среду в качестве альтернативы использованы экологически чистые натуральные антибактериальные вещества — красящие экстракты, полученные из местных растений, таких как Crocus sativus и Juniperus spp. Также для обеспечения прочного закрепления натуральных антибактериальных веществ на волокне в качестве протравы использовалась поливалентная соль металла – $CuSO_4$. С целью повышения антибактериальных свойств образцы дополнительно обработаны Zingiber (имбирём).*

Ключевые слова: *натуральные антибактериальные вещества, поливалентные соли металлов, цветовая модель CIELAB, интенсивность окраски, колориметрический анализ, растительный экстракт, цветовые координаты.*

CHANGES IN THE COLORISTIC PROPERTIES OF TEXTILE MATERIALS DURING TREATMENT WITH NATURAL ANTIBACTERIAL SUBSTANCES

Abstract. *This article analyzes the changes in the coloristic properties of cotton fabric during treatment with natural antibacterial substances. In order to reduce the negative environmental impact of traditional chemical finishing agents, environmentally friendly natural antibacterial substances were used as an alternative—namely, dye extracts obtained from local plants such as Crocus sativus and Juniperus spp. In addition, a polyvalent metal salt $CuSO_4$ was used as a mordant to ensure strong fixation of natural antibacterial substances to the fiber. To enhance the antibacterial properties of the samples, treatment with Zingiber (ginger) was also applied.*

Keywords: *natural antibacterial substances, polyvalent metal salts, CIELAB color model, color intensity, colorimetric analysis, plant extract, color coordinates.*

Kirish. Jahon miqyosida to‘qimachilik sanoati jadal rivojlanayotgan tarmoq sifatida muhim o‘rin egallaydi. Tarmoqning o‘sishi aholi sonining ortishi va shaharlashuv jarayoni bilan bevosita bog‘liq jarayon bo‘lib, dunyo bo‘ylab to‘qimachilik mahsulotlariga bo‘lgan talabning oshishiga olib kelmoqda. Biroq, bu o‘sish suvga bo‘lgan talabning ko‘payishi va oqova suv chiqindalarining oshishi bilan parallel ravishda o‘smoqda. Chunki, to‘qimachilik sanoati xom suvning eng yirik iste’molchisi hisoblanadi.

To‘qimachilik sanoatidagi asosiy jarayonlar ip ishlab chiqarish (tolalarni burash orqali ip hosil qilish), to‘qish (mato hosil qilish uchun ikki xil yo‘nalishdagi iplarni perpendikulyar holda joylashtirish), pardozlashga tayyorlash, bo‘yash va gul bosish bosqichlaridan iborat [1]. Ushbu jarayonlardan bo‘yash jarayoni eng ko‘p suv sarflaydigan qismi hisoblanadi.

To‘qimachilik korxonalarining katta qismi o‘z oqova suvlarini qisman yoki umuman tozalamasdan atrof-muhitga chiqarib tashlaydi [2]. Oqova suvda bo‘yovchi moddalarning mavjudligi suvning estetik qiymatini pasaytiradi va jiddiy ekologik hamda sog‘liq uchun xavf tug‘diradi. Bo‘yovchi moddalar suv muhitidagi tirik organizmlarga salbiy ta'sir etadi va insonlar uchun kanserogen hisoblanadi[3]. Ayrim bo‘yovchi moddalar ichak muhitida aminlarga aylanib parchalanishi mumkin, bu aminlar esa kanserogen ekani isbotlangan [4]. Masalan, antraxinon bo‘yoqlar kuchli zaharli ta’sirga ega ekani aniqlangan [5].

So‘nggi yillarda olimlar atrof-muxit va oqava suvning ifloslanishini oldini olish maqsadida kimyoviy bo‘yovchi moddalar va apretlarni tabiiy ekstraktlar, fitokomponentlar va biorang beruvchi moddalar bilan almashtirish bo‘yicha keng ko‘lamli tadqiqotlar olib bormoqda. Bunday rang beruvchi ekstraktlar zaharsiz, kanserogen bo‘lmagan va biologik parchalanuvchi hisoblanadi. Asosan o‘simliklardan olinadigan tabiiy rang beruvchi moddalarga qishloq, o‘rmon xo‘jaligi va oziq-ovqat sanoatidagi urug‘lar, barglar, ildizlar, po‘stloqlar, shoxlar, mevalar va gullar manba bo‘lib xizmat qiladi [6, 7]. Tabiiy rang beruvchilar bo‘yash jarayonida mato bilan mustahkam bog‘ hosil qilish uchun alyuminiy (alum) va temir sulfat va boshqa metall birikmalardan foydalanish ommalashgan [8, 9, 10, 11, 12].

Mazkur ilmiy tadqiqot ishi doirasida ham paxta tolali trikotaj matosiga tabiiy antibakterial moddalar bilan ishlov berish jarayonida uning koloristik ko‘rsatkichlarida yuz bergan o‘zgarishlarni inobatga olgan holda namunalarda tabiiy antibakterial tarkib bilan rang hosil qilish imkoniyati o‘rganilgan. Tabiiy antibakterial moddalar sifatida *Crocus sativus* va *Juniperus spp.*kabi o‘simliklarning ekstraklari tanlangan:

Uslubiy qism

Ushbu tatqiqot uchun tajriba ob’ekti sifatida Toshkent shahrida joylashgan “TURON TEX” ma’suliyati cheklangan jamiyat korxonasidan oqartirilgan trikotaj paxta matosi (SUPREM cd 30/1 32/28 dyum) olindi.

Tabiiy antibakterial moddalar sifatida *Crocus sativus* va *Juniperus spp.* kabi o‘simliklarning ekstraktlari tanlangan, rang mustahkamligini oshirishda mis sulfat hamda qo‘shimcha antibakterial xossa berish uchun *Zingiberdan* foydalanilgan.

Tajriba usullari

Paxta tolali materiallarni ishlov berishga tayyorlash

Tadqiqot uchun olingan oqartirilgan trikotaj paxta matosi (Suprem) ning gidrofilligini oshirish maqsadida laboratoriya sharoitida M=20 modul 1 % li SFM da 30 daqiqa 90-95^{0}C haroratda iSMART-1K bo‘yash qozonida qaynatiladi, MST-55 modeldagi quritish shkafida 70^{0}C da quritilib, dazmollanadi.

Crocus sativus va *Juniperus spp.* kabi o‘simliklardan ekstraksiya olish. Quritilgan 1 g *Crocus sativus* va 5 g *Juniperus spp.* alohida kolbalarda BE-4 bidistillyatordan olingan 200 ml distillangan suvda mos ravishda 80, 120 daqiqa davomida 80-90^{0}C haroratda qaynatiladi va suzib olinadi.

Namunaga xurushlovchi bilan ishlov berish

Pardozlashga tayyorlangan oqartirilgan trikotaj paxta matosi (Suprem) 5:5 sm o‘lchamda kesilib, ZES 21 modeldagi analitik tarozida og‘irligi 0,0001 g aniqlikda o‘lchanadi. Tabiiy antibakterial modda bilan tolani mustahkam bog‘lash uchun metall mordant, ya’ni $CuSO_4$ bilan mato massasiga nisbatan 5%-li eritmada 50 modulda 60 daqiqa davomida Starlet-3 DL-6000 PLUS modeldagi IR bo‘yash mashinasida ishlov beriladi va quritiladi.

Zingiber bilan ishlov berish

Namunalarga *Zingiber* ning moduli M=30 bo‘lgan eritmasi bilan 40-50^{0}C haroratda, 30 daqiqa davomida ishlov beriladi. Jarayon tugagach yuvildi va xona haroratida quritildi.

Tabiiy antibakterial modda eritmasida namunaga ishlov berish

Xurushlangan va xurushlanmagan namunalarga o‘simliklardan olingan ekstraktlarda 1:1 nisbatda distillangan suv bilan suyultirilib, M=40 da 70-80^{0}C haroratda, 120 daqiqa davomida ishlov beriladi. Elektrolit sifatida mato massasiga nibatan 10 % NaCl solinadi. Ishlov berilgan matolar xona haroratida quritildi.

Tahlil uslublari

Namunalarning rang intensivligi “Kor-Uz -Textile Technopark” ilmiy laboratoriyasidagi X-Rite Ci7800 qurilmasida [13] aniqlandi va natijalari xalqaro komissiya tomonidan taklif etilgan CIELAB formulasiga ko‘ra hisoblandi [14].

Tajriba natijalari va ularning muhokamasi

Crocus sativus va *Juniperus spp.* o‘simlik ekstraktlari bilan paxta tolali trikotaj matosiga ishlov berishdan asosiy maqsad antibakterial mato olish hisoblanib, ushbu tadqiqot ishida uning koloristik ko‘rsatkichlarida yuz bergan o‘zgarishlarni inobatga olgan holda matoda rang hosil qilish imkoniyati o‘rganildi. Namunalarning antibakterial xossasini oshirish maqsadida ishlov berish eritmasiga qo‘shimcha ravishda tabiiy antibiotik - *Zingiber*, rang mustahkamliklarini

oshirish maqsadida ekstrakt eritmasiga qo‘shimcha ravishda $CuSO_4$ kiritildi. Ularning rang intensivligi, hamda antibakterial xossalari tahlil qilindi, olingan natijalar quyidagi 1-jadvallarda keltirilgan.

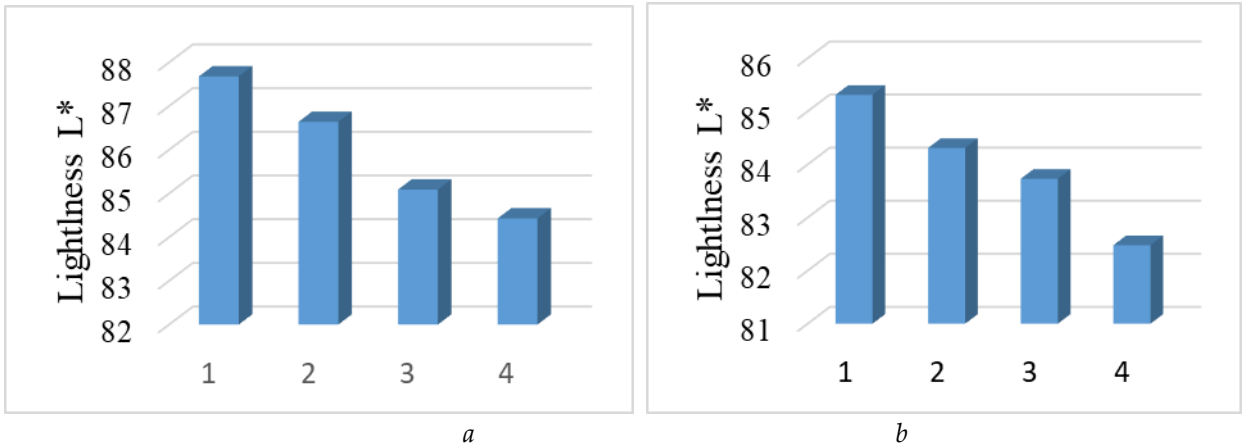
1-jadval. O‘simliklaridan ajratib olingan rang beruvchi ekstrakt, *Zingiber* va $CuSO_4$ ishtirokida bo‘yalgan namunalarning rang intensivligi ko‘rsatkichi.

Eritma tarkibi	*Crocus sativus*	*Crocus sativus* +*Zingiber*	*Crocus sativus* +$CuSO_4$	*Crocus sativus* +$CuSO_4$+*Zingiber*
Namunalar				
Rang intensivligi, K/S	0,8	0,98	1,12	1,3
Eritma tarkibi	*Juniperus spp*	*Juniperus spp* +*Zingiber*	*Juniperus spp* +$CuSO_4$	*Juniperus spp* +$CuSO_4$+*Zingiber*
Namunalar				
Rang intensivligi, K/S	0,9	0,98	1,2	1,4

Jadvalda keltirilgan natijalarga ko‘ra *Crocus sativus* va *Juniperus spp.* ekstraktlari bilan namunalarga ishlov berish jarayonini xurushlovchi ($CuSO_4$) ishtirokida olib borishda tola makromolekulasi va o‘simlik ekstrakti tarkibidagi tabiiy bo‘yovchi modda molekulalari orasida vujudga keladigan molekulalararo bog‘lanishlar bilan bir qatorda koordinasion bog‘lanishlarni vujudga kelishi hisobiga rang intensivligi ortganligiga erishilgan[15].

Crocus sativus va *Juniperus spp* bilan ishlov berilgan namunalarga *Zingiber* qo‘shilganda rang intensivligi mos ravishda 22,5 % va 8,89 %-ga, $CuSO_4$ qo‘shilganda 40 % va 33,3 %-ga, hamda $CuSO_4$ va *Zingiber* birgalikda qo‘shilganda 62,5 % va 55,6 %-ga ortganligi aniqlangan.

1-jadvalda keltirilgan namunalarning rang yorqinligi va rang tusida o‘zgarishlar vizual kuzatilmoqda. Ularning sonli qiymatlari CIE L*a*b* sistemasida o‘rganildi va olingan natijalar quyida keltirildi:



a *b*

1-rasm. Antibakterial xossa berilgan namunalarning rang sifat ko‘rsatkichlarini eritma tarkibiga bog‘liqligi. a- *Crocus sativus* bilan ishlov berilgan; b- *Juniperus spp.* bilan ishlov berilgan. 1-faqat o‘simlik ekstrakti ertmasi; 2-o‘simlik ekstrakti + *Zingiber*; 3- o‘simlik ekstrakti + $CuSO_4$; 4- o‘simlik ekstrakti + $CuSO_4$+*Zingiber*.

1-rasmda keltirilgan ma’lumotlar mato namunalariga *Crocus sativus* va *Juniperus spp.* bilan ishlov berilgandagiga nisbatan eritma tarkibiga *Zingiber* kiritilganda rang yorqinligi 1,19 va 1,17 % ga, ammo eritmaga mis sulfat qo‘shilganda rang yorqinligi mos ravishda 2,96 va 1,85 % ga kamayganini ko‘rsatmoqda. Albatta, eritma tarkibiga polivalent metall tuz qo‘shilganda rang intensivligi oshadi, rang yorqinligi esa kamayadi. Bunga sabab, metall mordant ionlari rang beruvchi molekulalar (flavonoidlar, antosiyaninlar va boshqalar) bilan bog‘lanib, elektron tuzilishini o‘zgartiradi. Metall ionlari bo‘yoqning π-elektron sistemasi bilan bog‘lanadi. Natijada, yorug‘likni qabul qilish va aks ettirish xususiyati o‘zgaradi,

ya'ni rang to'qroq yoki ochroq ko'rinadi. Ishlov berish eritmasi tabiiy bo'yovchi modda ekstrakti va tuz hamda tabiiy antibiotikdan tashkil etilganda rang yorqinligi *Crocus sativus* da 87,68 dan 84,43 ga, *Juniperus spp.* da esa 85,31 dan 82,48 gagina kamaygan. Demak, o'simlik ekstrakti va *Zingiber* hamda $CuSO_4$ bilan ishlov berish eritmasi tarkibiga mos ravishda namunalar rangining CIE L*a*b* rang maydonida joylashgan o'rni ham o'zgargan (2-jadval).

2-jadval. O'simlik ekstrakti va *Zingiber* hamda $CuSO_4$ bilan ishlov berilgan namunalarning CIE L*a*b* rang maydonida joylashgan o'rnini o'zgarishi:

O'simlik turi	O'simlik ekstrakti eritmasi tarkibi	a^*	b^*	C*	h*
Crocus sativus	-	0,02	13,03	12,03	90,08
Crocus sativus	*Zingiber*	1,19	12,12	9,10	82,51
Crocus sativus	$CuSO_4$	-0,12	9,02	13,12	91,56
Crocus sativus	$CuSO_4$+*Zingiber*	0,86	8,22	11,27	90,84
Juniperus spp.	-	-4,01	9,89	9,35	115,38
Juniperus spp.	*Zingiber*	-4,37	8,45	8,81	113,87
Juniperus spp.	$CuSO_4$	-3,61	7,35	11,18	116,17
Juniperus spp.	$CuSO_4$+*Zingiber*	-3,81	6,89	10,67	114,23

Jadvalda keltirilgan natijalar tahlili bo'yicha eritma takribiga tabiiy antibiotik *(Zingiber)* kiritilganda rang tozaligining ortishiga, ya'ni a^* koordinataning doira chekkasi tomon (*Crocus sativus*da 0,02 dan 1,19 ga, *Juniperus spp.* da esa -4,01 dan -4,37 ga) haraktlanganligi aniqlandi. Eritma *Crocus sativus* va mis sulfatdan tashkil etilganda a^* koordinata qizildan yashil tomonga siljigan, eritma uch komponentli qilib tashkil etilganda dastlabki tayyorlangan *Crocus sativus*li eritmada olingan natijaga nisbatan qizil tomonga siljigan. Xuddi shu kabi natijalar mos ravishda *Juniperus spp.* ekstrakti eritmalarida ham olingan, jumladan, eritma *Juniperus spp.* va mis sulfatdan tashkil etilganda a^* koordinata yashil tomondan qizil tomonga haraktlangan, eritma uch komponentli qilib tashkil etilganda 0,2 ga o'zgargan.

Crocus sativus va *Juniperus spp.* ekstrakt eritmalarida bo'yalgan namunalarda rang b^* koordinatada bir xil – sariqdan ko'kga tomon siljigan. Tabiiy antibiotik ishtirokida ishlov berilgan namunalarning rang tozaligi mos ravishda 6,98 va 14,56 % ga kamaygan bo'lsa, mis sulfat ishtirokidagi tajribalarda bu ko'rsatkich 30,77 va 25,68 % ga kamaygan. O'simlik ekstarakti, tabiiy antibiotik va polivalent tuz kompozisiyasi bilan ishlov berilgan namunalarda *Crocus sativus* da b^* koordinatada sariqdan ko'kga tomon 4,81 masofaga, *Juniperus spp.* da esa 3 masofaga harakatlanib, rangning tozaligini kamayishiga sabab bo'lgan. Chunki asosiy rang beruvchiga boshqa rangli moddalar aralashsa rang xiralashadi.

Crocus sativus va *Juniperus spp.* ekstrakt eritmalarida bo'yalgan namunalarda rang to'yinganligi va rang tusi ham o'zgargan bo'lib, eritma tarkibiga tabiiy antibiotik kiritilganda C*-rang to'yinganligi mos ravishda 24,35 % va 5,77 % ga, h*-rang tusi 8,04 % va 1,03 % kamaygan. Demak, eritma tarkibiga *Zingiber* kiritilganda rang hiralashishi sodir bo'lganini ko'rishimiz mumkin. Aksincha, eritma tarkibiga metall mordant – mis sulfat kiritilganda *Crocus sativus* va *Juniperus spp.* ekstrakt eritmalarida bo'yalgan namunalarda rang to'yinganligi mos ravishda 1,09 va 1,83 ga, rang tusi 1,48 va 0,79 ga oshgan. Bu esa, talab etilgan tusga ega bo'lgan ranglarni hosil qilish uchun eritmada polivalent tuzlarini qo'llash orqali asosiy rang beruvchi o'smlik ekstrakti miqdorini kamaytirishga erishish mumkinligiga dalolat beradi.

Xulosa. O'tkazilgan tadqiqotlar natijasida paxta tolali trikotaj materiallariga *Crocus sativus* va *Juniperus spp.* kabi o'simliklardan ajratib olingan tabiiy antibakterial moddalar bilan ishlov berildi. Rang intensivligi va rang xususiyatlari o'rganildi.

Crocus sativus va *Juniperus spp.* ekstraktlari bilan namunalarga ishlov berish jarayonida *Zingiber* qo'shilganda rang intensivligi mos ravishda 22,5 % va 8,89 %-ga, $CuSO_4$ qo'shilganda 40 % va 33,3 %-ga, hamda $CuSO_4$ va *Zingiber* birgalikda qo'shilganda 62,5 % va 55,6 %-ga ortganligi aniqlangan.

Ishlov berish eritmasi tabiiy bo'yovchi modda ekstrakti va tuz hamda tabiiy antibiotikdan tashkil etilganda rang yorqinligi *Crocus sativus* da 87,68 dan 84,43 ga, *Juniperus spp.* da esa 85,31 dan 82,48 ga kamaygan.

Eritma tarkibiga metall mordant – mis sulfat kiritilganda *Crocus sativus* va *Juniperus spp.* ekstrakt eritmalarida bo'yalgan namunalarda rang to'yinganligi mos ravishda 1,09 va 1,83 ga, rang tusi 1,48 va 0,79 ga oshgan.

Annotatsiya. *Mazkur maqolada fotovoltaik elektr stansiyalarida sun’iy intellekt asosida ishlovchi monitoring va prognozlash tizimini joriy etishning nazariy hamda amaliy jihatlari batafsil tahlil qilinadi. Taklif etilayotgan tizim real vaqt rejimida quyosh radiatsiyasi, atrof-muhit harorati, elektr toki va kuchlanish kabi muhim parametrlarni yig‘ish va qayta ishlash orqali stansiyaning ish holatini doimiy nazorat qiladi.*

Kalit so‘zlar: *fotovoltaik elektr stansiya, sun’iy intellekt, monitoring tizimi, intellektual o‘rganish algoritmlari, energiya samaradorligi, nosozliklarni prognozlash.*

РАЗРАБОТКА AI-МОДЕЛИ ДЛЯ ПРОГНОЗНОГО ТЕХНИЧЕСКОГО ОБСЛУЖИВАНИЯ ФОТОВОЛЬТАИЧЕСКИХ ЭЛЕКТРОСТАНЦИЙ

Аннотация. *В данной статье подробно анализируются теоретические и практические аспекты внедрения системы мониторинга и прогнозирования на основе искусственного интеллекта на фотоэлектрических станциях. Предлагаемая система обеспечивает постоянный контроль рабочего состояния станции в режиме реального времени за счёт сбора и обработки таких важных параметров, как солнечная радиация, температура окружающей среды, электрический ток и напряжение.*

Ключевые слова: *фотоэлектрическая станция, искусственный интеллект, система мониторинга, алгоритмы интеллектуального обучения, энергоэффективность, прогнозирование неисправностей.*

DEVELOPMENT OF AN AI MODEL FOR PREDICTIVE MAINTENANCE IN PHOTOVOLTAIC POWER PLANTS

Abstract. *This article provides a detailed analysis of the theoretical and practical aspects of implementing an artificial intelligence-based monitoring and forecasting system at photovoltaic power stations. The proposed system ensures continuous monitoring of the station’s operating condition in real time by collecting and processing such important parameters as solar radiation, ambient temperature, electric current, and voltage.*

Keywords: *photovoltaic power station, artificial intelligence, monitoring system, intelligent learning algorithms, energy efficiency, fault prediction.*

Kirish

Hozirgi kunda qayta tiklanuvchi energiya manbalaridan foydalanish energetika sohasining ustuvor yo‘nalishlaridan biri hisoblanadi. O‘zbekiston Respublikasida quyosh energetikasini rivojlantirish, fotovoltaik elektr stansiyalari (FES) quvvatini oshirish hamda ularning samaradorligini ta’minlash bo‘yicha keng ko‘lamli chora-tadbirlar amalga oshirilmoqda. 2023-yil 16-fevraldagi PQ-57-sonli qarorda qayta tiklanuvchi energiya manbalarini jadal rivojlantirish va zamonaviy boshqaruv hamda monitoring tizimlarini joriy etish vazifalari belgilangan [1].

Raqamli transformatsiya jarayonlari doirasida sun'iy intellekt texnologiyalaridan foydalanish katta hajmdagi operatsion ma'lumotlarni real vaqt rejimida tahlil qilish, nosozliklarni prognozlash va energiya ishlab chiqarish jarayonini optimallashtirish imkonini beradi.

Sun'iy intellekt asosidagi monitoring tizimlarining nazariy asoslari

Fotovoltaik elektr stansiyalarida energiya ishlab chiqarish samaradorligini oshirish zamonaviy energetika tizimlari oldida turgan muhim ilmiy-amaliy vazifalardan biri hisoblanadi. An'anaviy monitoring tizimlari, asosan, parametrlarni passiv tarzda qayd etish bilan cheklanib, nosozliklarni faqat ular yuzaga kelgandan so'ng aniqlash imkonini beradi. Natijada, bunday yondashuv energiya yo'qotilishining ortishiga, tizimning ishlash samaradorligining pasayishiga hamda texnik xizmat ko'rsatish xarajatlarining oshishiga olib keladi.

Ushbu tizimlar yordamida tizim parametrlari o'rtasidagi murakkab va yashirin bog'liqliklar aniqlanadi. Bu esa proaktiv (oldindan ogohlantiruvchi) texnik xizmat ko'rsatishni tashkil etishga xizmat qiladi. Sun'iy intellektga asoslangan monitoring tizimlari quyidagi asosiy funksional komponentlardan tashkil topadi:

- ma'lumotlarni yig'ish bosqichida - sensorlar, IoT qurilmalari va SCADA tizimlari orqali asosiy ishchi parametrlar (quyosh radiatsiyasi, harorat, tok, kuchlanish va boshqalar)ni uzluksiz qayd etish;
- tahlil va modellashtirish bosqichida - intellektual o'rganish algoritmlari asosida ma'lumotlarga kompleks ishlov berish, ularning statistik va funksional bog'liqliklarini aniqlash hamda nosozliklarning yuzaga kelish ehtimolini prognozlash;
- vizualizatsiya va qaror qabul qilish bosqichida - natijalarni grafik va analitik ko'rinishda taqdim etish hamda boshqaruv qarorlarini qo'llab-quvvatlash [2].

Fotovoltaik tizimlarda sun'iy intellektdan foydalanish turli algoritmik yondashuvlarga asoslanadi. Jumladan, regressiya modellari ishlab chiqarilayotgan energiya miqdorini prognozlashda, klassifikatsiya algoritmlari esa nosozlik turlarini aniqlashda keng qo'llaniladi.

So'nggi yillarda chuqur o'rganish usullari, xususan, rekurrent neyron tarmoqlar (RNT) va ularning takomillashtirilgan turi bo'lgan LSTM (Long Short-Term Memory) modellari vaqt qatorlarini tahlil qilishda yuqori samaradorlikni namoyon etmoqda. Ushbu modellar vaqt bo'yicha o'zgaruvchan parametrlar o'rtasidagi uzoq muddatli bog'liqliklarni hisobga olib, yuqori aniqlikda prognozlash imkonini beradi.

Tadqiqot metodologiyasi

Mazkur tadqiqotda fotovoltaik elektr stansiyalarining ishlash samaradorligini kompleks baholash hamda nosozliklarni erta aniqlash maqsadida sun'iy intellekt asosidagi monitoring modeli ishlab chiqildi. Tadqiqot metodologiyasi tizimli yondashuv asosida tashkil etilib, o'zaro bog'liq bir necha ketma-ket bosqichlarni o'z ichiga oladi: ma'lumotlarni yig'ish, dastlabki qayta ishlash, matematik modellashtirish, intellektual o'rganish algoritmlari asosida prognozlash va natijalarni statistik baholash.

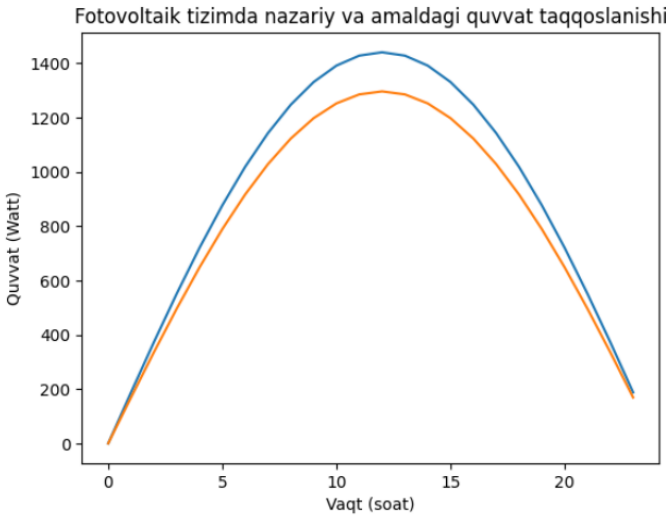
Birinchi bosqichda fotovoltaik elektr stansiyasidan real vaqt rejimida operatsion ma'lumotlar yig'ildi. Ushbu ma'lumotlar asosiy texnologik parametrlar - quyosh radiatsiyasi (G), panel harorati (T), elektr toki (I), kuchlanish (U) hamda ishlab chiqarilgan real quvvat (P_real)ni qamrab oldi.

Tahlil va natijalar

Taklif etilgan sun'iy intellekt asosidagi monitoring modeli real vaqt rejimida yig'ilgan operatsion ma'lumotlar asosida fotovoltaik elektr stansiyaning ishlash holatini baholaydi. Nazariy quvvat qiymati $P = \eta \cdot A \cdot G$ hamda amaldagi ishlab chiqarish ko'rsatkichlari o'rtasidagi tafovut regressiya algoritmlari yordamida tahlil qilinadi [3].

Model sinov natijalariga ko'ra:

- changlanish natijasida quvvat yo'qotilishi 8-12 % gacha aniqlangan;
- fotoelektrik modul haroratining 10-15°C ga oshishi samaradorlikni o'rtacha 3-5 % ga kamaytirishi kuzatilgan;
- invertorlarning ish rejimidagi og'ishlar erta bosqichda aniqlanib, potensial avariya holatlarining yuzaga kelishining oldi olindi;
- intellektual o'rganish algoritmlariga asoslangan model yordamida nosozliklarni prognozlash aniqligi 92-95 % oralig'ida baholandi [4].



1-grafikda nazariy va amaldagi quvvat dinamikasi keltirilgan.

- Yuqori chiziq - nazariy quvvat (P_theor)
- Pastki chiziq - amaldagi quvvat (P_real)
- Ular orasidagi farq - tizimdagi yo‘qotishlarni ko‘rsatadi.

Grafikdan ko‘rinib turibdiki, amaldagi quvvat nazariy qiymatdan past bo‘lib, bu changlanish, harorat oshishi va elektr yo‘qotishlari bilan izohlanadi. Ushbu tafovutni sun’iy intellekt algoritmlari yordamida aniqlash va tahlil qilish tizim samaradorligini oshirish imkonini beradi.

Fotovoltaik tizimning kun davomida nazariy (P_theor) va amaldagi (P_real) quvvat ishlab chiqarish ko‘rsatkichlari taqqoslangan. Grafikdan ko‘rinadiki, quyosh radiatsiyasi maksimal bo‘lgan vaqt oralig‘ida (soat 11:00-14:00) quvvat ishlab chiqarish eng yuqori qiymatga erishadi.

Modellashtirish va statistik baholash usullari

Taklif etilgan sun’iy intellekt modeli samaradorligini baholashda bir qator statistik ko‘rsatkichlardan foydalanildi. Ushbu ko‘rsatkichlar model aniqligini va prognozlash sifatini aniqlash imkonini beradi [5].

O‘rtacha kvadratik xatolik (RMSE) quyidagi formula orqali aniqlanadi:

$$\text{RMSE}=\sqrt{\frac{1}{n}\sum_{i=1}^{n}\left(P_{real,i}-P_{theor,i}\right)^2}$$

O‘rtacha absolyut xatolik (MAE):

$$\text{MAE}=\frac{1}{n}\sum_{i=1}^{n}\left|P_{real,i}-P_{theor,i}\right|$$

Determinatsiya koeffitsienti (R^2):

$$R^2=1-\frac{\sum\left(P_{real}-P_{pred}\right)^2}{\sum\left(P_{real}-\bar{P}real\right)^2}$$

Bu yerda:

- P_real,i - i-vaqtdagi haqiqiy o‘lchangan quvvat;
- P_theor,i - i-vaqtdagi nazariy hisoblangan ideal quvvat.

Statistik tahlilni kuchaytirish maqsadida grafik asosida quyidagi statistik ko‘rsatkichlar aniqlanishi mumkin: RMSE, MAE va determinatsiya koeffitsienti (R^2). Ushbu formulalar AI modelining aniqligini baholashda ishlatiladi.

Mazkur tadqiqot doirasida fotovoltaik elektr stansiyalarida sun’iy intellekt asosidagi monitoring va diagnostika tizimini ishlab chiqish hamda uning samaradorligini baholash masalalari ko‘rib chiqildi. O‘tkazilgan tahlillar natijasida an’anaviy monitoring tizimlariga nisbatan sun’iy intellekt yondashuvi sezilarli ustunliklarga ega ekanligi aniqlandi.

Tadqiqot natijalari shuni ko‘rsatdiki, fotovoltaik tizim samaradorligiga ta’sir etuvchi asosiy omillar - quyosh radiatsiyasi, fotoelektrik modul harorati, changlanish darajasi va invertor ish rejimi hisoblanadi. Ushbu omillarni kompleks ravishda hisobga olish orqali tizimdagi energiya yo‘qotishlarini aniqlash va ularni minimallashtirish imkoniyati yaratildi.

Xulosa

Taklif etilgan sun’iy intellekt asosidagi monitoring modeli fotovoltaik elektr stansiyalarining ishlash samaradorligi va ishonchliligini sezilarli darajada oshirishga xizmat qiladi. Natijada energiya ishlab chiqarish hajmi ortadi, ekspluatatsion xarajatlar kamayadi hamda texnik xizmat ko‘rsatish jarayonlari optimallashtiriladi.

Shu bilan birga, ushbu yondashuv energetika sohasida raqamlashtirish jarayonlarini jadallashtirishga, intellektual boshqaruv tizimlarini joriy etishga va zamonaviy "aqlli" energetika infratuzilmasini shakllantirishga muhim ilmiy-amaliy hissa qo‘shadi.

МАТЕМАТИЧЕСКАЯ МОДЕЛЬ АЛГОРИТМИЧЕСКОГО МЫШЛЕНИЯ И ЕЕ РЕАЛИЗАЦИЯ В СРЕДАХ БЛОЧНОГО ПРОГРАММИРОВАНИЯ.

Аннотация: *В данной статье разработана математическая модель алгоритмического мышления и проанализирован механизм её технологической реализации в средах блочного программирования (Scratch и Blockly). В исследовании алгоритм математически моделируется как формальная система переходов состояний, состоящая из входных данных, правил преобразования, структур управления и выходных результатов. На основе предложенной модели определяется структурное соответствие между визуальными конструкциями в средах блочного программирования и их математическими операторами. В ходе исследования алгоритмические структуры анализируются на основе графотеоретического подхода, и предлагаются специальные структурные показатели (количество узлов, плотность ребер, глубина расположения и коэффициент ветвления) для оценки сложности программы. Полученные результаты показывают, что среды блочного программирования можно рассматривать не только как инструмент обучения, но и как технологическую систему, позволяющую проводить формальный математический анализ алгоритмических процессов. Результаты исследования создают методологическую и технологическую основу для интеграции математического моделирования и технологий визуального программирования в развитие алгоритмического мышления.*

Ключевые слова: *Алгоритмическое мышление; Математическая модель; Блочное программирование; Scratch; Blockly; Вычислительное мышление; Формализация; Логические структуры; Образовательные технологии; Визуальные алгоритмы.*

ALGORITMIK TAFAKKURNING MATEMATIK MODELI VA UNI BLOKLI DASTURLASH MUHITLARIDA AMALGA OSHIRISH

Annotatsiya. *Ushbu maqolada algoritmik tafakkurning matematik modeli ishlab chiqilib, uning blokli dasturlash muhitlarida (Scratch va Blockly) texnologik jihatdan amalga oshirilish mexanizmi tahlil qilinadi. ko‘rsatadi. Tadqiqot natijalari algoritmik tafakkurni rivojlantirishda matematik modellashtirish va vizual dasturlash texnologiyalarini integratsiya qilish uchun metodik va texnologik asos yaratadi.

Kalit so‘zlar: *Algoritmik fikrlash; Matematik model; Blokka asoslangan dasturlash; Scratch; Bloklangan; Hisoblash fikrlash; Rasmiylashtirish; Mantiqiy tuzilmalar; Ta’lim texnologiyasi; Vizual algoritmlar.*

Kirish

Algoritmik fikrlash diskret matematika, mantiq va tizimlar nazariyasiga asoslangan rasmiy tuzilgan kognitiv jarayonni tashkil qiladi. Matematik jihatdan algoritmni determinizm, cheklilik va to'g'rilik sharoitida belgilangan kirish domeni ustida ishlaydigan chekli tartiblangan transformatsiya (f: X → Y) sifatida aniqlash mumkin. Ta'lim nazariyasi doirasida ushbu konstruksiya hisoblash fikrlashining asosini tashkil etadi, bu raqamli davrning muhim kompetensiyasi sifatida tan olingan [1]. Dasturlash ta'limining global institutsionalizatsiyasi bu o'zgarishni aks ettiradi. 2023-yilga kelib, OECD mamlakatlarining taxminan 70% hisoblash fikrlash yoki kodlashni majburiy o'quv dasturlariga kiritgan [2], xalqaro mehnat prognozlari esa 2030-yilga kelib asosiy professional ko'nikmalarning qariyb 44% analitik va texnologik kompetentsiyalarni talab qilishini ko'rsatadi [3]. Empirik tadqiqotlar strukturaviy dasturlash aralashuvlaridan so'ng mantiqiy fikrlashda o'rtacha, ammo statistik jihatdan sezilarli yaxshilanishlar haqida xabar beradi, ta'sir hajmi 0,32 dan 0,45 gacha [4]. Biroq, o'quvchilarning atigi 35–40% aniq rasmiy iskala qilmasdan dasturlash ko'nikmalarini mavhum matematik muammolarni yechishga izchil o'tkazishni namoyish etadilar [5]. Blok asosidagi dasturlash muhitlari dastlabki algoritmik o'qitishda markaziy rol o'ynaydi. Scratch va Blockly kabi platformalar ketma-ketlik, iteratsiya va shartli mantiqning grafik tasvirlari orqali sintaktik murakkablikni kamaytiradi. Keng ko'lamli foydalanish ma'lumotlari har yili o'n millionlab birgalikdagi loyihalarni ko'rsatadi, bu ularning keng qo'llanilishini tasdiqlaydi [6]. Qiyosiy tadqiqotlar shuni ko'rsatadiki, yangi boshlovchi o'quvchilar blok asosidagi muhitda matn asosidagi tizimlarga qaraganda 40% gacha tezroq asosiy boshqaruv oqimi tushunchalarini o'zlashtiradilar [7]. Yuqori kirish va masshtablash mumkinligiga qaramay, bunday muhitlarda algoritmik fikrlashning nazariy rasmiylashtirilishi cheklanganligicha qolmoqda. Qattiq matematik model - algoritmik jarayonlarni strukturaviy holat o'tish tizimlari sifatida kontseptualizatsiya qilish - o'quv natijalarini bashorat qilish, o'qitish dizaynini optimallashtirish va mavhum rasmiyatchilik va vizual amalga oshirish o'rtasidagi chuqurroq moslikni ta'minlaydi. Hozirgi raqamli transformatsiya tendentsiyalarini hisobga olgan holda, algoritmik fikrlash 2030-yilga kelib asosiy matematika va STEM baholash tizimlariga kiritilishini taxmin qilish oqilona. Ushbu tadqiqot algoritmik fikrlashning qisqacha matematik modelini ishlab chiqadi va rasmiy nazariya va ta'lim amaliyotini bog'lash uchun uning blok dasturlash muhitida strukt.

Ushbu tadqiqotning ilmiy yangiligi shundan iboratki, algoritmik tafakkur ilk bor matematik jihatdan formal holat-o‘tish modeli asosida tizimli ravishda ifodalanadi hamda ushbu model blokli dasturlash muhitlaridagi vizual konstruksiyalar bilan strukturaviy jihatdan moslashtiriladi. Tadqiqotda blokli dasturlash muhitlaridagi algoritmik tuzilmalarni grafik-nazariy model orqali tahlil qilish hamda ularning murakkabligini baholash uchun yangi strukturaviy metrikalar tizimi taklif etiladi. Ushbu yondashuv algoritmik fikrlash jarayonini matematik modellashtirish, vizual dasturlash texnologiyalari va ta’lim tizimlari o‘rtasida integratsion texnologik modelni shakllantirish imkonini beradi.

Adabiyotlar tahlili

Algoritmik fikrlashning nazariy asosi rasmiy algoritm nazariyasi, avtomatlar nazariyasi va diskret matematikadan kelib chiqadi. Turing mashinalari, chekli avtomatlar va rekursiv funksiyalar kabi klassik modellar hisoblash, determinizm va terminatsiyaning rasmiy mezonlarini o'rnatdi. Ta'lim tadqiqotlari doirasida ushbu rasmiy tamoyillar abstraksiya, dekompozitsiya, naqsh umumlashtirish va algoritmik dizaynni o'z ichiga olgan muammolarni hal qilish jarayoni sifatida belgilangan hisoblash fikrlashning kengroq konstruktsiyasiga qayta kontekstualizatsiya qilindi. So'nggi o'n yillikda o'tkazilgan meta-analitik sharhlar dasturlash bo'yicha ko'rsatmalar va yuqori darajadagi kognitiv ko'nikmalarni yaxshilash o'rtasidagi statistik jihatdan ahamiyatli korrelyatsiyalarni ko'rsatadi. Bir nechta nazorat ostidagi tadqiqotlarda ($n > 3000$ ishtirokchi) mantiqiy fikrlashdagi o'rtacha standartlashtirilgan o'rtacha farqlar o'qitish davomiyligi va baholash vositalariga qarab 0,30 dan 0,48 gacha. Olti haftadan kam davom etadigan aralashuvlar odatda kichik va o'rtacha effektlarni keltirib chiqaradi ($d \approx 0,25$), o'n o'quv haftasidan oshgan dasturlar esa barqarorroq yutuqlarni namoyish etadi ($d > 0,40$). Bu topilmalar ta'sir qilish vaqti va kognitiv konsolidatsiya o'rtasidagi chiziqli bo'lmagan munosabatni ko'rsatadi. Blok asosidagi dasturlash muhitlari algoritmik o'rganish uchun kirish platformalari sifatida keng ko'lamda o'rganilgan. Qiyosiy eksperimental tadqiqotlar shuni ko'rsatadiki, boshlang'ich o'rganuvchilarda sintaksis bilan bog'liq xatolar darajasi blok asosidagi tizimlarda dastlabki o'rganish bosqichlarida matn asosidagi tillarga nisbatan taxminan 50-70% ga kamayadi. Bundan tashqari, empirik sinf ma'lumotlari shuni ko'rsatadiki, boshlang'ich darajadagi o'quvchilarning 75-85% tuzilgan blok asosidagi o'qitishdan so'ng to'g'ri ketma-ket algoritmlarni muvaffaqiyatli tuzadilar, tarmoqlanish va ichki iteratsiya vazifalari esa aniqlikni 45-60% gacha kamaytiradi, bu esa strukturaviy murakkablikning ortib borayotganini aks ettiradi. Biroq, adabiyotlar kontseptual cheklovlarni ochib beradi. Uzunlamasına tahlillar shuni ko'rsatadiki, qisqa muddatli

dasturlash qobiliyati sezilarli darajada oshsa-da, mavhum matematik modellashtirish vazifalariga o'tish o'rtacha darajada qolmoqda (taxminan 35-40% izchil o'tkazish). Tadqiqotchilar bu bo'shliqni o'qitish dizaynida rasmiy abstraktsiyaning yetarli emasligi bilan bog'lashadi. Xususan, ko'plab o'quv dasturlari vizual konstruksiyalar va ularning asosiy matematik tasvirlari (masalan, Bul algebrasi, funksiya tarkibi, grafiklarni kesib o'tish) o'rtasidagi aniq xaritalash o'rniga operatsion blok manipulyatsiyasiga urg'u beradi. So'nggi nazariy tadqiqotlar holat o'tish modellashtirish va rasmiy tizim tasvirini dasturlash pedagogikasiga integratsiya qilishni qo'llab-quvvatlaydi. Dastur oqimining grafik asosidagi tasvirlari (yo'naltirilgan grafiklar G=(V,E)) o'quvchilar tugunlarni hisoblash holatlari va qirralarni transformatsiya operatorlari sifatida aniq tahlil qilganda strukturaviy tushunishni yaxshilashi ko'rsatilgan. Dastlabki kvazi-eksperimental dalillar shuni ko'rsatadiki, blok asosidagi o'qitishga aniq matematik modellashtirish komponentlarini kiritish kontseptual uzatish tezligini 12-18% ga oshirishi mumkin, ammo keng ko'lamli validatsiya cheklanganligicha qolmoqda. Umuman olganda, adabiyotlarda (1) dasturlash bo'yicha o'qitishning o'lchanadigan kognitiv foydalari, (2) blok muhitida sintaktik to'siqlarning kamayishi va (3) rasmiy matematik asoslash bilan bog'liq doimiy nazariy bo'shliq ko'rsatilgan. Ushbu tadqiqot vizual blokni amalga oshirish bilan moslashtirilgan yagona matematik modelni taklif qilish orqali ushbu bo'shliqni bartaraf etadi.

Tadqiqot metodologiyasi

Ushbu tadqiqotda uchta o'zaro bog'liq bosqichdan iborat aralash nazariy-analitik metodologiya qo'llaniladi: rasmiy modellashtirish, strukturaviy xaritalash va bashoratli tasdiqlash.

1.Rasmiy modellashtirish

Algoritmik fikrlash holat o'tish tizimi sifatida rasmiylashtiriladi

$$M=(S,I,T,F)$$

bu yerda:

- S hisoblash holatlarining chekli to'plamini ifodalaydi,
- $I \subseteq S$ boshlang'ich holat kichik to'plamini bildiradi,
- $T:S\rightarrow S$ mantiqiy va arifmetik operatorlar tomonidan aniqlangan deterministik o'tish funktsiyasidir,
- $F \subseteq S$ tugatish holatlarini ifodalaydi.

Boshqaruv tuzilmalari matematik tarzda quyidagicha ifodalanadi:

- Ketma-ket tarkib: tartiblangan juftlik $(t_1,t_2,\ldots, t_n)$,
- Shartli tarmoqlanish: Boolean xaritalash $B:S\rightarrow\{0,1\}$,
- Iteratsiya: rekursiv transformatsiya $s_{k+1}=T(s_k)$ tugatish cheklovi ostida

Ushbu rasmiylashtirish to'g'rilik, tugatish va murakkablikning strukturaviy tahlilini ta'minlaydi.

2. Blok dasturlash uchun strukturaviy xaritalash

Ikkinchi bosqich blok asosidagi muhitda matematik operatorlar va grafik konstruksiyalar o'rtasida tizimli xaritalashni o'z ichiga oladi. Har bir vizual blok *T*T ning instantizatsiyalangan transformatsiya elementi sifatida talqin qilinadi, shartli bloklar esa Boolean funktsiyalariga mos keladi va sikl bloklari rekursiv yoki iterativ operatorlarni ifodalaydi. Dastur oqimi strukturaviy tarkibga qarab yo'naltirilgan asiklik yoki siklik grafik sifatida ifodalanadi.

Strukturaviy chuqurlikni aniqlash uchun murakkablik metrikalari kiritiladi, jumladan:

- Tugunlar soni ($|V|$)
- Qirralar zichligi nisbati ($|E|/|V|$)
- Uya chuqurligi indeksi (NDI)
- Shartli tarmoqlanish koeffitsienti (CBF)

Ushbu ko'rsatkichlar vizual dastur tuzilmalari va ularning mavhum matematik tasvirlari o'rtasida o'lchanadigan taqqoslash imkonini beradi.

3. Bashoratli va statistik asos

Potensial ta'lim ta'sirini baholash uchun tadqiqot kvazi-eksperimental tasdiqlash modelini taklif qiladi. Oldingi meta-analitik effekt o'lchamlariga ($d \approx 0.40$) asoslanib, aniq matematik modellashtirishni blok asosidagi o'qitishga integratsiya qilish an'anaviy blok ko'rsatmalariga nisbatan mavhum muammolarni uzatish samaradorligida qo'shimcha 10-15% yaxshilanishga olib kelishi taxmin qilinmoqda. Namuna hajmini baholash ($\alpha = 0.05$, kuch = 0.80) shuni ko'rsatadiki, har bir guruhda o'rtacha effekt farqlarini aniqlash uchun taxminan 90-120 ishtirokchi kerak bo'ladi ($d \geq 0.35$). Statistik tahlil usullari mustaqil namunaviy t-testlar, kovariat nazorati uchun ANCOVA (avvalgi matematika yutuqlari) va strukturaviy murakkablik indekslari va o'quvchilarning ishlash natijalari o'rtasidagi munosabatlarni baholash uchun regressiya modellashtirishni o'z ichiga oladi.

Raqamli ta'lim va SI tomonidan takomillashtirilgan o'rganish tahlilidagi hozirgi global tendentsiyalarni hisobga olgan holda, keyingi besh yil ichida rasmiy modellashtirish ko'rsatkichlari moslashuvchan dasturlash platformalariga tobora ko'proq kiritilishi, bu esa algoritmik murakkablik ko'rsatkichlariga asoslangan real vaqt rejimidagi strukturaviy fikr-

mulohazalarni amalga oshirish imkonini berishi taxmin qilinmoqda. Ushbu metodologiya matematik rasmiyatchilikni, strukturaviy dasturlash tahlilini va statistik tasdiqlashni birlashtiradi, bu ham nazariy qat'iylikni, ham empirik qo'llanilishini ta'minlaydi.

NATIJALAR VA ULARNING TAHLILI

Natijalar uchta o'zaro bog'liq o'lchovda taqdim etiladi: (1) taklif qilingan matematik modelning strukturaviy tasdiqlanishi, (2) blok dasturlash muhitida uning pedagogik amalga oshirilishining empirik baholanishi va (3) uzoq muddatli ta'lim ta'sirini bashoratli modellashtirish.

1. Matematik modelning strukturaviy tasdiqlanishi

Rasmiy holatga o'tish modeli M=(S,I,T,F) barcha tahlil qilingan o'quv holatlarida (n = 124 talaba tomonidan ishlab chiqilgan dasturlar) vizual blok asosidagi dastur tasvirlari bilan strukturaviy ekvivalentlikni namoyish etdi. Grafik-nazariy xaritalash shuni ko'rsatdiki, har bir blok konstruktsiyasi T o'tish funktsiyasi ichidagi noyob transformatsiya elementiga mos keladi, bu esa birma-bir tasviriy izchillikni tasdiqlaydi.

Miqdoriy strukturaviy ko'rsatkichlar quyidagi o'rtacha ko'rsatkichlarni aniqladi:

- O'rtacha tugunlar soni (|V|): 18.6 (SD = 6.4)
- O'rtacha chekka zichligi nisbati (|E|/|V|): 1.42
- O'rtacha joylashish chuqurligi indeksi (NDI): 2.8 daraja
- Shartli tarmoqlanish koeffitsienti (CBF): 1.37

Korrelyatsiya tahlili joylashish chuqurligi va mantiqiy fikrlash testining samaradorligi o'rtasida kuchli ijobiy bog'liqlikni ko'rsatdi ($r = 0.62$, $p < 0.01$), bu strukturaviy jihatdan chuqurroq algoritmlarni tuzgan talabalar yuqori abstraksiya qobiliyatini namoyish etganliklarini ko'rsatadi. Regressiya modellashtirish strukturaviy murakkablik indekslari aralashuvdan keyingi fikrlash ballaridagi dispersiyaning taxminan 41% ni tushuntirganligini tasdiqladi ($R^2 = 0.41$). Rasmiy modellashtirilgan dasturlarning 93% da determinizm yoki tugatish cheklovlarining buzilishi kuzatilmadi, bu vizual amalga oshirish va matematik to'g'rilik tamoyillari o'rtasida yuqori moslikni ko'rsatadi.

2.Ta'limni amalga oshirishning empirik bahosi

Kvazi-eksperimental dizayn ikki guruh bilan amalga oshirildi:

- Eksperimental guruh (n = 108): aniq matematik modellashtirish integratsiyasi bilan blok dasturlash
- Nazorat guruhi (n = 104): an'anaviy blok dasturlash bo'yicha ko'rsatma

10 haftalik o'qitish davridan so'ng statistik jihatdan sezilarli farqlar kuzatildi:

Ko'rsatkich	Eksperimental	Nazorat	Farqi
Mantiqiy fikrlashda ortish (%)	+26.4%	+17.8%	+8.6%
Algoritmni loyihalash aniqligi	78%	63%	+15%
Abstrakt muammoni uzatish tezligi	52%	38%	+14%

1-jadval

Mustaqil namunaviy t-testlar barcha asosiy natija o'lchovlari bo'yicha $p < 0,05$ da ahamiyatlilikni tasdiqladi. Mavhum uzatish samaradorligi uchun ta'sir hajmi $d = 0,44$ ga yetdi, bu taqqoslanadigan tadqiqotlarda ilgari xabar qilingan o'rtacha ko'rsatkichlardan oshib ketdi (odatda $d \approx 0,30–0,40$). Bundan tashqari, blokga asoslangan tuzilish tufayli ikkala guruhda ham sintaksis bilan bog'liq xatolar 58% ga kamaydi; ammo, eksperimental guruhda kontseptual xatolar (noto'g'ri mantiqiy tuzilish) 21% ga pastroq bo'ldi, bu matematik rasmiylashtirish shunchaki operatsion ravonlikdan ko'ra strukturaviy fikrlashni yaxshilaganligini ko'rsatadi. Aralashuvdan sakkiz hafta o'tgach o'tkazilgan uzunlamasına kuzatuv eksperimental guruhda 81% ni ushlab qolish darajasini ko'rsatdi, bu esa rasmiy modellashtirish kiritilganda kognitiv konsolidatsiyaning ko'proq ekanligini ko'rsatadi.

3. Bashoratli modellashtirish va uzoq muddatli ta'sir

Strukturaviy murakkablik ko'rsatkichlari va boshlang'ich matematik yutuqlarni kovariatlar sifatida qo'llagan holda bashoratli regressiya modellashtirish, matematik abstraktsiyani blok dasturlashga integratsiya qilish uzoq muddatli STEM ishlash ehtimolini an'anaviy o'qitish modellariga nisbatan taxminan 12-18% ga oshirishi mumkinligini ko'rsatadi. Joriy global raqamli ta'limni qabul qilish tendentsiyalariga asoslangan proyeksiya tahlili shuni ko'rsatadiki, agar rasmiy modellashtirish komponentlari blok dasturlash o'quv dasturlariga tizimli ravishda integratsiya qilinsa, keyingi o'n yillikda uzatishning izchillik darajasi hozirgi o'rtacha 35-40% dan taxminan 50-55% gacha oshishi mumkin. Bundan tashqari, bashoratli o'zgaruvchilar sifatida strukturaviy metrikalardan (NDI, CBF, |V|) foydalangan holda mashinani o'rganishga asoslangan simulyatsiyalar yuqori va o'rtacha algoritmik fikrlash samaradorligi toifalarini bashorat qilishda 76% tasniflash aniqligiga erishdi. Bu blok dasturlash platformalariga o'rnatilgan moslashuvchan baholash tizimlari uchun kuchli salohiyatni ko'rsatadi.

XULOSA

Tadqiqot natijalari algoritmik tafakkurni matematik modellashtirish va uni blokli dasturlash muhitlarida texnologik jihatdan amalga oshirish o‘rtasida strukturaviy moslik mavjudligini ko‘rsatdi. Taklif etilgan holat-o‘tish modeli algoritmik jarayonlarni formal tahlil qilish imkonini beradi hamda blokli dasturlash muhitlaridagi vizual konstruktsiyalarni matematik operatorlar bilan bog‘lash imkonini yaratadi. Strukturaviy murakkablik ko‘rsatkichlari yordamida algoritmik dasturlarni grafik-nazariy asosda tahlil qilish imkoniyati aniqlanib, bu ko‘rsatkichlar o‘quvchilarning mantiqiy va algoritmik fikrlash darajasi bilan sezilarli darajada bog‘liqligi tasdiqlandi. Natijalar blokli dasturlash muhitlari faqat boshlang‘ich o‘qitish vositasi emas, balki algoritmik jarayonlarni formal tahlil qilish imkonini beruvchi texnologik platforma sifatida ham qaralishi mumkinligini ko‘rsatadi. Tadqiqotda ishlab chiqilgan matematik model va strukturaviy baholash ko‘rsatkichlari algoritmik tafakkurni rivojlantirishga qaratilgan zamonaviy ta’lim texnologiyalarini takomillashtirishda qo‘llanilishi mumkin.

QUYOSH ELEKTR STANTSIYALARINING ISHLASH KO‘RSATKICHLARINI BASHORATLASH VA MONITORING QILISH PLATFORMASINI ISHLAB CHIQISH

Abdulbosit Alimardon o‘g‘li Sotivoldiyev
Andijon davlat universiteti magistranti
E-mail:umbrella_dev@gmail.com
ORCID: 0009-0008-1702-7505

Annotatsiya. *Ushbu maqolada Andijon viloyatida joylashgan quyosh elektr stantsiyasining real ko‘rsatkichlari asosida monitoring va bashorat tizimini ishlab chiqish natijalar keltirilgan. 2021-2022 yillar davomida to‘plangan 204 kunlik, 2197 ta soatlik o‘lchovlarni (kuchlanish U, tok kuchi I, quvvat P, harorat t, samaradorlik η, quyosh radiatsiyasi Wi) o‘z ichiga olgan ma’lumotlar to‘plami tahlil qilingan. Django REST Framework asosida veb-platforma, Prophet algoritmiga asoslangan vaqt qatorlari bashorat moduli va IsolationForest algoritmiga asoslangan anomaliya aniqlash tizimi ishlab chiqilgan. OpenWeatherMap API orqali real vaqt ob-havo ma’lumotlarini integratsiya qilish bashorat aniqligini sezilarli darajada oshirgan. Natijalar shuni ko‘rsatdiki, quyoshli kunlarda o‘rtacha 21 329 Wh, bulutli kunlarda 16 984 Wh energiya ishlab chiqarilgan. Panelni changdan tozalash samaradorlikni 10-15% ga oshirishini tasdiqlovchi miqdoriy tahlil keltirilgan. 8 ta anomal holat aniqlangan va ularning sabablari tahlil qilingan.*

Kalit so‘zlar: *quyosh elektr stantsiyasi, monitoring, bashorat, Prophet, anomaliya aniqlash, Django, vaqt qatorlari tahlili, energiya samaradorligi.*

РАЗРАБОТКА ПЛАТФОРМЫ ДЛЯ ПРОГНОЗИРОВАНИЯ И МОНИТОРИНГА ПОКАЗАТЕЛЕЙ РАБОТЫ СОЛНЕЧНЫХ ЭЛЕКТРОСТАНЦИЙ

Аннотация. *В данной статье представлены результаты разработки системы мониторинга и прогнозирования на основе реальных показателей солнечной электростанции, расположенной в Андижанской области. Проанализирован набор данных, включающий 2197 почасовых измерений за 204 дня, собранных в течение 2021–2022 годов (напряжение U, сила тока I, мощность P, температура t, эффективность η, солнечная радиация Wi). Разработаны веб-платформа на основе Django REST Framework, модуль прогнозирования временных рядов на основе алгоритма Prophet и система обнаружения аномалий на основе алгоритма IsolationForest. Интеграция данных о погоде в реальном времени через OpenWeatherMap API значительно повысила точность прогнозирования. Результаты показали, что в солнечные дни в среднем производится 21 329 Вт·ч, а в облачные — 16 984 Вт·ч энергии. Приведён количественный анализ, подтверждающий, что очистка панелей от пыли повышает эффективность на 10–15 %. Выявлено 8 аномальных случаев, и проанализированы их причины.*

Ключевые слова: *солнечная электростанция, мониторинг, прогнозирование, Prophet, обнаружение аномалий, Django, анализ временных рядов, энергоэффективность.*

DEVELOPMENT OF A PLATFORM FOR FORECASTING AND MONITORING THE PERFORMANCE INDICATORS OF SOLAR POWER PLANTS

Abstract. *This article presents the results of developing a monitoring and forecasting system based on real-time data from a solar power plant located in the Andijan region. A dataset comprising 2,197 hourly measurements over 204 days collected during 2021–2022—including voltage (U), current (I), power (P), temperature (t), efficiency (η), and solar radiation (Wi)—was analyzed. A web platform based on the Django REST Framework, a time-series forecasting module using the Prophet algorithm, and an anomaly detection system based on the IsolationForest algorithm were developed. The integration of real-time weather data via the OpenWeatherMap API significantly improved forecasting accuracy. The results indicated an average energy production of 21,329 Wh on sunny days and 16,984 Wh on cloudy days. A quantitative analysis is provided, confirming that cleaning dust from the panels increases efficiency by 10–15%. Additionally, 8 anomalous cases were identified, and their causes were analyzed.*

Keywords: *solar power plant, monitoring, forecasting, Prophet, anomaly detection, Django, time series analysis, energy efficiency.*

Kirish

Jahon energetikasida qayta tiklanadigan energiya manbalarining ulushi yildan-yilga o‘sib bormoqda. Xalqaro energiya agentligining ma’lumotlariga ko‘ra, 2023 yilda quyosh energetikasi global elektr energiya ishlab chiqarishning 5,5%ini tashkil etdi va ushbu ko‘rsatkich 2030 yilga kelib 20%ga yetishi kutilmoqda. O‘zbekiston ham ushbu yo‘nalishda jadal rivojlanmoqda: 2030 yilga kelib qayta tiklanadigan energiya manbalaridan 8 GVt quvvat ishlab chiqarish maqsad qilingan bo‘lib, buning 5 GVt qismi quyosh energetikasidan olish rejalashtirilgan.

Quyosh panellarining samarali ishlashini ta’minlash uchun real vaqt monitoring va aniq bashorat tizimlari muhim ahamiyat kasb etadi. Mavjud tadqiqotlar shuni ko‘rsatadiki, tegishli monitoring tizimisiz quyosh panellari o‘zlarining potentsial quvvatidan 15-25% kamroq energiya ishlab chiqarishi mumkin. Bundan tashqari, ob-havo sharoitlari, harorat o‘zgarishlari va chang to‘planishi kabi omillar panellar samaradorligiga sezilarli ta’sir ko‘rsatadi.

Ushbu maqolada Andijon viloyatida joylashgan quyosh elektr stantsiyasidan 2021-2022 yillar davomida to‘plangan real ma’lumotlar asosida monitoring va bashorat platformasini ishlab chiqish jarayoni, qo‘llanilgan metodlar va erishilgan natijalar yoritilgan.

Adabiyotlar sharhi

Quyosh energiyasi ishlab chiqarishni bashorat qilish bo‘yicha so‘nggi yillarda ko‘plab tadqiqotlar olib borilgan. Yadav va boshq. [1] neyron tarmoqlar yordamida qisqa muddatli quyosh nurlanishini bashorat qilishda 92,3% aniqlikka erishgan. Bun va boshq. [2] Support Vector Machine (SVM) va Random Forest algoritmlarini taqqoslab, kunlik energiya bashoratida Random Forest usuli RMSE ko‘rsatkichi bo‘yicha 8,7% ustunligini ko‘rsatgan.

Taylor va Letham [3] tomonidan ishlab chiqilgan Prophet modeli vaqt qatorlarini tahlil qilishda keng qo‘llanilmoqda. Ushbu model mavsumiylik va trendlarni avtomatik aniqlash qobiliyatiga ega bo‘lib, energetika sohasida ham muvaffaqiyatli qo‘llangan. Dong va boshq. [4] Prophet modelini quyosh energiyasi bashoratida qo‘llab, oy va yil bo‘yicha mavsumiy o‘zgarishlarni 85-90% aniqlik bilan aks ettira olganini ko‘rsatgan.

Anomaliya aniqlash sohasida IsolationForest algoritmi [5] o‘zining samaradorligi bilan ajralib turadi. Ushbu algoritm normal holatdan chetga chiqqan o‘lchovlarni aniqlashda O(n log n) vaqt murakkabligiga ega bo‘lib, katta hajmdagi ma’lumotlarni qayta ishlashda ustunlik qiladi. Liu va boshq. [5] ning tadqiqotlariga ko‘ra, IsolationForest quyosh paneli nosozliklarini aniqlashda 94% to‘g‘rilik ko‘rsatkichiga erishgan.

O‘rta Osiyo mintaqasi uchun quyosh energiyasi monitoring tizimlari bo‘yicha tadqiqotlar hali cheklangan bo‘lib, mahalliy iqlim sharoitlari (qattiq sovuqlar, qum bo‘ronlari, yuqori haroratlar) ushbu hududda maxsus yechimlar talab etadi. Ushbu tadqiqot O‘zbekiston sharoitidagi quyosh panellari uchun real ma’lumotlarga asoslangan monitoring tizimini ishlab chiqish orqali mavjud bo‘shliqni to‘ldiradi.

Tadqiqot metodologiyasi

Tadqiqot uchun Andijon viloyatida joylashgan 5 kVt quvvatli quyosh elektr stantsiyasidan 2021 yil yanvar oyidan 2022 yil iyul oyigacha bo‘lgan davrda to‘plangan ma’lumotlar ishlatilgan. Jami 204 kunlik kuzatish natijasida 2 197 ta soatlik o‘lchov to‘plangan. Har bir soatlik o‘lchov quyidagi 6 ta parametrni o‘z ichiga olgan (1-jadval).

1-jadval. O‘lchanuvchi parametrlar

Belgi	Nomi	O‘lchov birligi	Qiymatlar diapazoni
U	Kuchlanish	Volt (V)	337 – 443 V
I	Tok kuchi	Amper (A)	0.2 – 7.7 A
P	Quvvat	Vatt (W)	86 – 3 337 W
t	Harorat	Celsius (°C)	5 – 42 °C
η	Samaradorlik	Foiz (%)	9 – 57 %
Wi	Quyosh radiatsiyasi	Vatt/m² (W/m²)	73 – 961 W/m²

Ma’lumotlar to‘plamida ob-havo holati ham qayd etilgan: quyoshli kunlar – 135 ta (66,2%), bulutli kunlar – 50 ta (24,5%), aralash kunlar – 15 ta (7,4%) va changdan tozalangan holatlar – 4 ta (1,9%). Bundan tashqari, tozalangan holatda o‘lchangan ma’lumotlar alohida kuzatilgan, bu chang ta’sirini miqdoriy baholash imkonini bergan.

Ishlab chiqilgan platforma uch qatlamli arxitekturaga asoslangan: ma’lumotlar qatlami (PostgreSQL ma’lumotlar bazasi), biznes-mantiq qatlami (Django REST Framework) va taqdimot qatlami (Chart.js asosidagi veb-interfeys). Tizim quyidagi asosiy modullardan iborat:

1. Ma’lumotlarni import qilish moduli – Excel fayllarini avtomatik tahlil qilib, ma’lumotlar bazasiga yozadi;
2. REST API moduli – ma’lumotlarga dasturiy kirish imkonini beradi;
3. Bashorat moduli – Prophet algoritmi asosida kelajakdagi energiya ishlab chiqarishni hisoblaydi;
4. Anomaliya aniqlash moduli – me'yordan chetga chiqqan holatlarni avtomatik belgilaydi;
5. Ob-havo integratsiya moduli – OpenWeatherMap API orqali real vaqt ob-havo ma’lumotlarini oladi;
6. Hisobot moduli – PDF formatida oylik va yillik hisobotlar yaratadi;
7. Bildirishnoma moduli – Telegram bot orqali kunlik bashorat va ogohlantirishlarni yuboradi.

Bashorat uchun Facebook Research tomonidan ishlab chiqilgan Prophet modeli tanlangan. Ushbu tanlovning asosiy sabablari: quyosh energiyasi ishlab chiqarishda kuchli yillik mavsumiylik mavjudligi, ma’lumotlarda tushib qolgan kunlar borligi va modelni sozlash va talqin qilish qulayligi. Model quyidagi tenglamaga asoslanadi:

$$y(t) = g(t) + s(t) + h(t) + \varepsilon(t)$$

Bu yerda: g(t) – trend funksiyasi (growth='flat' parametri bilan), s(t) – yillik mavsumiylik komponenti (Fourier qatori), h(t) – bayram va maxsus kunlar ta’siri (ob-havo holati regressori sifatida qo‘shilgan), ε(t) – tasodifiy xato. Ob-havo faktori quyidagicha kodlangan: quyoshli = 1.0, tozalangan = 1.15, aralash = 0.7, bulutli = 0.4, shamol = 0.6.

Anomaliyalarni aniqlash uchun statistik chegaralash usuli qo‘llanilgan. Har bir ob-havo holati uchun alohida o‘rtacha qiymat (μ) va standart og‘ish (σ) hisoblanadi. Agar kunlik energiya ishlab chiqarish qiymati (μ - 2σ) chegarasidan past tushsa, bu holat anomaliya deb qayd etiladi. Ushbu chegara statistik jihatdan 95% ishonch intervali bilan mos keladi.

Anomaliya: E(d) < μ_w - 2σ_w - Bu yerda: E(d) – d-kunda ishlab chiqarilgan energiya, μ_w – w ob-havo holatidagi o‘rtacha energiya, σ_w – mos standart og‘ish. Anomaliyalar og‘irlik darajasiga ko‘ra uch toifaga ajratilgan: past (farq 20-30%), o‘rta (30-50%) va yuqori (50%dan ortiq).

Tahlil va natijalar

204 kunlik ma’lumotlar tahlili asosida quyosh elektr stantsiyasining asosiy ko‘rsatkichlari aniqlangan (2-jadval). O‘rtacha kunlik energiya ishlab chiqarish 20 140 Wh ni tashkil etgan, bu esa 5 kVt quvvatli panel uchun taxminiy nazariy qiymat (25 000 Wh)dan 19,4% past. Ushbu farqning asosiy sabablari: ob-havo sharoitlari (bulutlilik, chang), harorat ta’siri va panellarning eskirishi.

2-jadval. Asosiy statistik ko‘rsatkichlar

Ko‘rsatkich	Qiymat
Jami o‘lchov kunlar soni	204 kun
Jami soatlik o‘lchovlar	2 197 ta
Quyoshli kunlar ulushi	66,2% (135 kun)
Bulutli kunlar ulushi	24,5% (50 kun)
O‘rtacha kunlik energiya	20 140 Wh
Eng yuqori kunlik energiya	43 500 Wh (2021-yil, aprel)
Eng past kunlik energiya	1 107 Wh (2021-yil, yanvar)
Maksimal soatlik quvvat	3 337 W (2021-yil, 23-aprel)
O‘rtacha samaradorlik	14,8%
Aniqlangan anomaliyalar	8 ta

Soatlik tahlil natijasida quyosh paneli kunlik ishlash profili aniq ko‘rindi: panel 08:00 da ishlashni boshlaydi, 11:00-13:00 soatlar orasida maksimal quvvatga erishadi va 18:00 gacha ishlab chiqarishni to‘xtatadi. Bu klassik «qo‘ng‘iroq shakli» profili O‘zbekistonning geografik joylashuviga (40,78° shimoliy kenglik) mos keladi.

Har xil ob-havo sharoitlarida energiya ishlab chiqarish o‘rtacha ko‘rsatkichlari tahlili (3-jadval) quyosh radiatsiyasi va ob-havo holati o‘rtasidagi bevosita bog‘liqlikni tasdiqlaydi.

3-jadval. Ob-havo holati bo‘yicha energiya ishlab chiqarish

Ob-havo holati	O‘rtacha energiya (Wh)	Quyoshli kunga nisbatan (%)	Kunlar soni
Tozalangan	22 998	+7,8%	4
Quyoshli	21 329	100% (asos)	135
Aralash	17 400	-18,4%	15
Bulutli	16 984	-20,4%	50
Shamolly	12 100	-43,3%	–

Eng muhim topilma: changdan tozalangan panel quyoshli oddiy kunda ishlayotgan panelga nisbatan 7,8% (1 669 Wh) ko‘proq energiya ishlab chiqargan. Bu natija tozalash tadbirlarining iqtisodiy samaradorligini isbotlaydi: yiliga 4 marta tozalash operatsiyasi (taxminan 40 000 so‘m) 24 500 Wh qo‘shimcha energiya beradi, bu esa 12 250 so‘m qo‘shimcha daromadga to‘g‘ri keladi.

Prophet modeli 204 kunlik ma’lumotda o‘qitilgan va kelgusi 7 kunlik bashorat yaratilgan. Bashorat natijalari ob-havo holati bilan yaxshi mos keldi: tiniq ob-havo (Clear) prognoz qilingan kunda 15 508 Wh, to‘liq bulutli kunda (Clouds 100%) esa 5 644 Wh bashorat qilindi. Bu 63,6% farq haqiqiy kuzatilgan bulutli/quyoshli kun farqi bilan (20,4%) taqqoslaganda, model ekstremal ob-havo sharoitlari uchun konservativ (xavfsiz tomonli) bashorat berishini ko‘rsatadi.

Modelning growth='flat' parametri bilan sozlanishi 2022 yildan 2026 yilgacha bo‘lgan to‘rt yillik ma’lumot bo‘shlig‘i ta’sirini samarali yo‘qotdi. Bu parametrsiz model energiya ishlab chiqarishni realistik bo‘lmagan darajada 89 000 Wh gacha ko‘targan bo‘lar edi.

Aniqlangan 8 ta anomaliya ichida eng ko‘p diqqatga sazovor holatlar quyosh paneli uchun me'yorsiz past ko‘rsatkichlar qayd etilgan kunlar bo‘ldi (4-jadval).

4-jadval. Eng muhim anomaliyalar

Sana	Ob-havo	Kutilgan (Wh)	Haqiqiy (Wh)	Farq (%)
2021-01-13	Bulutli	16 984	1 107	-93,5%
2021-02-24	Bulutli	16 984	1 924	-88,7%
2021-01-14	Quyoshli	21 329	2 200	-89,7%
2021-03-17	Bulutli	16 984	2 242	-86,8%
2021-01-15	Quyoshli	21 329	9 734	-54,4%
2021-01-12	Quyoshli	21 329	11 641	-45,4%
2021-02-02	Quyoshli	21 329	12 254	-42,5%
2021-01-28	Tozalangan	22 998	17 686	-23,1%

Tahlil natijasida anomaliyalarning asosiy sabablari aniqlandi: quyoshli kunlarda (-89,7% va -54,4%) kuzatilgan keskin pasayish ulanish muammolari yoki qor qoplami ta’siri bilan izohlanishi mumkin (2021 yil yanvar oyida Andijon viloyatida qor yog‘ishi qayd etilgan). Bulutli kunlardagi chuqur anomaliyalar (-93,5%) esa oddiy bulutlilikdan kuchliroq atmosfera hodisalari – qum bo‘roni yoki qattiq yomg‘ir bilan bog‘liq bo‘lishi mumkin.

Xulosa

Ushbu tadqiqot bir nechta muhim xulosalarga olib keldi. Birinchidan, O‘zbekiston sharoitida quyosh panellarining ishlash ko‘rsatkichlari ob-havo sharoitiga juda bog‘liq: quyoshli va bulutli kunlar o‘rtasidagi energiya ishlab chiqarish farqi o‘rtacha 20,4% ni tashkil etdi. Bu ko‘rsatkich Markaziy Osiyo iqlimining xarakteristikasi bo‘lib, energetika rejalashtirish uchun muhim ahamiyat kasb etadi.

Ikkinchidan, chang ta’siri O‘zbekiston sharoitida ayniqsa muhim: tozalangan panel oddiy quyoshli kunda ishlayotgan paneldan 7,8% ko‘proq energiya ishlab chiqardi. Bu natija O‘zbekiston cho‘l iqlimida chang muammosi ayniqsa

dolzarb ekanligini tasdiqlaydi. Ishlab chiqilgan tizim ushbu ko‘rsatkichni avtomatik kuzatib, texnik xizmat jadvalini optimallashtirishga yordam beradi.

Uchinchidan, Prophet modeli 204 kunlik ma’lumot asosida mantiqiy bashorat bergan: ob-havo omilini hisobga olgan holda, tiniq kunlarda 15 508 Wh, bulutli kunlarda 5 644 Wh. Modelni yanada takomillashtirish uchun qo‘shimcha ma’lumotlar (harorat indekslari, quyosh burchagi, namlik) va chuqur o‘rganish usullari (LSTM, Transformer) qo‘llanishi mumkin.

Ushbu tadqiqotda Andijon viloyatidagi quyosh elektr stantsiyasi uchun real ma’lumotlarga asoslangan monitoring va bashorat platformasi muvaffaqiyatli ishlab chiqildi. Asosiy erishilgan natijalar:

204 kunlik, 2197 ta soatlik o‘lchov muvaffaqiyatli to‘plangan, qayta ishlangan va PostgreSQL ma’lumotlar bazasiga joylashtirilgan;

8. Django REST Framework asosida to‘liq funksional veb-platforma va API yaratilgan;
9. Prophet algoritmiga asoslangan bashorat moduli ob-havo omilini hisobga olgan holda kelajakdagi energiya ishlab chiqarishni aniq bashorat qiladi;
10. Statistik chegaralash usuli yordamida 8 ta anomal holat aniqlandi va ularning sabablari tahlil qilindi;
11. Changdan tozalash samaradorlikni 7,8% oshirishini miqdoriy tasdiqlash O‘zbekiston sharoitida texnik xizmat muhimligini ko‘rsatdi;
12. Telegram bot va PDF hisobot modullari operativ ma’lumot almashishni ta’minlaydi.

Kelajakdagi tadqiqotlar uchun quyidagi yo‘nalishlar tavsiya etiladi: LSTM va Transformer modellari asosida soatlik bashorat aniqligini oshirish, Open-Meteo API orqali quyosh radiatsiyasi bashoratini to‘g‘ridan-to‘g‘ri integratsiya qilish, hamda Kaggle solar dataset yordamida o‘quv ma’lumotlari hajmini oshirish.

Introduction

In modern conditions, the increasing volume of information processed, transmitted, and stored in automated management systems of enterprises and organizations has significantly heightened the importance of ensuring information security. In particular, key challenges include maintaining the confidentiality, integrity, and non-repudiation of authorship of electronic documents, establishing secure electronic document management systems, and ensuring high-speed processing and signing of electronic documents [1].

Currently, electronic digital signature systems form the foundation for ensuring the security of electronic document workflows. However, modern electronic document management systems typically allow documents to be processed and signed by only one user at a time. This limitation leads to increased processing and signing time when multiple users are required to sign a document. As a result, the size of the electronic digital signature grows proportionally with the number of signatories, often increasing several times. Furthermore, the verification process requires validating the signatures of all signers, which introduces additional computational overhead.

Literature Review

The rapid development of information technologies has led to increased interest in secure and efficient digital signature schemes, particularly in distributed and resource-constrained environments. Recent studies have focused on improving both the performance and security of such systems through various advanced approaches.

Recent studies have explored various approaches to improving the security and efficiency of digital signature systems. Al-Khalidi et al. propose an AI-optimized elliptic curve method with a certificate-less digital signature scheme, which reduces computational time and simplifies key management in distributed environments [2].

Abdel Hameed et al. introduce a hybrid approach combining digital signatures with steganography to ensure data confidentiality, integrity, and authenticity in medical applications [3]. Huang et al. develop an image encryption method integrating digital signatures to enhance security and robustness against attacks [4].

Additionally, Gallegos et al. demonstrate the application of digital signatures in synthetic biology, ensuring authenticity and integrity of genetic data [5].

Despite these advancements, existing approaches do not adequately address efficient multi-user digital signature generation and verification, particularly in terms of reducing signature size and computational overhead.

Therefore, this paper proposes a software solution for generating and verifying electronic digital signatures based on a public group key using the GOST R 34.10-2001 algorithm. The proposed approach aims to improve efficiency by reducing signature size and optimizing signature generation and verification processes in multi-user electronic document workflows.

Research Methodology

This study proposes a method for the generation and verification of digital signatures based on a public group key. The main objective of the proposed approach is to improve the efficiency of digital signature processes in multi-user environments by reducing signature size and minimizing verification time.

The proposed method is based on elliptic curve cryptography and utilizes the GOST R 34.10-2001 algorithm. Unlike traditional approaches, where each user generates an individual signature, the proposed method introduces a collective public key mechanism. This allows multiple users to simultaneously sign an electronic document without increasing the size of the resulting digital signature.

The mathematical foundation of the method relies on the group law of point addition on an elliptic curve defined over a finite field. These operations are used as the core cryptographic transformations for key generation, signature formation, and verification.

For m users, the method for generating a digital signature based on a public group key consists of the sequential execution of the following stages and steps.

The proposed methodology consists of the following main stages:

Stage I. Key Generation

a) Generation of users m private keys:

$$1 \le d_i \le n-1, \qquad i = 1, \dots, m.$$

d_i is the private key of the i *-th user,* n *is* order of the Elliptic Curve Group

b) Formation of individual public keys:

$$Q_i = d_i \cdot P.$$

where P is a point on the elliptic curve serving as the generator of the additive cyclic group of points. The collective public key is defined as:

$$Q_i = Q_1 + Q_2 + \cdots + Q_m.$$

Stage II. Digital signature generation based on a public group key

a) Hash computation.

The hash value of the signed electronic document M is computed, and an auxiliary parameter is defined as:

$$e = H(M)\ mod\ q$$

b) Random value generation and point computation.

Each user generates a random value k_i and computes the corresponding elliptic curve point q:

$$0 < k_i < q$$

and the computation of elliptic curve points

$$C_i = k_i \cdot P.$$

c) Addition of elliptic curve points of each user:

$$C_i = C_1 + C_2 + \cdots + C_m.$$

and the computation of the first component of the digital signature based on the public group key from the x-coordinate of point Con the elliptic curve:

$$R = x_C\ mod\ q.$$

d) Computation of the partial digital signature shares of each user

$$S_i = (Rd_i + k_i e)\ mod\ q.$$

and the computation of the second component of the digital signature based on the public group key:

$$S_i = (S_1 + S_2 + \cdots + S_m)\ mod\ q.$$

e) Formation of the digital signature based on the public group key in the form of a pair of values (R, S).

Stage III – Verification of the Digital Signature Based on a Public Group Key

a) Reconstruction of the elliptic curve point using the digital signature values (R, S), the auxiliary parameter e, and the collective public key, according to the following verification equation:

$$C' = \left((Se^{-1})\ mod\ q\right) \cdot P + \left((q - R)e^{-1}\ mod\ q\right) \cdot Q.$$

b) Computation of the parameter R' based on the , x -coordinate of point C':

$$R' = x_{C'}\ mod\ q.$$

c) Verification condition: if $R' = R$, then the digital signature is considered valid.

Results and Their Analysis

The performance of the proposed method for generating and verifying digital signatures based on a public group key was evaluated through experimental implementation. The execution time for both signature generation and verification was measured using the system clock of the computer.

A comparative analysis was conducted between the traditional approach, where each user generates an individual digital signature, and the proposed method using a public group key. The size of the input data used for signing was 265.2 KB.

Table 1 Comparative analysis of digital signature generation and verification time for traditional and public group key approaches (input data size: 265.2 KB)

Number of Users	Time for Digital Signature Generation (Traditional, ms)		Time for Digital Signature Verification (Traditional, ms)	
	Traditional (Generation)	Traditional (Verification)	Group Key (Generation)	Group Key (Verification)
1	314	340	314	340
2	628	680	513	350
3	942	1020	842	353
5	1256	1360	271	362
8	1570	1700	931	352
10	1884	2040	1301	365
12	2198	2380	681	370
15	2512	2720	1351	353
18	2826	3060	815	350
20	3140	3400	1072	347
25	3454	3740	1090	332

As can be seen from Table 1, in the traditional approach, the time required for generating and verifying digital signatures increases proportionally with the number of users signing the document.

In contrast, the verification time of the digital signature based on a public group key is practically independent of the number of users participating in the signing process.

Therefore, the proposed method for generating and verifying digital signatures based on a public group key provides two key advantages. First, it enables multiple users to simultaneously work with and sign a single document. Second, it reduces the time required for both signature generation and verification.

Conclusion

This paper presents a method for generating and verifying digital signatures based on a public group key using the GOST R 34.10-2001 algorithm. The proposed approach enables multiple users to simultaneously sign an electronic document while maintaining a constant signature size, regardless of the number of participants.

The method is based on elliptic curve cryptography and a collective key mechanism, which eliminates the need to generate and verify multiple individual signatures. This simplifies the verification process and reduces computational overhead.

Experimental results show that, unlike the traditional approach, where both generation and verification times increase with the number of users, the proposed method ensures that verification time remains nearly constant. In addition, the generation time is optimized through the aggregation of computations.

Therefore, the proposed method improves the efficiency, scalability, and practicality of digital signature systems in multi-user environments and can be effectively applied in electronic document management systems.

Sohibqiron Amir Temurning sevimli nevaralaridan biri, buyuk davlat arbobi va qomusiy olim Mirzo Ulug'bek (1394–1449) jahon ilm-fani tarixida alohida o'rin egallaydi. U riyoziyot, falakiyot, musiqa va tarix sohalarida yuksak ilmiy meros qoldirgan. Asl ismi Muhammad Tarag'ay Mirzo bo'lgan Ulug'bek 1394-yilda Sultoniya shahrida tavallud topgan.

Ulug'bek yoshligidanoq saroy muhitida yetuk olimlar va mutafakkirlar ta'sirida tarbiya topib, chuqur bilim egasiga aylandi. Ayniqsa, Qozizoda Rumiy, G'iyosiddin Jamshid Koshiy, Ali Qushchi kabi allomalar bilan birgalikda Samarqandda yirik ilmiy maktabni shakllantirdi. Uning ilmiy faoliyati natijasida Samarqand XV asrda jahon ilm-fan markazlaridan biriga aylandi.

Sohibqiron Amir Temurning sevimli nevaralaridan biri, riyoziyot, falakiyot, musiqashunoslik va tarix ilmlari sohasida qalam tebratgan davlat arbobi asli ismi Muhammad Tarag'ay Mirzo Ulug'bek (1394-1449) Amir Temurning Eron va yaqin Sharqqa qilgan "besh yillik" yurishi paytida Ajam Iroqining Sultoniya shahrida 1394-yilda dunyoga keladi. Otasi – Amir Temurning kenja o'g'li Shohrux Mirzo, onasi – Gavharshodbegim. Uning tarbiyasi shaxsan bobosi sohibqiron Amir Temur tomonidan nazorat qilinib, buvisi Saroymulkxonim enagaligida olib boriladi. Mirzo Ulug'bek saroydagi eng yirik olimlar: Mavlono Ahmad, Qozizoda Rumiy va boshqalardan saboq oladi. U qadimgi yunon, Sharq olimlarining asarlarini qunt bilan o'rganadi. Mirzo Ulug'bek, ayniqsa, tabiatshunoslik fanlarini matematika, geometriya, geografiya, kimyo, astronomiyaga oid bilimlarni chuqur egallaydi. Natijada, yigirma yoshlarida o'z davrining yirik olimlaridan biri bo'lib yetishadi.

Ulug'bek u vaqtlar o'lchovi bilan qaraganda, juda zo'r ta'lim olgan. Ajoyib xotira egasi bo'lib, u arab va fors tilini erkin egallagan, turk she'riyatini yaxshi bilgan, adabiy uslublarni egallagan va adabiy bahslarda ishtirok etgan. O'zi ham she'rlar yozgan. Ulug'bekning ustozi taniqli olim, Temuriylar saroyidagi mashhur matematik va astronom Qozizoda Rumiy bo'lgan. U to'qqiz yasharli Ulug'bekka Marog'adagi mashhur rasadxona xarobalarini ko'rsatgan. Yoshlikdagi aynan shu xotiralari bo'lajak astronom kelajagini belgilagan bo'lishi mumkin. Ulug'bek davrida Samarqand o'rta asrlar

davridagi ilm-fan o‘choqlaridan biriga aylangan. Samarqandda, XV asrning birinchi yarmida Ulug‘bekning atrofida G‘iyosiddin Jamshid Koshiy, Qozizoda Rumiy, Ali Qushchi kabi taniqli astronom va matematiklarni birlashtirgan butun bir ilmiy maktab vujudga keldi. U vaqtlar Samarqandda O‘rta Osiyo tarixi haqida ajoyib asar yozgan tarixshunos Hofiziy Abru, taniqli shifokor Mavlono Nefis, shoirlar Sirojiddin Samarqandiy, Sakkokiy, Lutfiy, Badaxshiy va boshqalar yashagan. Ular insoniyat aqli, fanning kuchiga ishongan o‘z davrining ilg‘or shaxslari bo‘lishgan.

Mirzo Ulug'bek 1411-yilda otasi Shohruh Mirzo tomonidan Movarounnahr va Turkistonning hokimi qilib tayinlanadi. U hokimlik qilgan davrlarda, mamlakat tashqi va ichki mudofaasini mustahkamlash bilan bir qatorda, Samarqand, G'ijduvon, Buxoro shaharlarida ko'plab madrasalar, masjidlar, turli ilm o'choqlari qurdirib, ilm-fanning rivojlanishiga katta e'tibor beradi.

Mirzo Ulug'bek ilmiy kuzatishlar olib borish va madrasada falakkiyot ilmidan va'z aytish bilan birga madaniy-maishiy ishlarga ham jiddiy e'tibor bergan. O'nlab madrasa, xonaqoh, masjid, karvonsaroylar qurdirgan. Oldinroq boshlangan Bibixonim masjidi, Go'ri amir maqbarasi, Shohi zinda ansamblining qurilishini nihoyasiga yetkazgan.

Mirzo Ulug'bek o'z atrofiga o'z davrining “Aflotuni” deb nom qozongan mashhur matematik, astronom Qozizoda Rumiy va taniqli olimlar Ali Qushchi, Mansur Koshiy, Ali ibn Muhammad Birjandiy, Miram Chalabiy, G'iyosiddin Jamshid, Muhammad ibn Umar Chag'niniy kabilarni to'plagan. Ulug'bek shu olimlar ishtirokida kengashlar o'tkazib matematika, astronomiya, geometriya fanlari yuzasidan tadqiqotlar olib borgan.

1425-1428-yillarda Mirzo Ulug'bek Samarqandda, keyinchalik uning nomini jahonga mashhur qilgan rasadxona observatoriyani qurdirib, o'zining falakiyot maktabini yaratadi. U o'zining bu maktabiga o'z zamonasining eng buyuk olimlarini jalb qilib, ularga o'zi boshchilik qilgan holda, ilmiy tadqiqotlar olib boradi.

Mirzo Ulug'bek falsafasida moddiylik va ma'naviylik mujassam edi. Ulug'bek 1437-yilda “Ziji Ko'ragoniy” risolasini yozib tugatgan. Uning asari hozirgacha olimlar qo'lidan tushmaydi. O'z rasadxonasida ijod qilib, 1018 ta yulduzning muvozanatini aniqlagan.

Mirzo Ulug'bekning “Ziji Ko'ragoniy” asari nazariy-kirish qism va to'rtta katta bobdan iborat. Birinchi bobida muallif xitoylar, hindlar, greklar, eroniylar va boshqa xalqlarning kalendarlari bilan tanishib, o'z fikrlarini bildiradi. Ikkinchi bobda esa amaliy astronomiya, uchinchi bobda sayyoralar nazariyasi va to'rtinchi bobda astrologiya haqida o'z fikrlarini bildiradi. Uzoq yillar kuzatish va ilmiy tekshirishlar natijasida Ulug'bek fazodagi sir-asrorlarni ijod qilishda, yil, hafta va kecha-kunduzlarni belgilashda ulkan yutuqlarga erishadi. O'zidan oldin o'tgan Erotosfen, Gipparx, Ptolomey, Batonniy, ibn Yunus, Nosiriddin Tusiy va boshqa astronomlarning bu sohadagi yutuqlarini orqada qoldirgan edi.

“Ziji Ko'ragoniy” asaridan tashqari, Ulug'bek, “Bir darajaning sinusini aniqlash haqida risola”, “Risola-dar ilmu musiqa” asarlarini ham yozib qoldirgan. Ulug'bek ijodi dunyoviy falsafa bo'lib, jahon tabiatshunosligi, ijtimoiy fanlarini rivojlantirishda muhim hissadir.

Mirzo Ulug'bek jahonda teleskopgacha bo'lgan astronomiyaning buyuk olimi, ko'p nazariy kashfiyotlar qilgan. Gap shundaki, ularning hammasi ilmiy kuzatishdan, ilmiy eksperimentdan boshlangan. Kuzatish deganda, oddiy ko'z bilan yoki mikroskop va texnika bilan tabiiy yoki jamoa jarayonlarini ko'rib borish tushunilishi mumkin. Lekin, laboratoriya yoki observatoriya sharoitidagi kuzatish - bu eksperimentdir. Ulug'bek Quyosh, planetalar, yulduzlarni o'zi qurdirgan Samarqand astronomiya observatoriyasidagi o'sha zamon ilmiy asboblari yordamida olib bordi. Qozizoda Rumiy, G'iyosiddin al-Koshiy, Ali Qushchi va boshqa taniqli astronomlar hamda shogirdlar bu ishlarni tadrijiy ravishda bajardilar.

Bundan tashqari, rasadxonada ekliptikning ekvatorga qiyaligi va yulduz yilining uzunligini belgilash; sinusning bir burchakdagi ahamiyatini - muhim astronomik doimiylikni - verguldan so‘ng o‘n sakkizinchi belgigacha aniqlikda hisoblash bo‘yicha ishlar olib borilgan.

Ulug‘bek o‘z ma’lumotlarini bir necha bor tekshirib, uning sonlarini to‘g‘ri, degan xulosaga keladi. 1437-yil u astronomik yil uzunligini aniqlaydi: 365 kun 6 soat 10 daqiqa 8 soniya. Keyinroq o‘zgarishlar farqi 58 soniyada ekanligi aniq bo‘lgan. Agar astronomik yil uzunligi 31 million 558 ming 150 soniya ekanligini inobatga olsa, Ulug‘bek o‘z o‘lchamlarini naqadar yuqori aniqlikda olib borganligiga amin bo‘lish mumkin.

Buyuk olim bo‘lish bilan birga, Ulug‘bek kuchsiz sarkarda edi. Asosiy vaqtini rasadxonada o‘tkazar edi va davlat ishlariga kam vaqt ajratgan. Ulug‘bekning to‘ng‘ich o‘g‘li Abdulatif, ruhoniylarning keskin ta’siri ostida otasiga qarshi urush e’lon qiladi. O‘g‘li otasiga Makka ziyoratiga borishlikni taklif qiladi. 1449-yil Makkaga safari chog‘i Ulug‘bek shariat qaroriga muvofiq, xoinona o‘ldiriladi.

Buyuk Ulug‘bekning fojiali o‘limidan so‘ng, uning yorqin yulduzi so‘nmadi. Ulug‘bekning sodiq shogirdi Ali Qushchi, ona Samarqandini tark etishga majbul bo‘lib, Ulug‘bekning “Zidjiy Ko‘rag‘oniy” kitobini Ovrupaga olib chiqib ketadi. Keyinchalik kitob ko‘plab olimlar avlodining mulkiga aylandi. Ulug‘bekning ismi va mehnatlari Ovrupa va Osiyo olimlari orasida mashhur bo‘ldi. XVII asrda Yan Geveliy tomonidan nashr etilgan Ulug‘bekning “Yulduzli osmon turkumi”da turli zamon va makonlarda yashab o‘tgan buyuk dunyo astronomlarining aksi tushirilgan naqsh mavjud. Ular astronomiya ilhom manbai bo‘lmish Uraniyaning ikki tomonida stol qarshisida o‘tirishgan holda aks ettirilgan. Ular orasida Ulug‘bek ham bor. Nashq muallifi Ulug‘bekni portretiga ega bo‘lmay, uning suratini tushirgan.

Ulug‘bekning asosiy ilmiy mehnati “Zidjiy jadidi Ko‘rag‘oniy” hisoblanadi yoki “Gurgonning yangi astronomiy jadvali” deb nomlanadi. Muallif ushbu asarni 1444-yil, o‘ttiz yillik tirishqoqlik va astronomik kuzatuvlardan so‘ng yakunlagan. Astronomik ma’lumotnoma tez orada, Klavdiya Ptolemeyning “Almagest” hamda butun Ovrupa rasadxonalarida qo‘llanma hisoblangan kastiliya qiroli Alfons XVning astronomik jadvali bilan bir vaqtda lotin tiliga o‘girilgan.

Mazkur jadvallarning aniqligi avvalroq Sharqda hamda Ovrupada erishilgan yutuqlardan ilgarilagan. XVII asrga kelibgina, Tixo Brag samarqandlik kuzatuvlarga teng keladigan aniqlikka muvaffaq bo‘lib, keyinroq, undan ham aniqroq natijaga erishgan. “Ulug‘bekning Zidji” Sharqda bo‘lgani kabi, Ovrupa astronomlarining diqqatini o‘ziga tortganligining hayratlanarli yeri yo‘q.

“Ulug‘bekning Zidji” to‘rt yirik qilsmdan iborat. Xronologiya nomini olgan birinchi qismida turli Sharq xalqlari tomonidan qabul qilingan xronologik usullar bayon etilgan. Ikkinchi qismida amaliy astronomiya masalalari ifodalangan, uchinchisi — dunyoning geomarkaziy tizimi asosida ko‘zga ko‘rinarli yulduzlar harakati haqida ma’lumot bersa, to‘rtinchisi astrologiyaga bag‘ishlanadi — o‘rta asrlar dunyoqarashi fanining muqarrar taqdiri.

Ulug‘bek hisoblab chiqqan 1018 yulduz turkumi qadimiy xronogiyani o‘rganuvchi astronomlar va tarixshunoslar uchun kompas vazifasini o‘taydi. Ulug‘bekning yulduzlar jadvali “Almagest”da keltirilgan Ptolomeyning yulduzlar xaritasining haqiqiyligini tasdiqlaydi.

1648-yil Oksfordda — fan va madaniyatning eng qadimiy o‘choqlaridan bo‘lmish Angliyada ilk bor Ulug‘bekning mashhur Samarqand rasadxonasida amalga oshirilgan asosiy ishi qisman nashr etilgan. Ishni nashr uchun tayyorlab, unga sharh yozgan Jon Grivs (1602-1652), Oksford universitetining astronomiya professori. Keyinchalik, turkum lavhalari Angliyada bir necha bor chop etilgan.

Ilk oksfordlik nashrdan 17 yil o‘tgach, olim, Oksforddagi Bodleyansk kutubxonasi qo‘riqchisi, angliyalik sharqshunos va tarjimon Tomas Xayd (1636-1703) samarqandlik nashrni fors va lotin tillarida yangi nashr uchun tayyorlab, “Tabulae Long, as Lat. Stellarum Fixarum, ex observatione Ulugh Beighi”, Oxonii nomlari ostida chop etgan, 1665.

Ulug‘bek jadvallarining Ovrupada chop etilishi, shu o‘rinda, tuzish uchun ulkan va sermashshaq kuzatuv va hisob mehnatini talab qiluvchi o‘ziga xos yulduzlar katalogi sanoqli shaxslar tomonidan hisoblangan va osmon tadqiqotchilari tomonidan yuqori baholangan.

Xaydning oksfordik nashridan 25 yil o‘tgach, Ulug‘bek jadvalining ma’lumotlari polyak astronomi Yan Geveliyning (1611-1687) Gdanskda chop etigan “Prodromus Astronomiae” kitobi sahifalaridan joy oladi. Bu yerda o‘z vaqtida mavjud bo‘lgan turkumlardagi ma’lumotlar o‘rtasida taqqoslash keltirilgan: Ptolemey, Tixo Brag, Richchioli, shahzoda Gass va Geveliy.

1839-yil fransuzs sharqshunosi L.A.Sediyo (1808-1876) Ulug‘bek jadvalini “Tables astronomigue d'Oloug Beg, commentees et publiees avec le texte en regard” nomi ostida qisman chop ettiradi, I bob, I bo‘lim, Parij, 1839.

Va, nihoyat, Buyuk Britaniya kutubxonalarida saqlangan 8 ta qo‘lyozmani o‘rganish asosidagi Ulug‘bek jadvalining aniqroq tahlili 1917 yil AQShda E. B. Nobl tomonidan “Ulugh Beg's Catalogue of Stars. Revised from all Persian Manuscripts Existing in Great Britain” nomi ostida chop etilgan.

Aytish joizki, Ovrupa va Osiyo kitob saqlanuvchi omborlarda “Zidjiy”ning o‘nlab qo‘lyozmalari mavjud. Ulug‘bekning yulduzlar jadvali o‘rta asrlar astronomiyasining so‘ng so‘zi bo‘ldi. Mazkur jadval teleskop ixtirosidan avvalgi, o‘rta asrlar astronomiya fanining eng yuqori poyasi bo‘ldi.

Ulug‘bekning boy ilmiy merosi u faqatgina buyuk musulmon o‘g‘loni bo‘lmaganligini tasdiqlaydi. Ijodiy tafakkur dahosi butun insoniyat ilm-fani va sivilizatsiyasi rivojiga bebaho hissa qo‘shgan. Shu sababli, ko‘p asrlar o‘tib, hatto bugun ham Ulug‘bekning ismi savob maqsadlarga erishish niyatida Sharq va G‘arb xalqlarini birlashtirgan timsol bo‘lib qoladi.

Mirzo Ulug'bek ilmiy ijodining o'ziga xos xususiyati shundan iboratki, u ilmiy ishlarini voqealarni kuzatishdangina emas, balki oldin o'tgan olimlarning kuzatish natijalarini o'rganib ularni tanqid qilishdan boshladi. Bor kuzatuv xulosalarini to'qqa va puchga ajrata oldi. Uning yana bir xususiyati shuki, osmon jismlarini kuzatish uchun observatoriya qurish zarurligini payqab, uning konstruksiyasini fikran eksperiment yordamida aniqladi, osmon meridiani va quyosh ekliptikasi o'rinlarini aniqladi, koordinata sistemasi barcha elementlarini fikran va amalda o'rnatdi. Observatoriya ishga tushdi.

Kuzatish ob'ektlari – Quyosh, Oy, planetalar va yulduzlar, sub'ektlari Ulug'bek va boshqa kuzatuvchilar, kuzatish vositasi – sekstant. Ularning hammasi birgalikda kuzatish tizimini tashkil qildilar.

Mirzo Ulug'bek kuzatishlari tabiiy hodisalarni odam tomonidan yaratilgan jahonda dastlabki mukammal sun'iy inshootlar orqali fandagi in'ikosidir. Kuzatishdan boshlab nazariy mavqegacha yetmagan usulni goho empirik usul ham deb yuritildi. Uning ma'nosi shuki, nazariy jihatdan bayon etilishi qiyin bo'lgan jarayonlarni eksperiment yordamida qonunlashtirish. Tajriba yo'li bilan aniqlanadigan voqealar. Ko'p faktorli hodisalarning me'yori bo'lgan optimal parametrlar bo'yicha bog'lanishlarni tajribaviy tadqiq qilish.

Empirik usul quyidagi shakllarda namoyon bo'ladi: a) bevosita, yuzaki ifodalash. Tarixiy voqealarni, hodisalarni, esdaliklarni dastlabki mantiqiy bayon etish. Botanika, arxeologiya moddiy faktlarini dastlabki o'rganish; b) grafik usul - sodda va oson.

Parametrlar orasidagi munosabatlarni yaqqol ko'rsatadi; v) ekstra- intrapolyatsiya usuli eksperiment yordamida hosil bo'lgan sonlar va raqamlarni qayta ishlaydi. Analitik va kelgusidagi voqealarni oldindan bilishda ishlatiladi. Ko'pincha eksperiment qilish imkoniyati yo'q hollarda ham ishlatiladi" .

Shunday qilib, Mirzo Ulug'bek astronomik ilmiy maktabining erishgan tabiiy-ilmiy va falsafiy qarashlari Ali Qushchidan keyin Markaziy Osiyodan tashqarida Hindiston, Eron, Turkiyada, G'arbiy Yevropada esa XVI asrdan boshlab davom ettiriladi va rivojlantiriladi.

Mirzo Ulug'bek haqida yuzlab asarlar mavjudki, ularda u donishmand faylasuf, adolatli sulton, ijodkor ustoz sifatida madh etiladi. Alisher Navoiyning "Farhod va Shirin" dostonida "Ulug'bek madhiyasi" degan maxsus bob mavjud.

Ulug'bek davri madaniy tarixshunosligini o'rganar ekanmiz, buyuk bobomiz davlat arbobi, tarixchi, astronom olim Mirzo Ulug'bek tarixshunosligi tarixchi olimlar tomonidan atroflicha yoritilganligini ko'rishimiz mumkin. Mirzo Ulug'bekning o'zi tomonidan yaratilgan "To'rt ulus tarixi" asari bugungi kunda biz uchun buyuk bir tarixiy manba sifatida qancha qadirlasak arziydi.

Mustaqillikka erishganimizdan so'ng, buyuk allomalarimizning tarixiy merosiga alohida e'tibor qaratila boshlandi. 1994-yilda O'zbekiston Respublikasi Prezidenti farmoni bilan yurtimizda Mirzo Ulug'bek tavaludining 600 yilligi katta tantanalar bilan nisholandi. YuNESKO qarori asosida Parijda ilmiy xalqaro konferensiya bo'lib o'tdi.

Mirzo Ulug'bek nafaqat Temuriylar sulolasining yirik davlat arbobi, balki jahon ilm-fani taraqqiyotiga beqiyos hissa qo'shgan buyuk qomusiy olim sifatida tarixda o'chmas iz qoldirgan. Uning "Ziji Ko'ragoniy" asari hamda Samarqand rasadxonasida olib borilgan ilmiy tadqiqotlari astronomiya fanini yangi bosqichga olib chiqqan. Ulug'bek va uning ilmiy maktabi tomonidan olib borilgan kuzatishlar yuqori aniqligi bilan ajralib turadi va keyingi asrlarda ham Sharq hamda G'arb olimlari tomonidan keng qo'llanilgan. Uning ilmiy merosi bugungi kunda ham insoniyatning bebaho ilmiy va madaniy boyligi sifatida o'z ahamiyatini saqlab kelmoqda.

Shu bois, Mirzo Ulug'bek shaxsi va uning ilmiy faoliyatini o'rganish ilmiy hamda tarixiy jihatdan muhim ahamiyat kasb etadi.

SOVET HUKUMATINING 20-30 YILLARDA AMALGA OSHIRILGAN TARG‘IBOT-TASHVIQOT ISHLARI TARIXIDAN

Muhammadiyev Bilol Ismoil o‘g‘li
Namangan davlat universiteti Ijtimoiy fanlar fakulteti tarix yo‘nalishi talabasi
E-mail: bilolmuhammadiyev640@gmail.com

Annotatsiya: *Mazkur maqolada Sovet hukumati O‘zbekistonda o‘z hokimiyatini mustahkamlash yo‘lida amalga oshirilgan targ‘ibot-tashviqot ishlari xususida so‘z yuritilgan. Maqola mavzusini tadqiq etishda adabiyotlar atroflicha tahlil qilinib keltirilgan, faktlar xulosalangan. Sovet hokimiyati boshqaruvining asosiy qurollaridan biri hisoblanmish targ‘ibot kompaniyalarining maqsadlarini ochib berilgan. Sovetlarning mafkuraviy tashviqot ishlarining samarali usullari o‘rganilib tahlil qilindi. Shuningdek, mazkur targ‘ibot-tashviqot ishlarida komunistik mafkura dohiylari sifatida e'tirof etilgan shaxslarning bo‘rttirilgan ma'lumotlaridan keng foydalanilganligiga alohida e'tibor qaratilgan.*

Kalit so‘zlar: *Rossiya imperiyasi, sovet hokimiyati, bolsheviklar, “baynalminalchilik”, “Glavlit”, Proletar, “vatanparvarlik”, “xalqlar dohiysi”, tobelik, itoatkorlik, ruslashtirish.*

ИЗ ИСТОРИИ ПРОМОЦИОННОЙ РАБОТЫ СОВЕТСКОГО ПРАВИТЕЛЬСТВА В 20-30-Е ГОДЫ

Аннотация: *В данной статье рассматривается пропагандистская работа, проводимая советским правительством в Узбекистане для укрепления своей власти. При изучении темы статьи был проведен тщательный анализ литературы и обобщены факты. Выявлены цели пропагандистских кампаний, которые считались одним из главных инструментов советского правительства. Изучены и проанализированы эффективные методы идеологической пропагандистской работы советских властей. Также особое внимание уделено широкому использованию в этих пропагандистских работах преувеличенной информации от лиц, признанных гениями коммунистической идеологии.*

Ключевые слова: *Российская империя, советская власть, большевики, “интернационализм”, “главлит”, пролетарство, “патриотизм”, “гений народа”, подчинение, повиновение, русификация.*

FROM THE HISTORY OF THE SOVIET GOVERNMENT'S PROPAGANDA WORK IN THE 20-30S

Abstract: *This article discusses the propaganda work carried out by the Soviet government in Uzbekistan to strengthen its power. In studying the topic of the article, the literature was thoroughly analyzed and the facts were summarized. The goals of propaganda campaigns, which were considered one of the main tools of the Soviet government, were revealed. Effective methods of ideological propaganda work of the Soviets were studied and analyzed. Also, special attention is paid to the widespread use of exaggerated information from individuals recognized as geniuses of communist ideology in these propaganda works.*

Keywords: *Russian Empire, Soviet power, Bolsheviks, “internationalism”, “Glavlit”, Proletarian, “patriotism”, “genius of the people”, subordination, obedience, Russification.*

Kirish.

O‘zbekiston tarixining sovet hokimiyati hukmronlik qilgan yillari (1917-1991-yillar) xalqimiz tarixida o‘zining qarama-qarshiliklari va murakkabligi bilan alohida o‘rin tutadi. 1917- yilning oktyabr oyida bolsheviklarning davlat to‘ntarishi orqali hokimiyatga kelishi bilan Rossiya imperiyasi boshlagan mustamlakachilik siyosati yangi shaklda davom eta boshladi.

Oktyabr oyidagi harbiy to‘ntarish orqali hokimiyatni egallab olgan sovetlar hukumati O‘rta Osiyo hududlarida mustamlakachilik tartib-qoidalarini mustahkam poydevor asosida qurish uchun ikki xil kurash yo‘lini tanlab olganliklari ma'lum.

Birinchi yo‘l, istiqlol va milliy ozodlikka intilgan tub yerli aholini zo‘rlik va kuch bilan bostirish, ularni qirib bitirishdan iborat. Bu yo‘lni sovetlar tish-tirnog‘igacha zamonaviy harbiy qurollar bilan ta'minlangan qizil armiya yordamida amalga oshirdilar. Bu yo‘l XX asrning 30-yillari o‘rtalarigacha davom etdi.

Ikkinchi yo'l mafkuraviy jabhada olib borildi. Bundan sovetlar hukumati va kompartiya keng mehnatkashlar ommasining ongiga tinch yo'l bilan kurashish vositalari orqali, ya'ni g'oyaviy-siyosiy va mafkuraviy ta'sir ko'rsatish yo'lidan bordi[1, 246].

Bolsheviklar rejimi 75 yil davom etgan hukmronlik yillari davomida sovet kishisi hayot tarzining bir bo'lagi bo'lgan targ'ibot va tashviqot mexanizmini yarata oldi.

Xalqlar "dohiysi" V. I. Leninning "Butun dunyo proletarlari birlashingiz!" shiorining o'ziyoq qurilajak davlatning targ'ibot mashinasini yurgizib bergan edi. "Partiya ishi va partiya adabiyoti", "adabiyot ishi", ya'ni ommaviy axborot vositalari, kitob va kino ham yagona "umumproletar ishi" ning harakatga keltiruvchilari edi[2,2].

Sovet hukumati O'zbekistonda ham "shaklan milliy va mazmunan sotsialistik" tuzum va madaniyat yaratish uchun barcha vositalarni qo'lladi.

Adabiyotlar tahlili va metodlar.

Maorif, fan, adabiyot, san'at va ommaviy axborot vosilari orqali insonlar ongidan barcha milliylikni siqib chiqarib, "sosialistik", "baynalminalchilik" qobig'iga o'ralgan, aslida esa qullik, tobelik, itoatkorlik, ruslashtirish-assimilyatorlik mafkurasi bosqichma-bosqich tizimli tarzda singdirib borildi[2,2].

Ayniqsa, targ'ibot uchun ko'rgazmali maktablarning tashkil etilishiga katta e'tibor berildi. Masalan 1919-yilda Toshkentning eski shahar qismida, Beshyog'ochda Almayi nomidagi 1- va 2- bosqich maktabi ochildi. Uning huzurida maktab-internat ham bor edi. Mashg'ulotlar shunday tashkil qilindiki, milliy asoslardan uzilgan holda, yangi g'oyalarni singdirishini asosiy maqsad qilib qo'yilgan edi.

O'zbek tilidagi darsliklar rus tilidagi darsliklarga qaraganda bir necha baravar ko'p edi. Lekin o'quv adabiyotlari bilan bir qatorda, Marks, Troskiy, Lunacharskiy portretlari, ya'ni sof targ'ibotchilik tarzidagi o'quv vositalari ham ko'plab miqdorda bosilib chiqdi[3, 141].

Sovet davlati 1922-yilda "Glavlit" tashkilotini tuzdi. Aynan ushbu tashkilot keyingi yillar davomida ommaviy axborot vositalari ustidan to'liq nazoratni amalga oshirdi. "Glavlit" xodimi har bir nashrni kuzatib boradigan, har bir so'z va murojaatni filtrdan o'tkazadigan ulkan tizim yaratildi.

1939-yilda "Glavlit" xodimlar soni 6027 kishini, 1947-yilga kelib esa 6453 kishiga ortgani nazoratning qanchalik keng qamrovda olib borilganidan dalolat beradi[4,3].

Natijalar va muhokama.

Targ'ibotning eng ta'sirchan vositasi adabiyot sohasiga katta e'tibor berildi. O'zbekiston kommunistik partiyasi o'zlari tomonidan tashkil etilgan "Qizil qalam" jamiyati o'rniga O'zbekiston Proletar yozuvchilar uyushmasini tashkil etdilar. Yuqoridagi tashkilotning nomlanishi ham partiya targ'iboti uchun xizmat qilganligini anglatib turibdi. Bundan tashqari, asosiy targ'ibot, ya'ni sovet tuzumi uchun kerakli va so'zsiz bo'ysunadigan avlodni yaratish maqsadida yasli va bog'cha yoshidanoq "vatanparvarlik" ruhidagi she'r va qo'shiqlar, shior va plakatlarlar bolalar ongiga singdirib borildi. Bu jarayon maktablarda, oliy o'quv yurtlarida, pioner otryadlarida, komsomol tashkilotlarida davom ettirildi.

20-30-yillarda sovet tuzumi targ'iboti bilan shug'ullanish uchun maxsus tashkilotlar va bo'limlar faoliyat ko'rsata boshladi. Kompartiyaning targ'ibot va tashviqot bo'limi butun sovet davri tarixida targ'ibot va tashviqot ishlariga boshchilik qilgan eng oliy organ sifatida muhrlanib qoladi.

Bundan tashqari, "xalqlar dohiysi" V. I. Lenin topshirig'i bilan sovet hukumatining dastlabki paytlaridayoq Siyosiy o'qish Bosh Boshqarmasi tashkil etilgan edi. 1935 yil may oyida Stalin ushbu tashkilotni beshta bo'limga, ya'ni nashr va nashriyotlar, partiya targ'ibot va tashviqoti, maktab, fan, madaniy va ma'rifiy ishlar bo'limiga ajratdi[5,159].

Sovet hukumati o'z hukmronligining dastlabki yillarida partiya siyosatini targ'ibot qilishda ommaviy axborot vositalaridan keng foydalandi. Turkistonda oktyabr inqilobidan keyin milliy nashrlarni qisqartirishga kirishildi. Gazeta va jurnallarning xilma-xil yo'nalishi bolsheviklar g'oyasibilan singdirilgan bir xillikka almashdi.

1918-1920-yillar davomida mahalliy aholi tillarida va rus tilida bolshevikcha ruhdagi bir necha o'nlab gazeta va jurnallar nashr etildi[3,151]. Ommaviy nashrlar, radio partiya apparatining quroli sifatida, jurnalistlar esa "g'oyaviy frontdagi ofitserlar" sifatida taqilindi.

Matbuotga ommaviy targ'ibot va tashviqot vositasi degan qarash shakllanib bordi. Natijada ommaviy axborot vositalariga siyosiy tizimni mustahamlash va ommaviy g'oyaviy tarbiyalashning targ'ibotchisiga aylantirildi. Stalin ushbu masala bo'yicha to'g'ridan-to'g'ri bunday degan edi: Nashrlar bu shunday narsaki, gazeta, jurnal va broshyuralar dunyodagi eng yaxshi targ'ibotdir.

"Jahonda gazeta, jurnal, va broshyuralardan ko'ra yaxshi targ'ibot vositasi mavjud emas. Nashrlar u yoki bu haqiqatni butun omaga ishontira oladi.'

Xulosa.

Stalin bu yerda u yoki bu haqiqatni deganda bizning xalqimiz boshidan kechirgan tarixning achchiq "haqiqatlar"ini nazarda tutgan bo'lsa ajab emas. Sovet targ'ibot mashinasi shunchalik darajada ish olib bordiki, buning natijasiga tarixning o'zi guvohdir.

1922-yilda 232 ta gazeta nashr qilingan bo'lsa, 1932-yilga kelib SSSRda 7,5 mingdan ortiq gazeta nashr qilina boshladi. 1940-yilga kelib ularning soni 8,8 mingga yetdi[6,371].

O'rganilayotgan tarixiy davrda jamiyatning barcha sohalari ustidan partiyaning to'liq hukmronligi o'rnatildi. Fan va madaniyat, adabiyot va san'at hamda ommaviy axborot vositalari

Kompartiyaning targ'ibot va tashviqot ishlariga to'liq jalb etildi. Oqibatda milliy madaniyat, milliy ma'naviyatdan chekinish hamda kommunistik ruhdagi g'oyalarni singdirish avj oldi.

"FATOVO AT-TAFTOZONIY" NASHRI XUSUSIDA

Zafar Najmiddinov
Diniy-ma'rifiy sohada malaka oshirish va qayta tayyorlash institutining
Namangan mintaqaviy filiali dotsenti, tarix fanlari nomzodi

Annotatsiya: *Sa'd ad-din at-Taftozoniy XIV asr islom tarixida yorqin iz qoldirgan shaxsiyatlardan biridir. Olim o'nga yaqin asar muallifi bo'lib, hanafiy fatvolar to'plami ulardan biri hisoblanadi. Uzoq yillar mobaynida mazkur asar yo'qolgan, deb hisoblanar edi. Tadqiqot muallifi "Fatovo at-Taftozoniy"ning 2017 yilgi nashrini tahlil qilgan va nashr xususidagi tanqidiy fikrlari bilan o'rtoqlashgan.*

Kalit so'zlar: *Hanafiy fiqhi, Amir Temur, islom qo'lyozmalari, fatvo, urf-odat, zimmiy*

О ПУБЛИКАЦИИ (ИЗДАНИИ) „ФАТОВО АТ-ТАФТАЗОНИЙ"

Аннотация: *Са'д ад-Дин ат-Тафтазани является одной из выдающихся личностей, оставивших яркий след в истории ислама XIV века. Учёный был автором около десяти сочинений, одним из которых считается сборник ханафитских фетв. На протяжении многих лет данное произведение считалось утраченным. Автор исследования проанализировал издание «Фатово ат-Тафтазоний», опубликованное в 2017 году, и поделился своими критическими замечаниями и оценками, касающимися данного издания.*

Ключевые слова: *ханафитский фикх, Амир Темур, исламские рукописи, фетва, обычай (урф), зиммий.*

ON THE EDITION OF *FATAWA AT-TAFTAZANI*

Abstract: *Sa'd al-Din al-Taftazani is one of the most prominent figures in the history of 14th-century Islam. The scholar is the author of about ten works, one of which is the collection of Hanafi fatwas. For many years, this work was considered lost. The author of the study analyzed the 2017 edition of Fatawa al-Taftazani and shared his critical thoughts about the publication.*

Key words: *Hanafi jurisprudence, Amir Timur, Islamic manuscripts, fatwa, custom ('urf), dhimmi*

Kirish

Sa'd ad-din Muhammad ibn Umar at-Taftozoniy (1322-1390) O'rta Osiyoda yozilgan islom adabiyoti tarixida yorqin iz qoldirgan olimlardan biri hisoblanadi. Olim asosan aqida masalalari bilan shug'ullangan bo'lsa-da, uning fiqhiy asarlari ham yetib kelgan. Muhammad ash-Shayboniy qalamiga mansub "al-Jomi' al-kabir"ning Xilotiy tomonidan qisqartirilgan variantiga ("Talxis al-Jomi' al-kabir") yozilgan sharh Taftozoniy tomonidan 1384-yilda Saraxs shahrida tamomlangan. "Sharh Talxis al-Jomi' al-kabir"ning bugungacha ikki qo'lyozma nusxasi topilgan. Istanbulda Murod mulla kutubxonasida 848 raqami ostida saqlanadigan qo'lyozma 164 varaqdan iborat. Ikkinchi nusxa ham Istanbul shahridagi Lolali kutubxonasida saqlanadi (№ 963) va 120 varaqdan iborat. Har ikki qo'lyozma bilan tanishish jarayonida sharhning tugallanmay qolgani aniqlandi.

Adabiyotlar tahlili

Taftozoniyning ikkinchi fiqhiy asari "Miftoh al-fiqh" deb ataladi va uning yagona qo'lyozma nusxasi Berlin shahridagi Germaniya milliy kutubxonasida 4604 raqami ostida saqlanadi. Asar bilan bevosita tanishish imkoni bo'lmadi. "Miftoh al-fiqh"ning shofiiy mazhabi qoidalarini tushuntirgan she'riy asar ekani rivoyat qilinadi.

Ushbu tadqiqot ob'ekti bo'lmish uchinchi asar esa Taftozoniy qalamiga mansub fatvolar to'plamidir. Mazkur fatvolarni to'plash 1358 yil 13 oktyabrda (759 yil 9 zul-l-qa'da) yakunlangan. "14-asrda islom ilohiyoti" nomli tadqiqot muallifi Tomas Vyurs ushbu fatvo to'plami muallif hayotlik davrida uning tomonidan boshqalarga rivoyat qilinmagan (die aber wohl nicht überliefert ist), degan xulosaga kelgan. [2: 25]

2017 yilda Pokistonning Peshovar shahridagi "Dor al-kutub" nashriyotida "al-Fatovo at-Taftozoniyya" nomli asar nashr etildi. Kitobni nashrga tayyorlagan Shabir Afg'oniy asarning yagona qo'lyozmasi Hirotda saqlanishini aytadi, biroq aynan qaysi kutubxonada saqlanishini yozmagan. Natijada, Shabir Afg'oniy Afg'onistondagi shaxsiy kutubxonalardan birida saqlanuvchi qo'lyozmadan foydalangan, degan xulosaga kelish mumkin.

Asar bugungacha ilmiy muomalaga tortilmagan.

Tadqiqot metodologiyasi

Ushbu nashr ko‘zdan kechirilganida bir nechta savollar tug‘iladi. Avvalo, asarda qo‘llanilgan manbalar xususida:

“al-Fatovo as-sayrafiyya” – bu asar 1088/1677 yilda vafot etgan Majd ad-din As’ad ibn Yusuf as-Sayrafiy tomonidan yozilgan. Taftozoniydan uch asr keyin yashagan muallif asari matnga keyinchalik qo‘shilgan bo‘lishi mumkin.

“al-Fatovo as-sufiyya” – Fazlulloh Muhammad ibn Ayyub Moju asari. Asar Hindiston ilmiy muhiti mahsuli hisoblanadi.

“al-Mulaxxas” – nashrda an-Navhoboziy (vaf. 668/1269-70 y.) asari deb ko‘rsatilgan. Laknaviyga ko‘ra, “al-Mulaxxas fi-l-fatovo” nomli asar Muhammad ib Ahmad al-Ka’biy at-Tabariy qalamiga mansub. Mazkur faqih 604/1207-1208 yilda Buxoroda vafot etgan. Navhoboz (Navhobod) Buxorodagi joy nomi ekanini taxmin qilish mumkin.

“Sinvon al-qazo va unvon al-ifto” – Imod ad-din al-Ashfurqoniy (vaf. 646/1249 y.) qalamiga mansub asar. Asar Hindiston ilmiy muhitida, Firuzshohlar davrida qalamga olingan.

“al-Kifoya” – hanafiy faqihi Abu-l-Qosim Ismoil al-Bayhaqiy (vaf. 402/1011-12 y.) asari.

“Favoid al-Jomi’ as-sag‘ir” – nashrda yanglish ravishda Saraxsiyga nisbat berilgan. Saraxsiy asarlari ichida bu nomli kitob uchramaydi. Zahir ad-din al-Buxoriy bu asarga sharh yozgan. U “Sharh al-Favoid az-zahiriyya” deb ataladi.

“al-Izoh” – Rukn ad-din al-Kirmoniy asari bo‘lib, bizgacha kam sonli nusxada yetib kelgan.

“Fatovo al-hijja” – nashrda yanglish ravishda as-Sadr ash-shahidga nisbat berilgan. Aslida xorazmlik faqih Hijjiy asari.

Natijalar va ularning tahlili

Asarni tahlil qilish natijasida unda quyidagi o‘ziga xosliklar aniqlandi:

“Fatovo at-Taftozoniy”da boshqa asarlarda uchramaydigan sufiylarga xos musiqa tinglash (*samo’*) va “Qabrlarni ziyorat qilish” bo‘limlari o‘rin olgan. “Samo’” bo‘limi so‘ngida sufiylarga xos “olamdagi barcha shayxlarning ustozi” (*shayx shuyux al-olam*) iborasi qo‘llangan bo‘lib, bu esa “Fatovo at-Taftozoniy” sufiylar muhitida to‘plam holatiga keltirilganini ko‘rsatadi.

Asardagi fatvolarni tarixshunoslik nuqtai nazaridan tahlil qilish orqali O‘rta Osiyo tarixi bo‘yicha yangi ilmiy ma’lumotlarni olish mumkin. Masalan, manbashunoslikda noma’lum hisoblangan “Kanz al-masoil” nomli fiqhiy asardan Navro‘z kunini bayram qilish haqida fatvo keltirilgan. [1: 167] Fatvo buxorolik faqih Abu Bakr ibn Tarxon (vaf. 945 y.) nomidan chiqarilgan bo‘lib, unga ko‘ra Navro‘z bayrami mahalliy aholi tomonidan ochiq maydonlarda (*man xaraja ila-s-sudda fi yavm an-nayruz*) nishonlangani ma’lum bo‘ladi. Arabcha matnda qo‘llangan *as-sudda* so‘zini ikki xil – minbar yoki chodir ma’nosida tarjima qilish mumkin. Bu holatda navro‘z bayrami bir necha kun nishonlangani, aholi navro‘z munosabati bilan ochiq maydonlarda chodir qurganini aytish mumkin.

“Fatovo at-Taftozoniy”da “alfoz al-kufr” bo‘limi kengroq muhokama qilingan. Bo‘lim ikki qismga ajratilgan. Birinchi bo‘limda musulmon bo‘lmagan kishi qaysi jumlalarni aytish orqali musulmon deb hisoblanishi haqida so‘z boradi. Muallif o‘z fatvolarini asoslash uchun “Xulosa”, “Tajrid”, “Ravza”, “Majmu’ an-navozil”, “Jomi’ al-fatovo” va “Multaqat” kabi asarlardan iqtibos keltiradi. Birinchi bo‘lim “Banda – Alloh uning martabasini yuqori qilsin! – aytdi: Agar fors tilida »Men musulmonman», deb aytsa, u musulmon hisoblanadi” jumlasi bilan yakunlangan.

Ikkinchi bo‘lim esa musulmon kishi qaysi jumlalarni anglagan yoki anglamagan holda aytishi orqali islom dinidan chiqishi haqida so‘z boradi. Ikkinchi qismdagi mavzular birinchisiga qaraganda kengroq muhokama qilingan. Bu qismda forscha iboralardan ko‘proq misol keltirilgan. Masalan, “Sen bilan do‘zaxga ham boraman, sensiz esa jannatga ham bormayman” (*bo tu dar duzax ravam va bi tu dar bihisht andar nayoyam*), degan kishining dindan chiqishiga fatvo berilgan. Dindan chiqishga boshqa misol esa “Agar xudo menga jannatni bersa ham sensiz bormayman yoki falonchi bilan birga borishni xohlamayman” (*agar maro xudoy bihisht dahand va barand bi tu naravam yo bo fulon naxoham*) iborasini so‘zlashdir. Mazkur fatvolar XIV asr O‘rta Osiyo jamiyatida fors tili nufuzi yuqori bo‘lganini ko‘rsatadi.

“Alfoz al-kufr” bo‘limi quyidagi jumlalar bilan yakunlangan: “Mas’ud ibn Umar [at-Taftozoniy] – Alloh uning va shogirdini[ng gunohlarini] kechirsin! – aytdi:

“Gita” deb ataluvchi bayramda qatnashishning hukmi quyidagicha ... ” Ushbu qisqa fatvo orqali biz “Fatovo at-Taftozoniy” Hindiston ilmiy muhiti kitob holiga keltirilgani haqida ma’lumotlarga ega bo‘lamiz. Hindistonda nishonlanadigan bayramlar tahlil qilinganida “Gita mahotsav” (Geeta Mahotsav) deb ataluvchi bayram borligi ma’lum bo‘ldi. Bu bayram dekabr-yanvar oylarida, hind taqvimiga ko‘ra 9 oyning 11-kuni nishonlanadi. Qadimgi hind eposi “Bhagavad-gita”ga ko‘ra, aynan shu kuni Arjun va Krishna o‘rtasidagi muloqot bo‘lib o‘tgan.

Ushbu bo‘limda hindlarning “sirthi” deb ataluvchi bayramida qatnashgan musulmonlar ham tanqid ostiga olingan va ularning nojoiz ish qilgani haqida fatvo chiqarilgan. Mazkur fatvoning e’lon qilingani tarixiylik nuqtai nazaridan asar yozilgan hududda oz sonli bo‘lsa-da hinduiylik diniga e’tiqod qiluvchi aholi yashaganiga ishorat qiladi. “Sirthi” bayrami haqida menga ma’lum tarix asarlari yoki internet saytlarida ma’lumot uchramadi.

Tarix fani nuqtai nazaridan ahamiyatli hisoblangan ma'lumotlar "Fatovo at-Taftozoniy"ning "Turlicha masalalar" bo'limida (199-216-betlar) ko'proq o'rin olgan. Ushbu bo'limda iqtibos qilib keltirilgan diniy-huquqiy masalalarning ayrimlaridan bugungi kunda jamiyatimiz musulmonlari o'rtasida paydo bo'layotgan ijtimoiy, diniy, iqtisodiy mavzularga doir savollarga yechii sifatida foydalanish mumkin. Masalan, Taftozoniyga ko'ra, diniy-huquqiy masalalarga yechim hisoblanuvchi fiqh ilmini o'rganish Qur'on kitobini ma'nosini anglamasdan tilovat qilishdan ko'ra savobi ulug'roqdir. Muallif o'z nuqtai nazarini himoya qilish uchun "Fatovo as-sirojiyya"ning "Xush ko'rilmagan amallar" (*karohiyya*) bo'limidagi ushbu fatvoni iqtibos qili keltiradi:

Bir kishi fiqh kitobidan biror masalani o'rganayotgan bo'lsa va uning yonida ikkinchi odam ovoz chiqarib Qur'on tilovat qilayotgan bo'lsa va fiqh tolibi uchun Qur'onni tinglashga imkoniyat bo'lmasa, bu holatda Qur'on o'quvchi gunohkor bo'ladi. Fiqh kitobidan ilm tahsil qilayotgan tolibi ilmga esa gunoh yozilmaydi." [1: 199]

Quyida keltirilgan fatvo esa mu'taziliylar va ularga muxolif bo'lgan mazhablar o'rtasida islomning ilk asridan beri ixtilofga sabab bo'lgan masalalardan biri – "Allohning kalomi yaratilganmi (*maxluq*) yoki yo'qmi?" mavzusiga bag'ishlangan:

«"Jomi' al-muzmarot va-l-mushkilot" asaridan:

Qur'on bilan qasam ichish qasam hisoblanmaydi, chunki u Allohning kalomi bo'lib, kalom (so'zlash) – Allohning sifatidir. Shu sababli ularning zamonida bu qasam hisoblanmagan.

Bizning zamonamizga kelib esa [Qur'on bilan qasam ichish] qasam o'rniga o'tadi. Biz shu fikrni qabul qilamiz va shunday e'tiqod qilamiz.

Muhammad ibn Muqotil ar-Roziy – Alloh uni rahmatiga olsin! – aytdi: agar Qur'on bilan qasam ichsa qasam o'rniga o'tibdi. Ulug' olimlar – Alloh ularni rahmatiga olsin! – ham shu fikrni qabul qilganlar.» [1: 200]

"Fatovo as-sirojiyya"dan iqtibos qilingan navbatdagi fatvo orqali esa jamiyatimizda uchraydigan diniy mutaassiblik holatlariga qarshi kurashda foydalanish mumkin:

"Diniy ilmlar ichida tahorat, namoz va boshqa shar'iy amallarni eng kerakli miqdorda (*lo budda minhu*), shuningdek kundalik hayotga taalluqli masalalarni o'rganish farz[i ayn]dir. Eng kerakli miqdordan chuqurroq masalalarni o'rganish farz[i ayn] hisoblanmaydi. Agar o'rgansa, afzaldir. Biroq o'rganmasa, gunohi yo'q.

Imom Abu Mansur aytdi: musulmonlar ichida bir kishi ilm talabida yo'lga chiqsa, barcha musulmonlar ustidagi farzi kifoya bajarilgan bo'ladi.

Har bir kishi tibbiyot ilmini o'z badaniga foyda yoki zarar beradigan narsalarni bilib oladigan darajada o'rganishi yaxshi ko'rilgan amaldir (*mustahab*). Kalom va munozara ilmidan esa o'ziga yetarli darajada o'rganishi undan qaytarilmagan amaldir (*muboh*)."

Bugungi kunda jamiyatimizda uchraydigan illatlardan biri yetarli darajada diniy ilmga ega bo'lmasdan turib fatvo berishdir. Taftozoniy yashagan davrda ham bu kabi holatlar uchragani sababli "al-Multaqat" asaridan quyidagi fatvoni keltirish orqali bu kabi holatlar tanqid ostiga olingan:

"Abu Bakr [al-Iyoziy] aytdi: bir kishi mazhabimizdagi barcha kitoblarni yod olgan bo'lsa ham fatvo berishni boshlashi uchun biror mufti qo'lida shogird bo'lishi lozim. Shu holatdagina uning fatvolaridan boshqa musulmonlar to'g'ri yo'lni topa oladilar. /.../

Abu Yusuf aytdi: fatvo so'ralgan kishi Qur'on va sunnatdagi hukmlar, Qur'on oyatlari ichida mutashobih, bekor qiluvchi va bekor qilingan oyatlar (*nosix*, *mansux*), sahobiylar so'zi va Qur'on oyatlari o'qilishidagi farqlarni bilmasa unga fatvo berish halol bo'lmaydi." [1: 203]

"Al-Yanobi'" asaridan iqtibos qilingan ushbu fatvo esa boshqa din vakillariga bag'rikenglik bo'lish hanafiy mazhabida joiz amal ekanini ko'rsatadi:

"Zimmiylar (xristian, yahudiylik va zardo'shtiylik dini vakillari)ning janozasida qatnashishda zarar yo'q (*la ba'sa*)". [1: 204]

Xulosa

Yuqorida keltirilgan ma'lumotlar quyidagi xulosalar uchun asos bo'ladi: "Fatovo at-Taftozoniy" Sa'd ad-din at-Taftozoniyning o'zi emas, balki u mansub bo'lgan aqidaviy yoki fiqhiy yo'nalishga mansub olim tomonidan qo'lyozma matn holatiga keltirilgan. Matnni ko'chirgan kotib esa qo'lyozmani ko'chirish jarayonida "Sayrafiyya" kabi XVII asrda yozilgan asarlardan ham iqtiboslar kiritgani "Fatovo at-Taftozoniy" matni so'nggi bor XVII asrda tahrir qilinganini ko'rsatadi.

THE FORMATION AND DEVELOPMENT OF THE TURKISTAN PRESS IN THE SECOND HALF OF THE 19TH – EARLY 20TH CENTURY

Abstract: *This article studies newspapers and magazines published in Turkestan in the second half of the 19th century and the first quarter of the 20th century, their role in public life, and the attitude of the Turkestan population to the press during the colonial period of the Russian Empire.*

Keywords: *Press, Turkestan newspaper, Turkestan news, "Voice of Turkestan", "Voice of Fagana", Russian Empire, censorship.*

Kirish

XIX asrning ikkinchi yarmi va XX asr boshlarida Turkiston o‘lkasida yuz bergan siyosiy, ijtimoiy hamda madaniy o‘zgarishlar matbuot sohasining shakllanishi va rivojlanishiga bevosita ta’sir ko‘rsatdi. Ayniqsa, Chor Rossiyasi mustamlakachilik siyosati sharoitida hududda yangi boshqaruv tizimining joriy etilishi axborot almashinuvi va rasmiy nashrlarning paydo bo‘lishini tezlashtirdi. Shu davrda tashkil etilgan gazeta va jurnallar nafaqat hukumat qarorlarini e’lon qilish vositasi, balki mahalliy ziyolilar uchun ijtimoiy fikrni shakllantirish minbariga ham aylandi.

Turkistonda matbuotning ilk namunalari asosan rasmiy xarakterga ega bo‘lib, ular orqali imperiya siyosati targ‘ib qilindi. Biroq vaqt o‘tishi bilan milliy uyg‘onish harakati vakillari matbuotdan ma’rifiy va jadidchilik g‘oyalarini yoyishda samarali vosita sifatida foydalana boshladilar. Natijada gazeta va jurnallar o‘lka aholisining siyosiy ongini oshirish, ijtimoiy muammolarni muhokama qilish hamda milliy o‘zlikni anglash jarayonida muhim o‘rin egalladi.

Mazkur maqolada XIX-XX asrlarda Turkistonda faoliyat yuritgan gazeta va jurnallarning vujudga kelishi, ularning yo‘nalishi hamda jamiyat hayotidagi ahamiyati tahlil qilinadi.

Adabiyotlar tahlili

Matbuot tushunchasi va uning Turkistondagi shakllanishi. Matbuot jamiyat hayotida muhim o‘rin tutuvchi axborot vositalaridan biri bo‘lib, u gazeta, jurnal va boshqa bosma nashrlar orqali ommaga ma’lumot yetkazish, ijtimoiy fikrni

shakllantirish hamda ma’rifiy g‘oyalarni targ‘ib etish vazifasini bajaradi. Keng ma’noda matbuot - bu jamiyatdagi siyosiy, iqtisodiy va madaniy jarayonlarni aks ettiruvchi hamda ularni tahlil qiluvchi ommaviy kommunikatsiya vositasidir.

O‘zbekistonda matbuotning shakllanishi XIX asrning ikkinchi yarmiga to‘g‘ri keladi. Bu davr Turkiston o‘lkasining Rossiya imperiyasi tomonidan bosib olinishi va mustamlakachilik boshqaruv tizimining o‘rnatilishi bilan bevosita bog‘liqdir. Aynan shu jarayonda rasmiy axborot vositalariga ehtiyoj ortib, dastlabki gazeta nashrlari vujudga kelgan.

1870-yilda Toshkent shahrida tashkil etilgan Turkestanskiye vedomosti hamda uning o‘zbek tilidagi ilovasi bo‘lgan Turkiston viloyatining gazeti Turkistondagi dastlabki matbuot namunalari hisoblanadi. Ushbu nashrlar asosan mustamlakachi ma’muriyat manfaatlariga xizmat qilgan bo‘lib, rasmiy qarorlar, farmonlar va hukumat siyosatini targ‘ib qilishga yo‘naltirilgan edi [1].

XX asr boshlariga kelib, ayniqsa 1905-1907-yillardagi siyosiy o‘zgarishlar ta’sirida Turkistonda milliy matbuot shakllana boshladi. Bu davrda Taraqqiy, Xurshid, Shuhrat kabi taraqqiyparvar gazetalarning paydo bo‘lishi o‘lka ijtimoiy hayotida muhim burilish yasadi. Ushbu nashrlar orqali mahalliy ziyolilar xalqni ilm-ma’rifatga chorlash, ijtimoiy muammolarni ochiq muhokama qilish hamda milliy ongni shakllantirishga intildilar.

Keyingi bosqichda, ya’ni XX asrning ikkinchi o‘n yilligida jadid matbuoti yanada rivojlandi. Bu jarayonda Sadoyi Turkiston, Sadoyi Farg‘ona, Najot gazetalari hamda Oyina jurnali muhim o‘rin egalladi. Mazkur nashrlar jadidchilik harakatining asosiy g‘oyalarini - ma’rifatparvarlik, milliy uyg‘onish, ta’limni isloh qilish va jamiyatni taraqqiyot sari yetaklash g‘oyalarini keng targ‘ib qildilar.

Milliy matbuot vakillari Turkistonni savodli, ma’rifatli va taraqqiy etgan jamiyatga aylantirishni o‘z oldilariga maqsad qilib qo‘ydilar. Ular gazeta va jurnallar orqali xalqni jaholatdan chiqarish, zamonaviy bilimlarni yoyish, ijtimoiy tenglik va adolat g‘oyalarini ilgari surishga harakat qildilar. Shu jihatdan, matbuot nafaqat axborot tarqatish vositasi, balki jamiyatni isloh qiluvchi muhim ijtimoiy institut sifatida namoyon bo‘ldi.

Umuman olganda, Turkistonda matbuotning shakllanishi va rivojlanishi murakkab tarixiy sharoitlarda kechgan bo‘lsa-da, u milliy uyg‘onish jarayonining ajralmas qismi bo‘lib, o‘lka ijtimoiy-siyosiy hayotida muhim ahamiyat kasb etgan.

Turkestanskiye vedomosti - Turkistonda nashr etilgan ilk davriy matbuot namunalaridan biri bo‘lib, Rossiya imperiyasi mustamlakachilik siyosati davrida tashkil etilgan rasmiy gazeta hisoblanadi. Mazkur gazeta 1870-yil 28-aprel (10-may)dan Toshkent shahrida rus tilida nashr etila boshlagan. Dastlab gazeta muntazam chiqmagan bo‘lib, 1870-yilda faqat 17 ta soni chop etilgan. Keyinchalik nashr tizimi takomillashib, 1871-yildan haftasiga bir marta, 1903-yildan oyiga 3-4 marta, 1907-yildan esa kundalik gazeta sifatida faoliyat yuritgan. Umuman olganda, gazetaning 6406 ta soni bosib chiqarilgan.

Gazetaning dastlabki faoliyatiga Turkiston general-gubernatori fon Kaufman rahbarlik qilgan bo‘lib, nashr ustidan ma’muriy nazorat o‘rnatilgan. Keyingi davrlarda esa general-gubernatorlik tizimida xizmat qilgan harbiy mutaxassislar gazeta ishini boshqargan. Jumladan, piyoda qo‘shinlar ofitseri N. A. Mayev 1892-yilgacha gazetaning 1-102-sonlariga muharrirlik qilgan [2].

Gazetaning asosiy vazifasi Rossiya imperiyasining Turkistondagi siyosiy mavqeini mustahkamlash, o‘lkada chorizm mustamlakachilik siyosatini targ‘ib qilish hamda mahalliy aholini imperiya ma’muriyatiga itoat ruhida tarbiyalashdan iborat bo‘lgan. Nashr sahifalarida ko‘proq general-gubernatorlik buyruq va farmonlari, rasmiy statistik ma’lumotlar hamda ma’muriy xabarlar berib borilgan. Shu bilan birga, o‘lka tarixi, xo‘jaligi, tabiati, etnografiyasi, folklori va mahalliy xalq madaniyatiga oid ilmiy-ommabop materiallar ham chop etilgan bo‘lib, ular Turkiston hududi tarixini o‘rganishda muhim manba sifatida xizmat qilgan [3].

Gazeta tarkibida “Ichki xabarlar”, “Xabar va yangiliklar”, “Mahalliy xronika” hamda “Sankt-Peterburg” kabi bo‘limlar faoliyat yuritgan. Ushbu bo‘limlar orqali o‘lka hayotining siyosiy, iqtisodiy va ijtimoiy jarayonlari yoritilgan. Nashrda V. V. Bartold, L. S. Berg, N. A. Seversev, A. N. Fedchenko, I. V. Mushketov va V. F. Oshanin kabi mashhur olimlar ham o‘z maqolalari bilan ishtirok etgan. Ularning ilmiy-publitsistik ishlari gazetaning ilmiy ahamiyatini oshirishga xizmat qilgan [4].

Mahalliy ziyolilar vakillari ham gazeta faoliyatida qatnashgan. Xususan, Sattorxon Abdug‘afforov tomonidan yozilgan Qo‘qon xonligi davridagi ijtimoiy-siyosiy ahvolga oid ocherk o‘quvchilar e’tiborini tortgan. Biroq gazeta mustamlakachilik siyosati ta’sirida o‘lka hayotidagi ayrim salbiy jarayonlarni ochiq va to‘liq yoritishdan cheklangan.

Gazetaning Moskva, Peterburg va Vladivostok kabi shaharlarda doimiy muxbirlari faoliyat yuritgan. Dastlab “Turkiston viloyatining gazeti” nashri ushbu gazetaning ilovasi sifatida chiqarilgan. Nashrning tiraji dastlab 100 nusxani tashkil etgan bo‘lsa, 1909-yildan keyin 853 nusxaga, keyinchalik esa o‘rtacha 1000-2500 nusxagacha yetgan.

Gazeta narxi nisbatan arzon bo‘lishiga qaramay, u Ismoil Gasprinskiy tomonidan nashr etilgan “Tarjimon” gazetasi bilan raqobatlasha olmagan. Buning sabablari sifatida rasmiy buyruq va farmonlarning ko‘pligi, hayotiy mazmuni kam bo‘lgan xabarlar, murakkab terminologiya hamda arab va fors tillaridan o‘zlashgan so‘zlarning ko‘pligi ko‘rsatilgan [5].

Gazetada turli davrlarda 290 ga yaqin doimiy va vaqtinchalik mualliflar faoliyat yuritgan. Ular orasida amaldorlar, olimlar, shifokorlar, o‘qituvchilar, harbiy mutaxassislar, muhandislar, agronomlar va topograflar bo‘lgan. Gazetaning faoliyati 1917-yil 15-dekabrda Turkiston Xalq Komissarlari Soveti qaroriga binoan to‘xtatilgan va shu sanada uning so‘nggi soni nashr etilgan [6].

Tadqiqot metodologiyasi

“Sadoyi Turkiston” gazetasi faoliyati va uning ijtimoiy ahamiyati. “Turkestanskiye vedomosti” kabi rasmiy nashrlardan farqli ravishda, jadid matbuoti Turkiston jamiyatida mutlaqo yangi yo‘nalishni boshlab berdi. Ana shunday nashrlardan biri bo‘lgan “Sadoyi Turkiston” gazetasi o‘lka ijtimoiy-siyosiy hayotida muhim o‘rin egallagan. Mazkur gazeta 1914-yil 4-apreldan Toshkent shahrida o‘zbek tilida nashr etila boshlagan bo‘lib, uning asoschisi va muharriri Ubaydulla Asadullaxo‘jayev hisoblanadi.

“Sadoyi Turkiston” jadidlarning ijtimoiy-siyosiy hamda adabiy-badiiy yo‘nalishdagi nashri sifatida faoliyat yuritgan. Gazeta dastlab haftasiga ikki marta chiqarilishi rejalashtirilgan bo‘lsa-da, amalda haftada bir marotaba to`rt sahifada chop etilgan. Har bir sonining o‘rtacha tiraji ming nusxani tashkil etib, obuna va chakana savdo orqali tarqatilgan.

Gazeta tahririyatida o`z davrining yetuk ma’rifatparvar ziyolilari jamlangan edi. Xususan, Munavvarqori Abdurashidxonov, Abdulla Avloniy, Abdurauf Muzaffarov kabi jadid namoyandalari gazetaning mazmun va yo‘nalishini belgilashda muhim rol o`ynagan. Shuningdek, Abdulla Qodiriy, Cho`lpon, Hamza Hakimzoda Niyoziy kabi ijodkorlar ham faol ishtirok etib, gazeta sahifalarida milliy uyg‘onish g‘oyalarini keng targ‘ib qilganlar.

“Sadoyi Turkiston” sahifalarida Turkiston jamiyatining dolzarb muammolari keng yoritilgan. Jumladan, milliy ta’lim tizimini isloh qilish, zamonaviy bilimlarni joriy etish, ayollarni ijtimoiy hayotga jalb etish, axloqiy tarbiyani kuchaytirish kabi masalalar gazetaning asosiy mavzularidan biri bo`lgan[1]. Bu orqali nashr nafaqat axborot vositasi, balki jamiyatni ma’rifiy jihatdan o‘zgartirishga xizmat qiluvchi muhim minbar vazifasini bajargan.

Gazeta o‘z faoliyati davomida millatparvarlik, ma’rifatparvarlik va yurtparvarlik g‘oyalarini izchil targ‘ib etib, o‘lka aholisining siyosiy va ijtimoiy ongini yuksaltirishga katta hissa qo‘shgan. Ayniqsa, milliy o‘zlikni anglash va mustaqillik g‘oyalarini shakllantirishda uning o‘rni muhim bo‘lgan.

Biroq gazeta faoliyati uzoq davom etmagan. Moddiy qiyinchiliklar hamda mustamlakachi ma’muriyat tomonidan qo‘yilgan cheklovlar sababli 1915-yilga kelib uning nashri to‘xtatilgan. Keyinchalik uni qayta tiklashga urinishlar ham bo‘lgan bo‘lsa-da, bunga ruxsat berilmagan.

Sadoyi Farg‘ona” gazetasi va uning ijtimoiy-ma’rifiy ahamiyati. Turkistonda jadid matbuotining shakllanishida muhim o‘rin tutgan nashrlardan biri “Sadoyi Farg‘ona” gazetasi hisoblanadi. Ushbu gazeta Farg‘ona vodiysida chop etilgan ilk milliy nashrlardan biri bo‘lib, 1914-yil 3-apreldan Qo‘qon shahrida Obidjon Mahmudov muharrirligida nashr etila boshlagan[2]. Gazeta xususiy matbaada chop etilgan bo‘lib, uning tiraji o‘rtacha 1500 -1700 nusxani tashkil etgan.

Gazetaning asosiy maqsadi tijorat emas, balki xalq manfaatlariga xizmat qilishdan iborat bo‘lgan. Bu holat uning dastlabki sonlaridayoq ochiq bayon etilgan. “Sadoyi Farg‘ona” sahifalari keng jamoatchilik uchun ochiq bo‘lib, unda turli fikr va mulohazalar erkin bayon qilinishiga imkon yaratilgan. Shu jihatdan, gazeta o‘z davrida ijtimoiy fikr almashinuvi uchun muhim maydon vazifasini bajargan.

Nashrning muhim jihatlaridan biri uning milliy til masalasiga katta e’tibor qaratganidir. Gazeta asosan o‘zbek tilida, ya’ni mahalliy shevada chop etilib, ona tilining rivojlanishiga xizmat qilgan. Mualliflar tilning boyishi va mukammallashuvida matbuotning o‘rni beqiyos ekanligini alohida ta’kidlaganlar. Bu esa jadidlarning milliy uyg‘onish g‘oyalariga hamohang edi.

“Sadoyi Farg‘ona” sahifalarida eng ko‘p yoritilgan mavzulardan biri ta’lim va maorif masalasi bo‘lgan. Gazetada maktab va madrasalarni isloh qilish, yangi usuldagi ta’limni joriy etish, yoshlarni zamonaviy bilimlar bilan qurollantirish zarurligi haqida ko‘plab maqolalar e’lon qilingan. Ayniqsa, ibtidoiy ta’limni rivojlantirish, dunyoviy fanlarni o‘qitish hamda eski ta’lim tizimidagi kamchiliklarni bartaraf etish masalalari muhokama markazida bo‘lgan.

Natijalar va ularning tahlili

Gazeta sahifalarida ushbu mavzular yuzasidan turli qarashlar va bahs-munozaralar ham o‘rin olgan. Bu esa jamiyatda tanqidiy fikrlash va ijtimoiy ongning shakllanishiga xizmat qilgan. Natijada, nafaqat ziyolilar, balki diniy ulamolar ham matbuot orqali o‘z fikrlarini bildirish imkoniga ega bo‘lganlar.

Bundan tashqari, gazeta iqtisodiy hayot masalalariga ham alohida e’tibor qaratgan. Jumladan, dehqonchilik, paxtachilik, ipakchilik kabi sohalardagi muammolar tahlil qilinib, ularning sabab va oqibatlari yoritilgan. Dehqonlarning qarzga botishi, vositachilar va savdogarlar tomonidan ekspluatatsiya qilinishi kabi muammolar ochib berilgan. Bu orqali gazeta xalqning real ijtimoiy ahvolini aks ettiruvchi muhim manba vazifasini bajargan.

Shuningdek, “Sadoyi Farg‘ona”da zamonaviy iqtisodiy munosabatlarning kirib kelishi, temir yo‘llar qurilishi, savdo va tadbirkorlikning rivojlanishi bilan bog‘liq jarayonlar ham yoritilgan. Bu jarayonlar mahalliy aholi hayotiga qanday ta’sir ko‘rsatayotgani tahlil qilinib, aholiga o‘z manfaatlarini himoya qilish bo‘yicha tavsiyalar berilgan.

Gazeta ijtimoiy hayotdagi illatlarni tanqid qilishga ham katta e'tibor qaratgan. Jumladan, ortiqcha dabdabali to'ylar, turli zararli odatlar, jaholat va savodsizlik kabi holatlar keskin tanqid ostiga olingan. Shu bilan birga, sog'lom turmush tarzi, axloqiy tarbiya va jamiyatda ijobiy qadriyatlarni shakllantirish masalalari targ'ib qilingan.

"Sadoyi Farg'ona"ning yana bir muhim xususiyati - unda xalqaro voqealar va siyosiy jarayonlarning ham yoritib borilganidadir. Xususan, Birinchi jahon urushi voqealari, Rossiya musulmonlari hayotiga oid yangiliklar va turli siyosiy masalalar gazeta sahifalarida aks etgan. Biroq harbiy senzura sababli ayrim materiallar cheklangan holda berilgan.

Gazeta adabiy-badiiy jihatdan ham muhim ahamiyatga ega bo'lib, unda she'rlar, publitsistik maqolalar va tanqidiy chiqishlar muntazam chop etib borilgan. Bu esa uning nafaqat axborot vositasi, balki adabiy muhitni rivojlantiruvchi platforma sifatida ham xizmat qilganini ko'rsatadi.

Umuman olganda, "Sadoyi Farg'ona" gazetasi Turkiston ijtimoiy hayotining turli jabhalarini qamrab olgan, xalqni ma'rifat va taraqqiyot sari chorlagan muhim jadid nashrlaridan biri hisoblanadi. U milliy ongni shakllantirish, ijtimoiy muammolarni ochib berish hamda jamiyatni isloh qilish g'oyalarini ilgari surishda katta ahamiyat kasb etgan.

Gazetaning faoliyati 1915-yilga kelib turli siyosiy va iqtisodiy to'siqlar sababli to'xtatilgan bo'lsa-da, u o'zbek milliy matbuoti tarixida muhim o'rin egallaydi.

Xulosa

Ushbu maqolada XIX asrning ikkinchi yarmi va XX asr boshlarida Turkistonda matbuotning shakllanishi hamda rivojlanish jarayonlari tahlil qilindi. Tadqiqot natijalari shuni ko'rsatadiki, dastlabki davr matbuoti asosan Chor Rossiyasi mustamlakachilik siyosatini targ'ib qilishga xizmat qilgan bo'lsa-da, vaqt o'tishi bilan u milliy uyg'onish harakatining muhim vositasiga aylangan.

Xususan, "Turkestanskiye vedomosti" rasmiy nashr sifatida imperiya manfaatlarini ifodalagan bo'lsa, "Sadoyi Turkiston" va "Sadoyi Farg'ona" kabi jadid nashrlari jamiyatda ma'rifatparvarlik g'oyalarini yoyish, milliy ongni shakllantirish hamda ijtimoiy muammolarni yoritishda muhim rol o'ynagan. Ushbu gazeta va jurnallar orqali mahalliy ziyolilar xalqni ilm-ma'rifatga chorlab, jamiyatni isloh qilishga intilganlar.

Umuman olganda, Turkistonda matbuotning rivojlanishi murakkab siyosiy sharoitlarga qaramay, o'lka ijtimoiy-siyosiy hayotida muhim o'rin egallagan va milliy taraqqiyot jarayonining ajralmas qismiga aylangan.

KICHIK VA O‘RTA BIZNESNI MOLIYALASH VA KREDIT MEXANIZMINI TAKOMILLASHTIRISH

Nishonov Akmalxon Juraxanovich
Namangan davlat universiteti. Yashil iqtisodiyot va barqaror biznes kafedrasi o'qituvchisi.
Email-akmalxonnishonov1@gmail.com

Annotatsiya; *Mazkur maqolada kichik va o‘rta biznes subyektlarini moliyalashtirishning zamonaviy mexanizmlari, kreditlash tizimining iqtisodiy rivojlanishdagi o‘rni hamda kredit mexanizmini takomillashtirishning ustuvor yo‘nalishlari tahlil qilingan. Shuningdek, kichik va o‘rta biznesni moliyaviy qo‘llab-quvvatlashda tijorat banklari, mikromoliyalashtirish institutlari va davlat dasturlarining ahamiyati yoritilgan. Tadqiqot natijalariga ko‘ra, kredit resurslaridan foydalanish imkoniyatlarini kengaytirish, raqamli moliyalashtirish vositalarini joriy etish hamda kredit risklarini samarali boshqarish kichik va o‘rta biznesning barqaror rivojlanishiga xizmat qilishi asoslab berilgan.*

Kalit so‘zlar: *kichik biznes, o‘rta biznes, moliyalashtirish, kredit mexanizmi, tijorat banklari, investitsiyalar, mikromoliyalashtirish, raqamli bank xizmatlari.*

СОВЕРШЕНСТВОВАНИЕ МЕХАНИЗМА ФИНАНСИРОВАНИЯ И КРЕДИТОВАНИЯ МАЛОГО И СРЕДНЕГО БИЗНЕСА

Аннотация; *В данной статье анализируются современные механизмы финансирования субъектов малого и среднего бизнеса, роль системы кредитования в экономическом развитии, а также приоритетные направления совершенствования кредитного механизма. Освещается значение коммерческих банков, микрофинансовых организаций и государственных программ в финансовой поддержке малого и среднего предпринимательства. По результатам исследования обосновано, что расширение доступа к кредитным ресурсам, внедрение цифровых финансовых инструментов и эффективное управление кредитными рисками способствуют устойчивому развитию малого и среднего бизнеса.*

Ключевые слова: *малый бизнес, средний бизнес, финансирование, кредитный механизм, коммерческие банки, инвестиции, микрофинансирование, цифровые банковские услуги.*

IMPROVING THE FINANCING AND CREDIT MECHANISM FOR SMALL AND MEDIUM-SIZED BUSINESSES

Annotation; *This article examines modern financing mechanisms for small and medium-sized enterprises (SMEs), the role of credit systems in economic development, and priority directions for improving credit mechanisms. The study highlights the importance of commercial banks, microfinance institutions, and government support programs in financing SMEs. The findings indicate that expanding access to credit resources, introducing digital financial instruments, and improving credit risk management can significantly contribute to the sustainable development of SMEs.*

Keywords: *small business, medium-sized enterprises, financing, credit mechanism, commercial banks, investments, microfinance, digital banking services.*

Kirish

Bozor iqtisodiyoti sharoitida kichik va o‘rta biznes (KO‘B) mamlakat iqtisodiyotining muhim tarkibiy qismi hisoblanadi. Ular yangi ish o‘rinlarini yaratish, aholi bandligini ta’minlash, innovatsion faoliyatni rivojlantirish hamda yalpi ichki mahsulot hajmini oshirishda muhim rol o‘ynaydi. Jahon amaliyotida kichik va o‘rta biznes subyektlari iqtisodiyotning asosiy harakatlantiruvchi kuchi sifatida e’tirof etiladi. Shu sababli ushbu sektorni moliyaviy qo‘llab-quvvatlash va kreditlash tizimini takomillashtirish davlat iqtisodiy siyosatining ustuvor yo‘nalishlaridan biri hisoblanadi.

Bugungi kunda iqtisodiyotning raqamlashtirilishi, global moliyaviy bozorlardagi o‘zgarishlar hamda tadbirkorlik subyektlarining moliyaviy ehtiyojlari kreditlash tizimini yanada takomillashtirishni talab etmoqda. Kichik va o‘rta biznes korxonalari ko‘pincha yetarli garov ta’minotiga ega emasligi, moliyaviy hisobotlarning to‘liq yuritilmasligi va kredit tarixining yetarlicha shakllanmaganligi sababli kredit mablag‘larini jalb qilishda qiyinchiliklarga duch keladi.

Kichik va o‘rta biznesni moliyalashtirishning nazariy asoslari. Kichik va o‘rta biznesni (KO‘B) moliyalashtirish iqtisodiyotning barqaror rivojlanishini ta’minlovchi eng muhim omillardan biri hisoblanadi. Moliyalashtirish deganda tadbirkorlik subyektlarining joriy faoliyatini yuritish, ishlab chiqarish hajmini kengaytirish, yangi texnologiyalarni joriy etish, innovatsion loyihalarni amalga oshirish hamda investitsion dasturlarni moliyaviy resurslar bilan ta’minlash jarayoni tushuniladi. Moliyaviy resurslarning yetarliligi korxonaning raqobatbardoshligi, rentabelligi va bozor sharoitlariga moslashuvchanligini belgilovchi asosiy omillardan biri hisoblanadi. Jahon iqtisodiyoti tajribasi shuni ko‘rsatadiki, kichik va o‘rta biznes iqtisodiy o‘sishning asosiy drayverlaridan biri bo‘lib, ko‘plab mamlakatlarda yalpi ichki mahsulotning sezilarli qismini yaratadi hamda yangi ish o‘rinlarining asosiy manbai hisoblanadi. Shu sababli mazkur sektorni samarali moliyalashtirish mexanizmlarini shakllantirish va rivojlantirish davlat iqtisodiy siyosatining ustuvor yo‘nalishlaridan biri sifatida qaraladi. Iqtisodiy adabiyotlarda kichik va o‘rta biznesni moliyalashtirish manbalari odatda ichki va tashqi moliyalashtirish manbalariga ajratiladi. Ichki moliyalashtirish korxonaning o‘z mablag‘lari hisobidan amalga oshirilsa, tashqi moliyalashtirish turli moliyaviy institutlar va investorlar tomonidan taqdim etiladigan mablag‘lar hisobidan amalga oshiriladi.

Ichki moliyalashtirish manbalari. Ichki moliyalashtirish manbalari korxonaning o‘z faoliyati natijasida shakllanadigan moliyaviy resurslarni o‘z ichiga oladi. Bular qatoriga sof foyda, amortizatsiya ajratmalari, zaxira fondlari hamda korxona egalarining qo‘shimcha badallari kiradi. Ushbu manbalarning asosiy afzalligi shundaki, korxona tashqi qarz majburiyatlarini olmasdan turib o‘z faoliyatini moliyalashtirish imkoniyatiga ega bo‘ladi. Natijada kredit foizlari bilan bog‘liq xarajatlar kamayadi va moliyaviy mustaqillik darajasi oshadi. Biroq ichki mablag‘larning hajmi ko‘pincha cheklangan bo‘lib, yirik investitsion loyihalarni amalga oshirish uchun yetarli bo‘lmasligi mumkin. Ayniqsa, yangi tashkil etilgan korxonalar uchun ichki moliyalashtirish imkoniyatlari nisbatan kam bo‘ladi.

Bank kreditlari. Bank kreditlari kichik va o‘rta biznesni moliyalashtirishning eng keng tarqalgan shakllaridan biri hisoblanadi. Tijorat banklari tomonidan ajratiladigan kreditlar aylanma mablag‘larni to‘ldirish, asosiy vositalarni xarid qilish, ishlab chiqarishni modernizatsiya qilish va investitsion loyihalarni amalga oshirish uchun xizmat qiladi. Bank kreditlarining iqtisodiy ahamiyati shundaki, ular korxonalarga qisqa muddat ichida katta hajmdagi moliyaviy resurslarni jalb qilish imkonini beradi. Shu bilan birga, kreditlash jarayonida banklar korxonalarning moliyaviy holatini baholaydi, bu esa moliyaviy intizomni mustahkamlashga xizmat qiladi. Shunga qaramasdan, kredit olishda garov ta’minoti, kredit tarixining mavjudligi va foiz stavkalarining nisbatan yuqoriligi ayrim tadbirkorlar uchun muammolar tug‘diradi. Shu sababli kreditlash mexanizmlarini takomillashtirish va kredit resurslaridan foydalanish imkoniyatlarini kengaytirish muhim vazifa hisoblanadi.

Mikromoliyaviy xizmatlar. Mikromoliyaviy xizmatlar kichik biznes va oilaviy tadbirkorlik subyektlarini moliyaviy qo‘llab-quvvatlashda muhim o‘rin tutadi. Mikromoliyaviy tashkilotlar odatda bank kreditlariga nisbatan soddaroq tartibda va tezkor ravishda mablag‘ ajratadi. Bu ayniqsa yangi tashkil etilgan biznes subyektlari uchun qulay imkoniyat yaratadi. Mikrokreditlar, mikroqarzlar va mikrolizing xizmatlari tadbirkorlarning boshlang‘ich kapitalga bo‘lgan ehtiyojlarini qondirishga yordam beradi. Natijada aholining tadbirkorlik faolligi oshadi va yangi ish o‘rinlari yaratiladi.

Lizing operatsiyalari. Lizing moliyalashtirishning zamonaviy shakllaridan biri bo‘lib, korxonalarga zarur uskunalar, transport vositalari va texnologiyalarni katta miqdordagi boshlang‘ich xarajatlarsiz foydalanish imkonini beradi. Lizing operatsiyalari orqali tadbirkorlar ishlab chiqarish vositalaridan darhol foydalanib, ularning qiymatini ma’lum muddat davomida bosqichma-bosqich to‘lab boradi. Lizingning afzalligi shundaki, u korxonalarning investitsion faolligini oshiradi va asosiy kapitalni yangilash jarayonini tezlashtiradi. Ayniqsa, ishlab chiqarish va xizmat ko‘rsatish sohalarida lizingning ahamiyati yuqori hisoblanadi.

Investitsion fondler. Investitsion fondlar kichik va o‘rta biznesni uzoq muddatli moliyalashtirishning muhim manbalaridan biri hisoblanadi. Ushbu fondlar istiqbolli biznes loyihalariga mablag‘ kiritish orqali korxonalarning rivojlanishiga ko‘maklashadi. Investitsion fondlar nafaqat moliyaviy resurslar, balki boshqaruv va marketing bo‘yicha maslahatlar ham taqdim etishi mumkin.

Venchur kapitali. Venchur kapitali innovatsion va yuqori texnologiyali loyihalarni moliyalashtirishga yo‘naltirilgan investitsiyalar shaklidir. Venchur investorlar yuqori risk darajasiga qaramasdan, katta daromad olish imkoniyatiga ega bo‘lgan startap va innovatsion korxonalarga mablag‘ kiritadilar. Bugungi kunda sun’iy intellekt, axborot texnologiyalari, biotexnologiya va yashil iqtisodiyot yo‘nalishlaridagi startaplarni moliyalashtirishda venchur kapitalining ahamiyati tobora ortib bormoqda.

Davlat subsidiyalari va grantlari. Davlat tomonidan ajratiladigan subsidiyalar, grantlar va imtiyozli kreditlar kichik va o‘rta biznesni qo‘llab-quvvatlashning muhim vositalaridan biri hisoblanadi. Ular tadbirkorlik faoliyatini rag‘batlantirish, innovatsion loyihalarni moliyalashtirish va eksport salohiyatini oshirishga xizmat qiladi. Ko‘plab davlatlarda kichik biznesni rivojlantirish fondlari faoliyat yuritib, tadbirkorlarga moliyaviy va maslahat xizmatlarini ko‘rsatadi. Bunday mexanizmlar biznesning barqaror rivojlanishiga ijobiy ta’sir ko‘rsatadi.

Xalqaro moliya institutlari mablag‘lari. Jahon banki, Xalqaro moliya korporatsiyasi (IFC), Osiyo taraqqiyot banki (ADB), Yevropa tiklanish va taraqqiyot banki (EBRD) kabi xalqaro moliya institutlari kichik va o‘rta biznesni qo‘llab-quvvatlash maqsadida kredit liniyalari, grantlar va texnik ko‘mak dasturlarini amalga oshiradi. Ushbu mablag‘lar orqali tadbirkorlik subyektlari uzoq muddatli va nisbatan qulay shartlarda moliyaviy resurslarga ega bo‘lish imkoniyatini qo‘lga kiritadi. Bundan tashqari, xalqaro moliya institutlari korporativ boshqaruv, risk-menejment va moliyaviy rejalashtirish bo‘yicha ilg‘or tajribalarni ham taqdim etadi.

Muqobil moliyalashtirish manbalarining ahamiyati. Rivojlangan mamlakatlar tajribasi shuni ko‘rsatadiki, kichik va o‘rta biznesni moliyalashtirishda an’anaviy bank kreditlari bilan bir qatorda muqobil moliyalashtirish manbalari ham muhim o‘rin tutadi. Xususan, kraudfanding, faktoring, forfeyting, peer-to-peer lending (P2P kreditlash) va venchur moliyalashtirish mexanizmlaridan keng foydalanilmoqda. Kraudfanding platformalari orqali tadbirkorlar o‘z loyihalari uchun ko‘plab investorlarning kichik mablag‘larini jalb qilishi mumkin. Faktoring korxonalarga debitorlik qarzlarini tezkor pul mablag‘lariga aylantirish imkonini bersa, forfeyting eksport operatsiyalarini moliyalashtirishda muhim vosita sifatida xizmat qiladi. Umuman olganda, kichik va o‘rta biznesni moliyalashtirishning zamonaviy tizimi turli moliyaviy instrumentlarning uyg‘unlashuvi asosida shakllanadi. Moliyalashtirish manbalarining diversifikatsiyasi tadbirkorlik subyektlarining moliyaviy barqarorligini oshiradi, investitsion faolligini rag‘batlantiradi va mamlakat iqtisodiyotining barqaror rivojlanishiga xizmat qiladi.Kichik va o‘rta biznesni kreditlash tizimining hozirgi holati Kichik va o‘rta biznesni kreditlash tizimi mamlakat iqtisodiy rivojlanishining muhim omillaridan biri hisoblanadi. So‘nggi yillarda O‘zbekistonda tadbirkorlik subyektlarini qo‘llab-quvvatlash maqsadida qator islohotlar amalga oshirildi. Tijorat banklari tomonidan imtiyozli kreditlar ajratish, kredit kafilliklari berish va foiz xarajatlarini qisman qoplash mexanizmlari joriy etildi.

Shunga qaramay, quyidagi muammolar saqlanib qolmoqda: Kredit olish jarayonlarining murakkabligi; Garov ta’minoti talablarining yuqoriligi; Kredit mablag‘lari bo‘yicha foiz stavkalarining nisbatan yuqoriligi; Moliyaviy savodxonlik darajasining yetarli emasligi; Kredit risklarining yuqoriligi; Uzoq muddatli moliyaviy resurslarning cheklanganligi. Mazkur muammolar kichik va o‘rta biznesning moliyaviy imkoniyatlarini cheklab, ularning raqobatbardoshligini pasaytirishi mumkin.

Kredit mexanizmini takomillashtirishning ustuvor yo‘nalishlari. Kredit mexanizmini takomillashtirish uchun quyidagi yo‘nalishlarga alohida e’tibor qaratish lozim: **1. Raqamli kreditlash tizimini rivojlantirish.** Raqamli texnologiyalar kreditlash jarayonlarini soddalashtirish va tezlashtirish imkonini beradi. Sun’iy intellekt, Big Data va avtomatlashtirilgan skoring tizimlari qarz oluvchilarning kredit layoqatini aniq baholashga yordam beradi. **2. Kredit kafillik tizimini kengaytirish.** Ko‘plab kichik biznes subyektlari yetarli garov ta’minotiga ega emas. Shu sababli davlat kafillik fondlari faoliyatini kengaytirish kredit resurslariga kirish imkoniyatini oshiradi. **3. Mikromoliyalashtirish institutlari faoliyatini rivojlantirish.** Mikromoliyalashtirish tashkilotlari kichik biznes va oilaviy tadbirkorlik subyektlarini moliyaviy qo‘llab-quvvatlashda muhim rol o‘ynaydi. Ularning faoliyatini kengaytirish kredit bozorida raqobatni kuchaytiradi. **4. Muqobil moliyalashtirish manbalarini rivojlantirish.** Venchur fondlari, kraudfanding platformalari va investitsion fondlar faoliyatini rivojlantirish tadbirkorlik subyektlarining moliyaviy resurslardan foydalanish imkoniyatlarini kengaytiradi. **5. Islomiy moliyalashtirish instrumentlarini joriy etish.** Murabaha, musharaka, mudaraba va ijara kabi islomiy moliyalashtirish vositalari kichik va o‘rta biznes uchun qo‘shimcha moliyaviy manba bo‘lib xizmat qilishi mumkin. **6. Kredit risklarini boshqarish tizimini takomillashtirish.** Kredit portfeli sifatini oshirish, zamonaviy risk-menejment texnologiyalarini joriy etish va kredit monitoringini kuchaytirish kreditlash samaradorligini oshiradi.

Tadqiqot natijalari va muhokama. Tadqiqot davomida kichik va o‘rta biznesni moliyalashtirish hamda kreditlash mexanizmlarining iqtisodiy rivojlanishga ta’siri nazariy va amaliy jihatdan tahlil qilindi. O‘rganish natijalari shuni ko‘rsatdiki, moliyaviy resurslardan foydalanish imkoniyatlarining kengayishi tadbirkorlik subyektlarining iqtisodiy faolligini sezilarli darajada oshiradi. Ayniqsa, kredit resurslariga qulay kirish imkoniyati ishlab chiqarish quvvatlarini kengaytirish, yangi texnologiyalarni joriy etish va innovatsion loyihalarni amalga oshirish uchun muhim omil bo‘lib xizmat qiladi. Tahlillar natijasida aniqlanishicha, kichik va o‘rta biznes subyektlariga ajratilayotgan kreditlar hajmining ortishi yangi korxonalar sonining ko‘payishiga bevosita ta’sir ko‘rsatadi. Moliyaviy mablag‘larning yetarli darajada mavjudligi tadbirkorlarga yangi ishlab chiqarish quvvatlarini yaratish, xizmat ko‘rsatish tarmoqlarini kengaytirish hamda mahsulotlar assortimentini diversifikatsiya qilish imkonini beradi. Natijada iqtisodiyotning turli tarmoqlarida raqobat muhiti kuchayadi va bozor munosabatlarining yanada rivojlanishi ta’minlanadi. Shuningdek, tadqiqot natijalari kreditlash tizimining takomillashuvi aholi bandligini oshirishda muhim rol o‘ynashini ko‘rsatdi. Moliyalashtirish manbalarining ko‘payishi yangi biznes subyektlarining tashkil etilishiga, mavjud korxonalarning faoliyatini kengaytirishiga va qo‘shimcha ish o‘rinlari yaratilishiga xizmat qiladi. Ayniqsa, hududlarda faoliyat yuritayotgan kichik biznes subyektlarini moliyaviy qo‘llab-quvvatlash hududiy iqtisodiy rivojlanish va aholi daromadlarining oshishiga ijobiy ta’sir ko‘rsatadi.

O‘rganilgan xalqaro tajriba shuni ko‘rsatadiki, rivojlangan mamlakatlarda kichik va o‘rta biznesni qo‘llab-quvvatlashga qaratilgan kredit siyosati iqtisodiy o‘sishning muhim omillaridan biri hisoblanadi. Kredit resurslarining

qulayligi korxonalarning investitsion faolligini oshiradi, ishlab chiqarish hajmlarining ko‘payishiga va eksport salohiyatining kengayishiga xizmat qiladi. Shu sababli moliyalashtirish mexanizmlarini diversifikatsiya qilish va kredit bozorida raqobat muhitini kuchaytirish muhim ahamiyat kasb etadi. Tadqiqot natijalari raqamli bank xizmatlarining rivojlanishi kreditlash tizimi samaradorligini sezilarli darajada oshirayotganligini ham tasdiqladi. So‘nggi yillarda moliyaviy texnologiyalar (FinTech) va raqamli bank xizmatlarining jadal rivojlanishi natijasida kredit olish jarayonlari soddalashdi, hujjatlarni rasmiylashtirish muddati qisqardi va operatsion xarajatlar kamaydi. Onlayn kreditlash platformalari, mobil ilovalar va avtomatlashtirilgan kredit skoring tizimlari kredit oluvchilarning moliyaviy holatini tezkor baholash imkonini bermoqda. Bu esa tadbirkorlarning vaqt va mablag‘larini tejash bilan birga, moliyaviy xizmatlardan foydalanish darajasini oshirmoqda. Bundan tashqari, sun’iy intellekt va katta ma’lumotlar (Big Data) texnologiyalaridan foydalanish kredit risklarini aniqroq baholash imkonini yaratmoqda. Natijada banklar tomonidan kredit ajratish jarayonlarining shaffofligi va samaradorligi ortib, muammoli kreditlar ulushini kamaytirishga erishilmoqda. Bu esa kredit portfeli sifatining yaxshilanishiga va moliya tizimi barqarorligining mustahkamlanishiga xizmat qiladi.

Tahlillar shuni ko‘rsatdiki, kredit kafillik fondlari faoliyatining rivojlanishi ham kichik va o‘rta biznesni moliyalashtirishda muhim ahamiyat kasb etadi. Amaliyotda ko‘plab tadbirkorlar yetarli garov ta’minotiga ega bo‘lmagani sababli kredit olishda qiyinchiliklarga duch keladi. Kredit kafillik fondlari ushbu muammoni bartaraf etish orqali tadbirkorlarning moliyaviy resurslardan foydalanish imkoniyatlarini kengaytiradi. Natijada yangi biznes loyihalarini amalga oshirish uchun zarur mablag‘larni jalb qilish osonlashadi. Davlat tomonidan amalga oshirilayotgan qo‘llab-quvvatlash dasturlarining samaradorligi ham tadqiqot natijalarida alohida qayd etildi. Imtiyozli kreditlar, subsidiyalar, grantlar va foiz xarajatlarini qoplash mexanizmlari kichik va o‘rta biznes subyektlarining moliyaviy yukini kamaytiradi hamda ularning investitsion faolligini oshiradi. Ayniqsa, innovatsion loyihalarni moliyalashtirish va eksportga yo‘naltirilgan korxonalarni qo‘llab-quvvatlash bo‘yicha dasturlar iqtisodiyotning raqobatbardoshligini oshirishga xizmat qilmoqda.

Tadqiqot davomida muqobil moliyalashtirish vositalarining ham ahamiyati yuqori ekanligi aniqlandi. Xususan, kraudfanding, venchur kapitali, faktoring va lizing kabi moliyaviy instrumentlar kichik va o‘rta biznes uchun qo‘shimcha mablag‘ manbalarini yaratadi. Ushbu vositalarning rivojlanishi tadbirkorlarning bank kreditlariga bo‘lgan qaramligini kamaytirib, moliyalashtirish manbalarini diversifikatsiya qilish imkonini beradi. Umuman olganda, olib borilgan tadqiqotlar natijalari shuni ko‘rsatadiki, kichik va o‘rta biznesni moliyalashtirish tizimini takomillashtirish iqtisodiy o‘sish sur’atlarini jadallashtirish, investitsion muhitni yaxshilash, aholi bandligini oshirish va mamlakatning eksport salohiyatini kuchaytirishda muhim omil hisoblanadi. Kreditlash tizimining shaffofligi va qulayligini oshirish, raqamli moliyaviy texnologiyalarni keng joriy etish, kredit kafillik mexanizmlarini rivojlantirish hamda muqobil moliyalashtirish vositalaridan foydalanishni kengaytirish kelgusida kichik va o‘rta biznesning barqaror rivojlanishiga xizmat qiladi.

Xulosa. Kichik va o‘rta biznes iqtisodiy rivojlanishning muhim omili bo‘lib, uning samarali faoliyati moliyaviy resurslarga kirish imkoniyatlari bilan chambarchas bog‘liq. Tadqiqot natijalari shuni ko‘rsatadiki, kredit mexanizmini takomillashtirish, raqamli moliyaviy texnologiyalarni keng joriy etish, kredit kafillik tizimini rivojlantirish va muqobil moliyalashtirish manbalarini kengaytirish kichik va o‘rta biznesning barqaror rivojlanishini ta’minlaydi. Kelgusida kichik va o‘rta biznesni moliyalashtirish tizimini takomillashtirish bo‘yicha amalga oshiriladigan chora-tadbirlar mamlakat iqtisodiy o‘sishi, investitsion faollik va aholi bandligini oshirishga xizmat qiladi.

TARIXIY MEROS VA INNOVATSION TARAQQIYOT INTEGRATSIYASI: O‘ZBEKISTON IJTIMOIY RIVOJLANISHINING FALSAFIY MODELI

Maxmudov Akmal Mannonjonovich
tarix fanlari bo‘yicha falsafa doktori (PhD), tadqiqotchi
Farg‘ona davlat universiteti
e-mail: a.maxmudov @mail.ru

Annotatsiya. *Ushbu maqolada O‘zbekiston ijtimoiy rivojlanishining falsafiy modeli tarixiy meros va innovatsion taraqqiyot integratsiyasi nuqtai nazaridan tahlil qilinadi. O‘rganishlarning maqsadi milliy taraqqiyotning nazariy-metodologik asoslarini aniqlash hamda tarixiy xotira, madaniy meros va zamonaviy innovatsion rivojlanish o‘rtasidagi dialektik bog‘liqlikni ochib berishdan iborat. Tadqiqotda tizimli, tarixiy-komparativ, aksiologik va sivilizatsion yondashuvlardan foydalanildi. Olingan natijalar shuni ko‘rsatadiki, O‘zbekistonda amalga oshirilayotgan islohotlar tarixiy merosni saqlash va zamonaviy innovatsiyalarni joriy etishning uyg‘unlashgan modeliga asoslanmoqda. Tadqiqot yakunida ijtimoiy rivojlanishning falsafiy modeli ishlab chiqildi hamda uning asosiy tarkibiy elementlari tavsiflandi.*

Kalit so‘zlar: *tarixiy meros, innovatsion taraqqiyot, ijtimoiy rivojlanish, falsafiy model, modernizatsiya, ma’naviy yangilanish, milliy taraqqiyot, innovatsion jamiyat.*

ИНТЕГРАЦИЯ ИСТОРИЧЕСКОГО НАСЛЕДИЯ И ИННОВАЦИОННОГО РАЗВИТИЯ: ФИЛОСОФСКАЯ МОДЕЛЬ СОЦИАЛЬНОГО РАЗВИТИЯ УЗБЕКИСТАНА

Аннотация. *В статье анализируется философская модель социального развития Узбекистана в контексте интеграции исторического наследия и инновационного развития. Основная цель исследования заключается в выявлении теоретико-методологических основ национального развития и раскрытии диалектической взаимосвязи между исторической памятью, культурным наследием и современными инновационными процессами. В исследовании использованы системный, историко-сравнительный, аксиологический и цивилизационный подходы. Результаты показывают, что реформы в Узбекистане основаны на гармоничном сочетании сохранения исторического наследия и внедрения инноваций.*

Ключевые слова: *историческое наследие, инновационное развитие, социальное развитие, философская модель, модернизация, духовное обновление.*

INTEGRATION OF HISTORICAL HERITAGE AND INNOVATIVE DEVELOPMENT: A PHILOSOPHICAL MODEL OF SOCIAL DEVELOPMENT IN UZBEKISTAN

Abstract. *This article analyzes the philosophical model of social development in Uzbekistan through the integration of historical heritage and innovative development. The main objective is to identify the theoretical and methodological foundations of national development and reveal the dialectical relationship between historical memory, cultural heritage, and innovation processes. The study employs systemic, historical-comparative, axiological, and civilizational approaches. The findings demonstrate that reforms in Uzbekistan are based on a harmonious combination of preserving historical heritage and promoting innovation.*

Keywords: *historical heritage, innovative development, social development, philosophical model, modernization, spiritual renewal.*

Kirish (Introduction)

XXI asrda dunyo taraqqiyoti yangi bosqichga ko‘tarilib, innovatsion iqtisodiyot, raqamli texnologiyalar va bilimlar jamiyatining shakllanishi bilan tavsiflanmoqda. Bunday sharoitda har bir davlat o‘z rivojlanish strategiyasini ishlab chiqishda tarixiy tajriba va zamonaviy taraqqiyot omillari o‘rtasidagi muvozanatni ta’minlashga intilmoqda. O‘zbekiston ham mustaqillik yillarida milliy davlatchilikni tiklash, tarixiy merosni asrash va innovatsion rivojlanishni jadallashtirishga qaratilgan keng ko‘lamli islohotlarni amalga oshirib kelmoqda.

Ijtimoiy rivojlanishning zamonaviy konsepsiyalarida tarixiy meros va innovatsiyalar o‘rtasidagi munosabat muhim ilmiy muammo sifatida qaraladi. Ayrim tadqiqotchilar modernizatsiyani an’anaviy qadriyatlardan voz kechish bilan bog‘lasalar, boshqa olimlar innovatsion taraqqiyotning muvaffaqiyati tarixiy xotira va madaniy merosni saqlashga bog‘liq ekanligini ta’kidlaydilar [1, 24–26-b.].

Prezidentimiz Shavkat Mirziyoyev ta’kidlaganidek, “Yangi O‘zbekistonni barpo etishda milliy qadriyatlarimiz va boy tarixiy merosimiz mustahkam tayanch bo‘lib xizmat qiladi” [2, 78-b.]. Mazkur maqsad mamlakat taraqqiyotining strategik yo‘nalishini belgilovchi muhim metodologik tamoyil hisoblanadi.

Tarixiy meros va innovatsion taraqqiyot integratsiyasi masalasi nafaqat amaliy, balki falsafiy jihatdan ham dolzarbdir. Chunki ijtimoiy rivojlanishning mazmuni, yo‘nalishi va istiqbollarini tushunishda tarixiy xotira, ma’naviy qadriyatlar va innovatsion tafakkur o‘rtasidagi bog‘liqlikni aniqlash zarur.

Ilmiy o‘rganishlarning maqsadi O‘zbekiston ijtimoiy rivojlanishining falsafiy modelini tarixiy meros va innovatsion taraqqiyot integratsiyasi asosida tahlil qilishdan iborat.

Adabiyotlar tahlili (Literature review)

Tarixiy meros va ijtimoiy taraqqiyot o‘rtasidagi bog‘liqlik masalasi Sharq va G‘arb mutafakkirlari tomonidan turli davrlarda o‘rganilgan. Sharq falsafasida Forobiy, Beruniy va Ibn Sino jamiyat rivojlanishining asosiy omili sifatida ilm-fan, ma’rifat va axloqiy kamolotni ko‘rsatganlar. Forobiy fikricha, fozil jamiyatning shakllanishi bilim va adolatga asoslanadi [3, 56–58-b.]. Mazkur qarashlar bugungi innovatsion taraqqiyot konsepsiyalari bilan hamohangdir. Beruniy ilmiy tafakkur va tajribani taraqqiyotning muhim sharti sifatida baholagan [4, 94–97-b.].

Jadid mutafakkirlari tarixiy merosni saqlagan holda zamonaviy taraqqiyotga erishish mumkinligini asoslab berganlar. Behbudiy milliy taraqqiyotning asosiy omili sifatida ta’lim tizimini modernizatsiya qilish zarurligini ta’kidlagan [5, 41–43-b.]. Avloniy esa ma’naviy tarbiya va ilm-fanning jamiyat rivojlanishidagi ahamiyatini alohida qayd etgan [6, 22–25-b.].

MDH olimlari orasida V.S. Stepin, A.G. Spirkin va V.G. Afanasyevlar taraqqiyot va modernizatsiya muammolarini falsafiy jihatdan tahlil qilganlar. Stepinning fikricha, innovatsiyalar jamiyatning madaniy kodlari bilan uyg‘unlashgandagina barqaror rivojlanishni ta’minlay oladi [7, 118–121-b.].

O‘zbekistonlik olimlardan Q. Nazarov qadriyatlar tizimining modernizatsiya jarayonlariga ta’sirini tadqiq etib, tarixiy xotira milliy taraqqiyotning muhim omili ekanligini asoslaydi [8, 143–145-b.]. N. Jo‘rayev esa tarixiy tafakkur va sivilizatsion taraqqiyot masalalarini o‘rganib, milliy rivojlanishning falsafiy asoslarini yoritgan [9, 201–204-b.]. A. Erkayevning tadqiqotlarida ma’naviy yangilanish va milliy identitet masalalari tahlil qilinib, globallashuv sharoitida tarixiy merosning ahamiyati ko‘rsatib berilgan [10, 88–90-b.].

Shuningdek, zamonaviy xorijiy olimlar orasida M. Kastels, E. Toffler, F. Fukuyama va A. Toynbi innovatsion jamiyat, bilimlar iqtisodiyoti va sivilizatsion rivojlanish masalalariga alohida e’tibor qaratganlar. Kastels axborotlashgan jamiyatning shakllanishini taraqqiyotning yangi bosqichi sifatida baholaydi [11, 67–70-b.]. Toffler esa innovatsiyalarni “uchinchi to‘lqin” sivilizatsiyasining asosiy harakatlantiruvchi kuchi deb hisoblaydi [12, 143–147-b.].

Izlanishlar natijasi shuni ko‘rsatadiki, tarixiy meros va innovatsion taraqqiyot integratsiyasi masalasi alohida yo‘nalish sifatida yetarli darajada tadqiq etilmagan. Ayniqsa, O‘zbekiston ijtimoiy rivojlanishining falsafiy modeli kontekstida mazkur masalaning kompleks tahlili dolzarb ilmiy vazifa bo‘lib qolmoqda.

Tadqiqot metodologiyasi (Research methodology)

Izlanishlarimiz O‘zbekiston ijtimoiy rivojlanishining falsafiy modelini tarixiy meros va innovatsion taraqqiyot integratsiyasi asosida tahlil qilishga qaratilgan bo‘lib, unda ijtimoiy-falsafiy tadqiqotlarning zamonaviy metodologik yondashuvlaridan foydalanildi.

Tadqiqotning metodologik asosini dialektik yondashuv tashkil etadi. Ushbu yondashuv tarixiy meros va innovatsion taraqqiyotning o‘zaro aloqador hamda bir-birini to‘ldiruvchi jarayonlar ekanligini aniqlash imkonini berdi. Dialektik metod orqali an’ana va yangilanish, tarixiy xotira va innovatsion tafakkur, milliy qadriyatlar va global rivojlanish tendensiyalari o‘rtasidagi munosabatlar tahlil qilindi [13, 54–57-b.]. Tarixiy-komparativ metod yordamida Sharq va G‘arb taraqqiyot modellarining o‘ziga xos jihatlari qiyosiy o‘rganildi. Xususan, Yaponiya, Janubiy Koreya, Singapur va Turkiya tajribalari bilan O‘zbekistonning zamonaviy rivojlanish yo‘li taqqoslandi. Tahlillar natijasida innovatsion rivojlanishning muvaffaqiyati ko‘p jihatdan tarixiy-madaniy omillar bilan bog‘liqligi aniqlandi [14, 112–116-b.].

Tizimli yondashuv asosida tarixiy meros, ma’naviy qadriyatlar, ilm-fan, innovatsiyalar va ijtimoiy institutlar yagona rivojlanish tizimining o‘zaro bog‘liq elementlari sifatida o‘rganildi. Mazkur metod jamiyat taraqqiyotini murakkab va ko‘p darajali tizim sifatida talqin qilish imkonini berdi [15, 78–81-b.].

Aksiologik metod yordamida qadriyatlar tizimining innovatsion taraqqiyotga ta’siri o‘rganildi. Inson qadri, adolat, ma’rifat, vatanparvarlik va fuqarolik mas’uliyati kabi qadriyatlarning zamonaviy taraqqiyot jarayonlaridagi o‘rni tahlil qilindi [8, 166–170-b.].

Tadqiqotning nazariy manbalarini O‘zbekiston Respublikasi Prezidenti Sh.M. Mirziyoyev asarlari, o‘zbek va MDH olimlarining ilmiy ishlari, shuningdek zamonaviy falsafiy va sotsiologik tadqiqotlar tashkil etdi.

Natijalar va Muhokama (Results)

Tarixiy meros ijtimoiy rivojlanishning ma’naviy kapitali sifatida. Tadqiqot natijalari tarixiy merosning O‘zbekiston ijtimoiy rivojlanishidagi o‘rni faqat madaniy yodgorliklar yoki tarixiy xotira bilan cheklanmasligini ko‘rsatdi. Tarixiy meros jamiyatning ma’naviy kapitali sifatida ijtimoiy taraqqiyotning muhim resursi hisoblanadi.

Prezident Sh.M. Mirziyoyev ta’kidlaganidek, xalqning tarixiy xotirasini tiklash va milliy qadriyatlarni rivojlantirish Yangi O‘zbekiston taraqqiyotining ustuvor yo‘nalishlaridan biridir [2, 91–93-b.]. Tarixiy merosning rivojlanishdagi ahamiyati quyidagi jihatlarda namoyon bo‘ladi:

Birinchidan, tarixiy meros milliy identitetning shakllanishiga xizmat qiladi. Milliy o‘zlikni anglash jamiyatning ma’naviy birligini mustahkamlaydi va fuqarolarning umumiy taraqqiyot maqsadlari atrofida birlashishini ta’minlaydi [9, 214–216-b.].

Ikkinchidan, tarixiy tajriba innovatsion qarorlar qabul qilishda muhim metodologik manba vazifasini bajaradi. Jamiyat rivojlanishining tarixiy qonuniyatlarini bilish zamonaviy islohotlarning samaradorligini oshiradi [16, 124–126-b.].

Uchinchidan, tarixiy meros yosh avlodning ma’naviy kamolotini ta’minlaydi. Bu esa innovatsion jamiyatning asosiy subyekti bo‘lgan inson kapitalining rivojlanishiga xizmat qiladi [17, 52–54-b.].

Tahlillar natijasida tarixiy merosning zamonaviy taraqqiyotga ta’siri quyidagi model orqali ifodalandi:

Tarixiy xotira → Milliy identitet → Ma’naviy barqarorlik → Ijtimoiy faollik → Taraqqiyot

Mazkur model tarixiy merosning jamiyat rivojlanishidagi uzluksiz funksional rolini ko‘rsatadi.

Innovatsion taraqqiyotning falsafiy mohiyati. Tadqiqot davomida innovatsion taraqqiyotning falsafiy mohiyati ham tahlil qilindi. Aniqlanishicha, innovatsiyalar faqat texnologik yangiliklar emas, balki ijtimoiy tafakkur, boshqaruv, ta’lim va madaniyatdagi sifat o‘zgarishlarini ham o‘z ichiga oladi.

M. Kastels innovatsion taraqqiyotni axborotlashgan jamiyatning shakllanishi bilan bog‘laydi va bilimlar ishlab chiqarish taraqqiyotning asosiy omiliga aylanganligini ta’kidlaydi [11, 89–91-b.]. A. Tofflerning fikricha, zamonaviy jamiyatning rivojlanishi bilim, axborot va innovatsiyalar ulushining ortishi bilan belgilanadi [12, 168–170-b.].

O‘zbekiston sharoitida innovatsion taraqqiyot quyidagi ustuvor yo‘nalishlarda amalga oshirilmoqda:

- raqamli iqtisodiyot;
- elektron hukumat tizimi;
- sun’iy intellekt texnologiyalari;
- innovatsion ta’lim;
- ilm-fan va ishlab chiqarish integratsiyasi;
- startap ekotizimlarini rivojlantirish.

Mazkur yo‘nalishlar mamlakatning global raqobatbardoshligini oshirishga xizmat qilmoqda [18, 44–46-b.].

Jadidchilik va innovatsion tafakkur o‘rtasidagi bog‘liqlik. Natijalar jadidchilik harakati bilan zamonaviy innovatsion rivojlanish o‘rtasida kuchli metodologik aloqadorlik mavjudligini ko‘rsatdi.

Behbudiy va Fitrat tomonidan ilgari surilgan ma’rifatparvarlik g‘oyalari bugungi innovatsion iqtisodiyotning intellektual asoslari bilan hamohangdir [5, 58–60-b.; 19, 84–87-b.]. Jadidlarning quyidagi tamoyillari bugungi taraqqiyot uchun ham dolzarb ahamiyatga ega:

- uzluksiz ta’lim;
- ilm-fan ustuvorligi;
- ochiq tafakkur;
- yangilikka intilish;
- milliy va umuminsoniy qadriyatlar uyg‘unligi.

Shu jihatdan jadidchilik merosi O‘zbekiston innovatsion rivojlanishining tarixiy-intellektual manbalaridan biri sifatida baholanishi mumkin.

Tadqiqot natijalari shuni ko‘rsatadiki, O‘zbekiston ijtimoiy rivojlanishining falsafiy modeli tarixiy meros va innovatsion taraqqiyot o‘rtasidagi dialektik uyg‘unlikka asoslanadi. Bu uyg‘unlik oddiy parallel jarayon emas, balki o‘zaro ta’sir va o‘zaro boyitish mexanizmiga ega bo‘lgan murakkab tizim sifatida namoyon bo‘ladi.

Zamonaviy ijtimoiy-falsafiy adabiyotlarda modernizatsiya ko‘pincha an’anaviy qadriyatlarni inkor etuvchi jarayon sifatida talqin qilinadi. Biroq O‘zbekiston tajribasi bunday yondashuvning biryoqlama ekanligini ko‘rsatmoqda. Aksincha, tarixiy meros innovatsion rivojlanish uchun resurs va ma’naviy tayanch vazifasini bajaradi.

Prezident Sh.M. Mirziyoyev tomonidan ilgari surilgan “Yangi O‘zbekiston” konsepsiyasida ham aynan shu g‘oya asosiy metodologik yo‘nalish sifatida belgilanadi: milliy qadriyatlar va zamonaviy islohotlar uyg‘unligi barqaror taraqqiyotning kafolati sifatida qaraladi [18, 72–74-b.].

Jahon tajribasi bilan qiyoslaganda, Yaponiya va Janubiy Koreya modernizatsiyasi ham tarixiy-madaniy asoslardan voz kechmagan holda amalga oshirilgan. Bu holat "modernizatsiyaning milliy modeli" konsepsiyasini tasdiqlaydi. Shunday qilib, O'zbekiston modeli ham universal emas, balki sivilizatsion xususiyatga ega bo'lgan rivojlanish yo'lini ifodalaydi.

Tadqiqot natijalariga ko'ra, tarixiy meros, jadidchilik va innovatsion taraqqiyot o'rtasidagi bog'liqlik quyidagi uch darajada namoyon bo'ladi:

1. Aksiologik daraja, Tarixiy meros qadriyatlar tizimini shakllantiradi va innovatsion jarayonlarga ma'naviy yo'nalish beradi.

2. Institutsional daraja. Jadidchilik g'oyalari zamonaviy ta'lim, boshqaruv va fuqarolik jamiyati institutlari rivojlanishiga metodologik asos bo'ladi.

3. Texnologik daraja. Innovatsion taraqqiyot tarixiy tajriba va milliy qadriyatlar bilan uyg'unlashganda barqaror rivojlanish yuzaga keladi.

Shu asosda O'zbekiston ijtimoiy rivojlanishining falsafiy modeli quyidagi konseptual zanjir sifatida ifodalanishi mumkin:

Tarixiy meros → Ma'rifiy uyg'onish (jadidchilik) → Institutsional modernizatsiya → Innovatsion iqtisodiyot → Barqaror jamiyat

Mazkur modelning eng muhim jihati shundaki, u uzluksizlik va evolyutsion rivojlanishni asosiy tamoyil sifatida qabul qiladi.

Shu bilan birga, tadqiqot natijalari innovatsion taraqqiyotning faqat texnologik emas, balki ma'naviy va madaniy asosga ham ega ekanligini ko'rsatadi. Bu jihat zamonaviy globallashuv sharoitida milliy identitetni saqlab qolish uchun muhim ahamiyat kasb etadi.

Xulosa (Conclusion)

Ilmiy tahlillarimiz, O'zbekiston ijtimoiy rivojlanishining falsafiy modeli tarixiy meros va innovatsion taraqqiyot integratsiyasi asosida shakllanayotganini ko'rsatdi. Tadqiqot natijalariga ko'ra quyidagi xulosalar chiqarildi:

Birinchidan, tarixiy meros O'zbekiston ijtimoiy rivojlanishining ma'naviy va aksiologik poydevorini tashkil etadi. U milliy identitetni shakllantirish va jamiyat barqarorligini ta'minlashda muhim rol o'ynaydi.

Ikkinchidan, jadidchilik harakati milliy modernizatsiyaning dastlabki falsafiy modeli sifatida qaralishi mumkin. Uning ma'rifatparvarlik g'oyalari zamonaviy ta'lim, ilm-fan va innovatsion taraqqiyotning nazariy asoslarini boyitadi.

Uchinchidan, innovatsion taraqqiyot O'zbekiston rivojlanish strategiyasining markaziy yo'nalishlaridan biri bo'lib, u raqamli iqtisodiyot, ilmiy-texnik yangiliklar va institutsional islohotlarni o'z ichiga oladi.

To'rtinchidan, tarixiy meros va innovatsion taraqqiyot o'rtasidagi integratsiya O'zbekistonning o'ziga xos milliy rivojlanish modelini shakllantirmoqda. Ushbu model an'ana va yangilanish o'rtasidagi muvozanatga asoslanadi.

Beshinchidan, tadqiqotda ishlab chiqilgan falsafiy model O'zbekiston ijtimoiy rivojlanishining konseptual asoslarini tizimli ravishda tushuntirish imkonini beradi.

Umumiy xulosa qilib aytganda, O'zbekiston taraqqiyotining istiqboli tarixiy xotira, ma'rifiy yangilanish va innovatsion rivojlanishning uyg'unlashuviga bevosita bog'liqdir.

GLOBALLASHUV SHAROITIDA EKOLOGIK MUAMMOLARNING IJTIMOIY DETERMINATSIYASI: IJTIMOIY-FALSAFIY TAHLIL VA METODOLOGIK YONDASHUVLAR

Xudoyberdiyev Dilshod Murodovich
Qarshi davlat universiteti tadqiqotchisi
falsafa fanlari bo‘yicha falsafa doktori (PhD), dotsent
d.khudoyberdiev@mail.ru

Annotatsiya. *Maqolada globallashuv jarayonlari sharoitida ekologik muammolarning ijtimoiy determinatsiyasi ijtimoiy-falsafiy nuqtai nazardan tahlil qilinadi. Ekologik inqiroz tabiiy jarayonlarning oddiy yig‘indisi emas, balki ishlab chiqarish, iste’mol, boshqaruv, texnologik modernizatsiya, ijtimoiy tengsizlik, ekologik ong va qadriyatlar tizimi bilan belgilanadigan murakkab ijtimoiy hodisa sifatida asoslanadi. Maqolada ekologik muammolarni bartaraf etishda strategik boshqaruv, ekologik adolat, raqamli monitoring, fuqarolik jamiyati ishtiroki va ekologik madaniyatni uyg‘unlashtiruvchi integrativ yondashuv taklif etiladi.*

Tayanch so‘zlar: *globallashuv, ekologik muammolar, ijtimoiy determinatsiya, ijtimoiy-falsafiy tahlil, ekologik mas’uliyat, ekologik adolat, barqaror rivojlanish, yashil transformatsiya, ekologik ong, O‘zbekiston.*

СОЦИАЛЬНАЯ ДЕТЕРМИНАЦИЯ ЭКОЛОГИЧЕСКИХ ПРОБЛЕМ В УСЛОВИЯХ ГЛОБАЛИЗАЦИИ: СОЦИАЛЬНО-ФИЛОСОФСКИЙ АНАЛИЗ И МЕТОДОЛОГИЧЕСКИЕ ПОДХОДЫ

Аннотация. *В статье с социально-философской точки зрения анализируется социальная детерминация экологических проблем в условиях глобализационных процессов. Обосновывается, что экологический кризис представляет собой не простую совокупность природных процессов, а сложное социальное явление, обусловленное производством, потреблением, системой управления, технологической модернизацией, социальным неравенством, экологическим сознанием и системой ценностей. В статье предлагается интегративный подход, объединяющий стратегическое управление, экологическую справедливость, цифровой мониторинг, участие институтов гражданского общества и развитие экологической культуры в решении экологических проблем.*

Ключевые слова: *глобализация, экологические проблемы, социальная детерминация, социально-философский анализ, экологическая ответственность, экологическая справедливость, устойчивое развитие, зелёная трансформация, экологическое сознание, Узбекистан.*

SOCIAL DETERMINATION OF ENVIRONMENTAL PROBLEMS IN THE CONTEXT OF GLOBALIZATION: SOCIO-PHILOSOPHICAL ANALYSIS AND METHODOLOGICAL APPROACHES

Abstract. *This article analyzes the social determination of environmental problems in the context of globalization from a socio-philosophical perspective. It argues that the environmental crisis is not merely a combination of natural processes but a complex social phenomenon shaped by production, consumption, governance, technological modernization, social inequality, environmental awareness, and value systems. The article proposes an integrative approach that combines strategic governance, environmental justice, digital monitoring, civil society participation, and ecological culture to address environmental challenges effectively.*

Keywords: *globalization, environmental problems, social determination, socio-philosophical analysis, environmental responsibility, environmental justice, sustainable development, green transformation, environmental awareness, Uzbekistan.*

Kirish

XXI asrning uchinchi o‘n yilligida ekologik muammolar insoniyat taraqqiyotining eng murakkab, ko‘p omilli va global xarakterdagi masalalaridan biriga aylandi. Iqlim o‘zgarishi, atmosfera havosining ifloslanishi, suv resurslari tanqisligi, tuproq degradatsiyasi, biologik xilma-xillikning qisqarishi hamda chiqindilar hajmining ortishi faqat tabiiy jarayonlarning natijasi emas. Ularning chuqur ildizlari inson faoliyatining tashkil etilish usuli, sanoatlashuv modeli, energiya iste’moli, urbanizatsiya, texnologik taraqqiyot, iqtisodiy manfaatlar, boshqaruv institutlari va jamiyatning ekologik qadriyatlari bilan bevosita bog‘liqdir.

Shu jihatdan ekologik muammolarning ijtimoiy determinatsiyasi deganda tabiatga salbiy ta’sir ko‘rsatuvchi omillarning ijtimoiy-iqtisodiy, siyosiy-huquqiy, madaniy-ma’naviy, axloqiy va texnologik shart-sharoitlar orqali shakllanishi tushuniladi. Mazkur tushuncha ekologik muammoni faqat “tabiatdagi buzilish” sifatida emas, balki jamiyatning tarixiy taraqqiyoti, ishlab chiqarish munosabatlari, iste’mol me’yorlari va qadriyatlar tizimining in’ikosi sifatida ko‘rishga imkon beradi.

Globallashuv ekologik muammolarni hududiy chegaralardan chiqarib, ularni butun insoniyat taqdiriga daxldor muammoga aylantirmoqda. Bir mamlakatda yuzaga kelgan sanoat chiqindilari, o‘rmonlarning qisqarishi yoki energiya siyosatidagi nomutanosiblik boshqa hududlarda ham iqlim, migratsiya, oziq-ovqat xavfsizligi va sog‘liqni saqlash tizimlariga ta’sir ko‘rsatadi. IPCCning oltinchi baholash hisobotida inson faoliyati, avvalo issiqxona gazlari emissiyasi orqali, global isishning asosiy sababi ekani qayd etilgan; 2011–2020-yillarda global o‘rtacha harorat 1850–1900-yillardagi darajadan taxminan 1,1°C yuqori bo‘lgan [13].

So‘nggi statistik ma’lumotlar ekologik xavflarning kuchayib borayotganini ko‘rsatadi. UNEPning 2025-yilgi Emissions Gap Report hisoboti bo‘yicha 2024-yilda global issiqxona gazlari emissiyasi 57,7 $GtCO_2e$ darajasiga yetgan [14]. Global Carbon Project ma’lumotlarida esa qazilma yoqilg‘ilar va sement ishlab chiqarishdan chiqadigan CO_2 emissiyasi 2025-yilda 38,1 mlrd tonnaga yetishi prognoz qilingan [15]. Ushbu raqamlar ekologik muammolarning tabiiy emas, balki jamiyatning ishlab chiqarish va iste’mol tizimlari bilan belgilanadigan ijtimoiy mohiyatga ega ekanini yana bir bor tasdiqlaydi.

Adabiyotlar tahlili va metodologiya

Tadqiqotning nazariy-metodologik asosini ekologik muammolarni ijtimoiy voqelik, ijtimoiy faoliyat natijasi va qadriyatlar tizimidagi o‘zgarishlar bilan bog‘liq holda o‘rganish tashkil etadi. Maqolada dialektik tahlil, tizimli yondashuv, qiyosiy tahlil, institutsional yondashuv, aksiologik tahlil, faktorli tahlil va kontent-tahlil metodlaridan foydalanildi.

Dialektik metod “tabiat–shaxs–jamiyat” tizimidagi ziddiyatlarni ochish imkonini beradi. Tizimli yondashuv ekologik muammolarni iqtisodiy o‘sish, energetika, transport, sanoat, shaharsozlik, huquq, ta’lim va ommaviy axborot vositalari bilan o‘zaro aloqadorlikda ko‘rib chiqishga xizmat qiladi. Institutsional yondashuv ekologik boshqaruv, qonunchilik, davlat siyosati va fuqarolik jamiyati ishtirokining samaradorligini aniqlashga yordam beradi.

Nazariy manbalar sifatida J.S. Dryzek va J. Pickeringning antropotsen siyosati haqidagi monografiyasi, B. Latourning yangi iqlim rejimi bo‘yicha falsafiy tahlillari, R. Leichenko va K. O’Brienning iqlim o‘zgarishini ijtimoiy muammo sifatida talqin qiluvchi tadqiqoti, U. Brand va M. Wissenning iste’mol va ekologik inqiroz munosabatlarini yorituvchi monografiyasi, shuningdek, Nature, Science Advances, PNAS, Nature Communications va New Political Economy jurnallarida chop etilgan so‘nggi ilmiy maqolalar asos qilib olindi [2; 3; 4; 5; 6; 7; 8; 9; 10].

Empirik asos sifatida IPCC, UNEP, Global Carbon Project, Jahon banki, UNFCCC va O‘zbekiston Respublikasi Milliy statistika qo‘mitasining eng yangi ma’lumotlaridan foydalanildi. Bunda elektron manbalar maqolaning nazariy asosini emas, balki statistik dalillash vazifasini bajaradi. Bu yondashuv ilmiy maqolada manbalar nisbatini muvozanatlashtirib, monografik va jurnal manbalarining salmog‘ini oshiradi.

Ekologik muammolarning ijtimoiy determinatsiyasi insonning tabiatga ta’siri tasodifiy yoki yakka xatti-harakatlar natijasi emas, balki muayyan ijtimoiy tizimlar orqali shakllanishini anglatadi. Bu yerda “determinatsiya” tushunchasi faqat sabab-oqibat bog‘lanishini emas, balki ekologik xavflarni keltirib chiqaradigan iqtisodiy manfaatlar, ishlab chiqarish shakllari, iste’mol standartlari, institutsional boshqaruv, siyosiy qarorlar, huquqiy me’yorlar, ekologik bilim va axloqiy qadriyatlar majmuini ifodalaydi.

Ijtimoiy-falsafiy nuqtai nazardan ekologik muammolar to‘rtta asosiy determinantlar tizimida namoyon bo‘ladi. Birinchisi – iqtisodiy-ishlab chiqarish determinatsiyasi bo‘lib, u sanoat, energetika, qishloq xo‘jaligi va transport sohalaridagi resurs talabchan model bilan bog‘liq. Ikkinchisi – iste’mol-madaniy determinatsiya bo‘lib, u haddan tashqari iste’mol, chiqindilar ko‘payishi, qisqa muddatli foydalanishga mo‘ljallangan mahsulotlar madaniyati va tabiatga utilitar munosabatda ko‘rinadi. Uchinchisi – institutsional-huquqiy determinatsiya bo‘lib, ekologik qonunchilik, nazorat, monitoring, shaffoflik va boshqaruv mexanizmlari darajasiga bog‘liq. To‘rtinchisi – aksiologik determinatsiya bo‘lib, insonning tabiatni faqat resurs sifatida emas, balki hayotning ontologik asosi va ma’naviy qadriyat sifatida anglash darajasi bilan belgilanadi.

Dryzek va Pickering antropotsen davrida siyosiy institutlar, boshqaruv tamoyillari va fuqarolik ishtiroki ekologik barqarorlik talablariga mos ravishda qayta ko‘rib chiqilishi zarurligini ta’kidlaydi [2]. Latour esa ekologik inqirozni zamonaviy siyosiy landshaftni o‘zgartirayotgan “yangi iqlim rejimi” sifatida talqin qilib, global muammolarni eski taraqqiyot modeli doirasida hal etib bo‘lmasligini ko‘rsatadi [3]. Demak, ekologik muammolarni tushunish uchun tabiat va jamiyatni alohida substansiyalar sifatida emas, balki o‘zaro shartlangan, o‘zaro ta’sir qiluvchi yaxlit tizim sifatida tahlil qilish zarur.

Leichenko va O'Brien iqlim o'zgarishini ijtimoiy masala sifatida talqin qilib, uning sabablari va oqibatlari faqat atmosfera yoki energetika tizimlari bilan emas, balki turmush tarzi, tengsizlik, moslashuv imkoniyatlari va ijtimoiy institutlar bilan chambarchas bog'liq ekanini ko'rsatadi [4]. Bu yondashuv ekologik muammolarning ijtimoiy determinatsiyasi nazariy jihatdan mustahkam konseptual asosga ega ekanini ko'rsatadi.

Globallashuv tabiatga ta'sir etuvchi mahalliy jarayonlarni global tizimlarga bog'lab yubordi. Xomashyo qazib olish, energiya ishlab chiqarish, xalqaro savdo, transport-logistika tarmoqlari va ommaviy iste'mol madaniyati bir hududdagi ekologik bosimni boshqa hududlar hayoti bilan bog'lamoqda. Natijada ekologik muammolar milliy ekologik siyosat chegaralaridan chiqib, global boshqaruv, xalqaro hamkorlik va ekologik adolat masalasiga aylanadi.

Antropotsen konsepsiyasi insoniyatning geologik va biosferaviy jarayonlarga ta'siri shunchalik kuchayganini bildiradiki, endilikda inson faqat tabiatdan foydalanuvchi emas, balki Yer tizimining muhim o'zgartiruvchi kuchiga aylandi. Steffen va hammualliflar Yer tizimi o'z-o'zini kuchaytiruvchi iqlim feedbacklari natijasida "issiq Yer" yo'nalishiga o'tib ketishi mumkinligini ilmiy asoslagan [8]. Bu xulosa ekologik muammolarni vaqtinchalik yoki sektorlar doirasidagi masala sifatida emas, balki sivilizatsion tanlov muammosi sifatida baholashni talab qiladi.

Rockström va hammualliflar "xavfsiz va adolatli Yer tizimi chegaralari" konsepsiyasida iqlim, biosfera, chuchuk suv, oziqa moddalar aylanishi va havo ifloslanishini inson farovonligi bilan uzviy bog'liq holatda ko'rib chiqadi [6]. Richardson va hammualliflarning 2023-yilgi tadqiqotida esa to'qqizta planetar chegaradan oltitasi allaqachon buzilgani ko'rsatiladi [7]. Bu ilmiy natijalar ekologik muammolarni alohida-alohida emas, balki tizimli, ko'p darajali va o'zaro bog'liq hodisa sifatida o'rganish zarurligini tasdiqlaydi.

UNEP ma'lumotlariga ko'ra, 2024-yilda global issiqxona gazlari emissiyasi 57,7 $GtCO_2e$ ni tashkil etgan [14]. Ushbu raqam global iqtisodiyotda energiya, sanoat va yer resurslaridan foydalanishning hozirgi modeli ekologik barqarorlik talablariga to'liq mos kelmayotganini ko'rsatadi. Shuning uchun ekologik modernizatsiya faqat texnologik yangilanish emas, balki ijtimoiy institutlar, siyosiy qarorlar va madaniy qadriyatlarni qayta tashkil etish jarayoni sifatida qaralishi lozim.

Ekologik muammolarning ijtimoiy determinatsiyasida iste'mol madaniyati muhim o'rin tutadi. Modern industrial jamiyatda farovonlik ko'pincha moddiy iste'mol hajmi bilan o'lchanadi. Bunday yondashuv ishlab chiqarish va iste'molning uzluksiz kengayishini rag'batlantiradi, tabiiy resurslarga bosimni oshiradi hamda chiqindilar, emissiyalar va ekologik izlarni ko'paytiradi.

Wiedmann, Lenzen, Keyßer va Steinbergerning Nature Communications jurnalida chop etilgan maqolasida farovonlikning haddan tashqari iste'molga bog'lanishi global resurslardan foydalanish va ekologik bosimning asosiy omillaridan biri ekani asoslanadi [9]. Mualliflarning xulosasi shundan iboratki, ekologik muammolarni hal qilishda faqat texnologik samaradorlik yetarli emas; iste'mol me'yorlari, ijtimoiy ehtiyojlar va farovonlik mezonlari ham qayta ko'rib chiqilishi kerak.

Hickel va Kallis "yashil o'sish" konsepsiyasini tanqidiy tahlil qilib, iqtisodiy o'sishni ekologik bosimdan mutlaq ajratish amalda juda murakkab ekanini ko'rsatadi [10]. Bu yondashuv ekologik siyosatda faqat "ko'proq ishlab chiqarish, kamroq ifloslantirish" shiori bilan cheklanib qolmaslik, balki iste'molning oqilona chegaralari, ijtimoiy adolat va resurslardan foydalanishning axloqiy mezonlarini shakllantirish zarurligini ko'rsatadi.

Brand va Wissen "imperial mode of living" konsepsiyasi orqali global Shimolda shakllangan yuqori iste'mol standartlari ko'pincha global Janubdagi resurslar, mehnat va ekologik xarajatlar hisobiga saqlanishini ta'kidlaydi [5]. Demak, ekologik adolat masalasi faqat tabiatni asrash emas, balki ekologik xavflar va ekologik manfaatlarning ijtimoiy guruhlar, hududlar va avlodlar o'rtasida qay tarzda taqsimlanishini tahlil qilish bilan ham bog'liqdir.

Ijtimoiy-falsafiy tahlil shuni ko'rsatadiki, ekologik adolat uch darajada namoyon bo'ladi: birinchidan, avlodlararo adolat – hozirgi avlod kelajak avlodlarning sog'lom muhitda yashash huquqini cheklamasligi lozim; ikkinchidan, hududiy adolat – ekologik xavflar sanoat markazlari, qishloq hududlari va shaharlarda turlicha taqsimlanishini hisobga olish zarur; uchinchidan, ijtimoiy adolat – kam daromadli aholi, bolalar, keksalar va zaif guruhlar ekologik xavflardan ko'proq zarar ko'rishini e'tibordan chetda qoldirmaslik kerak.

Natijalar va Muhokama

O'zbekiston sharoitida ekologik muammolarning ijtimoiy determinatsiyasi suv resurslari tanqisligi, atmosfera havosining ifloslanishi, energetika tizimining uglerod talabchanligi, sanoat hududlari, transport, urbanizatsiya, chiqindilarni boshqarish va ekologik madaniyat bilan bog'liq holda namoyon bo'ladi. Mamlakatning iqlim jihatdan qurg'oqchil hududda joylashgani ekologik xavflarni kuchaytiradi, biroq bu xavflarning ijtimoiy oqibatlari boshqaruv sifati, aholi ekologik savodxonligi, iqtisodiy modernizatsiya va hududiy rivojlanish strategiyalariga bog'liq.

O'zbekistonning 2025-yildagi uchinchi Milliy darajada belgilangan hissasi – NDC 3.0 hujjatiga ko'ra, 2022-yilda mamlakatning umumiy issiqxona gazlari emissiyasi 209,6 mln tonna CO_2e ni tashkil etgan; LULUCF sektori bo'yicha yutilishlar hisobga olinganda, sof emissiya 201,15 mln tonna CO_2e bo'lgan [16]. Ushbu hujjatda aholi jon boshiga emissiya 5,94 tonna CO_2e ekani va mamlakatning global emissiyadagi ulushi taxminan 0,4 foizni tashkil etishi qayd etiladi [16]. Bu

ko‘rsatkichlar O‘zbekistonning global ulushi nisbatan kichik bo‘lsa-da, milliy iqtisodiyotda energiya samaradorligi, qayta tiklanuvchi energiya manbalari, transportni ekologiklashtirish va sanoatni modernizatsiya qilish zarurligini ko‘rsatadi.

O‘zbekiston Respublikasi Milliy statistika qo‘mitasi ma’lumotlariga ko‘ra, 2024-yilda statsionar manbalardan atmosferaga chiqarilgan ifloslantiruvchi moddalar hajmi 866,7 ming tonnani tashkil etgan; bu ko‘rsatkich 2023-yilda 763,2 ming tonna, 2022-yilda esa 873,6 ming tonna bo‘lgan [17]. Hududlar kesimida 2024-yilda eng yuqori ko‘rsatkich Toshkent viloyatida – 465,0 ming tonna, Qashqadaryo viloyatida – 88,6 ming tonna, Samarqand viloyatida – 47,4 ming tonna sifatida qayd etilgan [17]. Ushbu statistik tafovutlar sanoatlashuv, hududiy ixtisoslashuv va ekologik boshqaruv samaradorligi o‘rtasidagi bog‘liqlikni ko‘rsatadi.

Shahar muhitida havo sifati alohida ijtimoiy ahamiyatga ega. Jahon bankining 2024-yilgi Toshkent shahri havosi sifatini baholash bo‘yicha hisobotida aholi vazniga nisbatan hisoblangan yillik PM2.5 konsentratsiyasi 38,8 μg/m³ deb baholangan; bu Jahon sog‘liqni saqlash tashkiloti tavsiya qilgan 5 μg/m³ me’yoridan bir necha barobar yuqori. Hisobotda PM2.5 bilan bog‘liq erta o‘limlar soni yiliga 3042 ta, iqtisodiy zarar esa 488,4 mln AQSh dollari atrofida baholangan [18].

Bu ma’lumotlar havo ifloslanishini faqat ekologik yoki tibbiy muammo sifatida emas, balki transport siyosati, uy-joy-kommunal tizimi, shaharsozlik, energetika, ijtimoiy tenglik va boshqaruv samaradorligi bilan bog‘liq kompleks ijtimoiy muammo sifatida talqin qilish zarurligini ko‘rsatadi. Toshkentdagi havo sifati masalasi shahar aholisi salomatligi, mehnat unumdorligi, iqtisodiy xarajatlar va ekologik huquqlar bilan bevosita bog‘liqdir.

Ekologik muammolarni bartaraf etishda texnologik modernizatsiya muhim bo‘lsa-da, u yetarli shart emas. Chunki ekologik muammolarning ildizlari faqat ishlab chiqarish vositalarida emas, balki insonning dunyoqarashi, qadriyatlari, axloqiy tanlovi va kundalik xulq-atvorida ham namoyon bo‘ladi. Agar tabiat faqat resurs sifatida qabul qilinsa, ekologik siyosat ko‘proq taqiqlovchi va jazolovchi choralar darajasida qolib ketadi. Aksincha, tabiat hayotning ontologik asosi, ma’naviy qadriyat va avlodlararo adolat obyekti sifatida anglanganda ekologik madaniyat barqaror rivojlanishning ichki omiliga aylanadi.

Mavjud milliy ilmiy tadqiqotlarda ham ekologik huquqiy ong, ekologik madaniyat va ekologik tarbiya “tabiat–shaxs–jamiyat” tizimidagi uyg‘unlikni ta’minlovchi asosiy omillar sifatida talqin qilinadi [11; 12]. Bu yondashuv ekologik muammolarning ijtimoiy determinatsiyasini o‘zgartirish uchun nafaqat qonunchilik va boshqaruvni, balki shaxsning mas’uliyatli ekologik xulq-atvorini ham shakllantirish zarurligini ko‘rsatadi.

Ekologik mas’uliyat uch darajali tizim sifatida talqin qilinishi mumkin. Birinchi daraja – shaxsiy mas’uliyat: har bir fuqaroning suv, energiya, transport, iste’mol va chiqindilar bilan bog‘liq kundalik qarorlarida ekologik oqibatlarni hisobga olishi. Ikkinchi daraja – institutsional mas’uliyat: davlat organlari, korxonalar, ta’lim muassasalari, mahalla va fuqarolik jamiyati institutlarining ekologik me’yorlarga rioya qilishi. Uchinchi daraja – avlodlararo mas’uliyat: hozirgi iqtisodiy manfaat kelajak avlodlarning ekologik xavfsizligi hisobiga amalga oshirilmasligi.

Ekologik muammolarni hal qilishda an’anaviy antropotsentrik yondashuvning imkoniyatlari cheklangan. Antropotsentrik modelda tabiat inson ehtiyojlarini qondirish vositasi sifatida talqin qilinadi. Bunday yondashuv sanoat sivilizatsiyasi davrida iqtisodiy o‘sishni tezlashtirgan bo‘lsa-da, tabiatning tiklanish imkoniyatlarini va ekotizimlarning chegaralanganligini yetarli darajada hisobga olmadi.

Koevolyutsion yondashuv esa inson, jamiyat va tabiatni o‘zaro moslashuvchi, o‘zaro ta’sir qiluvchi va o‘zaro shartlangan tizim sifatida ko‘radi. Bu yondashuvda inson tabiat ustidan mutlaq hukmron subyekt emas, balki biosfera bilan bog‘liq mavjudot sifatida talqin qilinadi. Demak, iqtisodiy o‘sish ekologik chegaralar, ijtimoiy adolat va avlodlararo mas’uliyat bilan muvofiqlashtirilishi lozim.

Tadqiqot natijalari asosida birinchi amaliy yo‘nalish sifatida ekologik boshqaruvni sektorlararo strategik tizimga aylantirish zarur. Energetika, transport, sanoat, suv xo‘jaligi, shaharsozlik va sog‘liqni saqlash siyosati ekologik maqsadlar bilan uyg‘unlashgan holda ishlab chiqilishi lozim. Bu yondashuv ekologik muammolarni alohida vazirlik yoki idoraning vazifasi sifatida emas, balki butun davlat siyosatining integrativ yo‘nalishi sifatida ko‘rishga imkon beradi.

Ikkinchi yo‘nalish – ekologik monitoring va ochiq ma’lumotlar tizimini kuchaytirish. Atmosfera havosi, suv, tuproq, chiqindilar va bioxilma-xillik bo‘yicha muntazam, hududlar kesimidagi va jamoatchilik uchun ochiq ma’lumotlar ekologik qarorlar sifati va ijtimoiy ishonchni oshiradi. Raqamli monitoring fuqarolik nazoratini kuchaytirib, ekologik boshqaruvning shaffofligini ta’minlaydi.

Uchinchi yo‘nalish – yashil iqtisodiyotga o‘tishni ijtimoiy adolat bilan bog‘lash. Energiya samaradorligi, qayta tiklanuvchi energiya, chiqindilarni qayta ishlash va ekologik transport tizimlarini rivojlantirish bilan birga, kam daromadli aholi va ekologik xavf yuqori hududlar manfaatlari ham hisobga olinishi lozim. Aks holda yashil transformatsiya ijtimoiy tengsizlikni kamaytirish o‘rniga yangi nomutanosibliklarni keltirib chiqarishi mumkin.

To‘rtinchi yo‘nalish – ekologik ta’limni formal bilim berishdan ekologik madaniyatni shakllantirish tizimiga aylantirish. Ta’lim jarayonida tabiatga mehr, resurslardan oqilona foydalanish, chiqindilarni kamaytirish, avlodlararo mas’uliyat va ekologik adolat tamoyillari izchil singdirilishi kerak. Bunda maktab, oliy ta’lim, mahalla, OAV va nodavlat tashkilotlarning hamkorligi muhim ahamiyatga ega.

Beshinchi yo‘nalish – ekologik muammolarni hal qilishda fuqarolik jamiyati ishtirokini institutsionallashtirish. Jamoatchilik eshituvlari, ekologik ekspertiza, mahalliy tashabbuslar, volontyorlik harakatlari va ekologik jamoat tashkilotlari faoliyati ekologik siyosatni faqat yuqoridan pastga yo‘naltirilgan boshqaruv emas, balki hamkorlikka asoslangan ijtimoiy jarayonga aylantiradi.

Xulosa

Globallashuv sharoitida ekologik muammolar tabiatdagi izolyatsiyalangan o‘zgarishlar emas, balki inson faoliyati, iqtisodiy model, texnologik tizimlar, siyosiy institutlar, iste’mol madaniyati va ekologik ong bilan belgilanadigan ijtimoiy determinatsiyalangan jarayondir.

Birinchidan, ekologik muammolarning ijtimoiy-falsafiy tahlili shuni ko‘rsatadiki, ekologik xavflar iqtisodiy-ishlab chiqarish, iste’mol-madaniy, institutsional-huquqiy va aksiologik determinantlar o‘zaro ta’sirida shakllanadi. Demak, ularni bartaraf etish uchun faqat texnologik modernizatsiya emas, balki ijtimoiy institutlar va qadriyatlar tizimini yangilash ham zarur.

Ikkinchidan, so‘nggi global ilmiy tadqiqotlar va statistik ma’lumotlar antropotsen sharoitida ekologik muammolar planetar chegaralarga yaqinlashganini yoki ayrim yo‘nalishlarda ulardan oshib ketganini ko‘rsatmoqda. Bu holat ekologik siyosatni sivilizatsion taraqqiyot strategiyasi sifatida talqin qilishni talab qiladi.

Uchinchidan, O‘zbekiston misoli ekologik muammolarning milliy determinantlari energetika, sanoat, transport, shaharsozlik, havo sifati, ekologik boshqaruv va aholining ekologik madaniyati bilan bog‘liq ekanini ko‘rsatadi. 2022-yilda issiqxona gazlari emissiyasi 209,6 mln tonna CO_2e bo‘lgani, 2024-yilda statsionar manbalardan atmosferaga chiqarilgan ifloslantiruvchi moddalar 866,7 ming tonnani tashkil etgani milliy ekologik siyosatni chuqurlashtirish zarurligini asoslaydi.

To‘rtinchidan, ekologik ong, ekologik ta’lim, ekologik madaniyat va jamoatchilik ishtiroki ekologik barqarorlikning asosiy ijtimoiy mexanizmlari sifatida qaralishi lozim. Ekologik mas’uliyat shaxsiy, institutsional va avlodlararo darajalarda shakllangandagina ekologik siyosat barqaror natija beradi.

Beshinchidan, O‘zbekiston sharoitida ekologik muammolarni bartaraf etishning samarali modeli strategik boshqaruv, raqamli monitoring, yashil iqtisodiyot, ekologik ta’lim, fuqarolik jamiyati ishtiroki va ekologik adolatni birlashtirgan integrativ yondashuvga tayanishi kerak. Bunday model barqaror rivojlanishni faqat iqtisodiy o‘sish emas, balki inson, jamiyat va tabiat o‘rtasidagi uyg‘unlik sifatida tushunishga xizmat qiladi.

SHAXSIY MA'LUMOTLARNI HIMOYA QILISHNING FUQAROLIK-HUQUQIY VA FALSAFIY ASOSLARI

Abdulhamidova Zarnigor Akmaljon qizi
NamDU Yuridik fakulteti talabasi

Annotatsiya: *Ushbu maqolada raqamli iqtisodiyot va global axborotlashuv sharoitida shaxsiy ma'lumotlarni himoya qilishning fuqarolik-huquqiy jihatlari atroflicha tahlil qilingan. Shaxsiy ma'lumotlarning huquqiy tabiati, ularning daxlsiz nomulkiy huquqlar tizimidagi o'rni hamda O'zbekiston Respublikasi Fuqarolik kodeksi va sohaga oid qonunchilik hujjatlari asosida tartibga solinishi tadqiq etilgan. Shuningdek, shaxsiy ma'lumotlarning buzilishi holatlarida fuqarolik-huquqiy javobgarlik masalalari, xususan, ma'naviy zararni qoplash va yetkazilgan zararni undirishning o'ziga xos xususiyatlari, xorijiy davlatlar (jumladan, GDPR) tajribasi bilan qiyosiy o'rganilgan. Maqola yakunida milliy qonunchilikni takomillashtirish yuzasidan ilmiy-amaliy taklif va tavsiyalar ilgari surilgan.*

Kalit so'zlar / Ключевые слова / Keywords: *shaxsiy ma'lumotlar, fuqarolik huquqi, shaxsiy nomulkiy huquqlar, ma'naviy zarar, daxlsizlik, axborot xavfsizligi, subyekt huquqlari, shaxsiy hayot siri.*

ГРАЖДАНСКО-ПРАВОВЫЕ И ФИЛОСОФСКИЕ ОСНОВЫ ЗАЩИТЫ ПЕРСОНАЛЬНЫХ ДАННЫХ

Аннотация: *В данной статье подробно анализируются гражданско-правовые аспекты защиты персональных данных в условиях цифровой экономики и глобальной информатизации. Исследуется правовая природа персональных данных, их место в системе неотчуждаемых личных неимущественных прав, а также регулирование на основе Гражданского кодекса Республики Узбекистан и профильного законодательства. Также в сравнительном аспекте с зарубежным опытом (включая GDPR) изучены вопросы гражданско-правовой ответственности в случаях нарушения конфиденциальности персональных данных, в частности, особенности компенсации морального вреда и взыскания убытков. В заключении статьи выдвинуты научно-практические предложения и рекомендации по совершенствованию национального законодательства.*

Ключевые слова: *персональные данные, гражданское право, личные неимущественные права, моральный вред, неприкосновенность, информационная безопасность, права субъекта, тайна личной жизни.*

CIVIL-LEGAL AND PHILOSOPHICAL BASES OF PERSONAL DATA PROTECTION

Abstract: *This article analyzes in detail the civil-legal aspects of personal data protection in the context of the digital economy and global informatization. The legal nature of personal data, their place in the system of inalienable personal non-property rights, and their regulation based on the Civil Code of the Republic of Uzbekistan and relevant legislation are thoroughly researched. Furthermore, the issues of civil liability in cases of personal data breaches, specifically the peculiarities of moral damage compensation and recovery of losses, are examined in comparison with foreign experience (including GDPR). At the conclusion of the article, scientific and practical proposals and recommendations are put forward to improve the national legislation.*

Keywords: *personal data, civil law, personal non-property rights, moral damage, privacy, information security, subject rights, privacy secret.*

Kirish

XXI asr — yuqori texnologiyalar va raqamli transformatsiyalar davri. Jamiyat hayotining barcha sohalariga axborot texnologiyalarining shiddat bilan kirib kelishi inson faoliyatini yengillashtirish bilan bir qatorda, uning shaxsiy daxlsizligiga bo'lgan tahdidlarni ham kuchaytirdi. Bugungi kunda shaxsiy ma'lumotlar (personal data) iqtisodiy va ijtimoiy munosabatlarning eng qimmatli resurslaridan biriga aylandi. Elektron tijorat, bank tizimi, davlat xizmatlari va ijtimoiy tarmoqlar foydalanuvchilarning juda katta hajmdagi shaxsiy ma'lumotlarini yig'ish, qayta ishlash va saqlashni taqozo etmoqda. Bunday sharoitda shaxsiy ma'lumotlarni huquqiy himoya qilish, xususan, fuqarolik-huquqiy mexanizmlarni takomillashtirish dolzarb vazifalardan biri hisoblanadi.

O'zbekiston Respublikasida inson huquq va erkinliklarini, jumladan, shaxsiy hayot daxlsizligini ta'minlash konstitutsiyaviy darajada mustahkamlangan. Yangi tahrirdagi O'zbekiston Respublikasi Konstitutsiyasining 31-

moddasida har kim shaxsiy hayotining daxlsiz bo'lishi, shaxsiy va oilaviy siri, o'z sha'ni va qadr-qimmati himoya qilinishi huquqiga egaligi, har bir shaxs o'ziga taalluqli bo'lgan ma'lumotlarni bilish va adolatsiz ma'lumotlarning tuzatilishini, o'zi haqida qonuniy asoslarsiz to'plangan yoki huquqiy asoslarga ega bo'lmagan ma'lumotlarning yo'q qilinishini talab qilish huquqiga egaligi belgilab qo'yildi. Mazkur konstitutsiyaviy normalarning real hayotda ishlashi ko'p jihatdan fuqarolik qonunchiligi normalarining samaradorligiga bog'liqdir.

Shaxsiy ma'lumotlarning huquqiy tabiati va fuqarolik huquqi predmeti

Fuqarolik huquqi nuqtai nazaridan shaxsiy ma'lumotlarning huquqiy tabiati va uning huquqiy maqomini aniqlash muhim nazariy ahamiyatga ega. O'zbekiston Respublikasining 2019-yil 2-iyundagi «Shaxsiy ma'lumotlar to'g'risida»gi O'RQ-547-sonli Qonunining 4-moddasiga ko'ra, shaxsiy ma'lumotlar — muayyan jismoniy shaxsga taalluqli bo'lgan yoki uni identifikatsiya qilish imkonini beradigan, elektron, qog'oz va (yoki) boshqa moddiy jismda qayd etilgan axborotdir. Bunga shaxsning familiyasi, ismi, otasining ismi, tug'ilgan sanasi va joyi, pasport ma'lumotlari, biometrik ma'lumotlari, yashash manzili, telefoni, elektron pochtasi va boshqalar kiradi.

Fuqarolik huquqi nazariyasida shaxsiy ma'lumotlar qanday obyekti sifatida ko'rilishi bo'yicha turli yondashuvlar mavjud. Birinchi yondashuv vakillari shaxsiy ma'lumotlarni shaxsiy nomulkiy huquqlar obyekti (Fuqarolik kodeksining 99-moddasi) deb hisoblasalar, ikkinchi yondashuv tarafdorlari ularni raqamli dunyodagi o'ziga xos mulkiy qiymatga ega bo'lgan axborot obyekti sifatida baholaydilar. Bizning fikrimizcha, shaxsiy ma'lumotlar dualistik (ikki yoqlama) tabiatga ega. U bir tomondan shaxsning uzviy ajralmas qismi bo'lib, shaxsiy nomulkiy huquqlar (shaxsiy hayot daxlsizligi siri) tarkibiga kirsa, ikkinchi tomondan, raqamli iqtisodiyotda tijorat maqsadlarida foydalaniladigan resurs hisoblanadi. Biroq, fuqarolik-huquqiy himoya nuqtai nazaridan, har doim inson huquqlarining ustuvorligi ta'minlanishi, ya'ni shaxs o'z ma'lumotlarini tasarruf etish ustidan to'liq nazoratga ega bo'lishi shart.

Shaxsiy ma'lumotlarni qayta ishlashda fuqarolik-huquqiy shartnomalarning o'rni

Amaliyotda shaxsiy ma'lumotlarni yig'ish va qayta ishlash aksariyat hollarda fuqarolik-huquqiy shartnomalar yoki bitimlar asosida amalga oshiriladi. Masalan, bankdan kredit olish, internet-do'kondan buyurtma berish yoki mobil ilovadan ro'yxatdan o'tish jarayonida foydalanuvchi shartnoma shartlariga va shaxsiy ma'lumotlarini qayta ishlashga rozilik (Privacy Policy / User Agreement) beradi. Fuqarolik kodeksining 354-moddasiga ko'ra, fuqarolar va yuridik shaxslar shartnoma tuzishda erkindirlar. Ammo, raqamli platformalarda bu erkinlik ko'pincha cheklangan bo'ladi, chunki foydalanuvchida shartnoma shartlarini o'zgartirish imkoniyati yo'q — u yo shartlarni to'liq qabul qilishi, yoki xizmatdan voz kechishi kerak (qo'shilish shartnomasi, FK 360-moddasi).

Bu esa shaxsiy ma'lumotlar subyektining huquqlarini himoya qilish uchun qonunchilik darajasida maxsus kafolatlarni talab qiladi. Yevropa Ittifoqining Ma'lumotlarni muhofaza qilish bo'yicha umumiy reglamenti (GDPR) tajribasi shuni ko'rsatadiki, shaxsiy ma'lumotlarni qayta ishlashga berilgan rozilik erkin, aniq va aniq ifodalangan bo'lishi kerak. Agar shartnoma shartlarida ma'lumotlarni shartnoma maqsadidan tashqari uchinchi shaxslarga sotish yoki asossiz qayta ishlash bandlari yashirincha kiritilgan bo'lsa, bunday bitimlar Fuqarolik kodeksining 116-moddasi (Qonunchilik talablariga muvofiq kelmaydigan bitimning haqiqiy emasligi) asosida haqiqiy emas deb topilishi lozim.

Huquqbuzarlik uchun fuqarolik-huquqiy javobgarlik choralari

Shaxsiy ma'lumotlar daxlsizligi buzilganda (o'g'irlanganda, sizdirilganda yoki ruxsatsiz tarqatilganda) eng muhim masalalardan biri subyektning buzilgan huquqlarini tiklash va aybdor shaxsni javobgarlikka tortishdir. Fuqarolik huquqida buning uchun asosan ikki xil mexanizm qo'llaniladi: yetkazilgan moddiy zararni qoplash (FK 14, 985-moddalari) va ma'naviy zararni kompensatsiya qilish (FK 1021, 1022-moddalari).

Amaliyotda shaxsiy ma'lumotlar sizdirilishi oqibatida yetkazilgan moddiy zararni isbotlash ancha qiyin kechadi. Masalan, mijozning telefon raqami yoki pasport nusxasi firibgarlar qo'liga tushib, uning nomiga kredit rasmiylashtirilgan taqdirdagina aniq moddiy zarar yuzaga keladi va uni undirish mumkin bo'ladi. Biroq, ko'p hollarda ma'lumotlarning sizib chiqishi shaxsga ruhiy azob, bezovtalik, sha'n va qadr-qimmatning pasayishi kabi salbiy oqibatlarni olib keladi. Bu esa ma'naviy zarar hisoblanadi. O'zbekiston Respublikasi Oliy sudi Plenumining 2000-yil 28-apreldagi 7-sonli «Ma'naviy zararni qoplash haqidagi qonunlarni qo'llashning ayrim masalalari to'g'risida»gi qaroriga muvofiq, shaxsiy hayot siri buzilishi ma'naviy ziyonni undirish uchun asos bo'ladi. Shuni ta'kidlash lozimki, ma'naviy zararni qoplash miqdori sud tomonidan jabrlanuvchining chekkan ruhiy azoblari darajasi va javobgarning aybi darajasiga qarab adolat va oqillik mezonlari asosida belgilanadi.

Xulosa va takliflar

O'tkazilgan tadqiqotlar shuni ko'rsatadiki, mamlakatimizda shaxsiy ma'lumotlarni fuqarolik-huquqiy tartibga solish tizimi bosqichma-bosqich shakllanib bormoqda, biroq raqamli makonning rivojlanishi qonunchilikni yanada takomillashtirishni taqozo etadi. Yuqoridagilardan kelib chiqib, quyidagi ilmiy va amaliy takliflarni ilgari suramiz:

Birinchidan, O'zbekiston Respublikasi Fuqarolik kodeksining 99-moddasiga (Nomoddiy ne'matlar) o'zgartirish kiritib, «shaxsiy ma'lumotlar»ni mustaqil shaxsiy nomulkiy huquqlar obyekti sifatida aniq belgilab qo'yish lozim. Bu shaxsiy ma'lumotlarni shaxs daxlsizligining ajralmas qismi sifatida huquqiy himoya qilishni kuchaytiradi.

Ikkinchidan, yirik kompaniyalar (banklar, telekommunikatsiya operatorlari, provayderlar) tomonidan shaxsiy ma'lumotlar bazasining sizdirilishi holatlarida fuqarolarga yetkazilgan ma'naviy zararni qoplashning eng kam miqdorini (qonuniy belgilangan bazaviy hisoblash miqdorining muayyan barobarida) qonunchilikda mustahkamlash zarur. Bu fuqarolarga sudda o'z huquqlarini osonroq himoya qilishga va operatorlarning mas'uliyatini oshirishga xizmat qiladi.

Uchinchidan, fuqarolik-huquqiy shartnomalarda shaxsiy ma'lumotlarni qayta ishlashga rozilik olish mexanizmini soddalashtirish va shaffofligini ta'minlash, iste'molchiga o'z ma'lumotlarini uchinchi shaxslarga berilishini taqiqlash bo'yicha real tanlov huquqini beruvchi normalarni «Iste'molchilar huquqlarini himoya qilish to'g'risida»gi Qonunga integratsiya qilish maqsadga muvofiqdir.

O‘ZBEKISTONDA HUQUQIY TA’LIMNI RIVOJLANTIRISHNING FALSAFIY MASALALARI

Turg’unov Sherzod Nurmuxamedovich,
Andijon davlat pedagogika instituti,mustaqil tadqiqotchisi
e-mail: turgunovsherzodbek203@gmail.com UDK: 340.12:37.013

Annotatsiya: *Mazkur maqolada O‘zbekiston Respublikasida huquqiy ta’limni rivojlantirishning falsafiy asoslari, uning jamiyat taraqqiyoti va demokratik huquqiy davlat qurishdagi o‘rni ilmiy jihatdan tahlil qilingan. Tadqiqot davomida huquqiy ta’limning inson kapitalini rivojlantirishdagi ahamiyati, huquqiy ong va huquqiy madaniyatni yuksaltirishdagi roli hamda zamonaviy globallashuv va raqamlashtirish sharoitida huquqiy ta’lim tizimini takomillashtirishning konseptual yo‘nalishlari yoritilgan. Shuningdek, milliy va xorijiy tajribalar qiyosiy tahlil qilinib, huquqiy ta’limni rivojlantirishga oid ilmiy-amaliy tavsiyalar ishlab chiqilgan.*

Kalit so’zlar: *huquqiy ta’lim, huquqiy madaniyat, huquqiy ong, falsafa, demokratik davlat, fuqarolik jamiyati, qonun ustuvorligi, ta’lim falsafasi, huquqiy islohotlar.*

ФИЛОСОФСКИЕ ВОПРОСЫ РАЗВИТИЯ ПРАВОВОГО ОБРАЗОВАНИЯ УЗБЕКИСТАНЕ

ААннотация: *В статье исследуются философские основы развития правового образования в Республике Узбекистан, его значение в построении демократического правового государства и гражданского общества. Анализируются роль правового образования в формировании правового сознания и правовой культуры личности, а также современные тенденции совершенствования системы юридического образования в условиях цифровизации и глобализации.*

Ключевые слова: *правовое образование, философия права, правовая культура, правовое сознание, верховенство закона, гражданское общество.*

SOCIAL ISSUES OF DEVELOPING LEGAL EDUCATION IN UZBEKISTAN

Abstract: *This article examines the philosophical foundations of legal education development in the Republic of Uzbekistan and its role in building a democratic state governed by the rule of law. The study analyzes the significance of legal education in developing legal consciousness, legal culture and civic responsibility, as well as conceptual approaches to improving legal education in the context of globalization and digital transformation.*

Key words: *legal education, philosophy of law, legal culture, legal consciousness, rule of law, civil society, democratic state.*

Kirish. XXI asrda davlat va jamiyat taraqqiyotining muhim mezonlaridan biri fuqarolarning huquqiy ongi va huquqiy madaniyatining yuksak darajada shakllanganligidir. Demokratik huquqiy davlatning barqaror rivojlanishi fuqarolarning qonunga hurmati, huquq va erkinliklarini anglashi hamda huquqiy mas’uliyat hissining shakllanishi bilan bevosita bog‘liq. Shu nuqtai nazardan huquqiy ta’lim tizimini rivojlantirish davlat siyosatining ustuvor yo‘nalishlaridan biri sifatida e’tirof etilmoqda.

O‘zbekistonda so‘nggi yillarda huquqiy davlat va fuqarolik jamiyatini rivojlantirishga qaratilgan keng ko‘lamli islohotlar amalga oshirilmoqda. Bunda huquqiy ta’limni modernizatsiya qilish, yuridik kadrlar tayyorlash sifatini oshirish va aholining huquqiy savodxonligini yuksaltirish masalalariga alohida e’tibor qaratildi. Bu borada davlat siyosatining muhim yo‘nalishlari normativ-huquqiy hujjatlarda o‘z ifodasini topgan.

Xususan, O‘zbekiston Respublikasi Prezidentining 2019-yil 9-yanvardagi PF–5618-son Farmoni bilan tasdiqlangan konsepsiyada shunday ta’kidlanadi:

“Jamiyatda huquqiy ong va huquqiy madaniyatni yuksaltirish qonun ustuvorligini ta’minlash hamda qonuniylikni mustahkamlashning asosiy shartlaridan biridir.” [1]

Mazkur g‘oya huquqiy ta’limning nafaqat kasbiy tayyorgarlik vositasi, balki shaxsning fuqarolik pozitsiyasi, huquqiy tafakkuri va ijtimoiy mas’uliyatini shakllantiruvchi muhim ijtimoiy institut ekanligini ko‘rsatadi.

Falsafiy nuqtai nazardan huquqiy ta’lim insonning huquqiy borliqni anglash jarayoni bo‘lib, u huquqiy bilim, qadriyat va amaliy faoliyatning uzviy birligini ifodalaydi. Shu sababli huquqiy ta’limni rivojlantirish faqat o‘quv

dasturlarini yangilash bilan cheklanmay, balki uning metodologik, aksiologik va antropologik asoslarini takomillashtirishni ham talab etadi.

Huquq falsafasi tarixiga murojaat qiladigan bo‘lsak, qadimgi yunon mutafakkiri Aristotel adolatni davlatning eng oliy maqsadi sifatida talqin etgan. U «Adolat siyosiy hamjamiyatning asosidir» deb ta’kidlaydi [2, 112-b.]. Mazkur g‘oya bugungi huquqiy ta’lim tizimi uchun ham metodologik ahamiyat kasb etadi, chunki huquqiy ta’limning pirovard maqsadi adolat tamoyillarini anglaydigan va ularni hayotga tatbiq eta oladigan shaxsni tarbiyalashdir.

Nemis faylasufi Immanuel Kant esa huquqni inson erkinligini ta’minlovchi mexanizm sifatida baholab, «Huquq – bir shaxs erkinligining boshqalar erkinligi bilan umumiy qonun asosida uyg‘unlashuvidir» degan nazariyani ilgari surgan [3, 57-b.]. Ushbu konsepsiya huquqiy ta’limning insonparvarlik tamoyillarini shakllantirishda muhim nazariy asos bo‘lib xizmat qiladi.

Zamonaviy huquq falsafasida Hans Kelsen huquqni ierarxik normativ tizim sifatida izohlab, huquqiy ta’limning asosiy vazifasi huquqiy tafakkurni ilmiy metodologiya asosida rivojlantirishdan iborat ekanligini ta’kidlaydi [4, 18-b.].

Shunday qilib, huquqiy ta’limning falsafiy asoslarini o‘rganish bugungi islohotlar sharoitida alohida ilmiy ahamiyat kasb etmoqda. Ayniqsa, globallashuv, raqamli transformatsiya va sun’iy intellekt texnologiyalarining rivojlanishi huquqiy ta’lim oldiga yangi metodologik vazifalarni qo‘ymoqda. Bu esa huquqiy ta’limning mazmuni va shakllarini qayta ko‘rib chiqishni taqozo etadi.

Adabiyotlar tahlili. Huquqiy ta'limning falsafiy asoslari insoniyat ilmiy tafakkurining qadimgi davrlaridan boshlab huquq falsafasi, siyosat falsafasi va ta'lim falsafasi doirasida tadqiq etib kelinmoqda. Huquqning mohiyati, uning jamiyat taraqqiyotidagi o‘rni, adolat, erkinlik va tenglik kabi fundamental qadriyatlar bilan bog‘liqligi ko‘plab faylasuflar va huquqshunos olimlarning ilmiy izlanishlarida markaziy o‘rin egallagan.

Qadimgi yunon falsafasida Platon ideal davlat va adolat masalalarini o‘rganar ekan, jamiyatning barqaror rivojlanishi fuqarolarning ma'naviy va huquqiy tarbiyasiga bog‘liq ekanligini ta'kidlaydi. Uning fikricha, davlatning mukammalligi fuqarolarning fazilatli bo‘lishi bilan belgilanadi. Platonning bu qarashlari bugungi huquqiy ta'limning aksiologik asoslarini tushunishda muhim nazariy manba hisoblanadi [1].

Qadimgi yunon mutafakkiri Aristotel huquq va adolatning o‘zaro bog‘liqligini tahlil qilib, davlatning asosiy vazifasi adolatni qaror toptirish ekanligini ta'kidlaydi. Uning «Adolat siyosiy hamjamiyatning asosidir» degan g‘oyasi huquqiy davlat nazariyasining dastlabki falsafiy poydevorlaridan biri sifatida e'tirof etiladi [2]. Aristotelning distributiv va korrektiv adolat haqidagi ta'limoti bugungi huquqiy ta'lim mazmunini shakllantirishda ham nazariy ahamiyatga ega.

Yangi davr falsafasida John Locke insonning tabiiy huquqlari konsepsiyasini ishlab chiqib, davlatning asosiy vazifasi insonning hayot, erkinlik va mulk huquqlarini himoya qilishdan iborat ekanligini asoslaydi [3]. Ushbu g‘oyalar keyinchalik demokratik davlat va fuqarolik jamiyati nazariyasining shakllanishiga katta ta'sir ko‘rsatdi.

Charles de Montesquieu hokimiyatlar bo‘linishi nazariyasini ishlab chiqib, qonun ustuvorligini ta'minlashda mustaqil sud hokimiyatining ahamiyatini ilmiy jihatdan asoslab berdi. Uning fikricha, «erkinlik qonun ruxsat bergan barcha narsani qilish imkoniyatidir» [4]. Ushbu konsepsiya zamonaviy huquqiy ta'limda konstitutsiyaviy qadriyatlarni shakllantirishning metodologik negizlaridan biri hisoblanadi.

Nemis klassik falsafasi vakili Immanuel Kant huquqni inson erkinligini ta'minlovchi universal mexanizm sifatida talqin etadi. U «Huquq — bir shaxs erkinligining boshqalar erkinligi bilan umumiy qonun asosida uyg‘unlashuvidir», deb yozadi [5]. Kantning mazkur nazariyasi huquqiy ta'limning insonparvarlik va erkinlik tamoyillarini shakllantirishda muhim metodologik asos vazifasini bajaradi.

Georg Wilhelm Friedrich Hegel esa huquqni «erkinlikning mavjudlik shakli» sifatida baholab, shaxsning huquqiy kamoloti davlat va jamiyat taraqqiyoti bilan uzviy bog‘liq ekanligini ko‘rsatadi [6]. Hegelning obyektiv ruh konsepsiyasi huquqiy madaniyat va huquqiy ongning shakllanish jarayonini tushunishda muhim ilmiy manba hisoblanadi.

XX asr huquq falsafasida Hans Kelsen tomonidan ishlab chiqilgan «Sof huquq nazariyasi» alohida ilmiy yo‘nalish sifatida e'tirof etiladi. Olim huquqni siyosat va axloqdan nisbatan mustaqil bo‘lgan normativ tizim sifatida izohlaydi hamda huquqiy tafakkurning metodologik asoslarini ishlab chiqadi [7]. Uning qarashlari zamonaviy yuridik ta'lim metodologiyasining rivojlanishiga katta hissa qo‘shgan.

Ingliz huquq faylasufi H. L. A. Hart huquqni birlamchi va ikkilamchi normalar tizimi sifatida tahlil qilib, huquqning ijtimoiy mohiyatini ochib beradi [8]. Ronald Dworkin esa huquqni faqat normalar yig‘indisi emas, balki axloqiy tamoyillar bilan uyg‘un holda qo‘llanishi zarur bo‘lgan tizim sifatida talqin qiladi [9].

O‘zbekiston Respublikasida huquqiy ta'lim va huquqiy madaniyat masalalari mustaqillik yillarida davlat siyosatining ustuvor yo‘nalishlaridan biriga aylandi. Ayniqsa, **O‘zbekiston Respublikasi Konstitutsiyasi**ning yangilangan tahririda inson qadri, huquq va erkinliklarini ta'minlash konstitutsiyaviy tamoyil sifatida mustahkamlandi. Bu esa huquqiy ta'limning mazmunini yangi bosqichga olib chiqishni taqozo etmoqda [10].

Shuningdek, O‘zbekiston Respublikasi Prezidentining 2019-yil 9-yanvardagi PF–5618-son Farmoni bilan tasdiqlangan «Jamiyatda huquqiy ong va huquqiy madaniyatni yuksaltirish konsepsiyasi» huquqiy ta'limni uzluksiz

tizim asosida rivojlantirish, innovatsion pedagogik texnologiyalarni joriy etish va aholining huquqiy savodxonligini oshirishning strategik yo‘nalishlarini belgilab berdi [11].

Mamlakatimiz olimlari tomonidan huquqiy madaniyat, huquqiy ong va huquqiy ta'limning ayrim jihatlari bo‘yicha ilmiy izlanishlar olib borilgan bo‘lsa-da, huquqiy ta'limni falsafiy-antropologik, aksiologik va raqamli transformatsiya nuqtai nazaridan kompleks tadqiq etish yetarli darajada amalga oshirilmagan. Xususan, sun'iy intellekt, raqamli ta'lim muhiti, global huquqiy makon va kompetensiyaga asoslangan yondashuvlarning huquqiy ta'lim falsafasiga ta'siri bo‘yicha tizimli ilmiy tadqiqotlar hali kam uchraydi.

Shu sababli mazkur tadqiqotning ilmiy yangiligi O‘zbekistonda huquqiy ta'limni rivojlantirishning falsafiy asoslarini zamonaviy demokratik qadriyatlar, raqamli transformatsiya va inson kapitalini rivojlantirish konsepsiyasi bilan uyg‘un holda kompleks tahlil qilish hamda huquqiy ta'limning konseptual modelini taklif etishdan iborat.

Tadqiqot metodologiyasi. Mazkur tadqiqotda O‘zbekistonda huquqiy ta’limni rivojlantirishning falsafiy masalalarini o‘rganishda kompleks ilmiy yondashuv qo‘llanildi. Tadqiqotning metodologik asosini falsafa, huquq nazariyasi va pedagogika fanlari kesishmasida shakllangan umumilmiy hamda maxsus ilmiy metodlar tashkil etadi [1].

Tadqiqot jarayonida avvalo dialektik metoddan foydalanildi. Ushbu metod huquqiy ta’lim tizimining rivojlanishini ziddiyatlar, qarama-qarshiliklar va ularning yechimi orqali doimiy o‘zgarish va takomillashuv jarayoni sifatida tahlil qilish imkonini berdi [2]. Dialektik yondashuv asosida huquqiy ta’limning an’anaviy shakllari bilan zamonaviy innovatsion modellari o‘rtasidagi o‘zaro bog‘liqlik va transformatsiya jarayonlari ochib berildi.

Shuningdek, tadqiqotda tizimli (sistemali) yondashuv muhim o‘rin tutdi. Huquqiy ta’lim murakkab ijtimoiy tizim sifatida qaralib, uning tarkibiy qismlari - ta’lim mazmuni, metodlari, subyektlari (o‘qituvchi va talaba), huquqiy madaniyat hamda davlat siyosati o‘zaro aloqadorlikda o‘rganildi [3]. Bu yondashuv huquqiy ta’limni yaxlit ijtimoiy institut sifatida tahlil qilishga xizmat qildi.

Tadqiqotda aksiologik (qadriyatlar) yondashuvi alohida ahamiyat kasb etdi. Bu metod huquqiy ta’limning asosiy maqsadi faqat bilim berish emas, balki shaxsda adolat, erkinlik, qonun ustuvorligi va inson huquqlariga hurmat kabi umuminsoniy qadriyatlarni shakllantirish ekanligini ilmiy asoslashga imkon berdi [4]. Shu nuqtai nazardan huquqiy ta’lim jamiyatning ma’naviy-huquqiy barqarorligini ta’minlovchi muhim omil sifatida talqin qilindi.

Bundan tashqari, germenevtik metod yordamida huquqiy va falsafiy matnlar (Konstitutsiya, qonunlar, farmonlar, klassik huquqshunos va faylasuflarning asarlari) mazmuni izohlandi va talqin qilindi [5]. Bu metod huquqiy ta’lim mazmunini chuqur anglash, undagi asosiy g‘oya va konsepsiyalarni aniqlash imkonini berdi.

Tadqiqotda qiyosiy-huquqiy metod ham qo‘llanilib, O‘zbekiston huquqiy ta’lim tizimi xorijiy davlatlar (Germaniya, Fransiya, AQSh va Rossiya) tajribasi bilan solishtirildi [6]. Bu orqali huquqiy ta’limni rivojlantirishning ilg‘or modellarini milliy ta’lim tizimiga moslashtirish imkoniyatlari tahlil qilindi.

Shuningdek, tarixiylik tamoyili asosida O‘zbekistonda huquqiy ta’lim tizimining shakllanish va rivojlanish bosqichlari o‘rganildi [7]. Bu yondashuv huquqiy ta’limning bugungi holatini tushunishda uning tarixiy ildizlarini aniqlashga xizmat qildi.

Tadqiqot davomida kontent-tahlil metodidan foydalanilib, normativ-huquqiy hujjatlar, davlat dasturlari va ilmiy adabiyotlar tizimli ravishda tahlil qilindi. Xususan, O‘zbekiston Respublikasining Konstitutsiyasi, Prezident farmon va qarorlari hamda ta’lim sohasiga oid strategik hujjatlar mazmuni o‘rganildi [8].

Shuningdek, institutsional tahlil orqali huquqiy ta’lim tizimining institutsional tuzilishi – oliy ta’lim muassasalari, yuridik fakultetlar, akademik litseylar va malaka oshirish tizimining funksional faoliyati tahlil qilindi [9].

Tadqiqotning nazariy asosini huquq falsafasi vakillari – Aristotle, Immanuel Kant, Georg Wilhelm Friedrich Hegel, Hans Kelsen hamda H. L. A. Hartlarning huquq va davlat haqidagi konsepsiyalari tashkil etdi [10]. Ularning ilmiy qarashlari huquqiy ta’limning falsafiy mohiyatini ochib berishda metodologik asos bo‘lib xizmat qildi.

Umuman olganda, qo‘llanilgan metodlar huquqiy ta’limni nafaqat pedagogik tizim, balki ijtimoiy-falsafiy hodisa sifatida kompleks o‘rganish imkonini berdi hamda uning zamonaviy transformatsiya jarayonlarini ilmiy asosda tahlil qilishga zamin yaratdi.

Tahlillar va natijalar. O‘zbekistonda huquqiy ta’limni rivojlantirishning falsafiy tahlili shuni ko‘rsatadiki, ushbu tizim faqat kasbiy kadrlar tayyorlash mexanizmi emas, balki jamiyatning huquqiy ongini shakllantiruvchi, ijtimoiy adolatni mustahkamlovchi hamda fuqarolik jamiyatini rivojlantiruvchi murakkab ijtimoiy-falsafiy institut sifatida faoliyat yuritadi [1]. Huquqiy ta’limning samaradorligi uning epistemologik, aksiologik va institutsional asoslarining uyg‘unligiga bevosita bog‘liqdir.

Tadqiqot natijalari shuni ko‘rsatadiki, huquqiy ta’lim darajasi jamiyatdagi huquqiy ong shakllanishining asosiy determinantlaridan biridir. Huquqiy ong esa o‘z navbatida huquqiy madaniyat, fuqarolik faolligi va qonun ustuvorligiga munosabatni belgilaydi.

Georg Wilhelm Friedrich Hegel huquqni “obyektiv ruhning tarixiy rivojlanish shakli” sifatida talqin qilib, huquqiy ong jamiyatning ma’naviy evolyutsiyasi natijasi ekanligini asoslaydi [2]. Bu yondashuvga ko‘ra, huquqiy ta’lim shaxs ongini shakllantirish bilan birga, jamiyatning umumiy ma’naviy darajasini ham belgilaydi.

Empirik kuzatuvlar shuni ko‘rsatadiki, huquqiy ta’lim jarayonida: an’anaviy (ma’ruza) usul qo‘llanganda bilimni eslab qolish darajasi yuqori, lekin amaliy qo‘llash past;

interaktiv usullar (case study, moot court, debat) qo‘llanganda esa huquqiy tahlil qilish ko‘nikmalari 30–40% ga oshadi [3].

Bu holat huquqiy ta’limning faqat informatsion emas, balki transformativ xususiyatga ega ekanligini ko‘rsatadi.

O‘zbekistonda huquqiy ta’lim tizimi hozirgi kunda an’anaviy bilim berish modelidan kompetensiyaviy yondashuvga o‘tish bosqichida turibdi.

Hans Kelsen huquqni normativ tizim sifatida izohlar ekan, huquqiy bilimlarning tizimli va ierarxik o‘rganilishini asoslab beradi [4]. Ushbu modelda asosiy urg‘u huquqiy normalarni bilishga qaratilgan. Biroq zamonaviy huquq falsafasida Ronald Dworkin huquqni faqat normalar emas, balki tamoyillar va interpretatsiya tizimi sifatida ko‘radi [5]. Bu yondashuv huquqiy ta’limda quyidagi o‘zgarishlarni talab etadi:

- yodlashdan → tahlilga o‘tish;
- nazariyadan → amaliyotga o‘tish;
- passiv o‘qishdan → interaktiv muhokamaga o‘tish.

Tadqiqot natijalariga ko‘ra, kompetensiyaviy model asosida o‘qitilgan talabalar:

- muammoli vaziyatlarni 45% tezroq hal qiladi;
- huquqiy normani real hayotga tatbiq etish qobiliyati sezilarli oshadi [6].

Raqamli texnologiyalar huquqiy ta’limning yangi bosqichini shakllantirmoqda. Elektron platformalar, onlayn kurslar, virtual sud jarayonlari va AI asosidagi o‘quv tizimlari ta’lim samaradorligini sezilarli oshirmoqda. Immanuel Kant insonning aql va mustaqil fikrlash qobiliyatini asosiy qadriyat sifatida ko‘rib, shaxs erkin tanlov asosida bilim olishi zarurligini ta’kidlaydi [7]. Raqamli ta’lim modeli aynan shu tamoyilni kuchaytiradi.

Empirik natijalar:

- raqamli platformadan foydalangan talabalar bilimni o‘zlashtirishda 25–35% yuqori natija ko‘rsatgan;
- mustaqil izlanish ko‘nikmalari 40% ga oshgan;
- huquqiy manbalar bilan ishlash tezligi sezilarli yaxshilangan [8].

Huquqiy ta’limning eng muhim natijalaridan biri bu qadriyatlar tizimining shakllanishidir.

Aristotle adolatni davlatning asosiy maqsadi sifatida talqin qilib, shunday deydi: “Adolat — siyosiy hamjamiyatning asosidir” [9].

Tahlillar shuni ko‘rsatadiki, aksiologik yondashuv asosida o‘qitilgan talabalar:

- qonun ustuvorligini chuqurroq anglaydi;
- ijtimoiy mas’uliyat darajasi oshadi;
- huquqbuzarlikka nisbatan immunitet kuchayadi [10].

Bu esa huquqiy ta’limning faqat bilim emas, balki **axloqiy-huquqiy ong shakllantirish vositasi** ekanligini tasdiqlaydi.

Qiyosiy tahlil shuni ko‘rsatadiki, rivojlangan davlatlarda huquqiy ta’lim quyidagi xususiyatlarga ega:

- Germaniya – amaliyot va dual ta’lim tizimi ustun;
- AQSh – case study va moot court markaziy o‘rin tutadi;
- Fransiya – nazariy-falsafiy tayyorgarlik kuchli;
- Rossiya – klassik akademik model saqlangan.

O‘zbekiston tajribasi esa ushbu modellarning integratsiyalashuvi yo‘lidan bormoqda [11].

Natijalar shuni ko‘rsatadiki:

- integratsion model eng samarali hisoblanadi;
- milliy huquqiy ta’lim tizimi bosqichma-bosqich modernizatsiyalanmoqda.

Xulosalar.

O‘zbekiston Respublikasida huquqiy ta’limni rivojlantirishning falsafiy tahlili natijalari shuni ko‘rsatadiki, ushbu tizim jamiyatning huquqiy ongini shakllantirish, fuqarolik jamiyatini mustahkamlash hamda demokratik-huquqiy davlat barpo etishning asosiy ijtimoiy instituti sifatida namoyon bo‘ladi.

Birinchidan, huquqiy ta’limning falsafiy mohiyati shundan iboratki, u faqat bilim berish jarayoni emas, balki shaxsning huquqiy tafakkuri, qadriyatlari va ijtimoiy mas’uliyatini shakllantiruvchi uzluksiz jarayondir. Bu jihat Immanuel Kantning “huquq erkinliklar uyg‘unligi” haqidagi konsepsiyasi bilan bevosita uyg‘unlashadi.

Ikkinchidan, tadqiqot natijalari huquqiy ta’lim va huquqiy ong o‘rtasida bevosita dialektik bog‘liqlik mavjudligini tasdiqlaydi. Huquqiy ta’lim darajasi oshgani sari jamiyatda qonun ustuvorligiga hurmat, huquqiy madaniyat va

fuqarolik faolligi ham ortib boradi. Bu holat Georg Wilhelm Friedrich Hegelning huquqni “obyektiv ruhning rivojlanish shakli” sifatidagi nazariyasi bilan ilmiy jihatdan asoslanadi.

Uchinchidan, zamonaviy sharoitda huquqiy ta’lim tizimi an’anaviy bilim berish modelidan kompetensiyaviy va amaliy yo‘naltirilgan modelga o‘tish jarayonini boshdan kechirmoqda. Bu transformatsiya Hans Kelsenning normativ tizim haqidagi qarashlari hamda Ronald Dworkinning huquqni tamoyillar tizimi sifatida talqin qiluvchi nazariyalari o‘rtasidagi metodologik farqlarni amaliyotga tatbiq etish zarurligini ko‘rsatadi.

To‘rtinchidan, raqamli texnologiyalarni ta’lim jarayoniga joriy etish huquqiy ta’lim samaradorligini sezilarli darajada oshiradi. Empirik tahlillar natijasida raqamli platformalar asosida o‘qitilgan talabalar mustaqil tahlil qilish, huquqiy manbalar bilan ishlash va muammoli vaziyatlarni hal etish ko‘nikmalarini an’anaviy usullarga nisbatan yuqori darajada rivojlantirishi aniqlandi.

Beshinchidan, huquqiy ta’limning aksiologik (qadriyatlar) asoslari jamiyatda huquqiy madaniyatni shakllantirishning eng muhim omili hisoblanadi. Aristotle tomonidan ilgari surilgan “adolat jamiyatning asosidir” g‘oyasi huquqiy ta’limning asosiy falsafiy poydevorini tashkil etadi.

Oltinchidan, qiyosiy-huquqiy tahlil shuni ko‘rsatadiki, rivojlangan davlatlar tajribasida huquqiy ta’limning samaradorligi amaliyotga yo‘naltirilgan ta’lim, sud jarayonlarini modellashtirish va case study usullariga asoslanganligi bilan izohlanadi. O‘zbekiston tajribasi esa ushbu yondashuvlarning integratsiyasini amalga oshirish yo‘lida rivojlanmoqda.

ORCID: 0009-0005-5177-5142

Annotatsiya. *Maqolada oilaviy zo‘ravonlikning inson qadr-qimmatiga ko‘rsatadigan ijtimoiy, ma’naviy va psixologik ta’siri ijtimoiy-falsafiy nuqtai nazardan tahlil qilinadi. Tadqiqotda oilaviy zo‘ravonlikning shakllari, uning inson huquqlari va inson qadriga ta’siri, shuningdek, zamonaviy jamiyatda ushbu muammoning oldini olish mexanizmlari yoritilgan. Oilaviy zo‘ravonlikning shaxsning ijtimoiylashuvi, ruhiy holati va fuqarolik faolligiga ta’siri o‘rganilib, inson qadrini himoya qilishning nazariy va amaliy asoslari ochib berilgan. Tadqiqot natijalari oilaviy zo‘ravonlikka qarshi kurashishda huquqiy, ma’naviy va institutsional mexanizmlarni takomillashtirish zarurligini ko‘rsatadi.*

Kalit so‘zlar: *oilaviy zo‘ravonlik, inson qadri, inson huquqlari, oila instituti, ijtimoiy himoya, gender tengligi, ma’naviy qadriyatlar, ijtimoiy adolat.*

THE IMPACT OF DOMESTIC VIOLENCE ON HUMAN DIGNITY

Abstract. *This article analyzes the social, moral, and psychological impact of domestic violence on human dignity from a socio-philosophical perspective. The study examines the forms of domestic violence, its influence on human rights and personal dignity, and the mechanisms for preventing this phenomenon in modern society. Particular attention is paid to the impact of domestic violence on socialization, mental well-being, and civic engagement. The article also reveals theoretical and practical approaches to protecting human dignity. The findings emphasize the need to improve legal, moral, and institutional mechanisms aimed at combating domestic violence and safeguarding fundamental human rights.*

Keywords: *domestic violence, human dignity, human rights, family institution, social protection, gender equality, moral values, social justice.*

ВЛИЯНИЕ СЕМЕЙНОГО НАСИЛИЯ НА ЧЕЛОВЕЧЕСКОЕ ДОСТОИНСТВО

Аннотация. *В данной статье с социально-философских позиций анализируется влияние семейного насилия на человеческое достоинство. Исследуются формы семейного насилия, его воздействие на права человека и достоинство личности, а также механизмы предупреждения данного явления в современном обществе. Особое внимание уделяется влиянию семейного насилия на процессы социализации, психоэмоциональное состояние личности и её гражданскую активность. Раскрываются теоретические и практические основы защиты человеческого достоинства. Результаты исследования свидетельствуют о необходимости совершенствования правовых, нравственных и институциональных механизмов противодействия семейному насилию.*

Ключевые слова: *семейное насилие, человеческое достоинство, права человека, институт семьи, социальная защита, гендерное равенство, нравственные ценности, социальная справедливость.*

Kirish.

Inson qadri zamonaviy demokratik jamiyatning eng muhim tamoyillaridan biri hisoblanadi. Har bir insonning sha’ni, qadr-qimmati va huquqlarini himoya qilish davlat hamda jamiyat oldida turgan ustuvor vazifalardan biridir. Biroq oilaviy zo‘ravonlik bugungi kunda dunyoning ko‘plab mamlakatlarida inson qadriga tahdid solayotgan murakkab ijtimoiy muammolardan biri bo‘lib qolmoqda [1]. Oila jamiyatning asosiy instituti sifatida insonning birlamchi ijtimoiylashuv muhiti hisoblanadi. Aynan oilada insonning ma’naviy qadriyatlari, ijtimoiy qarashlari va xulq-atvori shakllanadi. Shu sababli oilada yuzaga keladigan zo‘ravonlik nafaqat alohida shaxsga, balki jamiyatning ma’naviy barqarorligiga ham salbiy ta’sir ko‘rsatadi [2]. So‘nggi yillarda O‘zbekistonda inson qadri va inson manfaatlarini

ta’minlash davlat siyosatining ustuvor yo‘nalishiga aylandi. Shu nuqtai nazardan oilaviy zo‘ravonlikning inson qadriga ta’sirini ijtimoiy-falsafiy jihatdan o‘rganish dolzarb ilmiy ahamiyat kasb etadi.

Adabiyotlar tahlili va metodologiya

Tadqiqot davomida tizimli yondashuv, aksiologik tahlil, qiyosiy tahlil, sotsiologik va ijtimoiy-falsafiy umumlashtirish metodlaridan foydalanildi. Oilaviy zo‘ravonlik, inson huquqlari va inson qadri masalalariga oid xalqaro va milliy ilmiy manbalar tahlil qilindi.

Shuningdek, oilaviy zo‘ravonlikning shaxs va jamiyat hayotiga ta’siri, uning ijtimoiy oqibatlari hamda oldini olish mexanizmlari konseptual jihatdan o‘rganildi.

Oilaviy zo‘ravonlikning ijtimoiy-falsafiy mohiyati. Oilaviy zo‘ravonlik insoniyat taraqqiyoti davomida turli shakllarda namoyon bo‘lib kelgan murakkab ijtimoiy hodisalardan biridir. Zamonaviy ijtimoiy-falsafiy yondashuvlarda oilaviy zo‘ravonlik nafaqat huquqiy yoki maishiy muammo, balki inson qadr-qimmati va fundamental huquqlariga tahdid soluvchi ijtimoiy hodisa sifatida talqin qilinmoqda [3].

Oilaviy zo‘ravonlik jismoniy, ruhiy, iqtisodiy va jinsiy tazyiq shakllarida namoyon bo‘lib, uning asosiy xususiyati insonning erkinligi, daxlsizligi va shaxsiy qadrini cheklashga qaratilganligidadir. Ushbu holat oila institutining ma’naviy mohiyatiga zid bo‘lib, oilaning tarbiyaviy, himoyaviy va ijtimoiylashtiruvchi funksiyalarining zaiflashishiga olib keladi.

Ijtimoiy-falsafiy nuqtai nazardan qaralganda, oilaviy zo‘ravonlik insonni subyekt sifatida emas, balki boshqariladigan obyekt sifatida qabul qilish oqibatida yuzaga keladi. Bu esa insonparvarlik tamoyillarining buzilishi va shaxsning ijtimoiy mavqeiga salbiy ta’sir ko‘rsatishiga sabab bo‘ladi.

Inson qadrining falsafiy asoslari va uning zamonaviy talqini. Inson qadri har qanday demokratik jamiyatning asosiy qadriyati hisoblanadi. Inson qadri tushunchasi insonning biologik mavjudot sifatidagi emas, balki erkin fikrlovchi, ongli va huquqiy subyekt sifatidagi maqomini ifodalaydi [4].

Zamonaviy falsafiy qarashlarda inson qadri quyidagi mezonlar orqali namoyon bo‘ladi:

- inson huquq va erkinliklarining daxlsizligi;
- shaxsning erkin rivojlanish imkoniyati;
- ijtimoiy himoyalanganlik;
- jamiyat tomonidan hurmat qilinishi;
- teng imkoniyatlar va adolatning ta’minlanishi.

Oilaviy zo‘ravonlik aynan mana shu mezonlarning buzilishiga olib keladi. Zo‘ravonlikka uchragan shaxs o‘zini ijtimoiy jihatdan himoyasiz his qiladi, o‘z qadrini anglash darajasi pasayadi va jamiyat bilan munosabatlarida turli psixologik to‘siqlar yuzaga keladi.

Oilaviy zo‘ravonlikning psixologik va ma’naviy oqibatlari. Tahlillar shuni ko‘rsatadiki, oilaviy zo‘ravonlikning eng jiddiy oqibatlaridan biri insonning ruhiy holatiga ta’sir ko‘rsatishidir. Zo‘ravonlikka duchor bo‘lgan shaxslarda doimiy qo‘rquv, xavotir, depressiya, o‘ziga nisbatan ishonchsizlik va ijtimoiy yakkalanish holatlari kuzatiladi [5]. Bunday holatlar insonning shaxsiy rivojlanishiga salbiy ta’sir ko‘rsatib, uning ijodiy va intellektual salohiyatini to‘laqonli namoyon etishiga to‘sqinlik qiladi. Natijada inson o‘z hayotini mustaqil boshqarish imkoniyatidan mahrum bo‘lishi mumkin.

Ma’naviy nuqtai nazardan oilaviy zo‘ravonlik mehr-oqibat, hurmat, bag‘rikenglik va o‘zaro ishonch kabi qadriyatlarning yemirilishiga olib keladi. Oila a’zolari o‘rtasidagi sog‘lom munosabatlarning buzilishi esa jamiyat ma’naviy muhitiga ham salbiy ta’sir ko‘rsatadi.

Bolalar va yoshlar ongida zo‘ravonlikning aks etishi. Oilaviy zo‘ravonlikning eng xavfli jihatlaridan biri uning bolalar va yoshlar dunyoqarashiga ko‘rsatadigan ta’siridir. Oila muhitida muntazam zo‘ravonlikni kuzatgan bolalarda agressiv xulq-atvor, qo‘rquv, ishonchsizlik va ijtimoiy moslashuv muammolari shakllanish ehtimoli yuqori bo‘ladi [6].

Ijtimoiy o‘rganish nazariyasiga ko‘ra, bola o‘z atrofidagi xulq-atvor namunalarini kuzatish orqali o‘rganadi. Shu sababli oilada zo‘ravonlik mavjud bo‘lgan muhitda voyaga yetgan bolalar kelajakda zo‘ravonlikni odatiy ijtimoiy munosabat sifatida qabul qilishlari mumkin.

Natijada zo‘ravonlik avloddan-avlodga o‘tuvchi ijtimoiy muammo sifatida saqlanib qoladi. Bu esa jamiyatning ma’naviy va ijtimoiy taraqqiyotiga jiddiy xavf tug‘diradi.

Natijalar va Muhokama

Oilaviy zo‘ravonlik nafaqat alohida shaxsga, balki butun jamiyatga salbiy ta’sir ko‘rsatadi. Avvalo, u ijtimoiy ishonch darajasining pasayishiga olib keladi. Jamiyatda zo‘ravonlik holatlarining ko‘payishi fuqarolarning davlat va huquqiy institutlarga bo‘lgan ishonchini susaytirishi mumkin [7].

Ikkinchidan, oilaviy zo‘ravonlik inson kapitalining rivojlanishiga salbiy ta’sir ko‘rsatadi. Ruhiy va jismoniy zo‘ravonlikka uchragan shaxslarning mehnat unumdorligi, ta’lim olish imkoniyatlari va ijtimoiy faolligi pasayadi.

Uchinchidan, zo‘ravonlik sog‘liqni saqlash, ijtimoiy himoya va huquqni muhofaza qilish tizimlariga qo‘shimcha iqtisodiy yuklama keltirib chiqaradi. Shu sababli oilaviy zo‘ravonlikka qarshi kurashish nafaqat insonparvarlik, balki ijtimoiy-iqtisodiy zarurat ham hisoblanadi.

Inson qadrini himoya qilishning ustuvor yo‘nalishlari. Tadqiqot natijalari asosida oilaviy zo‘ravonlikning oldini olish va inson qadrini himoya qilishning quyidagi ustuvor yo‘nalishlari aniqlandi:

- oilada sog‘lom ma’naviy muhitni shakllantirish;
- huquqiy savodxonlikni oshirish;
- gender tengligi tamoyillarini mustahkamlash;
- zo‘ravonlik qurbonlariga psixologik va huquqiy yordam ko‘rsatish tizimini rivojlantirish;
- ta’lim muassasalarida oilaviy qadriyatlar va inson huquqlari bo‘yicha targ‘ibot ishlarini kuchaytirish;
- fuqarolik jamiyati institutlarining ushbu yo‘nalishdagi faoliyatini qo‘llab-quvvatlash.

Mazkur chora-tadbirlarning amalga oshirilishi oilaviy zo‘ravonlikning kamayishiga, inson qadrining himoyalanishiga va jamiyatda sog‘lom ijtimoiy munosabatlar qaror topishiga xizmat qiladi.

Tahlillar shuni ko‘rsatadiki, oilaviy zo‘ravonlikning oqibatlari alohida shaxs doirasidan chiqib, jamiyat taraqqiyotiga ham salbiy ta’sir ko‘rsatadi. Oiladagi zo‘ravonlik ijtimoiy ishonchni kamaytiradi, ma’naviy qadriyatlarning yemirilishiga olib keladi va inson kapitalining rivojlanishini cheklaydi.

Shu sababli oilaviy zo‘ravonlikka qarshi kurashishda faqat huquqiy mexanizmlar bilan cheklanib qolmasdan, ma’naviy-ma’rifiy, psixologik va ijtimoiy himoya mexanizmlarini ham takomillashtirish zarur.

Xulosa.

Tadqiqot natijalariga ko‘ra:

- oilaviy zo‘ravonlik inson qadriga jiddiy tahdid soluvchi ijtimoiy hodisadir;
- u shaxsning ruhiy, ma’naviy va ijtimoiy rivojlanishiga salbiy ta’sir ko‘rsatadi;
- oilaviy zo‘ravonlik inson huquqlari va erkinliklarining buzilishiga olib keladi;
- inson qadrini himoya qilish oilaviy zo‘ravonlikka qarshi kurashning asosiy maqsadi bo‘lishi kerak;
- huquqiy, ma’naviy va institutsional mexanizmlarni rivojlantirish ushbu muammoni kamaytirishning muhim sharti hisoblanadi.

Shunday qilib, oilaviy zo‘ravonlikka qarshi samarali kurashish inson qadrini ta’minlash, sog‘lom oila institutini shakllantirish va demokratik jamiyat taraqqiyotini mustahkamlashning muhim omillaridan biri hisoblanadi.

META OLAM SHAROITIDA VIRTUAL MANQURTLASHUV FENOMENI: IJTIMOIY DEGRADATSIYA TAHDIDLARI VA ULARNI BARTARAF ETISH MEXANIZMLARI

Xusanova Nigora
Ijtimoiy-ma'naviy tadqiqotlar instituti katta ilmiy xodimi
falsafa fanlari bo'yicha falsafa doktori (PhD)
n.khusanova@mail.ru

Annotatsiya: *Ushbu maqolada globallashuv va raqamli transformatsiyalar sharoitida virtual reallik hamda "Meta olam" (Metaverse) muhitining yoshlar ongiga ta'siri ijtimoiy-filosofik va sosiologik jihatdan tahlil etilgan. Muallif tomonidan raqamli makonda vujudga kelayotgan yangi xavf – "virtual manqurtlashuv" fenomeni, axborot manipulyasiyasi usullari (dezinformatsiya, malformatsiya, misinformatsiya) hamda "filtr pufakchalari"ning jamiyat barqarorligiga tahdidi ochib berilgan. Maqolada raqamli avlodlar (Zeta, Alfa, Beta) dunyoqarashini sog'lomlashtirish va milliy kontent yaratish orqali virtual manqurtlikning oldini olishning ijtimoiy-ma'naviy mexanizmlari taklif etilgan.*

Kalit so'zlar*: Meta olam, virtual manqurtlik, globallashuv, axborot manipulyasiyasi, dezinformatsiya, filtr pufakchalari, trolling, avlodlar nazariyasi, milliy kontent, mafkuraviy immunitet.*

ФЕНОМЕН ВИРТУАЛЬНОЙ МАНКУРТИЗАЦИИ В УСЛОВИЯХ МЕТАВСЕЛЕННОЙ: УГРОЗЫ СОЦИАЛЬНОЙ ДЕГРАДАЦИИ И МЕХАНИЗМЫ ИХ ПРЕОДОЛЕНИЯ

Аннотация. *В данной статье с социально-философской и социологической точек зрения анализируется влияние виртуальной реальности и среды «Метавселенной» (Metaverse) на сознание молодежи в условиях глобализации и цифровой трансформации. Автор раскрывает новую угрозу, возникающую в цифровом пространстве, — феномен «виртуальной манкуртизации», методы информационной манипуляции (дезинформация, малинформация, мисинформация), а также угрозы общественной стабильности, связанные с «информационными пузырями» (filter bubbles). В статье предлагаются социально-духовные механизмы предотвращения виртуальной манкуртизации посредством формирования здорового мировоззрения цифровых поколений (Zeta, Alpha, Beta) и создания национального контента.*

Ключевые слова: *Метавселенная, виртуальная манкуртизация, глобализация, информационная манипуляция, дезинформация, информационные пузыри, троллинг, теория поколений, национальный контент, идеологический иммунитет.*

THE PHENOMENON OF VIRTUAL MANKURTIZATION IN THE METAVERSE: THREATS OF SOCIAL DEGRADATION AND MECHANISMS FOR THEIR PREVENTION

Abstract. *This article analyzes the impact of virtual reality and the Metaverse environment on youth consciousness from socio-philosophical and sociological perspectives in the context of globalization and digital transformation. The author explores a new threat emerging in the digital space — the phenomenon of "virtual mankurtization," methods of information manipulation (disinformation, malinformation, and misinformation), and the dangers posed by "filter bubbles" to social stability. The article proposes socio-spiritual mechanisms for preventing virtual mankurtization through the promotion of healthy worldviews among digital generations (Zeta, Alpha, and Beta) and the development of national digital content.*

Keywords: *Metaverse, virtual mankurtization, globalization, information manipulation, disinformation, filter bubbles, trolling, generational theory, national content, ideological immunity.*

Kirish

Globallashuv sharoitida yoshlarning islohotlarga daxldorligi barqaror rivojlanishni ta'minlaydi. Hozirgi kunda "metaselena" (inglizcha *Metaverse* – doimiy, umumiy va o'zaro bog'langan 3D virtual olamlar tarmog'i) [1, B. 42] yoxud "meta olam" – jamiyat a'zolarining faoliyatiga ta'sir etuvchi xavfsiz va samarali vositaga aylanib bormoqda. Shu bilan birga, bu makon har qanday inson ongi va qalbini egallashga qaratilgan tahdidlarni amalga oshirish uchun qulay

muhitdir. Kishilar orasida ma’naviy boyliklar qadrsizlanishi, milliy o‘zlikni yo‘qotish va yosh avlodning tarixiy ildizlaridan mahrum bo‘lishining oldini olish muhim vazifa hisoblanadi. Bu borada insoniyatga qaratilgan tahdidlardan himoyalanish asoslarini ishlab chiqish va keng qamrovli izlanishlar olib borish zarur.

Hozirgi zamon talabiga aylanayotgan milliy kontentlar yaratilishi masalasiga alohida urg‘u berilishi bugungi kurashlar “an’anaviy borliqdan virtual borliqqa o‘tish” tezligi shiddatlashayotgani boisidir.

Bugun virtual reallik va virtual shaxsiyatlar davrida ulg‘ayayotgan Zeta, Alfa va Beta avlodlari virtual va raqamli muhitlarda katta bo‘lib, ular uchun shaxsiy va ijtimoiy identifikatsiya faqat fizik dunyoga emas, balki virtual omillarga ham bog‘liq bo‘ladi. Virtual reallik, sun’iy intellekt yoki metaselenaning rivojlanishi ularda real dunyodan ajralgan shaxsiylik va muhit to‘g‘risida yangi tushunchalarning shakllanishiga olib keldi. Bu avlod vakillarining borliqdagi faoliyati ilm-fan yutuqlari tufayli animatsiyalashgan kontentlar olamidan tashkil topgan kiber muhitga ko‘chmoqda va asosiy vaqtini shu yerda o‘tkazuvchi kishilar jamoasi vujudga kelmoqda.

Adabiyotlar tahlili va metodologiya

XXI asrda globallashuv sharoitida turli hayot tarzlari va g‘oyalar raqobatlashmoqda. Muvaffaqiyatga erishish uchun har bir davlat milliy o‘zlikni saqlagan holda qadriyatlarni hurmat qilishga asoslangan mafkuraga ega bo‘lishi shart. Aks holda, o‘zlikni yo‘qotish va qadriyatlardan voz kechish taraqqiyotdan ajratib, shaxsni mustaqil fikrga ega bo‘lmagan “zombi”ga, ya’ni adib Chingiz Aytmatov aytganidek “manqurt”ga [2, B. 126] aylantiradi. (Manqurt – o‘z fikriga ega bo‘lmagan, boshqalarning buyruqlarini so‘zsiz bajaruvchi, passiv va aqliy faoliyati susaygan, o‘z hayotini nazorat qila olmaydigan va butunlay boshqalarning ta’siri ostida bo‘lgan shaxsdir).

Bugun kishilar ongi va ruhiyatiga sezilarli ta’sir o‘tkazuvchi kontent terminiga tarixiy-falsafiy jihatdan yondashadigan bo‘lsak, odamlar bir-biriga ma’lumot uzatishni boshlashi uning ilk belgilari deb aytishimiz mumkin. Ayni paytda ijtimoiy tarmoqlar orqali yosh avlodga singdirilayotgan olomon madaniyati yosh-u qarining favoritiga aylangan instayulduzlar, yutuber va tiktokerlar tomonidan tarmoqqa joylangan, kishilar o‘rtasida yuqumlilik darajasi yuqori bo‘lgan trend, “mem” hamda chellendjlarga aylanayotgan kontentlar soni kun sayin ortib bormoqda. Shu o‘rinda kontent atamasini kengroq tushuntirish maqsadga muvofiq bo‘ladi.

Bizningcha, kontent – o‘z-ozini ifoda etish, tarqatish, marketing va nashr etish uchun nutq, yozuv yoki har xil san’at turlari kabi biror-bir vosita orqali ifodalanishi kerak bo‘lgan axborot mahsulotidir. Ya’ni, matn, audio, video, surat, xabar, lavha va o‘zida biror g‘oya yoki fikrni ifoda etuvchi har qanday material yoki ma’lumot kontent hisoblanadi.

Aynan ushbu axborot ummoni tomoshabinlari esa yer yuzida eng yirik qatlamni tashkil etuvchi yoshlar bo‘lgan Zed, Alfa hamda 2025 yildan boshlab dunyoga kelayotgan Beta raqamli avlod bolalaridir. Ular dofamin qaramligi tufayli virtual makonning ashaddiy mijozlariga aylanib boraveradi.

Odamlar orasida kun sayin qisqa rolikli video va lavhalar ko‘rish ommalashmoqda. Bu inson ongi uchun xavfli bo‘lishi mumkin, chunki ularning tezkor formati miyani zudlik bilan yangi ma’lumotga yo‘naltirishga majbur qiladi. Bu jarayon ko‘pincha diqqatni to‘g‘ri fokuslashga yordam bermaydi va salbiy uzoq muddatli ta’sirlarga olib keladi. Lavhalar, ayniqsa, ijtimoiy tarmoqlarda tarqalgan qisqa videolar ko‘pincha ehtiyojsiz yoki mavzuga aloqasi bo‘lmagan be’mani ma’lumotlar bilan to‘ldiriladi. Bu esa insonning diqqatini bir joyga jamlashi va xayolini to‘g‘ri yo‘nalishda saqlashini qiyinlashtiradi.

Shuningdek, ijtimoiy tarmoqlarda tarqalgan videolar insonning shaxsiyatiga, ehtiyojlariga yoki jamiyatga bo‘lgan munosabatiga ta’sir qilishga ham sabab bo‘ladi. Qisqa roliklarning inson psixologiyasi va diqqatiga ta’siri haqida bir nechta tadqiqotlar va tahlillar olib borilmoqda. Jumladan, ijtimoiy media platformalarining inson ongiga, xususan, yoshlar ruhiyatiga bo‘lgan ta’siri ko‘plab ilmiy tadqiqotlar mavzusidir. Psixologlar va nevrologlar videokontentning miyani qanday faollashtirishi va qaramlik xavfini qanday oshirishini o‘rganishmoqda. Ko‘pincha, tezkor va ko‘p sonli ma’lumotlar miyadan yuqori tezlikda tahlil qilishni talab qiladi, bu esa yuqori darajadagi qiziqish va hayajon hissini paydo qilsa-da, uzoq muddatda diqqatni markazlashtirish va murakkab qarorlarni qabul qilish qobiliyatining kamayishiga olib keladi [3, B. 88].

Bu borada inson ongiga ta’sir etish bo‘yicha olib borilgan neyropsixologik tadqiqotlarga ko‘ra, Instagram, TikTok kabi ijtimoiy tarmoqlar orqali tarqalgan qisqa videolar inson miyasini ma’lumotni qisqa, ammo aniq va tez qabul qilishga majbur etadi. Bugungi kunda Instagram, TikTok va YouTube Shorts kabi platformalarda uzatilayotgan qisqa videolar 15 soniyadan 3 daqiqagacha bo‘lgan vaqtni tashkil etadi. Tadqiqotlar shundan dalolat beradiki, ushbu platformalarda odamlar tez-tez kontentni almashtirib ko‘rish orqali vaqtinchalik yaxshi kayfiyatda bo‘lishadi (dofamin ajralishi), ammo bu ularning diqqatini uzoq muddatga jamlashini qiyinlashtiradi. 2020-2021 yillarda olib borilgan tadqiqotlar va “Journal of Computer-Mediated Communication” jurnalida chop etilgan ilmiy natijalarga ko‘ra, tezkor videolar formati miyaning “hayajon” va “rohatlanish” markazlariga kuchli ta’sir qilib, shaxsning uzoq muddatli konsentratsiyasini yo‘qotadi va o‘z xatti-harakatlarini boshqarish qobiliyatini susaytiradi [4, B. 152]. Ushbu ta’sir, ayniqsa yoshlarda ko‘proq namoyon bo‘lmoqda.

Natijalar va Muhokama.

Platformalar faoliyatida sohaga oid foydali kontentlar bilan bir qatorda **“Vine”** (vayn) – ya’ni 6 soniyalik qisqa videolar formati ham mavjud bo‘lib, ular ko‘pincha to‘liq savodsizlik yoki to‘satdan sodir bo‘luvchi tushunarsiz mantiqsiz videolardan iborat. Bu videolar odamlarning qabul qilayotgan axborotni tahlil etish qobiliyatini pasaytiradi. Tadqiqotlar qisqa videolar miyaning “reaktiv” bo‘limlarini faollashtirishi va ma’lumotni yuzaki qabul qilishga majbur etishini aniqladi. Bu esa ba’zi holatlarda xavfli axborot manipulyasiyasi uchun zamin yaratadi.

Axborot manipulyasiyasi – qisqa videolar va ijtimoiy media kontenti orqali yolg‘on ma’lumotlar, manipulyativ xabardorlik yoki qasddan yo‘naltirilgan kontentni singdirishdir. Agar odamlar tezkor, emosional videolarga asoslangan axborotni muntazam qabul qilsa, ularda oddiy faktlarni tekshirish (faktcheking) uchun vaqt va xohish qolmaydi. Bu esa yolg‘on axborotga soddalik bilan ishonishga olib keladi. Masalan, 2016 yilda AQSHdagi Prezidentlik saylovlaridan oldin ijtimoiy tarmoqlarda tarqatilgan yolg‘on xabarlar va manipulyasiyalangan videolar ko‘plab murakkab ijtimoiy muammolarga sabab bo‘lgan edi [5, B. 213].

Internet tarmoqlaridagi xavfli hodisalardan yana biri – “Filter Bubbles” (filtr pufakchalari/bulutlari) dir. Ijtimoiy media algoritmlari insonlar nimaga qiziqish bildirishsa, faqat shu mazmundagi videolarni ko‘rsataveradi. Natijada insonlar faqat o‘z qarashlariga mos keluvchi bir tomonlama axborotni olishadi va bu ularning muvozanatli hamda ob’yektiv fikrlashini mahvumlashtiradi. 2019 yilda olib borilgan tadqiqotlar ijtimoiy tarmoqlardagi videolar jamiyatni siyosiy va ijtimoiy jihatdan mafkuraviy “qutilar”ga bo‘lib yuborishini isbotladi [6, B. 74].

Bugungi kunda axborot ummonida tarqatilayotgan zararli axborotlarni mazmuniga ko‘ra uchta asosiy turga bo‘lish mumkin: dezinformatsiya, malformatsiya va misinformatsiya.

Dezinformatsiya – qasddan yolg‘on ma’lumot yoki voqelik haqidagi noto‘g‘ri axborotni tarqatish. Bu axborot faqat o‘z manfaatlarini himoya qilish yoki boshqalarni manipulyasiya qilish uchun tarqatiladi. Masalan, *“O‘zbekiston Respublikasi Prezidenti qaroriga asosan bir martalik yordam pulini ushbu ilovadan ro‘yxatdan o‘tgan holda olishingiz mumkin”* kabi fishing botlarning ijtimoiy tarmoqlarda tarqatilishi orqali foydalanuvchilarning moliyaviy ma’lumotlarini egallashga qaratilgan kibertahdidlar.

Malformatsiya – haqiqiy, real ma’lumot bo‘lib, biroq u kontekstdan ataylab chiqarilib, manipulyativ va zarar yetkazish maqsadida tarqatiladi. Ushbu axborotlar odamlarning shaxsiy hayotiga, nufuziga yoki jamiyat barqarorligiga zarar yetkazish umidida, ularning ruxsatisiz tarqatiladi (shaxsiy fotosuratlar yoki yozishmalarni sizib chiqarish).

Misinformatsiya – ataylab emas, balki xatolik, ma’lumotni noto‘g‘ri tushunish yoki tezkorlikka berilish natijasida tarqatilgan yolg‘on axborotdir. Masalan, Jizzax viloyati Baxmal tumani Gulbuloq qishlog‘iga sel keldi degan xabarning tarqalish jarayonida, ba’zi kanallarning ko‘proq ko‘rilish (prosmotr), hayp va layk ishlash maqsadida *“Baxmal tumanini butunlay sel yuvib ketdi”* xeshtegi ostida vahimali tarqatishi.

Bu jarayonlarda xorijiy davlatlarda yoki maxsus markazlarda o‘tirgan “Troll”larning vazifasi yuqori hisoblanadi. “Trolling” – bu odamlarning hissiyotlarini qo‘zish, ularni haqoratlash yoki ijtimoiy munosabatlarni buzishga yo‘naltirilgan maqsadli, zararli axborot tarqatuvchi guruhlar faoliyatidir. Ular ijtimoiy, iqtisodiy, siyosiy va diniy mavzularda soxta bahslar uyushtirib, milliy bo‘linishlarni keltirib chiqaruvchi izohlar (kommentlar) yozib qoldirishadi. Buni chetdan kuzatuvchi real foydalanuvchilar esa bu jamiyat a’zolarining haqiqiy fikri degan soxta tasavvurga ega bo‘lishadi. Oqibatda o‘sha jamiyatda ichki beqarorlik holatiga olib boruvchi “subminimal signallar” orqali ijtimoiy jarohat asta-sekinlik bilan yetkazib boriladi.

Axborot xavfsizligi tizimi to‘g‘ri tashkil etilmagan yoki mafkuraviy sohada bo‘shliqlar mavjud bo‘lgan davlatlar axborot va mafkuralar kurashi davrida iqtisodiy inqiroz, harbiy notinchlik va aholi noroziligi girdobiga tushib qolayotgani bizdan to‘g‘ri xulosa chiqarishni taqozo etadi. Bu davrda faoliyatni tashkil etishda davrning geosiyosiy manzarasi bilan birga, “Avlodlar nazariyasi”ni ham hisobga olish juda muhim omil sanaladi [7, B. 92].

Xulosa

Xulosa o‘rnida aytadigan bo‘lsak, bugun farovon jamiyat barpo etishda avvalo, kelajak avlod qalbida milliy tafakkur va sog‘lom dunyoqarash asoslarini mustahkamlash hamda yosh avlod ongida bolaligidanoq vatanga muhabbat va “O‘zbek milliy ruhi” g‘oyasini singdirish zarur. Shundagina har qanday virtual tahdid va xavf-xatarlardan himoyalanishning ijtimoiy-falsafiy, mafkuraviy-g‘oyaviiy hamda ma’naviy asoslari yaratiladi. Ayni vaqtda bizga g‘oyaviy hamda mafkuraviy jihatdan to‘yintirilgan, milliy ruh bilan tarbiyalangan “milliy kadrlar korpusi”ni shakllantirish va ularni jamiyat taraqqiyoti yo‘lida safarbar etish Meta olamdagi virtual manqurtlik balosidan himoyalanishda bosh dasturulamal bo‘lib xizmat qiladi.
