Annotatsiya. *Maqolada femtosekundli lazer impulslarini shakllantirishning zamonaviy usullari tizimli tahlil qilingan. Impuls parametrlarini boshqarishning to‘ rt bosqichi — rezonator ichida generatsiya, chirplangan impulslarni kuchaytirish (CPA/OPCPA), chiziqli dispersiyani boshqarish va nochiziqli post-kompressiya — yagona texnologik zanjir sifatida ko‘ rib chiqilgan. Dasturlanadigan shakllantirish vositalari (4f-Furye sxemasi, suyuq kristalli fazoviy yorug‘ lik modulyatorlari, akustooptik dasturlanadigan dispersion filtrlar, deformatsiyalanuvchi ko‘ zgular) qiyosiy baholangan. Bo‘ shliqli tolalar va ko‘ p o‘ tishli kameralar yordamida bir necha tebranish davriga teng impulslarni yuqori o‘ rtacha quvvatda olish yo‘ nalishi yoritilgan. Adaptiv teskari aloqali optimallashtirish va neyron tarmoqlar asosidagi intellektual boshqaruv, fazoviy-vaqtinchalik shakllantirish hamda burst rejimlari zamonaviy tendensiyalar sifatida tahlil qilingan. Impulslarni diagnostika qilish usullari umumlashtirilib, sohaning asosiy cheklovlari va istiqbolli yo‘ nalishlari asoslab berilgan.*

Kalit so‘ zlar: *femtosekundli impuls, impulsni shakllantirish, chirplangan impulsni kuchaytirish, dispersiyani boshqarish, ko‘ p o‘ tishli kamera, fazoviy yorug‘ lik modulyatori, akustooptik dispersion filtr, adaptiv optimallashtirish, few-cycle impuls, tashuvchi-o‘ rov fazasi.*

МЕТОДЫ ФОРМИРОВАНИЯ ФЕМТОСЕКУНДНЫХ ЛАЗЕРНЫХ ИМПУЛЬСОВ: СОВРЕМЕННЫЕ ПОДХОДЫ

Аннотация. *В статье систематически проанализированы современные методы формирования фемтосекундных лазерных импульсов. Четыре этапа управления параметрами импульса — внутрирезонаторная генерация, усиление чирпированных импульсов (CPA/OPCPA), линейное управление дисперсией и нелинейная посткомпрессия — рассмотрены как единая технологическая цепочка. Сравнительно оценены программируемые средства формирования (4f-схема Фурье, жидкокристаллические пространственные модуляторы света, акустооптические программируемые дисперсионные фильтры, деформируемые зеркала). Освещено направление получения импульсов длительностью в несколько периодов колебаний при высокой средней мощности с помощью полых волокон и многопроходных ячеек. Проанализированы адаптивная оптимизация с обратной связью и интеллектуальное управление на основе нейронных сетей, пространственно-временное формирование и burst-режимы. Обобщены методы диагностики импульсов, обоснованы основные ограничения и перспективные направления развития области.*

Ключевые слова: *фемтосекундный импульс, формирование импульса, усиление чирпированных импульсов, управление дисперсией, многопроходная ячейка, пространственный модулятор света, акустооптический дисперсионный фильтр, адаптивная оптимизация, few-cycle импульс, фаза огибающей относительно несущей.*

METHODS OF FEMTOSECOND LASER PULSE SHAPING: MODERN APPROACHES

Abstract. *The paper systematically analyses modern methods for shaping femtosecond laser pulses. Four stages of pulse-parameter control — intracavity generation, chirped-pulse amplification (CPA/OPCPA), linear dispersion management and nonlinear post-compression — are treated as a single technological chain. Programmable shaping tools (the 4f Fourier arrangement, liquid-crystal*

spatial light modulators, acousto-optic programmable dispersive filters, deformable mirrors) are compared. The generation of few-cycle pulses at high average power using hollow-core fibres and multipass cells is discussed. Adaptive feedback optimisation and neural-network-based intelligent control, spatiotemporal shaping and burst regimes are analysed as current trends. Pulse characterisation methods are summarised, and the principal limitations and promising directions of the field are substantiated.

Keywords: *femtosecond pulse, pulse shaping, chirped pulse amplification, dispersion management, multipass cell, spatial light modulator, acousto-optic dispersive filter, adaptive optimisation, few-cycle pulse, carrier-envelope phase.*

KIRISH

Femtosekundli (1 fs = 10^{-15} s) davomiylikdagi lazer impulslari zamonaviy fizik eksperimentning eng kuchli vositalaridan biriga aylandi. Ularning ikki xususiyati noyob imkoniyatlarni belgilaydi: energiyaning o‘ ta qisqa vaqt oralig‘ ida jamlanishi tufayli nisbatan kichik energiyada ham 10^{13}–10^{20} Vt/sm² tartibidagi nurlanish zichligiga erishiladi; impuls davomiyligi esa atom va molekulalardagi tebranish (10–100 fs) hamda elektron (100 as – 1 fs) jarayonlari vaqt shkalasi bilan taqqoslanadi.

Biroq ko‘ pchilik masalada impulsning shunchaki qisqa bo‘ lishi yetarli emas — uning vaqt-chastota profilini maqsadli boshqarish talab etiladi. Spektral amplituda va, ayniqsa, spektral faza ustidan nazorat o‘ rnatish “impulsni shakllantirish” (pulse shaping) deb ataladigan mustaqil yo‘ nalishning predmetini tashkil etadi[1]. Masala quyidagicha qo‘ yiladi: kirishdagi maydonning spektral tasviriga $H(\omega) = A(\omega)\cdot\exp[i\varphi(\omega)]$ kompleks uzatish funksiyasi qo‘ llaniladi. Spektral fazani markaziy chastota atrofida qatorga yoyish orqali guruh kechikishi, guruh kechikishi dispersiyasi (GDD), uchinchi (TOD) va yuqori tartibli hadlar ajratiladi; aynan shu koeffitsientlarni boshqarish shakllantirishning fizik mazmunini tashkil etadi.

Sohaning rivojlanishida bir necha hal qiluvchi bosqich ajratiladi: 1985-yilda taklif etilgan chirplangan impulslarni kuchaytirish (CPA) usuli o‘ ta yuqori quvvatli impulslarni olish yo‘ lidagi asosiy to‘ siqni bartaraf etdi[2] va 2018-yilgi Nobel mukofoti bilan taqdirlandi; 1990-yillarda dasturlanadigan shaperlar paydo bo‘ ldi[3]; 2000-yillarda few-cycle impulslar amaliyotga kirdi; so‘ nggi o‘ n yillikda esa yuqori o‘ rtacha quvvatli tizimlar, ko‘ p o‘ tishli kameralar va sun’iy intellekt asosidagi adaptiv boshqaruv sohaning yangi qiyofasini shakllantirdi. **Tadqiqotning maqsadi** — femtosekundli impulslarni shakllantirish usullarini yagona tizimda tasniflash, ularning fizik asoslari va cheklovlarini qiyosiy tahlil qilish hamda 2020–2026 yillardagi asosiy tendensiyalarni aniqlashdan iborat.

ADABIYOTLAR TAHLILI VA TADQIQOT METODOLOGIYASI

Sohaning uslubiy poydevori klassik ishlarda qo‘ yilgan: difraksion panjaralar yordamida impulsni siqish g‘ oyasi E. Treacy tomonidan asoslangan[4], prizmali kompressorlarning manfiy dispersiyali sxemasi R. Fork, O. Martinez va J. Gordon ishlarida ishlab chiqilgan[5], chirplangan ko‘ p qatlamli qoplamalar kontseptsiyasi R. Szipőcs va F. Krausz guruhlari tomonidan taklif etilgan[6]. Bo‘ shliqli tola yordamida spektrni kengaytirish va keyingi siqish usuli M. Nisoli, S. De Silvestri va O. Svelto tomonidan amalga oshirilgan[7], teskari aloqali adaptiv boshqaruv esa A. Assion va G. Gerber guruhlari tomonidan kimyoviy reaksiyalarni boshqarishda eksperimental tasdiqlangan[8].

Tadqiqot metodologiyasi tizimli adabiyotlar sharhi prinsiplariga asoslanadi. Web of Science, Scopus, Optica Publishing Group, IEEE Xplore, Springer Nature va Nature Portfolio resurslari bo‘ yicha “femtosecond pulse shaping”, “pulse compression”, “multipass cell”, “chirped pulse amplification”, “spatiotemporal light shaping” kalit so‘ zlari bo‘ yicha 2015–2026 yillarga oid nashrlar tanlab olindi. Saralash mezonlari: manbaning retsenziyalanadigan xalqaro jurnalda chop etilganligi; usulning fizik mexanizmiga yoki texnik amalga oshirilishiga printsipial yangilik kiritilganligi; impuls davomiyligi, energiyasi va o‘ rtacha quvvati bo‘ yicha miqdoriy natijalarning keltirilganligi. Materiallar qiyosiy tahlil, tizimli-strukturaviy yondashuv va umumlashtirish usullari yordamida qayta ishlandi.

TAHLIL VA NATIJALAR

Shakllantirishning umumiy sxemasi va tasnifi

Zamonaviy femtosekundli tizimda impuls shakli bir joyda emas, ketma-ket to‘ rt bosqichda shakllanadi: rezonator ichida rejimlarni sinxronlash orqali dastlabki impulsni yaratish; kuchaytirish, bunda impuls avval cho‘ ziladi,

kuchaytiriladi va qayta siqiladi; chiziqli dispersiyani boshqarish; nochiziqli post-kompressiya. Ushbu bosqichlar ustiga ko‘ ndalang qatlam sifatida dasturlanadigan shakllantirish va adaptiv boshqaruv qo‘ shiladi. Fizik jihatdan barcha usullar ikki sinfga bo‘ linadi: chiziqli usullar (spektr o‘ zgarmaydi, faqat spektral faza va amplituda qayta taqsimlanadi) va nochiziqli usullar (yangi spektral komponentalar hosil bo‘ ladi). Chiziqli usullar impulsni chegaraviy qiymatdan qisqa qila olmaydi — buning yagona yo‘ li spektrni kengaytirishdir.

Rezonator ichida shakllantirish

Femtosekundli impulsning “tug‘ ilish joyi” — rejimlari sinxronlangan lazer rezonatori. Passiv sinxronlashning eng keng tarqalgan mexanizmi — Kerr linzasi asosidagi sinxronlash (KLM), bunda muhitning nochiziqli sindirish ko‘ rsatkichi hisobiga yuqori intensivlikdagi nurlanish uchun qo‘ shimcha fokuslanish yuzaga keladi va rezonator yo‘ qotishlari kamayadi. Ikkinchi yondashuv — yarimo‘ tkazgichli to‘ yinuvchi yutuvchi ko‘ zgular (SESAM), bu esa sinxronlashning o‘ z-o‘ zidan boshlanishini ta’minlaydi[9]. Tolali lazerlarda impuls dispersiya, nochiziqlik, kuchayish va yo‘ qotishlar muvozanatidan hosil bo‘ ladi; rezonator dispersiyasiga qarab soliton, cho‘ zilgan impuls, similariton va dissipativ soliton rejimlari ajratiladi. Yb-tolali tizimlarda 50–200 fs, Er-tolali tizimlarda 60–150 fs davomiylik odatiy; Ti:sapfir lazerlari esa 5–10 fs qiymatlarni bevosita rezonatordan olish imkonini beradi.

Kuchaytirish bosqichida shakllantirish: CPA va OPCPA

Energiyani oshirishdagi asosiy to‘ siq — kuchaytiruvchi muhitdagi optik buzilish va o‘ z-o‘ zidan fokuslanish. CPA usuli buni uch bosqichli sxema bilan hal etadi: impuls cho‘ zgich yordamida 10^3–10^5 marta uzaytiriladi, xavfsiz cho‘ qqi quvvatida kuchaytiriladi va kompressor yordamida qayta siqiladi. Usulning muhim cheklovi — kuchayish polosasining torayishi (gain narrowing): muhit spektrning markaziy qismini kuchliroq kuchaytiradi, natijada chiqishdagi impuls uzunroq bo‘ lib qoladi. Buni kompensatsiya qilish uchun spektral filtrlar va akustooptik dasturlanadigan dispersion filtrlar qo‘ llaniladi.

Muqobil yechim — optik parametrik chirplangan impulslarni kuchaytirish (OPCPA), bunda kuchayish nochiziqli kristalldagi parametrik o‘ zaro ta’sir hisobiga sodir bo‘ ladi; kuchayish polosasi juda keng, issiqlik yuklamasi esa minimal qoladi. Yupqa diskli Yb:YAG lazerlari bilan nasoslanadigan OPCPA tizimlari few-cycle impulslarda teravatt darajasidagi cho‘ qqi quvvatini namoyish etgan[10].

Chiziqli dispersiyani boshqarish

Panjarali kompressorlar katta manfiy GDD beradi va yuqori energiyali tizimlarda ajralmas, biroq hajmli va yo‘ qotishlari nisbatan katta. Prizmali kompressorlar ixcham va kam yo‘ qotishli, lekin dispersiya kattaligi cheklangan. Grism kombinatsiyasi GDD va TOD ni mustaqil sozlash imkonini beradi. Chirplangan ko‘ zgularda turli to‘ lqin uzunliklari qoplamaning turli chuqurligidan qaytadi va nazorat qilinadigan dispersiya hosil bo‘ ladi; ixchamligi, kam yo‘ qotishi va ultra keng polosasi tufayli ular few-cycle texnikasining asosiy elementiga aylandi. Qoldiq dispersiya tebranishlarini bartaraf etish uchun juftlangan ko‘ zgular va shishali xanjarlar tizimi qo‘ llaniladi.

1-jadval. Dispersiyani boshqarish elementlarining qiyosiy tavsifi

Element	GDD diapazoni	Yuqori tartibli hadlar	Samaradorlik	Asosiy qo‘ llanilishi
Panjarali kompressor	10^4–10^6 fs^2	Cheklangan	60–80 %	CPA, yuqori energiya
Prizmali kompressor	10^2–10^3 fs^2	Cheklangan	90–95 %	Rezonator ichida
Grism	Katta	GDD va TOD mustaqil	50–70 %	Tolali CPA
Chirplangan ko‘ zgu	−20…−250 fs^2 (diskret)	Loyihalash orqali	>99 %	Few-cycle texnika
Shishali xanjar	Uzluksiz, kichik	Yo‘ q	>99 %	Nozik sozlash
AOPDF (Dazzler)	Sozlanuvchi	To‘ liq dasturlanadi	10–40 %	CPA ichida korreksiya

Nochiziqli post-kompressiya

Impulsni chegaraviy qiymatdan qisqartirish uchun spektrni kengaytirish zarur. Asosiy mexanizm — o‘ z-o‘ zidan faza modulyatsiyasi (SPM): yuqori intensivlikdagi impuls muhitning sindirish ko‘ rsatkichini o‘ zgartiradi, o‘ z fazasini

[10] Thin-disk laser-pumped OPCPA system delivering 4.4 TW few-cycle pulses // Optics Express. — 2020. — Vol. 28, No. 23. — P. 34574–34585.

modulyatsiya qiladi va yangi chastota komponentalari paydo bo‘ ladi; kengaygan spektr keyin chirplangan ko‘ zgular bilan siqiladi. Birinchi keng tarqalgan yechim — gaz bilan to‘ ldirilgan bo‘ shliqli tolalar (HCF), ular 5 fs dan qisqa impulslarni olish imkonini bergan[11], biroq kirish energiyasi bo‘ yicha tor ish oynasi va o‘ rtacha quvvat bo‘ yicha cheklovlarga ega.

So‘ nggi o‘ n yillikda ustunlikni ko‘ p o‘ tishli kameralar (multipass cell, MPC) egalladi. MPC — Errit tipidagi ikki sferik ko‘ zguli tizim bo‘ lib, impuls unda o‘ nlab marta aylanadi va har bir o‘ tishda nochiziqli fazaning kichik ulushini to‘ playdi. Nochiziqlikning ko‘ p o‘ tishlar bo‘ ylab taqsimlanishi tufayli fazoviy-spektral bir jinslilik saqlanadi va nur sifati deyarli o‘ zgarmaydi; shu tariqa yuqori o‘ rtacha quvvatda few-cycle impulslarni olish namoyish etilgan[12]. Uchinchi yondashuv — yupqa plastinkalar ketma-ketligi: o‘ ta sodda va arzon, biroq yuqori energiyalarda nurning fazoviy bir jinsliligini saqlash qiyinlashadi.

Dasturlanadigan shakllantirish vositalari

Impuls shaklini ixtiyoriy va qayta dasturlanadigan tarzda boshqarishning asosiy vositasi — 4f-Furye sxemasi: panjara spektrni fazoda yoyadi, linza spektral komponentalarni Furye tekisligiga fokuslaydi, u yerdagi modulyator har bir komponentaning amplitudasi va fazasini mustaqil o‘ zgartiradi, so‘ ng simmetrik ikkinchi yarim spektrni qayta yig‘ adi[13]. Suyuq kristalli modulyatorlar (LC-SLM) amplituda va fazani mustaqil boshqaradi, yuqori fazoviy ruxsatga ega, ammo sekin yangilanadi. Akustooptik modulyator asosidagi shaperlar impulsdan impulsga (kHz–MHz) qayta dasturlanadi. Akustooptik dasturlanadigan dispersion filtr (AOPDF, “Dazzler”) 4f-sxemani umuman talab qilmaydi: to‘ lqin uzunligiga bog‘ liq kechikish kollinear akustooptik o‘ zaro ta’sir hisobiga kristall ichida hosil qilinadi[14]; ixchamligi tufayli u yuqori quvvatli tizimlarda standart vositaga aylangan. Deformatsiyalanuvchi ko‘ zgular esa yutilish yo‘ qotishlari deyarli nolga teng bo‘ lgani uchun yuqori quvvatli nurlarda afzalroq. Muhim yangi yo‘ nalish — shakllantirish elementlarini integral fotonika platformasiga (kremniy nitridi, lityum niobati) ko‘ chirish.

2-jadval. Dasturlanadigan shakllantirish vositalarining qiyosiy tavsifi

Vosita	Boshqariladigan parametr	Yangilanish tezligi	Kanallar soni	Asosiy cheklovi
LC-SLM	Amplituda va faza	10–100 Hz	640–1920	Sekin, quvvat chegarasi
AOM (4f ichida)	Amplituda va faza	kHz–MHz	~10^3	Samaradorlik past
AOPDF (Dazzler)	Amplituda, faza, kechikish	kHz	Uzluksiz	Uzatish koeffitsienti past
Deformatsiyalanuvchi ko‘ zgu	Faqat faza	~kHz	19–100	Faqat silliq profillar
Integral fotonik shaper	Faza, spektral filtr	MHz–GHz	O‘ nlab	Quvvat va polosa chegarasi

Adaptiv boshqaruv va sun’iy intellekt

Ko‘ p hollarda kerakli impuls shaklini oldindan analitik hisoblash mumkin emas: tizimdagi dispersiya to‘ liq ma’lum bo‘ lmaydi, o‘ rganilayotgan jarayonning javob funksiyasi esa murakkab. Bunday sharoitda teskari aloqali adaptiv optimallashtirish qo‘ llaniladi: shaper parametrlari o‘ zgartiriladi, eksperimental signal o‘ lchanadi va algoritm keyingi qadamni belgilaydi. An’anaviy ravishda genetik va evolyutsion algoritmlar ishlatilgan[15]. So‘ nggi besh yilda bu yondashuv mashinaviy o‘ qitish vositalari bilan boyitildi: Bayes optimallashtirish qimmat eksperimental o‘ lchovlar sonini bir necha barobar kamaytiradi, chuqur neyron tarmoqlar esa lazer tizimining “raqamli egizagi”ni tuzib, shaper parametrlaridan chiqish impulsiga o‘ tish funksiyasini bashorat qiladi. Tolali lazerlarda sun’iy intellekt rejimlarni sinxronlashni avtomatik topish va impuls barqarorligini ushlab turish uchun qo‘ llanilmoqda[16].

Fazoviy-vaqtinchalik shakllantirish va burst rejimlari

Klassik shakllantirish faqat vaqt-chastota o‘ lchovida ishlaydi. So‘ nggi yillardagi eng yorqin tendensiyalardan biri — vaqt va fazoni birgalikda, ya’ni to‘ rt o‘ lchovli E(x, y, z, t) maydon sifatida boshqarish. Fazoviy modulyatorlarning shaper bilan birlashtirilishi materiallarni ishlashda nur profilini dinamik o‘ zgartirish imkonini bermoqda[17]. Ushbu yo‘ nalishda fazoviy-vaqtinchalik optik girdoblar (STOV), “uchuvchi fokus” va “yorug‘ lik prujinasi” kabi yangi obyektlar shakllantirildi; yagona ultratez impulsni ixtiyoriy fazoviy-vaqtinchalik tasvirga aylantirish imkoniyati namoyish etilgan[18].

Amaliy texnologiyalarda ko‘ pincha bitta impulsning shakli emas, balki impulslar ketma-ketligining vaqt tuzilishi hal qiluvchi ahamiyatga ega. “Ablatsiyaviy sovitish” kontseptsiyasiga ko‘ ra, impulslar orasidagi interval issiqlikning diffuziya vaqtidan qisqa bo‘ lsa, materialdan modda olib chiqish samaradorligi keskin ortadi[19]. Shu asosda GHz-burst rejimi, keyinchalik esa MHz-burstlar ichiga joylashtirilgan GHz-burstlardan iborat “BiBurst” sxemasi shakllantirilib, ablatsiya samaradorligining bir necha barobar ortishi ko‘ rsatildi.

Shakllangan impulslarni diagnostika qilish

Davomiyligi femtosekund tartibidagi signal uchun undan qisqaroq mustaqil etalon mavjud emas, shu bois impuls o‘ zini-o‘ zi o‘ lchash prinsipiga tayaniladi. Intensivlik avtokorrelyatsiyasi faqat taxminiy davomiylikni beradi. Chastota bo‘ yicha ruxsatlangan optik kirishlash (FROG) spektrogramma qayd etib, iterativ algoritm yordamida amplituda va fazani tiklaydi[20]; spektral faza interferometriyasi (SPIDER) fazani iteratsiyasiz tiklaydi. Few-cycle diapazonida d-skan usuli keng tarqaldi: shishali xanjar surilganda kiritilayotgan dispersiya o‘ zgaradi va ikkinchi garmonika spektrining shu o‘ zgarishga bog‘ liq xaritasi qayd etiladi, bu esa siqish va o‘ lchashni bir vaqtda amalga oshirish imkonini beradi[21]. Few-cycle impulslar uchun tashuvchi to‘ lqin va o‘ rov o‘ rtasidagi faza (CEP) mustaqil fizik parametrga aylanadi va uni f–2f interferometriyasi hamda teskari aloqali halqalar yordamida barqarorlashtirish talab etiladi.

Asosiy muammolar va istiqbollar

Keng polosali tizimlarda to‘ rtinchi va undan yuqori tartibli dispersiya hadlarini to‘ liq kompensatsiya qilish qiyin; yechim — maxsus loyihalangan ko‘ zgu juftliklari va AOPDF bilan gibrid sxemalar. Dasturlanadigan shaperlar yuqori o‘ rtacha quvvatda issiqlik yuklamasi va shikastlanish chegarasi bilan cheklanadi, shu bois butunlay aks ettiruvchi sxemalar istiqbolli hisoblanadi. Impuls jabhasining qiyshayishi, fazoviy chirp va burchak dispersiyasi kabi fazoviy-vaqtinchalik bog‘ lanishlar (STC) fokusdagi haqiqiy intensivlikni sezilarli pasaytiradi va ko‘ p o‘ lchovli diagnostikani talab qiladi. Nihoyat, impuls parametrlarini o‘ lchash va e’lon qilishning yagona metrologik bazasi hali to‘ liq shakllanmagan, bu esa turli laboratoriyalar natijalarini taqqoslashni qiyinlashtiradi.

XULOSA VA TAKLIFLAR

Birinchidan, femtosekundli impulsni shakllantirishni alohida qurilma emas, balki generatsiya, kuchaytirish, dispersiyani boshqarish va nochiziqli post-kompressiyani qamrab oluvchi yagona texnologik zanjir sifatida ko‘ rish metodologik jihatdan to‘ g‘ ri yondashuv hisoblanadi; har bir bosqichning hissasi spektral fazaning tegishli tartibli hadlari orqali miqdoriy ifodalanadi.

Ikkinchidan, chiziqli usullar impulsni chegaraviy qiymatdan qisqartira olmaydi; bu chegarani yengishning yagona yo‘ li — nochiziqli spektral kengaytirish. Ushbu sohada ko‘ p o‘ tishli kameralar bo‘ shliqli tolalarni siqib chiqarmoqda, chunki ular yuqori uzatish koeffitsienti, yaxshi nur sifati va yuqori o‘ rtacha quvvatga chidamlilikni birlashtiradi.

Uchinchidan, dasturlanadigan vositalar orasida vazifalar taqsimoti aniq shakllangan: LC-SLM eng moslashuvchan laboratoriya vositasi, AOPDF esa kuchaytirish zanjiriga integratsiya qilinadigan sanoat standarti sifatida qaror topgan.

To‘ rtinchidan, sohaning eng kuchli zamonaviy tendensiyasi — sun’iy intellektning shakllantirish jarayoniga kirib kelishi hamda shakllantirish predmetining vaqt o‘ lchovidan to‘ rt o‘ lchovli fazoviy-vaqtinchalik maydonga kengayishi.

Takliflar: femtosekundli tizimlarni loyihalashda cho‘ zgich, kuchaytirgich, kompressor va post-kompressor dispersiyasini yagona optimallashtirish masalasi sifatida birgalikda modellashtirish tavsiya etiladi; impuls diagnostikasini shakllantirish konturiga real vaqt teskari aloqasi sifatida kiritish tizim barqarorligini oshirishning eng samarali yo‘ li hisoblanadi; O‘ zbekiston sharoitida ushbu texnologiyalarni joriy etishning eng istiqbolli yo‘ nalishlari — mikroelektronika va quyosh energetikasi materiallariga pretsizion ishlov berish, ultratez spektroskopiya asosidagi diagnostika hamda optik telekommunikatsiya komponentlarini sinovdan o‘ tkazish; mutaxassislar tayyorlashda nochiziqli optika, lazer texnikasi va hisoblash optimallashtirish usullarini birlashtirgan integrallashgan o‘ quv modullarini joriy etish maqsadga muvofiq.

Annotatsiya: *Ushbu ishda InAs/GaInSb pog‘ onali kvant o‘ rada elektron energiya sathlarining geometrik parametrlar va potensial to‘ siq turiga bog‘ liqligi nazariy jihatdan o‘ rganildi. Hisoblashlar effektiv massa yaqinlashuvi asosida bir o‘ lchamli statsionar Shredinger tenglamasini sonli yechish orqali amalga oshirildi. Cheksiz potensial to‘ siqli InAs/GaInSb modeli hamda chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb geterotuzilmasi uchun energiya sathlari hisoblanib, olingan natijalar taqqoslandi. Natijalar InAs qatlami kengayishi bilan energiya sathlari kamayishini hamda chekli potensial to‘ siqli holatda elektron to‘ lqin funksiyasining AlSb to‘ siqlariga kirib borishi tufayli energiya sathlari cheksiz potensial to‘ siqli holatdagiga nisbatan pastroq joylashishini ko‘ rsatdi.*

Kalit so‘ zlar: *elektron energiya sathlari, chekli potensial, cheksiz potensial, effektiv massa, Shredinger tenglamasi.*

ВЛИЯНИЕ БЕСКОНЕЧНЫХ И КОНЕЧНЫХ ПОТЕНЦИАЛЬНЫХ БАРЬЕРОВ НА ЭНЕРГЕТИЧЕСКИЙ СПЕКТР ЭЛЕКТРОНА В СТУПЕНЧАТОЙ КВАНТОВОЙ ЯМЕ INAS/GAINSB

Аннотация: *В данной работе теоретически исследована зависимость энергетических уровней электрона в ступенчатой квантовой яме InAs/GaInSb от геометрических параметров и типа потенциального барьера. Расчёты выполнены путём численного решения одномерного стационарного уравнения Шрёдингера в рамках приближения эффективной массы. Были рассчитаны энергетические уровни для модели InAs/GaInSb с бесконечным потенциальным барьером и гетероструктуры AlSb/InAs/GaInSb/AlSb с конечным потенциальным барьером, после чего полученные результаты были сопоставлены. Результаты показали, что с увеличением ширины слоя InAs энергетические уровни уменьшаются, а в случае конечного потенциального барьера вследствие проникновения волновой функции электрона в барьерные слои AlSb энергетические уровни располагаются ниже по сравнению со случаем бесконечного потенциального барьера.*

Ключевые слова: *энергетические уровни электрона, конечный потенциальный барьер, бесконечный потенциальный барьер, эффективная масса, уравнение Шрёдингера.*

EFFECT OF INFINITE AND FINITE POTENTIAL BARRIERS ON THE ELECTRON ENERGY SPECTRUM IN AN INAS/GAINSB STEPPED QUANTUM WELL

Abstract: *In this work, the dependence of the electron energy levels in an InAs/GaInSb stepped quantum well on the geometric parameters and the type of potential barrier is theoretically investigated. The calculations were performed by numerically solving the one-dimensional stationary Schrödinger equation within the framework of the effective mass approximation. The electron energy levels were calculated for the InAs/GaInSb model with an infinite potential barrier and for the AlSb/InAs/GaInSb/AlSb heterostructure with a finite potential barrier, and the obtained results were compared. The results show that the electron energy levels decrease with increasing InAs layer width, while in the finite potential barrier case the penetration of the electron wave function into the AlSb barrier layers causes the energy levels to be located at lower values than those in the infinite potential barrier case.*

Keywords: *electron energy levels, finite potential barrier, infinite potential barrier, effective mass, Schrödinger equation.*

Kirish

So‘nggi yillarda InAs, GaInSb va AlSb materiallari asosidagi II-tip kvant o‘ralar o‘rta infraqizil lazerlar, fotodetektorlar va past o‘lchamli elektron qurilmalar uchun istiqbolli strukturalar sifatida faol o‘rganilmoqda. Chen va hammualliflar GaInSb/InAs/AlSb kvant o‘ralarda interfeys turining fotolyuminessensiya energiyasi, tashuvchilar lokalizatsiyasi va to‘lqin funksiyaning fazoviy o‘lchamiga ta’sirini tajribaviy tahlil qilganlar [1]. Motyka va hammualliflar AlSb bilan chegaralangan W-shaklli kvant o‘ralarda qatlam qalinligi, tarkib va deformatsiyaning energetik hamda optik xossalarga ta’sirini ko‘rsatganlar [2]. Ryczko va Sęk esa shu turdagi o‘ralarda energetik holatlar va optik kuchayishni hisoblab, qatlam parametrlarini o‘zgartirish orqali optik javobni boshqarish mumkinligini aniqlaganlar [3]. InAs/InGaSb kvant o‘ralarda deformatsiya va qotishma tarkibining energetik zonalarga ta’siri Akiho va hammualliflar tomonidan o‘rganilgan [4]. Du va hammualliflar InAs/GaSb kvant o‘ralarda elektron va kovaklarning turli qatlamlarda fazoviy ajralishi hamda energetik tirqishning hosil bo‘lishini ko‘rsatganlar [5]. Irie va hammualliflar esa InAs qatlam qalinligi hamda tashqi elektr maydon orqali InAs/InGaSb kompozit kvant o‘ralarning energetik tirqishini boshqarish mumkinligini aniqlaganlar [6]. Avogadri va hammualliflar deformatsiyalangan uch qatlamli InAs/GaInSb kvant o‘ralarda katta invers energetik tirqish hosil bo‘lishini qayd etganlar [7]. Qu va hammualliflar InAs/GaSb qo‘sh kvant o‘ralarida elektr va magnit maydonlar yordamida trivial va topologik fazalar orasidagi o‘tishni boshqarish mumkinligini ko‘rsatganlar [8]. Yu va hammualliflar InAs/InGaSb/InAs W-kvant o‘ra faol sohasida deformatsiya taqsimotini tajribaviy aniqlaganlar [9]. Zamonaviy interband kaskad lazerlarda InAs/GaInSb faol qatlamlari va AlSb to‘siqlarining qo‘llanilishi Tournié va Petrović hammualliflikladagi ishlarda ham ko‘rsatilgan [10,11]. Keltirilgan ishlarda asosan interfeyslarning xususiyatlari, deformatsiya, optik o‘tishlar, energetik tirqish, lazer kuchayishi va ko‘p qatlamli real qurilmalar o‘rganilgan.

Mazkur ishda InAs/GaInSb geterotuzilmasi tanlanishiga bir necha fizik omillar sabab bo‘ladi. Avvalo, InAs va GaInSb materiallari o‘rtasida hosil bo‘ladigan o‘tkazuvchanlik zonasi uzilishi elektronlarni InAs qatlamida samarali lokalizatsiyalash imkonini beradi. Shu bilan birga, GaInSb qotishmasining tarkibini o‘zgartirish orqali potensial pog‘ona balandligi va zonaviy parametrlarni ma’lum chegaralarda boshqarish mumkin. Bu esa elektron energiya sathlarini geometrik parametrlar bilan bir qatorda material tarkibi orqali ham nazorat qilish imkoniyatini yaratadi.

Chekli potensial to‘siqli modelda tashqi qatlam sifatida AlSb materiali tanlandi. Bunga sabab AlSb ning keng taqiqlangan zona kengligiga ega bo‘lib, InAs va GaInSb qatlamlariga nisbatan yuqori potensial to‘siq hosil qilishi hamda amaliy interband kaskad lazerlar va II-tip kvant o‘ra geterotuzilmalarida keng qo‘llanilishidir. Shu sababli AlSb/InAs/GaInSb/AlSb strukturasi real yarimo‘tkazgich geterotuzilmalarini modellashtirish uchun qulay model hisoblanadi.

Bu ishda esa bir xil ichki kenglik L=a+b=20 nm bo‘lgan cheksiz potensial to‘siqli InAs/GaInSb o‘ra va chekli potensial to‘siqli AlSb/InAs/GaInSb/AlSb geterotuzilmaning diskret elektron energiya sathlari aniqlanadi hamda taqqoslanadi.

Nazariy model

Elektron energiya sathlarini hisoblashda effektiv massa yaqinlashuvi (Effective Mass Approximation, EMA) qo‘llanildi. Ushbu yaqinlashuvda kristall panjaraning murakkab davriy potensiali o‘rniga elektronning har bir qatlamdagi harakati shu materialga mos keluvchi effektiv massa orqali tavsiflanadi. Geterotuzilmada material almashishi natijasida elektronning effektiv massasi va potensial energiyasi koordinataning funksiyasi sifatida qaraladi [12,13].

Elektronning kvant holatlari bir o‘lchamli statsionar Shredinger tenglamasi yordamida aniqlanadi:

$$-\frac{\hbar^2}{2}\frac{d}{dx}\left(\frac{1}{m(x)}\frac{d\psi(x)}{dx}\right)+V(x)\psi(x)=E\psi(x)$$

bu yerda $m(x)$ −elektronning koordinataga bog‘liq effektiv massasi, $V(x)$ −potensial energiya, E — elektron energiyasi, $\psi(x)$ −elektron to‘lqin funksiyasi.

Hisoblashlarda elektronning effektiv massasi har bir qatlam ichida o‘zgarmas deb qabul qilinib, faqat geterochegaralarda sakrashli ravishda o‘zgaradi. Shu sababli har bir sohada Shredinger tenglamasining analitik yechimlari yozilib, qatlamlar chegaralarida ular o‘zaro bog‘landi.

Geterotuzilma chegaralarida BenDaniel–Duke chegaraviy shartlari qo‘llanildi. Ushbu shartlarga ko‘ra to‘lqin funksiyasi hamda uning effektiv massa bilan normallashgan hosilasi uzluksiz bo‘lishi kerak:

$$\psi_i(x)=\psi_{i+1}(x)$$
$$\frac{1}{m_i^*}\frac{d\psi_i(x)}{dx}=\frac{1}{m_{i+1}^*}\frac{d\psi_{i+1}(x)}{dx}$$

Mazkur chegaraviy shartlarni barcha interfeyslarda qo‘llash natijasida amplitudalar uchun algebraik tenglamalar sistemasi hosil qilinadi. Noldan farqli yechim mavjud bo‘lishi uchun ushbu sistemaning koeffitsiyentlar matritsasi determinanti nolga teng bo‘lishi lozim:

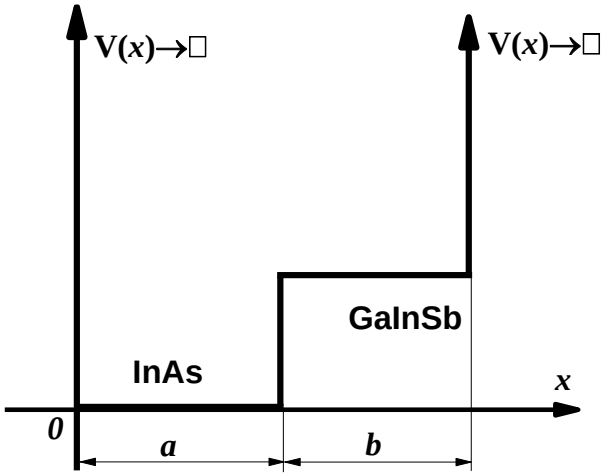
$$\det\big(\mathbf{M}(E)\big) = 0.$$

Determinant energiyaning transsendent funksiyasi bo‘ lib, uning ildizlari ruxsat etilgan diskret elektron energiya sathlarini beradi. Mazkur tenglama sonli usullar yordamida yechildi.

Ikki tomonlama cheksiz potensial to‘ siqli InAs/GaInSb geterotuzilma modeli. Cheksiz potensial to‘ siqli modelda InAs/GaInSb pog‘ onali kvant o‘ ra qaraladi. Ichki strukturaning umumiy kengligi $L = a + b$ doimiy deb olinadi. Bu yerda a −InAs qatlami, b esa GaInSb pog‘ ona qatlami kengligidir (1-rasm).

Potensial energiya quyidagi ko‘ rinishda aniqlanadi:

$$V(x) = \begin{cases} \infty, & x \le 0, \\ 0, & 0 < x < a \\ V_1, & a < x < L \\ \infty, & x \ge L. \end{cases}$$



Effektiv massa faqat geterotuzilma ichida aniqlanadi:

$$m(x) = \begin{cases} m_1, & 0 < x < a \\ m_2, & a < x < L \end{cases}$$

Cheksiz potensial mavjudligi sababli elektron to‘ lqin funksiyasi tashqi sohalarda nolga teng bo‘ lib, chegaralarda:

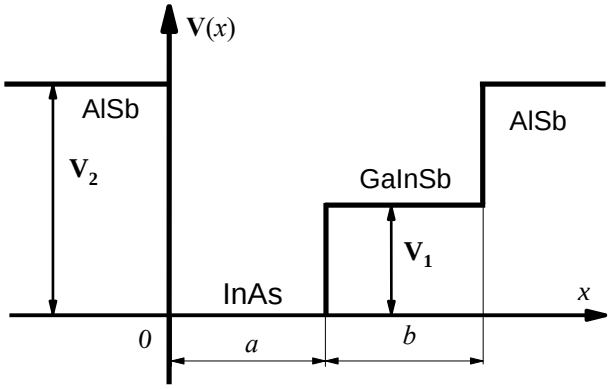
$$\psi(0) = 0, \qquad \psi(L) = 0.$$

Dirixle chegaraviy shartlari bajariladi.

1-rasm. Cheksiz potensial to‘ siqli InAs/GaInSb pog‘ onali kvant o‘ raning potensial profili.

Ikki tomonlama chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb geterotuzilma modeli. Chekli potensial to‘ siqli modelda InAs/GaInSb pog‘ onali kvant o‘ ra ikki tomondan AlSb to‘ siqlari bilan chegaralangan deb qaraladi (2-rasm). Bunda potensial energiya

$$V(x) = \begin{cases} V_2, & x < 0, \\ 0, & 0 < x < a, \\ V_1, & a < x < L, \\ V_2, & x > L. \end{cases}$$



ko‘ rinishida yoziladi.

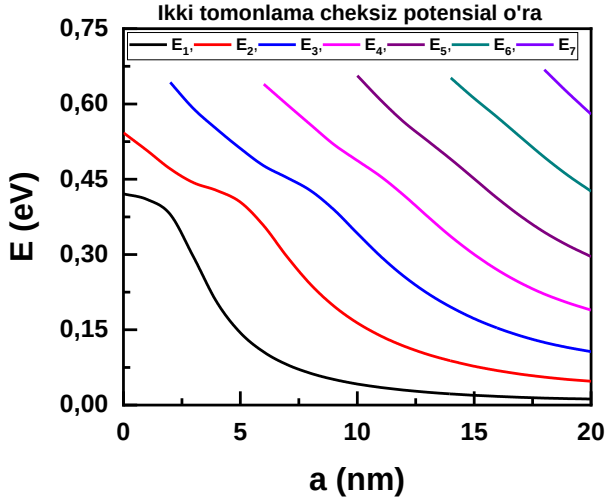
Effektiv massa esa

$$m(x) = \begin{cases} m_3, & x < 0, \\ m_1, & 0 < x < a \\ m_2, & a < x < L \\ m_3, & x > L. \end{cases}$$

ko‘ rinishda aniqlanadi.

Chekli potensial to‘ siqli holatda elektronning to‘ lqin funksiyasi tashqi AlSb qatlamlariga eksponensial ravishda kirib boradi. Natijada elektronning effektiv lokalizatsiya sohasi ortadi, kvant cheklanish kuchsizlanadi va diskret energiya sathlari cheksiz potensial to‘ siqli holatdagiga nisbatan pastroq qiymatlarda joylashadi.

2-rasm. Chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb strukturasining potensial profili.

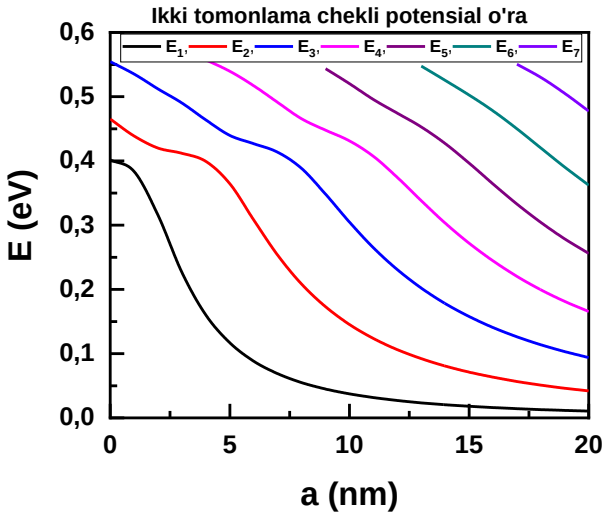


Natijalar va muhokamalar

Ushbu bo‘ limda InAs/GaInSb pog‘ onali kvant o‘ rada elektron energiya sathlarining geometrik parametrlar va potensial to‘ siq turiga bog‘ liqligi batafsil tahlil qilinadi. Hisoblashlar effektiv massa yaqinlashuvi asosida hosil qilingan transsendent tenglamani sonli yechish orqali amalga oshirildi. Ichki strukturaning umumiy kengligi $L = a + b = 20\,nm$ doimiy saqlanib, InAs qatlami kengligi a o‘ zgartirilganda GaInSb pog‘ ona kengligi $b = 20 - a$ shart orqali aniqlandi. Avval cheksiz potensial to‘ siqli InAs/GaInSb modeli, so‘ ngra chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb modeli uchun energiya sathlari hisoblandi. Olingan natijalar asosida kvant cheklanish darajasi, to‘ lqin funksiyasining potensial to‘ siqlarga kirib borishi hamda ushbu omillarning elektron energiya spektriga ta’siri fizik jihatdan izohlandi.

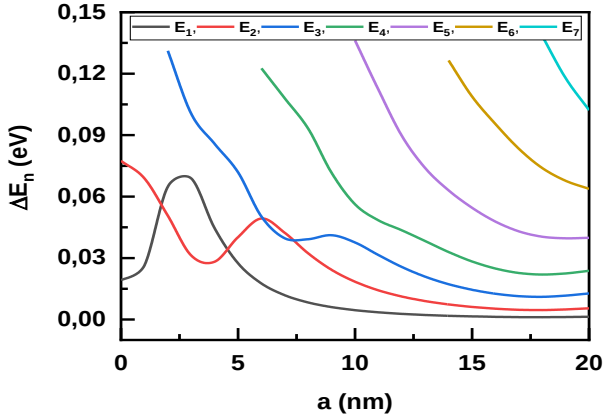
Hisoblashlarda electron effektiv massalarini $m_1 = 0.07948m_0$, $m_2 = 0.02312m_0$, $m_3 = 0.035m_0$ (m_0 — erkin elektron massasi) qiymatlarda potensial energiyalarni esa $V_1 = 0.38\,eV$, $V_2 = 0.558\,eV$ qiymatlarda tanlab olindi[7,12,13].

3-rasmda cheksiz potensial to‘ siqli InAs/GaInSb pog‘ onali kvant o‘ rada elektron energiya sathlarining InAs qatlami kengligi a ga bog‘ liqligi tasvirlangan. Hisoblashlarda ichki strukturaning umumiy kengligi $L = a + b = 20\,nm$ doimiy saqlanib, InAs qatlami kengligi ortishi bilan GaInSb pog‘ ona kengligi mos ravishda kamaytirildi. Grafikdan ko‘ rinadiki, barcha energiya sathlari a ning ortishi bilan monoton ravishda kamayadi. Buning asosiy sababi InAs qatlami kengayishi natijasida elektronning harakat sohasi ortishi va kvant cheklanishining susayishidir. Natijada elektronning kinetik energiyasi kamayib, diskret energiya sathlari pastroq qiymatlarga siljiydi. Shuningdek, quyi energiya sathlari (E_1, E_2 va E_3) kenglik o‘ zgarishiga yuqori sathlarga nisbatan sezilarli darajada kuchliroq ta’sirlanishi kuzatiladi. InAs qatlami tor bo‘ lganda faqat bir necha bog‘ langan holatlar mavjud bo‘ lsa, uning kengligi ortishi bilan kvant o‘ rada qo‘ shimcha bog‘ langan energiya sathlari hosil bo‘ ladi. Bunda qo‘ shni energiya sathlari orasidagi masofa ham asta-sekin kamayib boradi, bu esa kvant cheklanish effektining zaiflashayotganligini ko‘ rsatadi.



Natijalar InAs qatlami kengligini o‘ zgartirish orqali pog‘ onali kvant o‘ raning elektron energiya spektrini samarali boshqarish mumkinligini ko‘ rsatadi.

3-rasm. Cheksiz potensial to‘ siqli InAs/GaInSb pog‘ onali kvant o‘ rasida elektron energiya sathlarining a kenglikka bog‘ liqligi.

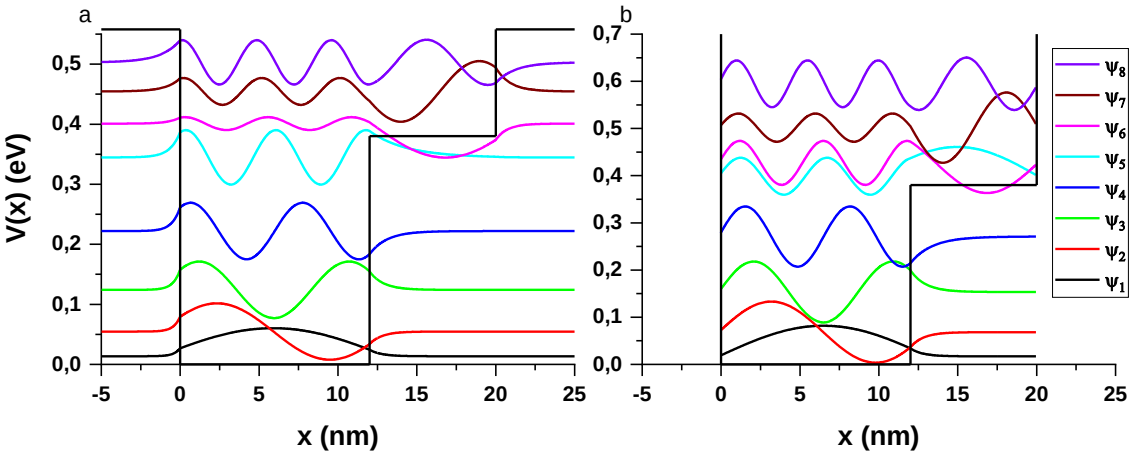


4-rasmda chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb geterotuzilmada elektron energiya sathlarining InAs qatlami kengligi a ga bog‘ liqligi tasvirlangan. Hisoblashlarda ichki strukturaning umumiy kengligi $L = a + b = 20\,nm$

doimiy saqlanib, InAs qatlami kengligi ortishi bilan GaInSb pog‘ ona kengligi mos ravishda kamaytirildi. Grafikdan ko‘ rinadiki, InAs qatlami kengayishi bilan barcha energiya sathlari monoton ravishda pasayadi. Bu holat elektronning fazoviy lokalizatsiya sohasi kengayishi natijasida kvant cheklanishining susayishi bilan izohlanadi. Chekli potensial to‘ siqli holatda elektron to‘ lqin funksiyasi AlSb to‘ siq qatlamlariga eksponensial ravishda kirib boradi. Natijada elektronning effektiv lokalizatsiya sohasi geometrik o‘ ra kengligidan kattaroq bo‘ ladi. Shu sababli kvant cheklanish energiyasi kamayadi va barcha diskret energiya sathlari cheksiz potensial to‘ siqli holatdagiga nisbatan pastroq qiymatlarda joylashadi. Shuningdek, quyi energiya sathlari (E_1, E_2 va E_3) InAs qatlami kengligining o‘ zgarishiga yuqori sathlarga qaraganda sezilarliroq ta’sirlanadi. InAs qatlami kengaygan sari yangi bog‘ langan holatlar vujudga keladi hamda qo‘ shni energiya sathlari orasidagi masofa asta-sekin kamayadi. Bu natijalar chekli potensial to‘ siq mavjud bo‘ lganda elektron energiya spektriga to‘ lqin funksiyasining to‘ siq qatlamlariga kirib borishi muhim ta’sir ko‘ rsatishini tasdiqlaydi.

4-rasm. Chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb strukturada elektron energiya sathlarining a kenglikka bog‘ liqligi.

5-rasmda cheksiz va chekli potensial to‘ siqli modellar uchun hisoblangan elektron energiya sathlari orasidagi farq $\Delta E_n = E_n^{\infty} - E_n^{chekli}$ ning InAs qatlami kengligi a ga bog‘ liqligi keltirilgan. Grafikdan ko‘ rinadiki, barcha energiya sathlari uchun ΔE_n musbat qiymatlarga ega bo‘ lib, bu cheksiz potensial to‘ siqli modelda energiya sathlari doimo chekli potensial to‘ siqli holatdagiga nisbatan yuqoriroq joylashishini tasdiqlaydi. Shuningdek, InAs qatlami tor bo‘ lgan holatda energiya farqi eng katta qiymatlarga ega bo‘ ladi. Bunga sabab tor kvant o‘ ralarda elektronning to‘ lqin funksiyasi tashqi AlSb to‘ siqlariga nisbatan sezilarli darajada kirib borishi natijasida kvant cheklanish energiyasining kamayishidir. InAs qatlami kengayishi bilan elektronning harakat sohasi ortadi va to‘ lqin funksiyasining to‘ siq qatlamlariga kirib borishining nisbiy ta’siri kamayadi. Natijada ΔE_n asta-sekin kamayib, cheksiz va chekli potensial to‘ siqli modellar bo‘ yicha olingan energiya sathlari bir-biriga yaqinlashadi. Quyi energiya sathlari uchun bu yaqinlashish yuqori sathlarga qaraganda tezroq sodir bo‘ ladi. Demak, potensial to‘ siqning cheklanganligini hisobga olish ayniqsa tor kvant o‘ ralarda muhim ahamiyatga ega bo‘ lib, o‘ ra kengligi ortishi bilan ushbu omilning energiya spektriga ta’siri bosqichma-bosqich kamayadi.



5-rasm. Cheksiz va chekli potensial to‘ siqli holatlarda ayrim energiya sathlarining taqqoslanishi.

6-rasmda chekli (a) va cheksiz (b) potensial to‘ siqli InAs/GaInSb pog‘ onali kvant o‘ ralar uchun dastlabki sakkizta elektron to‘ lqin funksiyalarining fazoviy taqsimoti potensial profil bilan birgalikda tasvirlangan. To‘ lqin funksiyalari mos

energiya sathlariga vertikal siljitilgan holda keltirilgan. Grafikdan ko‘rinadiki, energiya sathi ortishi bilan to‘lqin funksiyalaridagi tugunlar soni ham ortib boradi, bu esa kvant mexanikasining bog‘langan holatlar uchun xos qonuniyatiga mos keladi. Chekli potensial to‘siqli holatda (a) elektron to‘lqin funksiyalari tashqi potensial to‘siq qatlamlariga eksponensial ravishda kirib boradi. Natijada elektronning effektiv lokalizatsiya sohasi geometrik o‘ra kengligidan kattaroq bo‘ladi, kvant cheklanishi susayadi va elektron energiya sathlari nisbatan pastroq qiymatlarda joylashadi. Ayniqsa, yuqori energiya sathlariga mos to‘lqin funksiyalarida to‘siq qatlamlariga kirib borish yanada yaqqol kuzatiladi. Cheksiz potensial to‘siqli holatda (b) esa elektron to‘lqin funksiyalari kvant o‘ra chegaralarida qat’iy ravishda nolga teng bo‘lib, elektron faqat InAs/GaInSb ichki sohasida lokalizatsiyalangan. Shu sababli elektronning fazoviy cheklanishi kuchliroq bo‘lib, energiya sathlari chekli potensial to‘siqli holatdagiga nisbatan yuqoriroq qiymatlarda joylashadi.

Demak, potensial to‘siqning cheklanganligi elektronning fazoviy lokalizatsiyasi va to‘lqin funksiyalarining taqsimotiga sezilarli ta’sir ko‘rsatadi. To‘lqin funksiyasining to‘siq qatlamlariga kirib borishi kvant cheklanish energiyasini kamaytirib, elektron energiya spektrining past energiyalar tomon siljishiga olib keladi.

6-rasm. Chekli (a) va cheksiz (b) potensial to‘siqli InAs/GaInSb pog‘onali kvant o‘rada elektronning dastlabki sakkizta bog‘langan holati uchun to‘lqin funksiyalarining fazoviy taqsimoti.

1-jadvalda InAs qatlami kengligining ayrim qiymatlarida cheksiz potensial to‘siqli InAs/GaInSb modeli hamda chekli potensial to‘siqli AlSb/InAs/GaInSb/AlSb geterotuzilmasi uchun hisoblangan dastlabki elektron energiya sathlari taqqoslangan. Jadvaldan ko‘rinadiki, barcha hollarda chekli potensial to‘siqli modelda olingan energiya qiymatlari cheksiz potensial to‘siqli holatdagiga nisbatan kichikroq bo‘ladi. Ushbu farq chekli potensial to‘siq mavjud bo‘lganda elektron to‘lqin funksiyasining AlSb qatlamlariga eksponensial ravishda kirib borishi natijasida elektronning effektiv lokalizatsiya sohasi ortishi bilan izohlanadi. Shuningdek, InAs qatlami kengayishi bilan har ikkala modelda ham energiya sathlari pasayishi kuzatiladi, bu esa kvant cheklanishining susayishi natijasidir. Jadvalda keltirilgan sonli natijalar grafiklarda kuzatilgan qonuniyatlarni miqdoriy jihatdan tasdiqlaydi.

1-jadval. Cheksiz va chekli potensial to‘siqli holatlarda ayrim energiya sathlarining taqqoslanishi.

a, nm	E_1		E_2		E_3	
	Cheksiz	Chekli	Cheksiz	Chekli	Cheksiz	Chekli

1-jadvalda chekli potensial to‘siqli modelda elektron energiya sathlarining cheksiz potensial to‘siqli holatga nisbatan foiz hisobidagi kamayishi keltirilgan. Natijalardan ko‘rinadiki, potensial to‘siqning cheklanganligi barcha energiya sathlariga sezilarli ta’sir ko‘rsatadi. Ayniqsa, InAs qatlami tor bo‘lgan hollarda energiya farqi kattaroq bo‘lib, bu elektron to‘lqin funksiyasining tashqi AlSb to‘siqlariga nisbatan kuchliroq kirib borishi bilan bog‘liq. InAs qatlami kengayishi bilan energiya sathlari orasidagi nisbiy farq kamayish tendensiyasini namoyon qiladi, chunki elektronning fazoviy lokalizatsiyasi zaiflashadi va to‘lqin funksiyasining to‘siq qatlamlariga kirib borishining energiya spektriga ta’siri

nisbatan kichrayadi. Ushbu natijalar chekli potensial to‘ siqli model real yarimo‘ tkazgich geterotuzilmalaridagi elektron holatlarini tavsiflashda cheksiz potensial modelga qaraganda aniqroq fizik tavsif berishini ko‘ rsatadi.

2-jadval. Ayrim a qiymatlarida chekli holatdagi energiya pasayishining foizdagi qiymatlari.

a, nm	ΔE_1, %	ΔE_2, %	ΔE_3, %

10	10.83	11.24	10.99
15	7.64	7.90	8.41
20	11.32	11.54	11.92

Xulosa

Mazkur ishda InAs/GaInSb pog‘ onali kvant o‘ rada elektron energiya sathlarining ichki qatlam geometrik parametrlariga hamda potensial to‘ siq turiga bog‘ liqligi nazariy jihatdan o‘ rganildi. Effektiv massa yaqinlashuvi asosida bir o‘ lchamli statsionar Shredinger tenglamasi sonli yechilib, cheksiz potensial to‘ siqli InAs/GaInSb modeli hamda chekli potensial to‘ siqli AlSb/InAs/GaInSb/AlSb geterotuzilmasi uchun energiya sathlari hisoblandi.

Hisoblashlar InAs qatlami kengayishi bilan elektronning fazoviy lokalizatsiya sohasi ortishi va kvant cheklanishining susayishi natijasida barcha energiya sathlari monoton ravishda kamayishini ko‘ rsatdi. Bundan tashqari, chekli potensial to‘ siqli holatda elektron to‘ lqin funksiyasining AlSb to‘ siq qatlamlariga eksponensial kirib borishi sababli energiya sathlari cheksiz potensial to‘ siqli modeldagiga nisbatan pastroq qiymatlarda joylashishi aniqlandi. Ayniqsa, tor kvant o‘ ralarda ushbu farq sezilarli bo‘ lib, o‘ ra kengligi ortishi bilan ikki model natijalari bir-biriga yaqinlashishi kuzatildi.

Shunday qilib, tadqiqot natijalari potensial to‘ siqning cheklanganligini hisobga olish real yarimo‘ tkazgich geterotuzilmalarining elektron xossalarini aniq tavsiflashda muhim ekanligini ko‘ rsatdi. Olingan natijalar InAs/GaInSb asosidagi kvant o‘ ralarda energiya spektrini geometrik parametrlar va potensial profilini tanlash orqali boshqarish imkonini beradi hamda ular interband kaskad lazerlar, infraqizil fotodetektorlar va boshqa past o‘ lchamli optoelektron qurilmalarni loyihalashda nazariy asos sifatida xizmat qilishi mumkin.

Annotatsiya: *Mazkur ilmiy ishda qatlamli silikat materiali sifatida tabiiy* Vermikulit *asosida yuqori darajada to‘ ldirilgan organo-noorganik polimer kompozit materiallar sintez qilindi va ularning spektral xossalari o‘ rganildi.*

Tajriba jarayonida vermikulit sulfat kislota (H_2SO_4) va xlorid kislota (HCl) yordamida kimyoviy modifikatsiyalandi. Kislota bilan ishlov berish natijasida mineral qatlamlari orasidagi masofa kengayishi, ion almashinish jarayonlarining faollashuvi va faol markazlar sonining ortishi kuzatildi. Keyinchalik ortiqcha kislotalar ammiak eritmasi hamda natriy gidrokarbonat ($NaHCO_3$) yordamida neytrallandi, mahsulot filtrlash va quritish bosqichlaridan o‘ tkazildi.

Kompozit materiallar tayyorlashda polimer matritsa sifatida Polietilen *(PE),* Polipropilen *(PP) va* Poliamid *(PA) tanlab olindi. Modifikatsiya jarayoni eritilgan holatda, 10:1 (polimer:vermikulit) massa nisbatida amalga oshirildi. Olingan kompozitlar Ultrabinafsha spektroskopiya usuli yordamida tahlil qilindi.*

Spektral natijalar polimer zanjirlari bilan modifikatsiyalangan vermikulit o‘ rtasida molekulyar darajadagi o‘ zaro ta’sir mavjudligini ko‘ rsatdi. Xususan, xarakterli yutilish chiziqlarining siljishi, intensivlik o‘ zgarishlari va yangi tebranish modalarining paydo bo‘ lishi kompozit tuzilmasida interkalatsion hamda qisman eksfoliatsion jarayonlar sodir bo‘ lganini tasdiqlaydi.

Kalit so‘ zlar: *vermikulit, qatlamli silikatlar, polimer kompozitlar, Ultrabinafsha spektroskopiya usuli , organo-noorganik materiallar, modifikatsiya.*

ИССЛЕДОВАНИЕ СПЕКТРОВ ВЫСОКОЗАПОЛНЕННЫХ ОРГАНО-НЕОРГАНИЧЕСКИХ ПОЛИМЕРНЫХ МАТЕРИАЛОВ НА ОСНОВЕ СЛОИСТЫХ СИЛИКАТНЫХ МАТЕРИАЛОВ С ИСПОЛЬЗОВАНИЕМ УЛЬТРАФИОЛЕТОВОЙ СПЕКТРОСКОПИИ

Аннотация: *В рамках данного научного исследования были синтезированы высокозаполненные органо-неорганические полимерные композитные материалы на основе природного вермикулита в качестве слоистого силикатного материала, а также изучены их спектральные свойства.*

В ходе эксперимента вермикулит подвергали химической модификации с использованием серной кислоты (H_2SO_4) и соляной кислоты (HCl). В результате кислотной обработки было отмечено увеличение межслойного расстояния, активация процессов ионного обмена и увеличение количества активных центров. Затем избыток кислот был нейтрализован раствором аммиака и бикарбонатом натрия ($NaHCO_3$), после чего продукт подвергли фильтрации и сушке.

В качестве полимерной матрицы для получения композиционных материалов были выбраны полиэтилен (PE), полипропилен (PP) и полиамид (PA). Процесс модификации проводился в расплаве при массовом соотношении 10:1 (полимер:вермикулит). Полученные композиты были проанализированы с помощью методов инфракрасной (ИК) спектроскопии.

Результаты спектрального анализа показали наличие взаимодействий на молекулярном уровне между полимерными цепями и модифицированным вермикулитом. В частности, смещение характерной линии поглощения... В частности, сдвиг характерных линий поглощения, изменения интенсивности и появление новых колебательных мод подтверждают протекание процессов интеркаляции и частичной эксфолиации в структуре композита.

Ключевые слова: *вермикулит, слоистые силикаты, полимерные композиты, УФ-спектроскопия, органо-неорганические материалы, модификация.*

STUDY OF THE SPECTRA OF HIGHLY FILLED ORGANO-INORGANIC POLYMER MATERIALS BASED ON LAYERED SILICATE MATERIALS USING ULTRAVIOLET SPECTROSCOPY

Abstract: *In this scientific study, highly filled organo-inorganic polymer composite materials based on natural vermiculite as a layered silicate material were synthesized, and their spectral properties were studied.*

During the experiment, vermiculite was chemically modified using sulfuric acid (H_2SO_4) and hydrochloric acid (HCl). As a result of acid treatment, an increase in the spacing between mineral layers, activation of ion exchange processes, and an increase in the number of active centers were observed. Subsequently, the excess acids were neutralized with an ammonia solution and sodium bicarbonate ($NaHCO_3$), and the product was subjected to filtration and drying.

Polyethylene (PE), Polypropylene (PP), and Polyamide (PA) were selected as the polymer matrix for the preparation of the composite materials. The modification process was carried out in the melt at a mass ratio of 10:1 (polymer:vermiculite). The resulting composites were analyzed using infrared (IR) spectroscopy methods.

Spectral results showed the existence of molecular-level interactions between polymer chains and modified vermiculite. In particular, the shift of characteristic absorption lines, changes in intensity, and the emergence of new vibrational modes confirm the occurrence of intercalation and partial exfoliation processes in the composite structure.

Keywords: *vermiculite, layered silicates, polymer composites, UB spectroscopy, organo-inorganic materials, modification.*

Kirish

Mazkur ishda polietilen, polipropilen hamda poliamid asosidagi organo-noorganik kompozit materiallarning ichki tuzilishini aniqlash va komponentlar o‘ rtasidagi o‘ zaro ta’sir mexanizmlarini baholash maqsadida ultrabinafsha (UV) spektroskopiya usuli qo‘ llanildi. Ushbu yondashuv polimer matritsa va qatlamli silikat (vermikulit) o‘ rtasidagi bog‘ lanish xususiyatlarini turli darajalarda - elektron va molekulyar darajada - kompleks o‘ rganish imkonini berdi.

Polimer va silikat (yoki umuman olganda noorganik material) ning har qanday jismoniy aralashmasi majburiy ravishda nanokompozit hosil qilavermaydi. Bu holat polimer aralashmalariga o‘ xshaydi. Bundan tashqari, zarrachalarning aglomeratsiyasi mustahkamlikni kamaytirib, zaifroq materiallar hosil qilishga moyil hisoblangan [1]. Shunday qilib, polimer silikat qatlamlari orasiga interkalatsiya qila olmaganda, fazaviy ajralgan kompozit hosil bo‘ ladi, uning xususiyatlari an’anaviy mikrokompozitlarnikiga mos kelgan [2,3].

Vermikulit - $(Mg, Fe, Al)_3(Al, Si)_4O_{10}(OH)_2 \cdot 4H_2O$ umumiy formulaga ega bo‘ lgan gidratlangan qatlamli silikat minerali hisoblanadi. Uning kristall tuzilishi 2:1 tipdagi qatlamli tuzilishga ega bo‘ lib, bu esa uning fizik-kimyoviy xossalarini belgilaydi. Vermikulit odatda oltinsimon, jigarrang yoki bronza ranglarda uchraydi. Shu bilan birga, vermikulit yengil va g‘ ovak tuzilishga ega bo‘ lib, issiqlik va tovush izolyatsiyasi xossalari yuqori darajada namoyon bo‘ ladi. U namlikni yaxshi ushlab turadi hamda kimyoviy jihatdan barqaror material hisoblanadi. Nanogillar poliamidlar, polistirol, polietilen va polipropilen kabi bir nechta tijorat polimerlari bilan birlasha oladi [4].

Qatlamli silikatlar (ayniqsa montmorillonit, kaolinit va vermikulit) asosida olingan organo-noorganik polimer nanokompozitlar hozirgi zamon materialshunosligining eng istiqbolli yo‘ nalishlaridan biri hisoblanadi. Ushbu materiallarning strukturasi va xossalarini chuqur o‘ rganishda spektral tahlil usullaridan IQ-spektroskopiya, Raman spektroskopiya, UV-Vis va boshqalar muhim ahamiyat kasb etadi. Polimer va qatlamli silikat nanokompozitlarini tayyorlash, xarakterizatsiya qilish, materiallarning xususiyatlari, kristallanish xulq-atvori, eritma reologiyasi va qayta ishlashning akademik hamda sanoat jihatlari shu vaqtgacha ko‘ rib chiqilgan. Ushbu materiallar polimer fanlari tadqiqotlarida katta qiziqish uyg‘ otmoqda [5]. Ushbu materiallar sinfining boshqa qiziqarli xususiyatlariga to‘ siq xususiyatlarining yaxshilanishi, termik barqarorlik va yonishga qarshi turish qobiliyati kiradi [6]. Noorganik to‘ ldiruvchilarning mavjudligi tufayli modifikatsiyalanmagan polimer bilan solishtirganda kompozitlarning tortish kuchi va zarba chidamliligining yomonlashuvi kuzatilgan[7]. Bundan tashqari, Stephen S. Ray va Masami Okamoto tomonidan olib borilgan tadqiqotlarda Raman va FTIR spektroskopiya yordamida polimer matritsa va qatlamli silikatlar o‘ rtasidagi

o‘ zaro ta’sirlar tahlil qilingan. Ular spektral o‘ zgarishlar orqali nanokompozitlarning dispersiya darajasini baholash mumkinligini ko‘ rsatganlar [8]. O‘ zbekistonlik olimlar tomonidan ham ushbu yo‘ nalishda qator ilmiy ishlar olib borilgan. Jumladan, N.R. Ashurov va Q.N. Berdinazarov tadqiqotlarida poliolefinlar asosida qatlamli silikatlar bilan to‘ ldirilgan kompozitlar o‘ rganilgan [9]. Polimerlar tarkibiga qarab organic, noorganik va elementorganik toifalarga ajratiladi. Ulardan nisbatan kengroq tarqalgani organik polimerlardir [10].

Adabiyotlar tahlili

Polimer–qatlamli silikat nanokompozitlari yuqori mexanik, termik va funksional xususiyatlari sababli zamonaviy materialshunoslikning istiqbolli yo‘ nalishlaridan biri hisoblanadi. Giannelis [1] polimer va qatlamli silikatlar asosidagi nanokompozitlarda polimer zanjirlarining silikat qatlamlari orasiga kirib borishi, ya’ni interkalatsiya jarayonining material xossalariga ta’sirini ko‘ rsatgan. Alexandre va Dubois [2] polimer–silikat nanokompozitlarini olish usullari, ularning strukturasi va xossalarini umumlashtirib, interkalatsiya va eksfoliatsiya jarayonlarining muhimligini ta’kidlagan.

Beyer [3] qatlamli silikatlarning polimer materiallarning termik barqarorligi va yonishga chidamliligini oshirishdagi ahamiyatini ko‘ rsatgan. Haider, Kausar va Muhammad [4] esa turli polimerlar va qatlamli silikatlar asosidagi kompozitlarning olinishi hamda ularning mexanik va termik xususiyatlarini tahlil qilgan. S.S. Ray va M. Okamoto [5], S. Pavlidou va C.D. Papaspyrides [6] hamda R. Vaia [7] tadqiqotlarida polimer–qatlamli silikat nanokompozitlarining olinishi, tuzilishi, morfologiyasi, mexanik va termik xususiyatlari o‘ rganilgan. Tadqiqotlarda qatlamli silikatlarning polimer matritsasida yaxshi disperslanishi va komponentlararo o‘ zaro ta’sir nanokompozitlarning fizik-mexanik hamda termik xossalarini yaxshilashi ko‘ rsatilgan [5–8]. N.R. Ashurov va Q.N. Berdinazarov [9] polimer kompozit materiallarning fizik-kimyoviy asoslarini, A.S. Qosimov [10] esa polimerlarning molekulyar tuzilishi va fizik xususiyatlarini yoritgan.

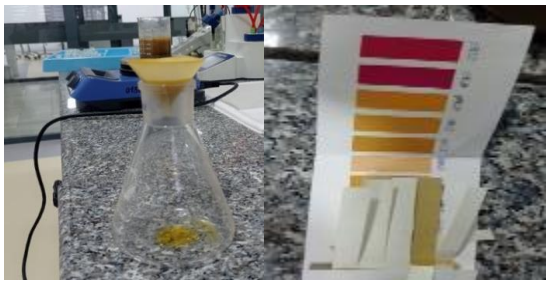
Mavjud adabiyotlar tahlili polimer–qatlamli silikat nanokompozitlarning mexanik, termik va strukturaviy xususiyatlari keng o‘ rganilganligini ko‘ rsatadi. Shu bilan birga, yuqori darajada to‘ ldirilgan organo-noorganik polimer materiallarning ultrabinafsha spektral xususiyatlari va spektral o‘ zgarishlarning kompozit tarkibi bilan bog‘ liqligi yetarlicha tadqiq etilmagan. Shu sababli bunday materiallarning UB-spektroskopik xususiyatlarini o‘ rganish muhim ilmiy va amaliy ahamiyatga ega.

Tadqiqot metodologiyasi

Vermikulitga kimyoviy ishlov berish

Vermikulit asosidagi (1-rasm) qatlamli silikatning ishlov berish bosqichi quyidagi jarayonlarni o‘ z ichiga oladi:

1-rasm.Vermikulit ko‘ rinishi



Vermikulitni ishchi holatga keltirish uchun 42 g namunaga 200 ml suvga qo‘ shilgan 40 ml konsentrlangan H_2SO_4 eritmasi bilan kimyoviy ishlov berildi, aralashma 80°C da quritildi va mexanik aralashtirgichda 1000 ayl/min tezlikda 10 soat davomida aralashtirildi. Natijada, quyuq va yaltiroq modifikatsiyalangan holga o‘ tganini ko‘ rsatadi (2- rasm).

2-rasm.Kislota bilan ta’sirlashuvdan keyingi tayyor bo‘ lgan aralashmali vermikulit

Hosil bo‘ lgan mahsulotdagi ortiqcha kislotani neytrallash uchun ikki bosqichli yuvish amalga oshirildi. Dastlab mahsulot 60 ml suvga qo‘ shilgan 20 ml ammiak eritmasi bilan ishlov berilib, pH universal indikator orqali nazorat qilindi.

Keyingi bosqichda distillangan suvga tayyorlangan $NaHCO_3$ eritmasi yordamida yuvish bajarildi; bu jarayonda $NaHCO_3$ kislota bilan reaksiyaga kirib, natriy tuzi, suv va CO_2 hosil qiladi. Shu orqali mahsulotdagi kislotali aralashmalar bartaraf etildi. Tozalangan massa filtratsiya qilinib, erkin oqishi ta'minlandi (3-rasm).

3-rasm.Filtr qog‘ ozdan vermikutning o‘ tish jarayoni va indikator qog‘ ozi

Vermikulitni modifikatsiyalash jarayoni tezlashtirish maqsadida tayyor aralashma yuzasi keng idishlarga solinib, xona haroratida 1 sutka davomida quritildi. Quritish davomida mahsulotning fizik holati, rangi va tuzilmasi kuzatildi, pH universal indikator bilan nazorat qilindi. Neytrallash va suvli qatlamdan tuzlar ajratilgach, mahsulot qattiq holatga o‘ tdi; bug‘ lanish jarayoni molekulalarni yaqinlashtirib, kristallanish yoki amorf tuzilishga olib keldi. Shu orqali vermikulit polimerlar bilan modifikatsiyalash jarayoniga tayyor holatga keldi va mahsulot saqlanishi hamda tahlilga yaroqliligi oshdi (4-rasm).

4 – rasm.Quritilgan va maydalangan vermikulit

Namlikdan tozalangan mahsulot uzoq muddat saqlanishi, fizik-kimyoviy tahlillarga tayyor bo‘ lishi va boshqa bosqichlar (presslash, analitik o‘ lchovlar) uchun moslashini ta'minlaydi. Shu bilan birga, yuzasi keng idishga yoyilgan modda asta-sekin bug‘ lanib, qattiq holatga o‘ tadi - bu jarayon **quritish va qotish** deb ataladi.

1 – jadval

Vermikulitning ishchi holatga tayyorlanish jarayoni

Bosqich	pH qiymati
Sulfat kislotali eritma	1.5
Vermikulit qo‘ shilgach	2.5
Mishelka bilan aralashtirilganda	3.0
10 soatdan so‘ ng (massaning holati)	3.2
Ammiak qo‘ shilgach	6.5
$NaHCO_3$ bilan yuvilgach	7.0

Kompozitlarni tayyorlash

Tajriba davomida vermikulit oldindan kimyoviy faollashtirilish maqsadida H_2SO_4 ning distillangan suvdagi eritmasi bilan ishlov berildi. Quritilgan va elangan vermikulit eritmaga qo‘ shilib, bir jinsli massa hosil qilindi va 80-90 °C da 10 soat davomida qizdirildi, natijada quyuq, yarim yopishqoq holatga kelgan massa olingan. Modifikatsiyalash jarayonida polimerlar - polietilen (PE), polipropilen (PP) va poliamid (PA) - har birining suyuqlanish haroratiga mos tarzda alohida ishlov berildi. Shu orqali vermikulit asosidagi yuqori to‘ ldirilgan organo-noorganik kompozit materiallar tayyorlandi (5-rasm), bu esa fazalararo o‘ zaro ta'sir va mexanik xossalarni yaxshilashga xizmat qiladi.

5 – rasm.Polimer materiallar: polietilen (PE), polipropilen (PP) va poliamid (PA) va boshqalar

1. Polietilen asosidagi kompozit tayyorlash

Tajriba uchun past zichlikka ega polietilen (suyuqlanish harorati 110-115 °C) tanlandi va maxsus laboratoriya pechida eritildi. Oldindan quritilgan va silliqlangan vermikulit 10:1 (polimer:vermikulit) nisbatda eritilgan polietilen ustiga qo‘ shilib, folga qog‘ oz ustida shisha tayoqcha yordamida bir xil massaga aralashtirildi. Tayyorlangan “PE+Vermikulit” kompozitlari sovitilib, shisha idishlarga solindi va Ultrabinafsha spektroskopiyasi uchun tayyorlandi (6-rasm).

6- rasm.Polietilen (PE) va vermikulit asosidagi kompozit material

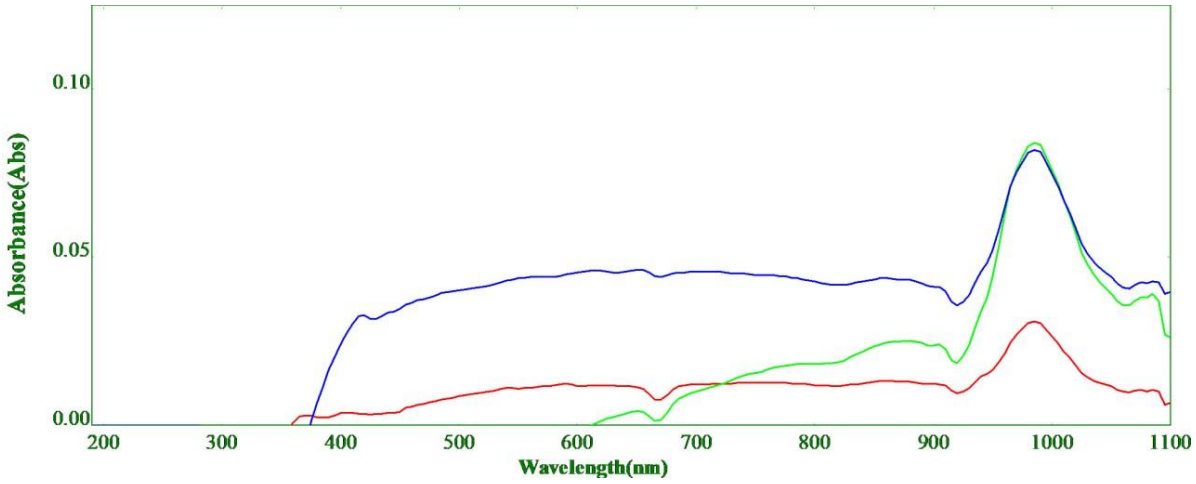
2. Polipropilen asosidagi kompozit tayyorlash

Polipropilen (PP, suyuqlanish harorati 160-165 °C) pechda eritilib, oldindan maydalangan va quritilgan vermikulit 10:1 (PP:vermikulit) nisbatda qo‘ shildi. Modda folga qog‘ oz ustida shisha tayoqcha yordamida bir xil massaga aralashtirildi. Sovutilgan kompozit qatlam qirib olinib, “PP+Vermikulit” nomi bilan shisha idishlarga solindi va Ultrabinafsha spektroskopiyasi uchun tayyorlandi.

3. Poliamid asosidagi kompozit tayyorlash

Uchinchi polimer - poliamid (PA) suyuqlanish harorati nisbatan yuqori bo‘ lib, 210-220 °C atrofida eriydi. Maxsus harorat nazorati ostida pechga joylashtirildi. Eriganidan so‘ ng, yuqoridagi kabi 10:1 nisbatda tayyorlangan, silliqlangan vermikulit polimerga qo‘ shildi.

Tarkibni bir hil massaga keltirish uchun aralashma yana folga qog‘ oz ustida shisha tayoqcha bilan aralashtirildi. Aralashma sovutilib, so‘ ngra folgadan ajratildi va “PA+Vermikulit” deb belgilangan shisha idishga qirib solindi.(7- rasm).



7 - rasm.PA+Vermikulit kompozit materiali olish jarayoni

Tayyorlangan barcha kompozit namunalar - polietilen, polipropilen, poliamid va yana bir polietilen asosidagi modifikatsiyalangan materiallar shisha idishlarga alohida qirib solinganidan so‘ ng, ularning tashqi ko‘ rinishi, rangdorligi va yopishqoqlik darajasi qayd etildi. Har bir shisha idish ustiga kompozit tarkibi va ishlatilgan polimer turi aniq ko‘ rsatilgan yorliqlar yopishtirildi. Bu esa keyinchalik analiz natijalarini to‘ g‘ ri solishtirish imkonini yaratadi.

Natijalar va ularning tahlili

Spektral tahlil

Tayyorlangan namunalar UV - spektrofotometr qurilmasiga joylashtirildi va 190-400 nm diapazondagi elektromagnit nurlanish ta'sirida ularning yutilish xususiyatlari o' rganildi. Har bir namuna uchun turli to' lqin uzunliklarida absorbsiya qiymatlari qayd etilib, ularning o' zgarish qonuniyatlari aniqlandi (8-rasm).

8- rasm.Polietilen, polipropilen va stirolning UV spektroskopiyasidagi tahlili natijasi

O' lchov natijalari asosida absorbsiya (A) ning to' lqin uzunligiga (λ) bog' liqlik grafigi qurildi. Grafiklarda har bir polimer alohida rang bilan ifodalandi, bu esa ularni o' zaro solishtirishni osonlashtirdi.Grafikda ranglar quyidagicha mazmunga ega:

1. Ko' k- polietilen
2. Yashil -stirol
3. Qizil -polipropilen

Spektrlarni shakllantirish jarayoni quyidagi ketma-ket bosqichlarda amalga oshirildi: 1.Dastlab har bir namuna ultrabinafsha nurlanish bilan yoritildi, so' ngra har bir to' lqin uzunligida yutilish darajasi aniqlanib, sonli ko' rsatkichlar sifatida qayd etildi.

2. Olingan ma'lumotlar kompyuter dasturlari yordamida qayta ishlanib, grafik ko' rinishga keltirildi.

Tadqiqot davomida polimer namunalar oldindan tayyorlanib, mos erituvchilarda bir xil konsentratsiyali eritmalar shaklida UV-spektrofotometr yordamida tahlil qilindi. O' lchovlar 190-400 nm diapazonda amalga oshirildi va har bir namuna uchun absorbsiya spektrlari qayd etildi. Olingan UV spektrlar polimer materiallarning elektron tuzilishini tavsiflashda muhim manba bo' lib xizmat qiladi. Tahlil natijalari shuni ko' rsatdiki, polimerlarning kimyoviy tuzilishi ularning yutilish xususiyatlariga bevosita ta'sir ko' rsatadi.

Spektral natijalar shuni ko' rsatdiki, to' yingan uglevodorod zanjiriga ega polietilen va polipropilen namunalarida UV diapazonda yutilish nisbatan past bo' lib, bu ularning elektron tuzilishida π-bog' larning yo' qligi bilan izohlanadi. Shu bilan birga, polipropilenda yon metil guruhlarning mavjudligi sababli ayrim hollarda juda kichik siljishlar kuzatildi. Polietilen spektrida absorbsiya qiymatlari juda past bo' lib, bu uning to' yingan uglevodorod zanjiridan tashkil topganligi bilan izohlanadi. Bunday tuzilishda π-bog' lar mavjud emasligi sababli elektron o' tishlar asosan yuqori energiyali sohada sodir bo' ladi va UV diapazonda deyarli sezilmaydi. Polipropilen spektrida ham shunga o' xshash holat kuzatiladi, biroq yon metil guruhlarning mavjudligi sababli yutilish darajasi biroz oshgan. Bu esa molekulyar muhitning nisbatan murakkabroq ekanligini bildiradi.

Stirol asosidagi polimerlarda esa keskin farq kuzatiladi. Aromatik halqa mavjudligi tufayli spektrda aniq va intensiv maksimumlar hosil bo' ladi. Bu maksimumlar $\pi \rightarrow \pi^*$ elektron o' tishlar bilan bog' liq bo' lib, moddaning kon'yugatsiyalangan tizimga ega ekanligini ko' rsatadi. Qatlamli silikat bilan modifikatsiyalangan kompozitlarda spektral cho' qqilarning siljishi va intensivlikdagi o' zgarishlar qayd etildi. Bu holat polimer zanjirlari va silikat qatlamlari o' rtasida ma'lum darajada elektron muhit o' zgarishi yuz berayotganini ko' rsatadi.

Erituvchi sifatida dimetilformamid (DMF) ishlatildi. DMF polimer zanjirlarini dispersiyalash, silikat qatlamlari orasiga kirishini osonlashtirish, interkalatsiya va eksfoliatsiya jarayonlarini faollashtirdi.

UV spektrlarida 200-220 nm oralig' ida $\sigma \rightarrow \sigma^*$ o' tishlar kuzatildi, bu polietilen va polipropilenning oddiy uglevodorod tuzilishini ko' rsatadi. 230-260 nm oralig' ida $n \rightarrow \pi^*$ o' tishlar mavjud bo' lib DMF tarkibidagi karbonil guruhlar bilan bog' liq. 260-280 nm oralig' ida $\pi \rightarrow \pi^*$ o' tishlar aromatik yoki kon'yugatsiyalangan tizimlarni bildiradi, silikat bilan o' zaro ta'sir elektron tizimni o' zgartiradi.

Polimer namunalari 190-400 nm oralig‘ ida UV-spektrofotometr yordamida o‘ lchanganda, natijalar shuni ko‘ rsatdiki:

Polietilen + VT: Yutilish cho‘ qqilari past, to‘ yingan uglevodorod zanjiriga xos xususiyat.

Polipropilen + VT: Yon metil guruhlar sababli kichik siljishlar va nisbatan kuchliroq yutilish.

Poliamid + VT: Amid guruhlari mavjudligi tufayli 210-250 nm oralig‘ ida yuqori yutilish maksimumi.

UB spektrlaridagi siljishlar polimer zanjirlari va silikat qatlamlari o‘ rtasidagi **interkalatsiya va eksfoliatsiya jarayonlari** bilan bog‘ liq.

Xulosa

Qatlamli silikat minerali - tabiiy vermikulit asosida yuqori darajada to‘ ldirilgan organo-noorganik polimer kompozit materiallar sintez qilindi va ularning molekulyar tuzilishi hamda fazalararo o‘ zaro ta’sir mexanizmlari zamonaviy spektral usullar yordamida kompleks o‘ rganildi.

Kompozit materiallar polimer matritsa sifatida **Polietilen**, **Polipropilen** va **Poliamid** asosida 10:1 (polimer:vermikulit) massa nisbatida eritma holatida tayyorlandi. Modifikatsiya jarayoni termik sharoitda amalga oshirilib, qatlamli silikatning polimer muhitda bir tekis disperslanishiga erishildi.

Olingan natijalar shuni ko‘ rsatadiki, kimyoviy faollashtirilgan vermikulit polimer matritsa bilan yuqori darajada moslashuvchan interfeys hosil qiladi. Bu esa kompozit materiallarda yuklanishning samarali taqsimlanishiga, elastiklik modulining oshishiga, termik barqarorlikning yaxshilanishiga va umumiy fizik-mexanik ko‘ rsatkichlarning ortishiga olib keladi.

Shunday qilib, UV spektroskopiya natijalari polimerlarning elektron tuzilishini aniqlash imkonini berib, aromatik va to‘ yingan tuzilmalarning farqlarini aniq ko‘ rsatib berdi.

Mualliflar hissasi , manfaatlar to‘ qnashuvi va moliyalashtirish

Mualliflar hissasi: barcha mualliflar tadqiqot konsepsiyasi, ma’lumotlarni tahlil qilish va maqola matnini tayyorlashda teng hissa qo‘ shgan. Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi yo‘ qligini bildiradi. Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

Annotatsiya: *Mazkur tadqiqot doirasida keng tarqalgan bronxolitik vosita bo‘ lgan salbutamol (Nebutamol®) moddasi sirtiy ionlashuv qonuniyatlari vakuum va atmosfera sharoitida tadqiq qilindi. Vakuum sharoitida salbutamol sirt ionlashuv mass-spektrometriya usuli yordamida qizib turgan oksidlangan volfram emitteri yordamida o‘ rganildi. Sirt ionlashuv mass-spektrlari kam chiziqli bo‘ lib, asosan fragment $[M-R]^+$ ionlardan tashkil topgan va m/z 86 ga mos keluvchi ion eng yuqori intensivlikka ega bo‘ lib, spektrning asosiy cho‘ qqisini tashkil etdi. Ion toklarini emitter temperaturasiga bog‘ liklari tadqiq qilinib, ular asosan qo‘ ng‘ iroqsimon tarzda ekangligi aniqlandi. Shuningdek, termodesorbsion sirtiy ionlashuv spektrometrida («Iskovich») salbutamol molekulasi atmosfera havosida termodesorbsion spektrlari olinib, fizik-kimyoviy xususiyatlari tadqiq qilindi. Olingan natijalar nafaqat fundamental jihatdan ko‘ p atomli zarrachalarning issiq qattiq jism bilan o‘ zaro ta’sirining xususiyatlarini aniqlashda, balki amaliy jihatdan sirt ionlashuv usulining qo‘ llanish doirasini muhim farmatsevtik vosita-β_2-agonistga nisbatan kengaytirib, keyinchalik bu sinfdagi moddalarni murakkab arlashmalarda tez va sezgir tahlil qilishga asos yaratadi.*

Kalit so‘ zlar: *sirt ionlashuv usuli, mass-spektrometr, emitter; salbutamol β_2-adrenergik agonist; ionlar hosil bo‘ lish mexanizmi, temperatura.*

ИССЛЕДОВАНИЕ ЗАКОНОМЕРНОСТЕЙ ПОВЕРХНОСТНОЙ ИОНИЗАЦИИ МОЛЕКУЛЫ САЛЬБУТАМОЛА В УСЛОВИЯХ ВАКУУМА И АТМОСФЕРЫ

Аннотация: *В рамках настоящего исследования были изучены закономерности поверхностной ионизации широко применяемого бронхолитического препарата сальбутамола (Nebutamol®) в вакуумных и атмосферных условиях. В вакууме сальбутамол исследовали методом поверхностно-ионизационной масс-спектрометрии с использованием нагретого окисленного вольфрамового эмиттера. Полученные масс-спектры поверхностной ионизации характеризовались малым числом линий и состояли преимущественно из фрагментных ионов $[M–R]^+$. Ион с m/z 86 обладал наибольшей интенсивностью и формировал основной пик спектра. Исследованы зависимости ионных токов от температуры эмиттера, при этом установлено, что они имеют преимущественно колоколообразный характер. Кроме того, на термодесорбционном спектрометре поверхностной ионизации («Исковичˮ) были получены термодесорбционные спектры*

молекулы сальбутамола в атмосферном воздухе и исследованы её физико-химические свойства. Полученные результаты имеют фундаментальное значение для выяснения особенностей взаимодействия многоатомных частиц с нагретой поверхностью твёрдого тела, а также практическое значение, поскольку расширяют область применения метода поверхностной ионизации в отношении важного фармацевтического средства — β_2-агониста, создавая основу для последующего быстрого и чувствительного анализа соединений данного класса в сложных смесях.

Ключевые слова: *метод поверхностной ионизации, масс-спектрометр, эмиттер, сальбутамол, β_2-адренергический агонист, механизм образования ионов, температура.*

STUDY OF THE SURFACE IONIZATION REGULARITIES OF THE SALBUTAMOL MOLECULE UNDER VACUUM AND ATMOSPHERIC CONDITIONS

Abstract: *Within the framework of this study, the surface ionization behavior of the widely used bronchodilator salbutamol (Nebutamol®) was investigated under both vacuum and atmospheric conditions. Under vacuum conditions, salbutamol was studied using the surface ionization mass spectrometry method with a heated oxidized tungsten emitter. The obtained surface ionization mass spectra were characterized by a limited number of peaks and consisted predominantly of fragment ions $[M-R]^+$. The ion with m/z 86 exhibited the highest intensity and represented the base peak of the spectrum. The dependences of ion currents on emitter temperature were investigated and were found to be predominantly bell-shaped. In addition, thermodesorption spectra of the salbutamol molecule in ambient air were obtained using a thermodesorption surface ionization spectrometer ("Iskovich"), and its physicochemical properties were investigated. The obtained results are of fundamental importance for elucidating the interaction mechanisms of polyatomic particles with a heated solid surface and are also of practical significance, as they expand the application range of the surface ionization method to an important pharmaceutical agent, a β_2-agonist, thereby providing a basis for the subsequent rapid and sensitive analysis of this class of compounds in complex mixtures.*

Keywords: *surface ionization method, mass spectrometer, emitter, salbutamol, β_2-adrenergic agonist, ion formation mechanism, temperature.*

Kirish

Zamonaviy pulmonologiya amaliyotida salbutamol o‘ zining qisqa muddatli, ammo yuqori samarali ta’siri tufayli birinchi navbatda tavsiya etiladigan, tanlangan β_2-adrenoretseptorlar agonisti hisoblanadi. U bronxial astma, o‘ pkaning surunkali obstruktiv kasalligi hamda jismoniy zo‘ riqish natijasida yuzaga keladigan bronxospazmni bartaraf etishda keng qo‘ llaniladi. Kimyoviy jihatdan salbutamol fenetanolaminlar sinfiga mansub bo‘ lib, molekulasining tuzilishi uning biologik faolligi bilan bir qatorda termik desorbsiya va sirt ionlashuv jarayonlaridagi xususiyatlarini ham belgilaydi. Salbutamol muhim farmatsevtik preparat bo‘ lishi bilan birga, biologik va farmatsevtik namunalarda uni tezkor hamda yuqori sezgirlik bilan aniqlash zarurati tufayli analitik tadqiqotlarda ham katta qiziqish uyg‘ otmoqda. Ayniqsa, uning termik barqarorligi, ionlashuv xususiyatlari va parchalanish mexanizmlarini o‘ rganish yangi tahlil usullarini ishlab chiqishda muhim ahamiyatga ega.

Adabiyotlar tahlili

Salbutamolning fizik-kimyoviy xossalari, farmakologik ta’siri va analitik aniqlash usullariga bag‘ ishlangan ilmiy tadqiqotlar ushbu preparatning nazariy hamda amaliy jihatdan keng o‘ rganilganligini ko‘ rsatadi. Uning β_2-adrenoretseptorlarga yuqori selektivligi, bronxodilatator faolligi va klinik qo‘ llanilish xususiyatlari ko‘ plab sharh maqolalarida batafsil yoritilgan [1,2]. Shuningdek, salbutamol enantiomerlarining stereoselektiv farmakologik faolligi, metabolizmi va biologik samaradorligi alohida tadqiqotlarda tahlil qilingan [3].

Salbutamolni aniqlashda an’anaviy analitik usullar sifatida immunotahlil, gaz xromatografiyasi–mass-spektrometriya(GC-MS)hamda suyuqlik xromatografiyasi–mass-spektrometriya (LC-MS/MS) keng qo‘ llaniladi. So‘ nggi yillarda esa oldindan xromatografik ajratishni talab qilmaydigan atmosfera bosimida ishlovchi desorbsion ionlashuv usullariga ham katta e’tibor qaratilmoqda. Jumladan, mikroto‘ lqinli plazma fakeli asosidagi desorbsion ionlashuv uchish vaqti mass-spektrometriyasi (TOF-MS) bilan birgalikda qo‘ llanilganda salbutamol tabletkalarida protonlangan molekulyar ion (*m*/*z* 240) hamda *m*/*z* 222, 166 va 148 fragment ionlari aniqlangan [4]. Ushbu usullar yuqori sezgirlik va tezkorlikka ega bo‘ lsa-da, atmosfera bosimida ionlanish mexanizmiga asoslanadi hamda murakkab va qimmat analitik uskunalarni talab qiladi. Shu bois ularning ion hosil bo‘ lish qonuniyatlari termik sirt ionlashuvi jarayonlaridan sezilarli darajada farq qiladi.

Salbutamolning farmakokinetikasi va antidoping nazoratidagi o‘ rni ham keng tadqiq etilgan. WADA tomonidan belgilangan 1000 ng/ml siydik chegarasi asosida o‘ tkazilgan ko‘ p markazli modellashtirish tadqiqotlari yuqori konsentratsiyalarda preparatning tizimli qabul qilinishini ishonchli aniqlash mumkinligini, biroq chegara qiymatlarida inhalatsion terapevtik qo‘ llanish bilan tizimli iste’molni to‘ liq farqlash murakkabligini ko‘ rsatgan [5]. Eksperimental hayvonlarda olib borilgan tadqiqotlarda salbutamolning asosiy qismi organizmda o‘ zgarmagan holda saqlanishi, oz

miqdori esa metillangan metabolitlarga aylanishi aniqlangan [6]. Bundan tashqari, preparatning yuqori haroratdagi degradatsiya mahsulotlari suyuqlik xromatografiyasi–ionsprey mass-spektrometriyasi yordamida tavsiflangan [7], dozalangan ingalyator aerozolining tarkibi esa real vaqt rejimida SESI-MS usulida tahlil qilingan [8].

Shuni ta'kidlash joizki, yuqoridagi tadqiqotlarning aksariyati atmosfera bosimida ishlovchi ionlashuv usullari yoki xromatografik ajratishga asoslangan analitik metodlarga bag‘ ishlangan. Biroq salbutamol molekulasining oksidlangan volfram sirti bilan o‘ zaro ta'siri, termik sirt ionlashuvi mexanizmi, ion tokining haroratga bog‘ liqligi hamda hosil bo‘ ladigan molekulyar va fragment ionlarning shakllanish qonuniyatlari hozirgacha deyarli o‘ rganilmagan. Mazkur tadqiqot aynan ushbu ilmiy bo‘ shliqni to‘ ldirishga qaratilgan bo‘ lib, salbutamolning sirt ionlashuvi jarayonlarini vakuum va atmosfera sharoitida kompleks o‘ rganishga xizmat qiladi.

Sirt ionlashuvi (SI) – qizdirilgan qattiq jism sirti bilan adsorbsiyalangan zarrachalar o‘ rtasidagi elektron almashinuvi natijasida termik desorbsiya jarayonida ionlar hosil bo‘ lishiga asoslangan geterogen fizik-kimyoviy jarayondir. Jarayon davomida molekulalar avval qizdirilgan sirtga adsorbsiyalanadi, so‘ ngra sirt bilan elektron almashinuvi natijasida ionlangan holda desorbsiya qiladi. Ion hosil bo‘ lish samaradorligi sirtning chiqish ishi (φ) bilan molekulaning ionlashuv potensiali (I) o‘ rtasidagi energetik nisbatga bog‘ liq bo‘ lib, bu bog‘ liqlik Saha–Langmuir tenglamasi bilan tavsiflanadi. Organik molekulalarda ushbu jarayon natijasida molekulyar va fragment ionlar hosil bo‘ ladi [9,10]. Shu sababli sirt ionlashuvi usuli yuqori tanlanuvchanlikka ega bo‘ lib, ionlashuv potensiallaridagi kichik farqlar ham turli organik birikmalarni ishonchli ajratish va identifikatsiya qilish imkonini beradi [9]. Mazkur usul aminlar, gidrazinlar, alkaloidlar, azot saqlovchi geterotsiklik birikmalar hamda boshqa organik asoslarni tadqiq etishda muvaffaqiyatli qo‘ llanilgan [9,10]. Keyingi tadqiqotlarda afyun alkaloidlari, morfin, nikotin saqlovchi biologik faol moddalar va ayrim pestitsidlarni tahlil qilishda oksidlangan hamda metall volfram sirtlaridan foydalanilib, ion tokining haroratga bog‘ liqligi asosida ionlashuv mexanizmi, ionlashuv energiyasi va sublimatsiya issiqligi baholangan [11].

Sirtda ion hosil bo‘ lish jarayonlarini o‘ rganishda ikkilamchi ion mass-spektrometriyasi (SIMS) ham muhim analitik usullardan biridir. Bu usulda qattiq jism sirti yuqori energiyali birlamchi ionlar bilan bombardimon qilinadi va hosil bo‘ lgan ikkilamchi ionlar yordamida sirtning elementar hamda molekulyar tarkibi yuqori sezgirlik bilan aniqlanadi [12,13]. Keyingi tadqiqotlar klaster ionlardan foydalanish molekulyar ikkilamchi ionlar hosil bo‘ lish ehtimolini oshirishini, ion unumdorligi esa klaster o‘ lchami, energiyasi va sirt xususiyatlariga bog‘ liqligini ko‘ rsatdi [14–18]. Shuningdek, klaster bombardimoni paytida kuzatiladigan noadditiv va nochiziqli samaralar hamda metall yordamida ionlashuvni kuchaytirish usullari SIMS usulining sezgirligini sezilarli darajada oshirishi aniqlangan [19–23]. Termik sirt ionlashuvi esa yuqori tanlanuvchanligi tufayli, ayniqsa, azot saqlovchi organik asoslarni aniqlash va identifikatsiya qilishda samarali analitik usul sifatida keng qo‘ llanilmoqda [24].

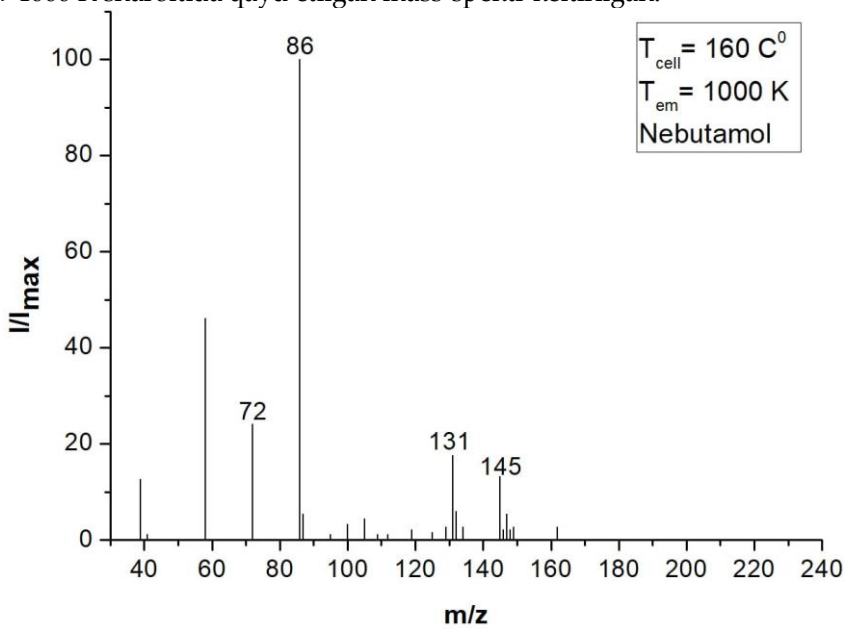
Salbutamol molekulasi azot asosli organik birikma bo‘ lib, tarkibidagi ikkilamchi amin guruhi qizdirilgan oksidlangan volfram sirti bilan elektron almashinuvi jarayonida ishtirok etadi. Shu sababli salbutamol sirt ionlashuvi jarayonida samarali ionlanadigan moddalar qatoriga kiradi va SI/MS usulida tadqiq etish uchun qulay model obyekt hisoblanadi. Uning sirt ionlashuvi sharoitida hosil bo‘ ladigan molekulyar va fragment ionlari tarkibini, ion tokining haroratga bog‘ liqligini hamda ion hosil bo‘ lish qonuniyatlarini o‘ rganish ilmiy va amaliy jihatdan muhim ahamiyatga ega.

Mazkur tadqiqotning maqsadi oksidlangan volfram termoemitteri sirtida salbutamolning sirt ionlashuv mass-spektrini qayd etish, hosil bo‘ lgan ionlarning tarkibini aniqlash, ion tokining haroratga bog‘ liqligini tadqiq qilish hamda olingan natijalarni termodesorbsion sirt-ionizatsion spektrometr yordamida tasdiqlashdan iborat.

Tadqiqot metodologiyasi

Mass-spektrometrik qurilma. Sirtiy ionlashuv–mass-spektrometrik (SI/MS) o‘ lchovlar sirtiy ionlashuv tadqiqotlari uchun modernizatsiya qilingan MI-1201V magnit sektorli mass-spektrometrida bajarildi. Ko‘ p atomli ionlarning to‘ xtatilish egri chiziqlarini qayd etish maqsadida asbob chiqish qismiga uch to‘ rli energoanalizator o‘ rnatildi. Tezlatuvchi kuchlanish 3 kV bo‘ lganda asbobning ishchi massaviy diapazoni 1–1000 a.m.b., vakuum kamerasidagi qoldiq bosim esa (1–2)×10^{-5} Pa ni tashkil etdi.

Termoemitter sifatida oksidlangan volfram lentasi qo‘ llanildi. Uni tayyorlash va oksidlash tartibi avvalgi ishlarda batafsil bayon qilingan [11]. Barcha o‘ lchovlar musbat ionlar rejimida, elektr maydoni kuchlanganligi E < 10^4 V/sm sharoitida amalga oshirildi. Ionlashuv yacheykasi harorati 160 °C da doimiy saqlandi, termoemitter harorati esa 600–1200 K oralig‘ ida bosqichma-bosqich o‘ zgartirildi.



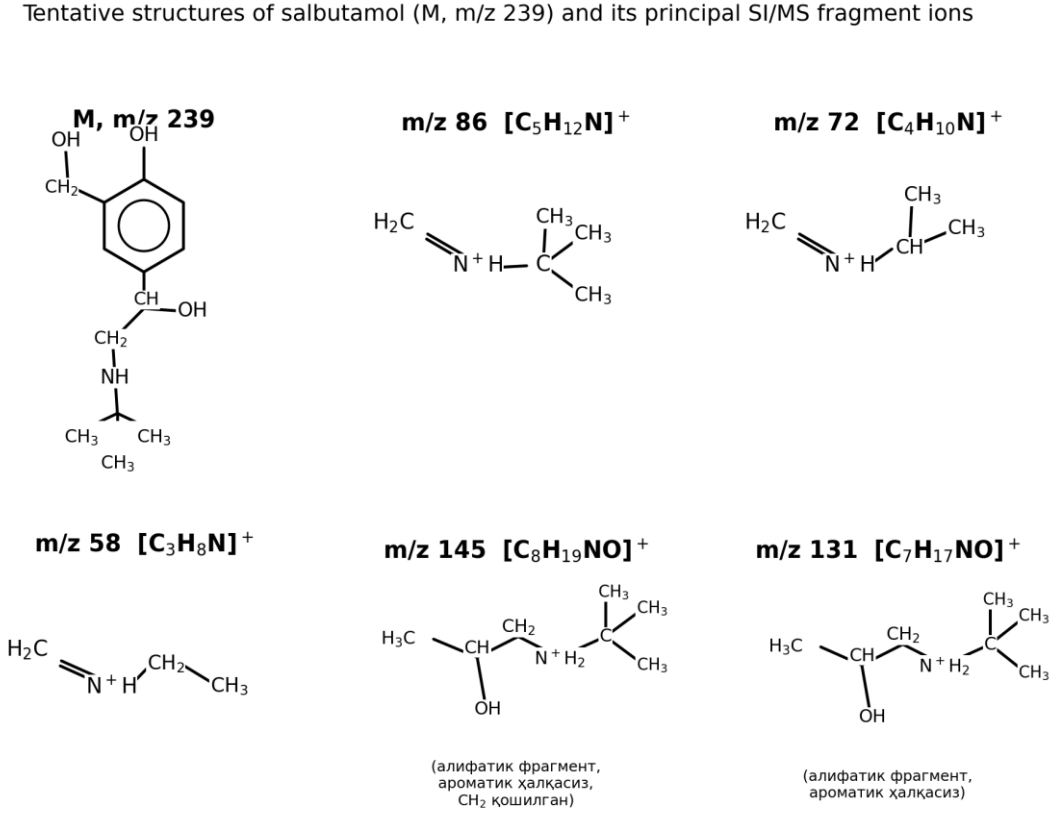
Atmosfera havosida ishlaydigan Iskovich qurilmasi. Qo‘ shimcha va mustaqil tekshirish sifatida, bir xil eritmalar atmosfera havosida ishlaydigan «Iskovich» tipidagi qurilmasida ham o‘ rganildi. Grafitlangan metall bug‘ latkich (diametri 3 mm, balandligi 1,5 mm) harorati 10°C/sek tezlikda xona haroratidan 500°C gacha chiziqli ravishda oshiriladi. Optimal sharoitlar: katod-anod kuchlanishi 380–400 V, T_{em}=350–400°C, havo oqimi 50 l/soat; uchlamchi aminlar uchun ionlashuv samaradorligi 900 Kl/mol gacha, ikkilamchi aminlar uchun 30–50, birlamchi aminlar uchun 5–10 Kl/mol (2,5–4,5 tartibli diapazonda), porog sezgirlik esa taxminan 50–80 pg (fon ustida) va 1 pg (shovqin ustida) ni tashkil etadi [19].

Termoemitter yuzasining qoplanish darajasiga qarab spektrda turli cho‘ qqilar kuzatiladi: submonosloy miqdorda-faqat desorbsiya maksimumi (T_{dmax}), katta miqdorda (100+ qatlam) -faqat sublimatsiya maksimumi (T_{smax}), oraliq miqdorda esa ikkala cho‘ qqi birga namoyon bo‘ ladi. Kalibrovka uchun amitriptilin (900 Kl/mol gacha, T_{smax}≈110°C) va morfin (50 Kl/mol, T_{smax}≈180°C) standartlari qo‘ llanildi, har birida 50 ng modda bug‘ latkichga tushirilgan holda. Druggy-4A dasturi moddani identifikatsiyalash va konsentratsiyasini aniqlash imkonini beradi. Salbutamol eritmasining 1,0, 0,7, 0,5 va 0,2 mkl hajmlari tahlil qilinib, ion tokining (I, $\times 10^{-12}$ A) haroratga (T, 60–500°C) bog‘ liqligi ikki turkumda qayd etildi: birinchisi 1,0/0,7/0,5 mkl, ikkinchisi 0,7/0,5/0,2 mkl.

Moddalar va namunalar tayyorlash. Tadqiqot obyekti sifatida inhalatsiya uchun mo‘ ljallangan tayyor suyuq dori shakli – salbutamol (Nebutamol®) ishlatildi. Atmosfera bosimida ishlovchi «Iskovich» qurilmasida tadqiqot o‘ tkazish uchun preparat etanol yordamida zarur konsentratsiyagacha suyultirildi va tayyorlangan eritmadan belgilangan hajm bevosita kvarts bug‘ latkich yuzasiga tomizildi. Vakuum sharoitida ishlovchi sirt ionlashuv mass-spektrometrida (SI/MS) esa namuna etanol bilan suyultirilgandan so‘ ng mass-spektrometrning bug‘ latish yacheykasiga tomizildi va erituvchi xona haroratida bug‘ latib yuborildi. Yacheykadagi modda miqdorini oshirish hamda yetarli ion signalini hosil qilish maqsadida tomizish va quritish amali bir necha marta takrorlandi. Shundan so‘ ng yacheyka vakuum tizimiga o‘ rnatilib, termik desorbsiya va sirt ionlashuv jarayonlari o‘ rganildi. Bunday namuna tayyorlash usuli emitter yuzasida moddaning yetarli miqdorda va nisbatan bir tekis taqsimlanishini ta’minlab, o‘ lchash natijalarining takrorlanuvchanligi hamda ishonchliligini oshiradi.

Natijalar va ularning tahlili

Salbutamol molekulasi tarkibida ikkilamchi tret-butilamino guruhi mavjudligi sababli uning sirt ionlashuvi mass-spektrometriyasi (SI/MS) sharoitida samarali ionlashuvi kutilgan edi va tajriba natijalari ushbu taxminni tasdiqladi. 1-rasmda T_{cell}=160°C va T_{em}=1000 K sharoitida qayd etilgan mass-spektr keltirilgan.

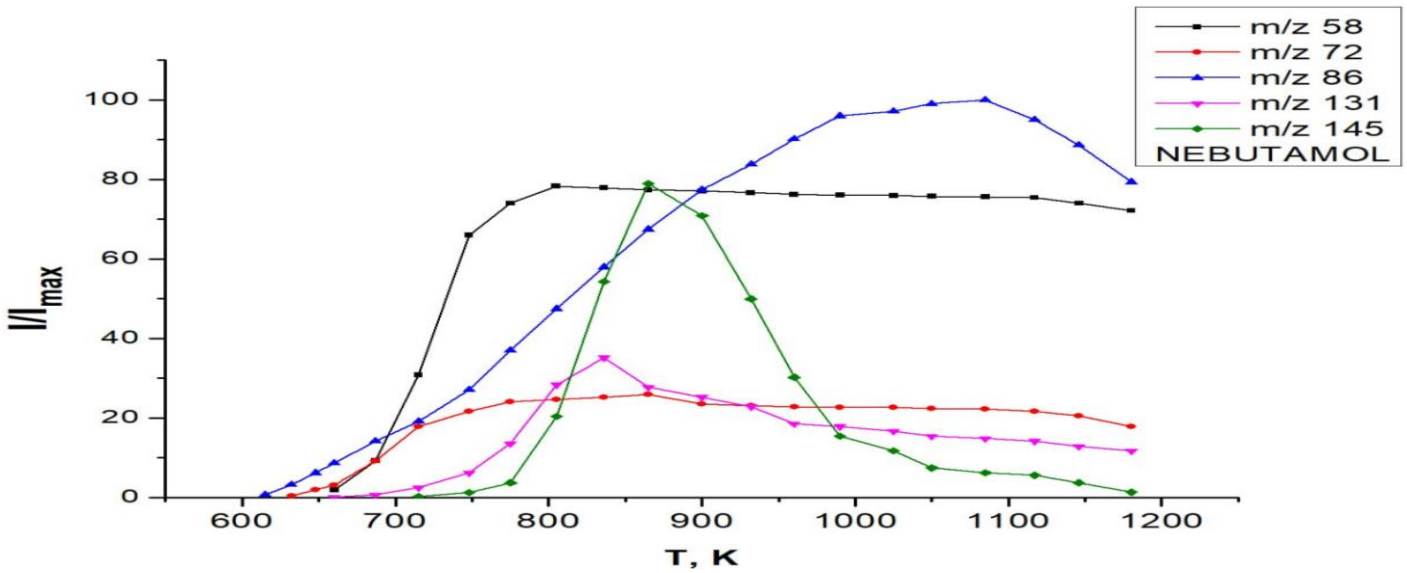


1-rasm. Oksidlangan volfram termoemitteri yuzasida T_{cell}=160°C va T_{em}=1000 K sharoitida olingan salbutamolning SI mass-spektri

Spektrda *m*/*z* 58, 72, 86, 131 va 145 qiymatlarida joylashgan beshta asosiy ion signali hamda chuqur fragmentatsiya natijasida hosil bo‘ lgan bir qator past intensivlikli ionlar kuzatildi. *m*/*z* 86 bazaviy cho‘ qqi bo‘ lib, umumiy intensivlikning 100% ini tashkil qildi, *m*/*z* 58 (taxminan 45%) va m/z 72 (taxminan 24%) o‘ rtacha intensivlikka ega bo‘ ldi, *m*/*z* 131 va 145 ionlarining nisbiy intensivligi esa 15–20% atrofida qayd etildi. **Spektrning muhim xususiyati shundaki, mazkur eksperimental sharoitlarda na molekulyar ion (M^+, m/z 239), na protonlangan molekulyar ion ($[M+H]^+$, *m*/*z* 240) kuzatilmadi. Bu holat salbutamol molekulasining qizdirilgan oksidlangan volfram sirtida intensiv fragmentatsiyalanishini hamda molekulyar ionga nisbatan barqaror fragment ionlarning ustun hosil bo‘ lishini ko‘ rsatadi.**

Aminlarning oksid yuzasida adsorbsiyalanishi azot atomidagi elektron juftining yuza bilan koordinatsion bog‘ lanishi orqali sodir bo‘ lib, qo‘ shni C–N va C–C bog‘ larini zaiflashtiradi hamda musbat zaryadlangan azot saqlovchi ionlar desorbsiyasini yengillashtiradi [9]. Shunga ko‘ ra, *m*/*z* 86 ni ikkilamchi amin guruhiga tutash C_α–C_β bog‘ i uzilishi va aromatik, gidroksil qismning yo‘ qolishi natijasida hosil bo‘ ladigan iminiy kationi $[CH_2{=}NH{-}C(CH_3)_3]^+$ ($C_5H_{12}N^+$, *m*/*z* 86) sifatida sharhlash mumkin. m/z 72 va 58 esa undan CH_2 guruhlarining ketma-ket yo‘ qolishi orqali hosil bo‘ ladigan

gomolog qatorga ($C_4H_{10}N^+$ va $C_3H_8N^+$) tegishli — bu tret-butilamino fragmentining bosqichma-bosqich dezalkillanishiga mos keladi.



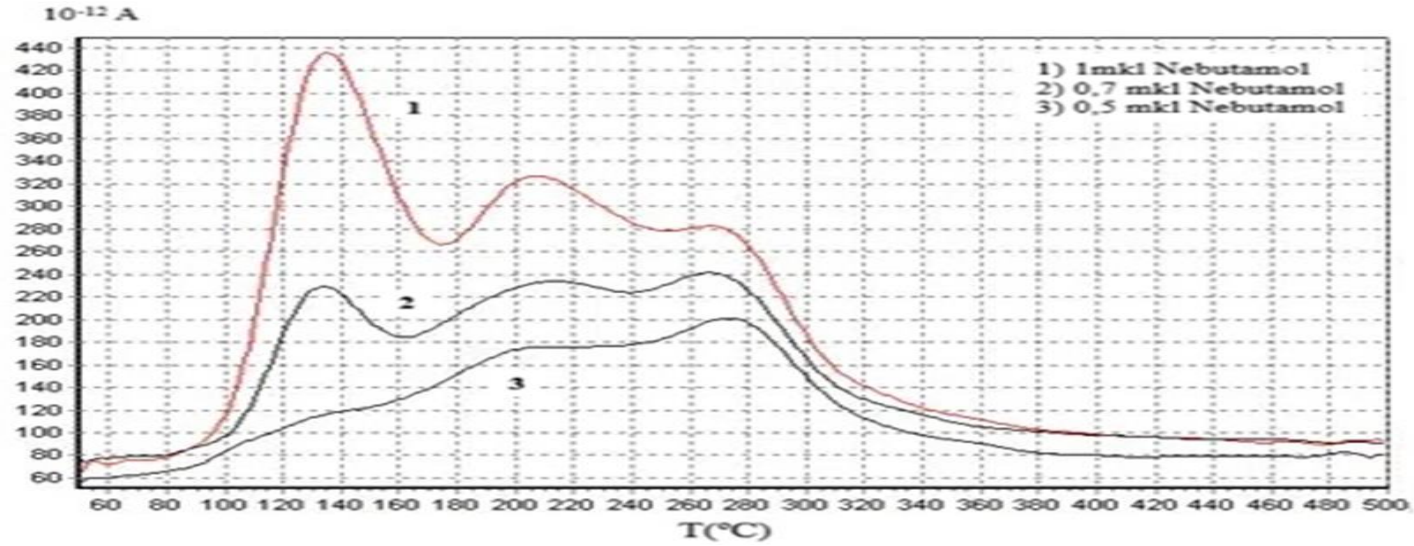
2-rasm. Salbutamolning sirtiy ionlashuv–mass-spektrometriya sharoitida kuzatilgan asosiy fragment ionlarining taklif etilgan hosil bo‘ lish ketma-ketligi

Bunga qarama-qarshi, m/z 131 va 145 aromatik halqani yo‘ qotgan alifatik fragmentlarga mos keladi. Aniq massa hisoblari ularni mos ravishda $C_7H_{17}NO^+$ va $C_8H_{19}NO^+$ formulalariga bog‘ laydi. Ushbu formulalar tret-butilamino zanjiri saqlanib qolgan holda aromatik halqaning katexol tipidagi neytral fragment sifatida ajralishini ko‘ rsatadi. Demak, 86/72/58 qatorini hosil qiluvchi C–N bog‘ i uzilishi bu holatda ham sodir bo‘ ladi, biroq musbat zaryad alifatik fragmentda saqlanadi. Bunday zaryad saqlanishi juftlari formoterol va salmeterol kabi boshqa β_2-agonistlarning ESI-CID fragmentatsiyasida ham kuzatilgan [18]. Taxminiy fragmentatsiya sxemasi 2-rasmda keltirilgan bo‘ lib, u ushbu ishda olingan SI/MS natijalari hamda salbutamol va β_2-agonistlarning mass-spektrometrik fragmentatsiyasi bo‘ yicha adabiyot ma’lumotlari asosida tuzildi [7,9,18].

Adabiyotlarda protonlangan salbutamol (*m*/*z* 240) uchun ESI-CID sharoitida suv va izobutilenning ketma-ket ajralishi natijasida *m*/*z* 222, 166 va 148 ionlari hosil bo‘ lishi ko‘ rsatilgan, DFT hisoblari esa jarayonning β-eliminatsiya orqali boshlanishini tasdiqlaydi [4,18]. SI/MS usulida kuzatilgan 58, 72, 86, 131 va 145 ionlari ESI-CID fragmentlaridan sezilarli farq qiladi, chunki ESI-CID da fragmentatsiya protonlangan ionning to‘ qnashuvi orqali, SI/MS da esa adsorbsiyalangan neytral molekulaning termik faollashuvi natijasida sodir bo‘ ladi. Shunga qaramay, har ikkala usulda ham tret-butilamino zanjiri fragmentatsiyaning asosiy markazi bo‘ lib qoladi [9,18].

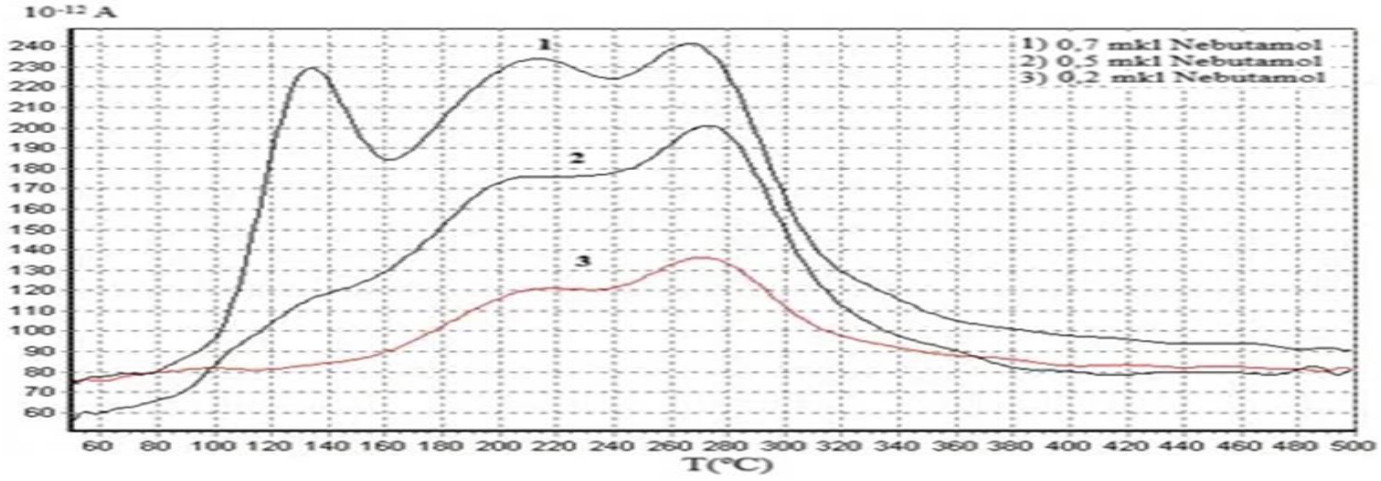
Tadqiq etilgan harorat oralig‘ ida molekulyar M^+ va $[M+H]^+$ ionlarining kuzatilmasligi sirt ionlashuvi jarayonida ion hosil bo‘ lishi bilan termik parchalanish o‘ rtasidagi raqobat hamda emitter sirtining chiqish ishi bilan izohlanadi [9]. Volfram oksidlanganda uning chiqish ishi taxminan 4,6 eV dan 6,5 eV gacha ortishiga qaramasdan [11], *m*/*z* 239 va 240 molekulyar ionlarining qayd etilmasligi emitterning chiqish ishini oshirishning o‘ zi molekulyar ionlarni barqaror hosil qilish uchun yetarli emasligini ko‘ rsatadi. Natijada salbutamol sirt ionlashuvi sharoitida molekulyar ion hosil qilishdan ko‘ ra termik fragmentatsiyaga moyillik namoyon etadi va mass-spektrda asosan fragment ionlar kuzatiladi [9].

Termoemitter haroratiga ion toklarining bog‘ liqligi birlamchi va ikkilamchi ionlarni farqlashning asosiy diagnostik vositasi hisoblanadi [9,11]. 3-rasmda besh asosiy ionning normallangan toklarining 600–1200 K oralig‘ idagi bog‘ liqligi ko‘ rsatilgan.



3-rasm. Salbutamolning asosiy ionlari (m/z 58, 72, 86, 131 va 145) normallangan ion toklarining termoemitter haroratiga bog‘ liqligi

Ionlar intensivligining temperaturaga bog‘ liq o‘ zgarishida ikki xil dinamika kuzatildi. *m/z* 58 ioni 650–800 K harorat oralig‘ ida keskin oshib, taxminan 75-78 % darajada barqarorlashdi va 1180 K gacha ushbu darajani saqlab qoldi. *m/z* 86 (bazaviy cho‘ qqi) esa kengroq harorat oralig‘ ida asta-sekin ortib, taxminan 1050-1100 K da maksimal intensivlikka (100%) erishdi, shundan keyin esa biroz pasayish kuzatildi. Bu holat mazkur ionlarning turli harorat bosqichlarida ketma-ket shakllanishini ko‘ rsatadi. *m/z* 72 ioni esa oraliq dinamikani namoyon qilib, taxminan 800 K gacha intensivligi oshib, keyingi haroratlarda 20–26% atrofida deyarli o‘ zgarishsiz saqlandi.



Aksincha, *m/z* 131 va ayniqsa 145 aniq qo‘ ng‘ iroqsimon bog‘ liqlik ko‘ rsatadi: m/z 131 830 K atrofida ~35% maksimumga erishib, 1180 K gacha ~12% gacha pasayadi; *m/z* 145 esa 860–900 K da ~79% keskin maksimumga ko‘ tarilib, keyin deyarli nolgacha tushadi. Bunday egri chiziqlar adsorbsiyalangan qatlamda hosil bo‘ lib qayta parchalanadigan reaktiv oraliq ionlarga xos bo‘ lib, bu imidakloprid va xlordimeform uchun oldin qayd etilgan natijaga o‘ xshaydi [11]. Umuman, *m/z* 145/131 ning erta kamayishi va *m/z* 86/58 ning kechiktirilgan ortishi, og‘ irroq fragmentlarning (145, 131) past haroratda hosil bo‘ lib, yuqori haroratda barqaror past massali ionlarga (86, 72, 58) izchil parchalanish yo‘ liga mos keladi; bu sxemani to‘ liq tasdiqlash uchun qo‘ shimcha monoenergetik yoki metastabil ion o‘ lchovlari talab etiladi.

Termodesorptsion Iskovich qurilmasidagi olingan natijalar. Mustaqil tekshirish sifatida, turli hajmdagi (0,2–1,0 mkl) alikvotlar uchun termodesorbsion tok-harorat bog‘ liqligi ikki turkumda (4- va 5-rasmlar) qayd etildi.

4-rasm. Salbutamol eritmasining 1,0 mkl (1), 0,7 mkl (2) va 0,5 mkl (3) alikvotlari uchun termodesorbsion ion tokining termoemitter haroratiga bog‘ liqligi

5-rasm. Salbutamol eritmasining 0,7 mkl (1), 0,5 mkl (2) va 0,2 mkl (3) alikvotlari uchun termodesorbsion ion tokining termoemitter haroratiga bog‘ liqligi.

Har ikki turkumda ham takrorlanuvchan ikki cho‘ qqili shakl kuzatildi: ~110–120°C da keskin birinchi maksimum (T_{dmax}) va ~200–290°C oralig‘ ida ikki yarim cho‘ qqidan (~210–220°C, ~260–280°C) iborat kengroq ikkinchi maksimum (T_{smax}) [19]. Yuqori hajmda (1,0 mkl) birinchi cho‘ qqi T≈135–140°C da I≈427–432×10^{-12} A, mahalliy minimum T≈165–180°C da I≈267–270×10^{-12} A, ikkinchi cho‘ qqi T≈210–220°C da I≈320–325×10^{-12} A, yelka T≈260–280°C da I≈276–280×10^{-12} A, so‘ ngra T≈400–500°C da I≈100×10^{-12} A gacha kamayadi. 0,7 mkl shu shaklni pastroq amplitudada takrorlaydi (birinchi cho‘ qqi I≈228–230×10^{-12} A). 0,5 mkl da birinchi cho‘ qqi deyarli kuzatilmaydi, tok T≈270–280°C da yagona maksimumga (I≈195–200×10^{-12} A) erishadi; 0,7 va 0,5 mkl egri chiziqlari 5-rasmda ham yaxshi moslik ko‘ rsatdi. 0,2 mkl da esa I≈135–138×10^{-12} A bilan yana ham pastroq yagona maksimum kuzatildi.

Ikki cho‘ qqili shakl yuqori hajmlarda multisloy (T_{dmax} va T_{smax} birga), past hajmlarda esa submonosloyga yaqinlashish (faqat Tsmax) bilan izohlanadi. Ion toki hajmga mutanosib ortdi (1,0>0,7>0,5>0,2 mkl), bu detektorning reproduktiv javobini tasdiqlaydi. Vakuumsiz, atmosfera havosida ishlovchi bu tizim SI/MS dan tubdan farqli prinsipga asoslangan bo‘ lsa-da, natijalarning mustaqil, hajmga sezgir kross-tekshiruvini ta’minladi.

Xulosalar

Keng qo‘ llaniladigan bronxodilatator salbutamol (Nebutamol®) birinchi marta oksidlangan volfram termoemitteri sirtida elektr maydon kuchlanganligi E < 10^4 V/sm sharoitida sirt ionlashuv–mass-spektrometriya (SI/MS) usuli yordamida tadqiq qilindi. Olingan mass-spektrda *m/z* 58, 72, 86, 131 va 145 fragment ionlari aniqlandi, bunda m/z 86 bazaviy cho‘ qqi sifatida qayd etildi. Tadqiq etilgan harorat oralig‘ ida molekulyar M^+ va protonlangan $[M+H]^+$ ionlarning kuzatilmasligi salbutamolning sirt ionlashuvi jarayonida termik fragmentatsiya ustunligini ko‘ rsatdi.

Ionlar intensivligining haroratga bog‘ liq o‘ zgarishi fragment ionlarning hosil bo‘ lish qonuniyatlarini aniqlash imkonini berdi. Xususan, *m/z* 58, 72 va 86 ionlari keng harorat oralig‘ ida yuqori barqarorlik namoyon etgan bo‘ lsa, *m/z* 131 va 145 ionlari ma’lum haroratlarda maksimal intensivlikka erishib, keyinchalik kamayishi ularning termik parchalanishning oraliq mahsulotlari ekanligidan dalolat berdi.

Olingan natijalar salbutamolning sirt ionlashuvi jarayonida hosil bo‘ ladigan xarakterli fragment ionlarni aniqlash, ularning haroratga bog‘ liq hosil bo‘ lish qonuniyatlarini tavsiflash hamda SI/MS usulining β_2-agonistlarni identifikatsiya qilishdagi analitik imkoniyatlarini kengaytiradi. Kelgusi tadqiqotlar salbutamolning ionlashuv energiyasi va sublimatsiya issiqligini Arrenius tenglamasi asosida miqdoriy baholash, shuningdek, turli termoemitterlarda olingan natijalarni zamonaviy mass-spektrometrik usullar bilan qiyosiy tahlil qilishga imkon beradi.

Annotatsiya*: Ushbu maqolada Maydanak balandtog‘ observatoriyasida xalqaro WEBT loyihasi doirasida olib borilgan kuzatuvlar asosida BL Lac 2200+420 blazarining fotometrik tadqiqoti natijalari bayon etilgan. Tadqiqotning maqsadi IRAF dasturiy paketida tasvirlarga birlamchi ishlov berish orqali obektning ko‘ p rangli ravshanlik egri chiziqlarini qurish va uning o‘ zgaruvchanlik qonuniyatlarini aniqlashdan iborat. Maqolada blazarning qisqa va uzoq muddatli o‘ zgaruvchanlik xususiyatlari hamda undagi relyativistik jet dinamikasi ilmiy tahlil qilingan.*

Kalit so‘ zlar*: yadrosi aktiv galaktikalar, blazarlar, BL Lac 2200+420, Maydanak observatoriyasi, IRAF dasturi, fotometriya, ravshanlik egri chizig‘ i, WEBT loyihasi.*

ФОТОМЕТРИЯ ЦИФРОВЫХ ДАННЫХ ФОРМИРУЮЩЕЙСЯ ГАЛАКТИКИ BL LAC 2200+420

Аннотация: В данной статье представлены результаты фотометрического исследования блазара BL Lac 2200+420 на основе наблюдений, проведенных на высокогорной обсерватории Майданак в рамках международного проекта WEBT. *Целью исследования является построение многоцветных кривых блеска и определение закономерностей переменности объекта путем первичной обработки изображений в программном пакете IRAF.* В работе научно проанализированы характеристики краткосрочной и долгосрочной переменности блазара, а также динамика его релятивистских джетов.

Ключевые слова: *активные ядра галактик, блазары, BL Lac 2200+420, обсерватория Майданак, программа IRAF, фотометрия, кривая блеска, проект WEBT.*

PHOTOMETRY OF DIGITAL DATA FROM THE FORMING GALAXY BL LAC 2200+420

Annotation: This article presents the results of a photometric study of the blazar BL Lac 2200+420 based on observations conducted at the Maidanak High-Altitude Observatory within the international WEBT project. *The research aims to construct multi-band light curves and determine the object’s variability patterns through data reduction using the IRAF software package.* The paper scientifically analyzes the short-term and long-term variability characteristics of the blazar, along with its relativistic jet dynamics.

Key words: *Active Galactic Nuclei, blazars, BL Lac 2200+420, Maidanak Observatory, IRAF software, photometry, light curve, WEBT project.*

Kirish

Ko‘ pgina galaktikalar markazlarida juda katta qora tuynuklarga ega deb hisoblanadi. Ushbu qora tuynuklar ichiga spiral tushadigan materiallardan iborat bo‘ lgan to‘ planish disklari muzokara qilinadi va mavjud deb topiladi. Materiallar to‘ planish diskiga tushganda, ishqalanish va tortishish kuchlari ta’sirida isitiladi [2:118]. Buning natijasida hosil bo‘ lgan energiya kvazarning markazida otilib chiqadi [2:120].

Kvazar galaktika markazidagi o‘ ta massiv qora tuynuk atrofida uni quvvatlantirish, energiya ishlab chiqarish, yig‘ ish diskiga tushishi uchun yetarli material bo‘ lganda hosil bo‘ ladi. Ma’lum bo‘ lgan kvazarlar juda uzoq galaktikalar

bo‘ lib, ulardan yorug‘ lik bizga milliardlab yillar davomida yetib kelgan. Kvazar–markazi qora tuynukli galaktika bo‘ lib, uning to‘ planish diski–qora tuynuk ichiga aylanadigan materiyaga ega.

Blazar bu–kvazarning hususiy holi bo‘ lib, u o‘ zidan o‘ ta kuchli plazma nurlarini taratadi [4:812]. Blazar taratayotgan plazma oqimini relyatvistik oqim deb ham ataladi [2:132]. Bunda, kvazar markazida ikkita nur o‘ zaro qarama–qarshi ikki tarafga favqulodda kuchli quvvat va shiddat bilan otilib chiqib turgan bo‘ ladi [4:815].

Ushbu plazma oqimi o‘ zining yo‘ lidan chiqqan har qanday jismni yo‘ q qilib yuborishi mumkin. “Blazar” nomi kvazar, hamda, BL–kaltakesak (BL Lacertae) nomlaridan yasalgan. Umuman aytganda, kuzatuvlar orqali blazarlarning tabiati, ularning tuzilishi, ularda kechayotgan yadroviy jarayonlar va ulardagi energiya manbalari o‘ rganiladi [2:140]. Blazarlar tadqiqoti galaktikalarning kelib chiqishi hamda ularning evolyutsiyasini yanada chuqurroq o‘ rganishga imkon beradi.

Blazarlar bo‘ yicha yana bir muammo ulardagi akretsion disklar muammosini to‘ liq yechimi topilmaganidir [1:105]. Shu va shunga o‘ xshash muommolarni yechish uchun blazarlarni tadqiq qilish va fotometrik kuzatuvlar olib borish o‘ z dolzarbligini yo‘ qotmagan. Shu borada ushbu ishda BL Lac 2200+420 nomli blazarining fotometrik tadqiqoti olib borildi.

Adabiyotlar tahlili

Ushbu tadqiqotda bajarilgan ishlar O‘ zR FA Astronomiya institutining “Galaktikadan tashqi astronomiya” bo‘ limi xodimlari Maydanak balandtog‘ observatoriyasida Whole Earth Blazar Telescope (WEBT) xalqaro dasturining faol ishtirokchisi hisoblanadi. Blazarlarni kuzatuv ishlari va ushbu ob’yektlarning tasvirlarini kompyuterda IRAF dasturi yordamida qayta ishlash loyihasi bilan uzviy bog‘ liqdir.

Tadqiqotning bosh maqsadi - BL Lac 2200+420 blazari bo‘ yicha olingan kuzatuv ma’lumotlar tasvirlarini tahlil qilish va ravshanlik egri chiziqlarini hosil qilishdan iborat. Ko‘ rsatilgan maqsadlarga erishish uchun quyidagi vazifalar belgilangan:

- Blazarlar tabiati, turlari haqida ma’lumotlar to‘ plash va o‘ rganish;
- IRAF dasturida fotometrik tahlil etishni o‘ rganish;
- BL Lac 2200+420 blazari bo‘ yicha olib borilgan ilmiy ishlarni o‘ rganish [4:820];
- Maydanak balandtog‘ observatoriyasida olib borilgan kuzatuv natijalarini o‘ rganish;
- Fotometrik tahlil usullarini o‘ rganish [2:145];
- BL Lac 2200+420 blazarining ravshanlik egri chiziqlarini hosil qilish.

Tadqiqot ob’yekti sifatida BL Lac 2200+420 blazari tanlangan [4:822], tadqiqot predmeti esa ushbu ob’yekt bo‘ yicha olingan raqamli tasvirlar ko‘ rinishidagi kuzatuv natijalaridir. Ushbu ishda raqamli fotometrik usullari va IRAF dasturlar to‘ plamidan foydalanilgan. Bu usullar va dasturiy ta’minot zamonaviy astrofizika fotometriyasida standart deb qabul qilingan, chunki ular eng ishonarli va aniq natijalarni beradi [2:150].

Tadqiqot metodologiya

Tadqiqotda O‘ zR FA Astronomiya institutining “Galaktikadan tashqi astronomiya” bo‘ limi xodimlari tomonidan Maydanak balandtog‘ observatoriyasida *Whole Earth Blazar Telescope* (WEBT) xalqaro dasturi doirasida olingan kuzatuv ma’lumotlarining sifatini baholash va ularni qayta ishlash tizimi tahlil qilindi.

Tadqiqotning bosh maqsadi — **BL Lac 2200+420 blazari** bo‘ yicha olingan tasvirlarni tahlil qilish va ob’yektning ravshanlik egri chiziqlarini hosil qilishdan iborat. Ushbu maqsadga erishish uchun tadqiqotda qiyosiy, tizimli yondashuv hamda raqamli astrofizikaviy tahlil usullaridan foydalanildi.

Tadqiqot ob’yekti sifatida BL Lac 2200+420 blazari tanlangan bo‘ lsa [4:822], tadqiqot predmeti — ushbu ob’yekt bo‘ yicha olingan raqamli tasvirlar ko‘ rinishidagi kuzatuv natijalaridir.

Metodologik jihatdan belgilangan vazifalarni hal etish uchun quyidagi bosqichma-bosqich yondashuvlar amalga oshirildi:

1.**Nazariy-qiyosiy tahlil:** Blazarlar tabiati, ularning turlari va BL Lac 2200+420 ob’yekti bo‘ yicha olib borilgan ilmiy ishlar [4:820], shuningdek, Maydanak observatoriyasining kuzatuv natijalari tizimli o‘ rganildi va qiyoslandi.

2.**Dasturiy-texnikaviy yondashuv:** Kuzatuv ma’lumotlarini kompyuterda qayta ishlash loyihasi doirasida zamonaviy astrofizikada standart deb qabul qilingan **IRAF** (*Image Reduction and Analysis Facility*) dasturlar to‘ plamidan foydalanildi [2:150].

3.**Eksperimental-matematik usullar:** Ob’yekt tasvirlariga raqamli fotometrik tahlil usullarini [2:145] qo‘ llash orqali astrofizikaviy jarayonlar modellashtirildi va yakunda blazarning ravshanlik egri chiziqlari hosil qilindi.

Ushbu qo‘ llanilgan raqamli fotometriya usullari va dasturiy ta’minot kombinatsiyasi tadqiqot natijalarining yuqori darajada ishonchli va aniq bo‘ lishini ta’minlaydi [2:150].

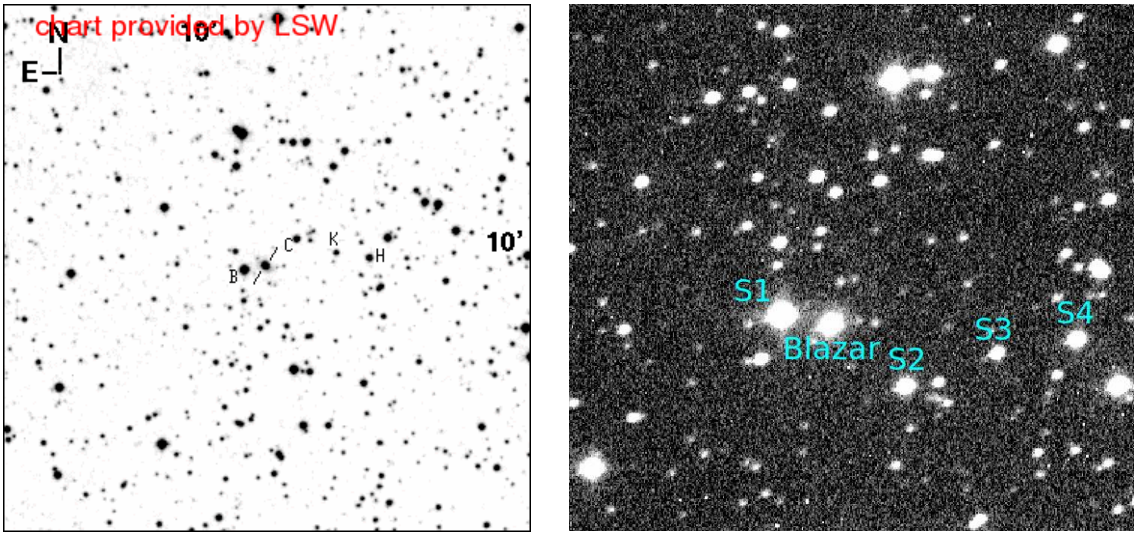
NATIJA VA MUHOKAMA

Ushbu maqolada BL Lac 2200+420 blazari bo‘ yicha, Maydanak balandtog‘ observatoriyasida olib borilgan kuzatuv ma’lumotlari muvaffaqiyatli fotometrik tahlil etildi. Fotometrik tahlil natijasida quyidagi muhim ilmiy natijalar qo‘ lga kiritildi:

• BL Lac 2200+420 blazarini o‘ rganishda zarur bo‘ ladigan fundamental ma’lumotlar va zamonaviy nazariya elementlari o‘ rganildi. Ushbu ma’lumotlar asosida obyekt fizikasiga oid kerakli tushunchalar olindi;

• Tasvirlarga ishlov berish va fotometrik tahlil o‘ tkazishda xalqaro standart hisoblangan IRAF dasturida ishlash ko‘ nikmasi to‘ liq shakllantirildi;

• 2020-yil iyun oyida BL Lac 2200+420 obyekti bo‘ yicha Maydanak observatoriyasida to‘ plangan raqamli kuzatuv ma’lumotlari fotometrik tahlil etildi va mos holda aniq ravshanlik egri chiziqlari chizildi;

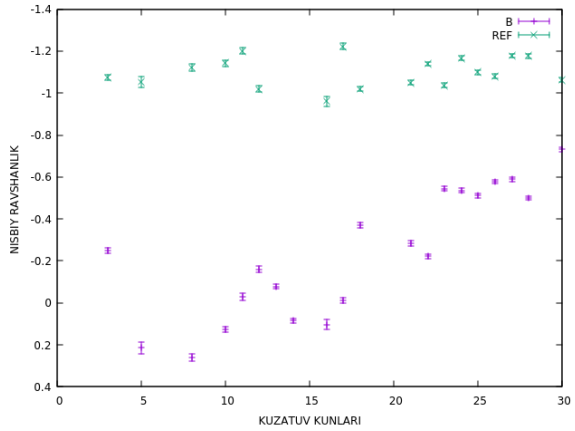


• Kuzatuv davrida blazarning optik ravshanligi doimo oshib borgani aniqlandi va bir oy davomida o‘ zgarish amplitudasi 0,75m yulduz kattaligini tashkil etdi [4:825]. Bu ko‘ rsatkich blazardan chiqayotgan energiya miqdori bir oy davomida salkam ikki barobarga oshganini ko‘ rsatadi [2:155].

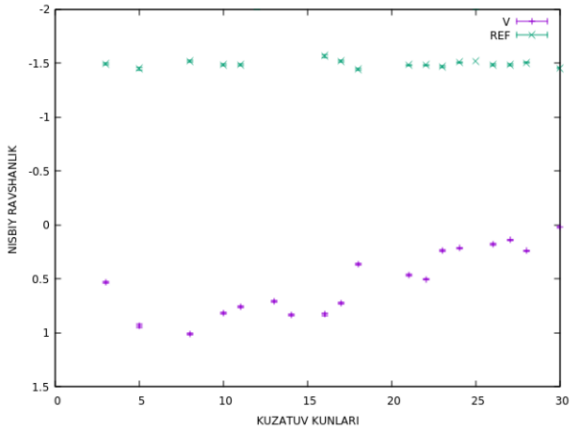
Tadqiqot doirasida BL Lac 2200+420 nomli blazar bo‘ yicha to‘ rtta (B, V, R, I) filtrdagi ravshanlik egri chiziqlari olindi va ob’yektning umumiy ravshanlik egri chizig‘ i hosil qilindi. Mana shu olingan ravshanlik egri chiziqlari hamda Δm qiymatlari yordamida obyektning nisbiy energiya miqdori aniqlandi [1:112].

Qo‘ lga kiritilgan ilmiy natijalar BL Lac 2200+420 blazarining individual xususiyatlarini o‘ rganishga va shu bilan birga boshqa shunga o‘ xshash faol galaktika yadrolari fizikasini chuqurroq tushunishga xizmat qiladi. Mazkur natijalar O‘ zR FA Astronomiya institutining “Galaktikadan tashqi astronomiya” bo‘ limi xodimlari tomonidan Maydanak balandtog‘ observatoriyasida olib borilayotgan blazarlarni muntazam kuzatuv ishlari va tasvirlarni kompyuterda qayta ishlash dasturlari doirasida tahlil qilindi.

BL Lac 2200+420 blazarlarning kuzatuv ma’lumotlari



Ob’yektimiz BL Lac 2200+420 blazarini to‘ rt filter (B, V, R, I) lardagi tayanch yulduzlarga nisbatan bir oy davomida yulduz kattaligini o‘ zgarishi aniqlandi. 1-rasmda BL Lac 2200+420 blazarini kataloglardagi tasviri (1-a-rasm), va teleskopda olingan tasviri (1-b-rasm).



a. b.

1-rasm. a) BL Lac 2200+420 blazarining kataloklardagi tasviri b) telesko‘ pda olingan tasvir

2-rasmda BL Lac 2200+420 blazarini B filterdagi ravshanlik egri chizig‘ i va S1 referend yulduzning ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida o‘ rganilgan maximum -0.59^m ga ko‘ tarilib, minumim 0.29^m ga tushgan [4:828]. BL Lac 2200+420 Blazari va tayanch yulduzlarning B filtrdagi fotometriyasi natijalari va nisbiy ravshanligi[2:158]. Bu yerda JD – yulian kunlari S1, S2, S3 tayanch yulduzlarini yulduz kattaliklari, S1err, S2err, S3err tayanch yulduzlarini yulduz kattaliklari xatoligi, hamda ob’yektimizni yulduz kattaligi va xatoligi keltirilgan.

3-rasm

3-rasmda BL Lac 2200+420 blazarini V filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum 0.29^m ga ko‘ tarilib, minumim 1^m ga tushgan. BL Lac 2200+420 blazari va tayanch yulduzlarning V filtrdagi fotometriyasi natijalari va nisbiy ravshanligi. Bu yerda JD – yulian kunlari S1, S2, S3 tayanch yulduzlarini yulduz kattaliklari, S1err, S2err, S3err tayanch yulduzlarini yulduz kattaliklari xatoligi, hamda ob’yektiimizni yulduz kattaligi va xatoligi keltirilgan.

4-rasm

5-rasm

4-rasmda BL Lac 2200+420 blazarini R filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum 0.59^m ga ko‘ tarilib, minumim 1.31^m ga tushgan. BL Lac 2200+420 Blazari va tayanch yulduzlarning V filtrdagi fotometriyasi natijalari va nisbiy ravshanligi. Bu yerda JD – yulian kunlari S1, S2, S3 tayanch yulduzlarini yulduz kattaliklari, S1err, S2err, S3err tayanch yulduzlarini yulduz kattaliklari xatoligi, hamda ob’yektiimizni yulduz kattaligi va xatoligi keltirilgan.

5-rasmda BL Lac 2200+420 blazarini I filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum 0.62^m ga ko‘ tarilib, minumim 1.42^m ga tushgan. BL Lac 2200+420 Blazari va tayanch yulduzlarning I filtrdagi fotometriyasi natijalari va nisbiy ravshanligi. Bu yerda JD – yulian kunlari S1, S2, S3 tayanch yulduzlarini yulduz kattaliklari, S1err, S2err, S3err tayanch yulduzlarini yulduz kattaliklari xatoligi, hamda ob’yektimizni yulduz kattaligi va xatoligi keltirilgan.

To‘ rt filterdagi minimal va maximal o‘ zgarishlar oralig‘ i 1-javalda keltirildi.

1-jadval. BL Lav 2200+420 blazarning yorqinlig o‘ zgarish amplitudalari har bir filtir bo‘ yicha

Filter	B		V		R		I	
Yulduz kattaligini o‘ zgarishi	Min=m^v	Max=m^v	Min=m^v	Max=m^v	Min=m^v	Max=m^v	Min=m^v	Max=m^v
	-0.59	0,29	0.29	1	0.59	1.31	0.62	1.42
Δm	0,88		0,71		0,72		0,8	
ΔE	693,28		3319,9		2966,3		1333,5	

Ushbu jadval asosida quydagi hulosaga kelish mumkun; eng avvalo har bir filtir bo‘ yicha yulduz kattaligini o‘ zgarishi aniqlandi. $\Delta m=m_2-m_1$ fo‘ rmulasi orqali. So‘ ng esa ushbu yulduz kattaligining o‘ zgarishidan energiya o‘ zgarishi aniqlandi.

$$m_2 - m_1 = 2{,}5lg\frac{1}{\Delta E}$$

$$\Delta E = 10^{\frac{m_2-m_1}{2{,}5}}$$

Yuqorida ko‘ rsatilgan fo‘ rmula orqali energiya o‘ zgarishi aniqlanib quydagi xulosa kelindi. Bir oy ichida ob’yektning B filtirdagi enrergiya miqdori salkam 700 marta nurlanayotgani, V filtirdagi energiya miqdori 3000 martadan ortiq nurlanayotgani, R filtirdagi energiya miqdori salkam 3000 martaga yaqin nurlanayotgani, I filtirdagi energiya miqdori esa 1300 martadan ortiq nurlanayotganini ko‘ rishimiz mumkun. Bundan umumiy hulosa qilib obyektimiz 2000 martadan ortiq nurlanib bir oy davomida faqat energiyasi oshib borayotganini ko‘ rishimiz mumkun.

XULOSA

Ushbu maqola ishimning bajarilishi natijasida. BL Lac 2200+420 blazari bo‘ yicha Maydanak observatoriyasidagi Zees-600 telesko‘ pi orqali 2020-yil iyun oyida olib borilgan kuzatuv ma’lumotlari fotometrik tahlil etildi. Fotometrik tahlil natijasida quyidagilar qo‘ lga kiritildi:

1. Yadrosi aktiv galaktikalarni o‘ rganishda zarur bo‘ ladigan ma’lumotlar va nazariya elementlari o‘ rganildi. BL Lac 2200+420 blazari bo‘ yicha chop etilgan ishlar o‘ rganilda va tahlil etildi.
2. 2020 -yil iyun oyi bo‘ yicha Maydanak observatoriyasida to‘ plangan kuzatuv ma’lumotlari fotometrik tahlil etildi va mos holda ravshanlik egri chiziqlari chizildi.
3. BL Lac 2200+420 blazarini fotometrik tahlili natijasida 4 ta filtirdagi ravshanlik egri chizig‘ i aniqlandi.
4. BL Lac 2200+420 blazarini B filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum -0.59^m ga ko‘ tarilib, minumim 0.29^m ga tushgan.
5. BL Lac 2200+420 blazarini V filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum 0.29^m ga ko‘ tarilib, minumim 1^m ga tushgan.
6. BL Lac 2200+420 blazarini R filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum 0.59^m ga ko‘ tarilib, minumim 1.31^m ga tushgan.
7. BL Lac 2200+420 blazarini I filterdagi ravshanlik egri chizig‘ i berilgan, bu filterdagi yulduz kattaligini o‘ zgarish oralig‘ i bir oy davomida maximum 0.62^m ga ko‘ tarilib, minumim 1.42^m ga tushgan.
8. O‘ rganilgan blazarimiz ravshanligi maksimumi binafsha diapazonga to‘ g‘ ri kelar ekan (B filtr). Undan kegin visual diapazonga to‘ g‘ ri keladi. Qizil va infra qizil diapazonlarda ravshanliklari bir- biriga yaqin bo‘ lib, qolganlariga nisbatan eng xira ekan (ob’yekt). Shundan V filtr dagi yulduz kattaliklar o‘ rtacha B filtrdan 0.7^m yulduz kattaligiga xiraroq I filt va R filtrda esa xattoki 1^m gacha xiraroq. Kuzatuv davrida blazarning ravshanligi doimo oshib brogan va bir oy davomida o‘ zgarish amplitudasi 0.75^m yulduz kattaligini tashkil etadi. Bu degani blazardan chiqayotgan energiya miqdori bir oy davomida ikki barovarga oshganini ko‘ rsatadi.

О СРАВНИТЕЛЬНОМ АНАЛИЗЕ ОДНОГО ТИПА «ДИФФЕРЕНЦИАЛЬНЫХ КВАДРАТУРНЫХ» ФОРМУЛ

Аннотатsiя: *В данной статье проводится сравнительный анализ некоторых типов квадратурных формул, используемых при приближенном вычислении определенных интегралов. Основная цель исследования – определить связь между так называемыми «дифференциальными» квадратурными формулами и приближенными формулами, созданными на основе рядов Тейлора-Маклорена. Авторы освещают с теоретической и практической точки зрения проблему приближенного вычисления определенных интегралов, являющуюся одной из важных областей вычислительной математики, а также изучают структуру и механизмы образования этих формул. Данное исследование служит углублению понимания алгебраических свойств квадратурных формул.*

Ключевые слова. *Квадратурная формула, левая одноточечная формула, правая одноточечная формула, точный интеграл, формула Тейлора, формула Маклорена.*

ON A COMPARATIVE ANALYSIS OF A TYPE OF "DIFFERENTIAL QUADRATURE" FORMULAS

Abstract. *This article provides a comparative analysis of some types of quadrature formulas used in the approximate calculation of definite integrals. The main goal of the study is to determine the relationship between the so-called “differential” quadrature formulas and approximate formulas created on the basis of Taylor-Maclaurin series. The authors cover from a theoretical and practical point of view the problem of approximate calculation of definite integrals, which is one of the important areas of computational mathematics, and also study the structure and mechanisms of formation of these formulas. This study serves to deepen the understanding of the algebraic properties of quadrature formulas.*

Keywords: *Quadrature formula, left one-point formula, right one-point formula, definite integral, Taylor formula, Maclaurin formula.*

Hisoblash matematikasi shunday sohaki, bunda asosan sonli metodlar, ya’ni masala yechimini sonli natijagacha keltirish usullari o‘ rganiladi. Bu jarayon faqatgina ilmiy jihatdangina emas, balki katta amaliy qiziqish ham uyg‘ otadiki, zero hisoblash – san’at hamdir.

Matematikada shunday xarakterdagi masalalar borki, masalan tub sonlarga doir mashxur muammolar. Shuningdek, yana, masalan tenglamalarni butun sonlarda yechish kabi masalalar uzoq vaqtlar davomida matematiklar dunyosida huddi sportga bo‘ lgan qiziqish singari “jo‘ shqin” qiziqish uyg‘ otib kelgan.

Xuddi shuningdek, hisoblash matematikasining “Aniq integrallarni taqribiy hisoblash” bo‘ limi borki, bu bo‘ lim kvadratura, kubatura, formulalarini o‘ rganish va qurish masalalari bilan shug‘ ullanadi. Bu mavzu, ya’ni aniq integrallar uchun taqribiy formulalar qurish jarayoni va uning metodik jihatlari, hech qanday mubolag‘ asiz aytish mumkinki, doimo ijodiy ilhom manbai bo‘ lib kelgan.

Aniq integrallar uchun qurilgan taqribiy formulalarning an’anaviy turlari bilan bir qatorda yana shunday formulalar borki bu formulalar integral ostidagi funksiya va uning hosilalarining faqatgina integrallash oralig‘ ining ikki chetki nuqtalaridagi qiymatlarinigina o‘ z ichiga olgan bo‘ lib, bu tur fo‘ rmulalar ham o‘ ziga xos jiddiy qiziqish uyg‘ otadi. [1-6]

Ma’lumki, an’anaviy kvadratura formulalarining qurilishi interpolyatsion ko‘ phadlarga asoslanishi, boshqa turdagi formulalar esa ketma-ket bo‘ laklab integrallash usuli yordamida hosil qilinishi ta’kidlangan. Shuningdek, ayrim formulalarda integral ostidagi funksiya va uning hosilalarining faqat integrallash oralig‘ ining chetki nuqtalaridagi qiymatlaridan foydalanilishi ko‘ rsatiladi. Bu esa tugun nuqtalarini tanlash zaruratini kamaytiradi va formulalarning amaliy qo‘ llanish imkoniyatlarini kengaytiradi.

Shuni qayd etish ketakki, [5] da qaralayotgan kvadratura formulasi integral osti funksiyasi f(x) mansub bo‘ lgan sohada eng yaxshi formula deb atalib, uni qurish usuli formula qoldiq hadini u o‘ z ichiga olgan noma’lum koeffitsiyentlarga nisbatan minimallashtirishga asoslangan.

Ammo, [4, 6] larda qaralgan kvadratura formulalarining qurilishi esa, ularning, darajasi 2n gacha bo‘ lgan ko‘ phadlarni aniq integrallash prinsipiga asoslangan bo‘ lib, bu formulalar eng yuqori algebraik daraja aniqligidagi kvadratura formulalari deb ataladi.

Maqolada, ba’zi bir kvadratura formulalari o‘ zaro formal tuzilishlarining o‘ xshashliklari o‘ rganiladi.

Ya’ni, “differensial” kvadratura formulalari deb ataluvchi formula bilan Teylor - Makloren formulalari yordamida qurilgan taqribiy formulalar orasidagi o‘ xshashlik ko‘ rsatiladi.

Yuqoridagi [4] dan ushbu

$$I = \int_0^1 f(x)dx, \tag{1}$$

integral uchun chap bir nuqtali formulani keltiramiz:

$$I_0 = \sum_{k=0}^{2n-1} A_{k,0} f^{(k)}(0), \tag{2}$$

bunda

$$A_{k,0} = (-1)^k \sum_{i=0}^{k} (-1)^i \frac{\Gamma(1)}{\Gamma(k-i+2)}.$$

(2) ni yoyib yozilsa:

$$I_0 = \frac{1}{1!} f(0) + \frac{1}{2!} f'(0) + \frac{1}{3!} f''(0) + \ldots + \frac{1}{(n+1)!} f^{(n)}(0). \tag{3}$$

Endi (1) integral uchun integral ostidagi f (x) funksiya uning Makloren formulasi yoyilmasi bilan almashtirilib hosil qilingan formulani qaraylik:

$$f(x) = f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \ldots + \frac{f^{(n)}(0)}{n!}x^x,$$

$$I_0' = \int_0^1 \left(f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \ldots + \frac{f^{(n)}(0)}{n!}x^n \right) dx,$$

va bundan hosil qilamiz:

$$I_0' = \frac{f(0)}{1!} + \frac{f'(0)}{2!} + \frac{f''(0)}{3!} + \ldots + \frac{f^{(n)}(0)}{(n+1)!}. \tag{4}$$

Ajablanarlisi shundaki, (3) va (4) formulalarning o‘ zaro ustma-ust tushishi, ya’ni ularning o‘ zaro aynan tengligi ko‘ rinib turibdi. Aslida (3) formula bo‘ laklab integrallash usuli bilan qurilgan [4]. Ammo (4) formula esa butunlay boshqa usul, ya’ni, ko‘ rganimizdek integral osti funksiyasini taqriban Makloren formulasi bilan almashtirish orqali hosil qilingan.

Endi esa (1) integral uchun o‘ ng bir nuqtali kvadratura formulasini keltiramiz [4]:

$$I_1 = \sum_{k=0}^{2n-1} B_{k,1} f^{(k)}(1),$$

bunda

$$B_{k,1} = \frac{(-1)^k \Gamma(1)}{\Gamma(k+2)}.$$

Bu formulaning yoyilgan ko‘ rinishi esa:

$$I_1^{'} = \frac{f(1)}{1!} - \frac{f^{'}(1)}{2!} + \frac{f^{''}(1)}{3!} - \frac{f^{''}(1)}{3!} + \ldots + \frac{f^{(n)}(1)}{(n+1)!}. \quad (5)$$

Bu formulani huddi shu (1) integral uchun integral osti funksiyasi $f(x)$ ni $a = 1$ xol uchun Teylor formulasi bilan almashtirib, hosil qilingan taqribiy formulani keltiramiz:

$$f(x) \approx f(1) + \frac{f^{'}(1)}{1!}(x-1) + \frac{f^{''}(1)}{2!}(x-1)^2 + \ldots + \frac{f^{(n)}(1)}{n!}(x-1)^n,$$

ya'ni

$I = \int_0^1 f(x)\,dx \approx \int_1^1 \left[f(1) + \frac{f^{'}(1)}{1!}(x-1) + \frac{f^{''}(1)}{2!}(x-1)^2 + \ldots + \frac{f^{(n)}(1)}{n!}(x-1)^n\right]dx$, bundan

$$I_1^{'} = \frac{f(1)}{1!} - \frac{f^{'}(1)}{2!} + \frac{f^{''}(1)}{3!} - \frac{f^{'''}(1)}{4!} + \ldots + (-1)^n \frac{f^{(n)}(1)}{(n+1)!}(x-1)^n, \quad (6)$$

hosil bo' ladi.

Bu holda ham (5) va (6) kvadratura formulalarning o' zaro aynan teng ekanligi ko' rinib turibdi:

$$I_1 = I_1^{'}.$$

Aniq integrallarni taqribiy hisoblash formulalari, ya'ni ikki xil kvardatura formulalari, hosil qilinishlariga ko' ra o' zaro butunlay boshqa-boshqa usullar bilan qurilgan bo' lsada, ularning aynan bir xil ekanliklari albatta, ham nazariy va ham amaliy qiziqish uyg' otadi.

Maqolaning ilmiy yangiligi shundaki, bir-biridan mutlaqo farq qiluvchi matematik yondashuvlar yordamida hosil qilingan formulalarning o' zaro ekvivalentligi nazariy jihatdan asoslab berilgan. Olingan natijalar aniq integrallarni hisoblashning yangi usullarini ishlab chiqish, mavjud algoritmlarni takomillashtirish hamda hisoblash jarayonlarining samaradorligini oshirishda muhim ahamiyat kasb etadi.

Annotatsiya. *Ushbu ishda transversal-izotrop uch qatlamli konussimon qobiqning bo‘ ylama-radial teranishlari masalasi qaraladi. Masala o‘ qqa simmetrik masala deb faraz qilinadi. Uch qatlamli konussimon qobiqqa silindrik koordinatalar sistemasi joylashtiriladi. Uch qatlamli konussimon qobiqning yon sirtidagi chegaraviy shartlardan foydalanilib bo‘ ylama-radial tebranish tenglamalari keltirib chiqariladi. Keltirib chiqarilgan bo‘ ylama-radial tebranish tenglamalarida uch qatlamli konussimon qobiqning markaziy o‘ qidan ixtiyoriy masofada joylashgan sirtdagi ko‘ chish vektori komponentalari izlanuvchi funksiyalar sifatida kiritiladi. So‘ ngra ichki va tashqi sirtdagi ko‘ chish va kuchlanishlar ham shu kiritilgan izlanuvchi funksiyalar orqali ifodalanadi.*

Kalit so‘ zlar: *qatlam, transversal-izotrop material, bo‘ ylama-radial tebranish, chegaraviy shart, tebranish tenglamasi, ko‘ chish, kuchlanish*

УРАВНЕНИЯ ПРОДОЛЬНО-РАДИАЛЬНЫХ КОЛЕБАНИЙ ТРЕХСЛОЙНОЙ КОНИЧЕСКОЙ ОБОЛОЧКИ

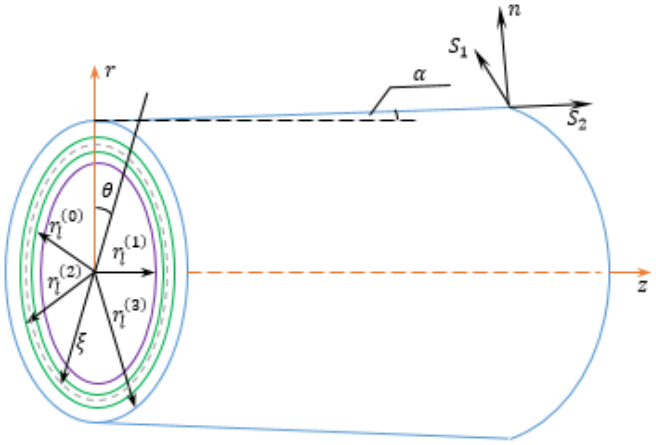
Аннотация. *В данной статье рассматривается задача о продольно-радиальных колебаниях поперечно изотропной трехслойной конической оболочки. Предполагается, что задача является осесимметричной. В трехслойную коническую оболочку вводится цилиндрическая система координат. Используя граничные условия на боковой поверхности трехслойной конической оболочки, выводятся уравнения продольно-радиальных колебаний. В выведенных уравнениях продольно-радиальных колебаний компоненты вектора смещения на поверхности, расположенной на произвольном расстоянии от центральной оси трехслойной конической оболочки, вводятся в качестве искомых (неизвестных) функций. Затем смещения и напряжения на внутренней и внешней поверхностях также выражаются через эти введенные искомые функции.*

Ключевые слова: *слой, поперечно изотропный материал, продольно-радиальные колебания, граничное условие, уравнение колебаний, смещение, напряжение*

LONGITUDINAL-RADIAL VIBRATION EQUATIONS OF A THREE-LAYERED CONICAL SHELL

Annotation. *This paper considers the problem of longitudinal-radial vibrations of a transversely isotropic three-layered conical shell. The problem is assumed to be axisymmetric. A cylindrical coordinate system is introduced into the three-layered conical shell. Using the boundary conditions on the lateral surface of the three-layered conical shell, the longitudinal-radial vibration equations are derived. In the derived longitudinal-radial vibration equations, the components of the displacement vector at a surface located at an arbitrary distance from the central axis of the three-layered conical shell are introduced as the sought (unknown) functions. Then, the displacements and stresses on the inner and outer surfaces are also expressed through these introduced sought functions.*

Keywords: *layer, transversely isotropic material, longitudinal-radial vibration, boundary condition, vibration equation, displacement, stress*



Kirish

Zamonaviy texnika va qurilish sohalarida yengil va yuqori mustahkamlikka ega konstruktiv elementlarga bo‘ lgan ehtiyoj tobora ortib bormoqda. Shu sababli uch qatlamli konussimon qobiq konstruksiyalari aviatsiya, gidrotexnika

inshootlari, transport vositalari hamda qurilish sanoatida keng qo‘ llanilmoqda. Bunday konstruksiyalarning asosiy afzalligi nisbatan kam og‘ irlikda yuqori qattiqlik va tebranishlarni so‘ ndirish xususiyatiga ega bo‘ lishidir. Konussimon shaklga ega qobiqlar, o‘ z navbatida, aylanma simmetriyaga ega bo‘ lgan turli texnik qurilmalarda alohida o‘ rin tutadi, chunki geometrik parametrlarning o‘ zgaruvchanligi tufayli ularning dinamik xarakteristikalari silindrik qobiqlarnikidan sezilarli farq qiladi. Bir qatlamli qobiqlarning tebranish nazariyasi klassik ishlarda yetarlicha o‘ rganilgan bo‘ lsa-da, ko‘ p qatlamli xususan, uch qatlamli qobiqlarning dinamik masalalari alohida yondashuvni talab qiladi, chunki qatlamlar orasidagi mexanik xossalarning farqi hisobga olinishi zarur. Uch qatlamli qobiqlarning statik va dinamik masalalari bir qator tadqiqotchilar tomonidan o‘ rganilgan. Xususan, Grigolyuk va Chulkovning [1] klassik ishlarida uch qatlamli qobiqlarning turg‘ unligi va tebranishlari, shu jumladan uch qatlamli silindrik va konussimon qobiqlarning kritik yuklamalari masalalari batafsil tadqiq etilgan. Ilyamov va hammualliflarining tadqiqotlarida elastik to‘ ldiruvchiga ega qobiqlarning mustahkamligi, turg‘ unligi va dinamikasi masalalari ko‘ rib chiqilgan [2], Latifovning ishida esa elastik va suyuq muhit bilan o‘ zaro ta’sirlashuvchi qobiqlarning tebranishlari o‘ rganilgan [3]. So‘ nggi yillarda O‘ zbekiston olimlari tomonidan ham bu yo‘ nalishda faol ishlar olib borilmoqda. Xususan, uch qatlamli qovushoq-elastik konussimon qobiqlarning tebranishlari masalasiga bag‘ ishlangan tadqiqotda harakat tenglamalari o‘ rta sirt siljishining asosiy komponentlariga nisbatan chiqarilgan hamda olingan yechimlar tahlil qilingan. [4] ishda sayoz o‘ rnatilgan uch qatlamli sferik qobiqlarning erkin tebranishlari tadqiq etilgan. Xudoynazarov va hammualliflari tomonidan qovushoq siqiluvchi suyuqlik bilan to‘ ldirilgan elastik silindrik qobiqning bo‘ ylama-radial tebranishlari masalasi o‘ rganilgan [5]. Bu ish, xususan, bo‘ ylama va radial tebranishlarni birgalikda tavsiflovchi tenglamalar tuzilishi jihatidan mazkur tadqiqotga metodik jihatdan yaqin turadi.

Shunga qaramay, uch qatlamli konussimon qobiqning bo‘ ylama-radial tebranishlarini tavsiflovchi to‘ liq shakllangan tenglamalar sistemasini qatlamlarning turli mexanik-geometrik parametrlarini hisobga olgan holda tahlil qilish masalasi to‘ liq yechilmagan bo‘ lib qolmoqda, bu esa mazkur tadqiqotning dolzarbligini belgilaydi.

Masalaning qo‘ yishi. Ichki hamda tashqi sirtlariga bo‘ ylama va radial kuchlar ta’sir qiluvchi uch qatlamli transversal-izotrop konussimon qobiqning bo‘ ylama-radial tebranishlarini tadqiq qilamiz. (r, θ, z) silindrik koordinatalar sistemasi boshini uch qatlamli konussimon qobiqning kichik ko‘ ndalang kesimiga joylashtiramiz (1-rasm).

1-rasm. Uch qatlamli konussimon qobiq

Bunda Oz – o‘ qini uch qatlamli konussimon qobiqning simmetriya o‘ qi bo‘ ylab, Or – o‘ qini uch qatlamli konussimon qobiqning ko‘ ndalang kesimi radiusi bo‘ ylab yo‘ naltiramiz. Bu yerda z-bo‘ ylama, r-radial va θ-burchak koordinatalaridir [6]. Uch qatlamli konussimon qobiqning qatlamlari materiallari transversal-izotrop deb hisoblaymiz.

Konussimon qobiqning yasovchisibilan markaziy o‘ qi orasidagi burchakni α bilan, uzunligini l bilan va $z = 0$ kichik ko‘ ndalang kesimi ichki radiusini r_0 bilan belgilaymiz. Ichki qatlamning qalinligi h_1, o‘ rta qatlamning qalinligi h_0 va tashqi qatlamning qalinligi h_2 bo‘ lsin deb faraz qilamiz. U holda $z = 0$ kesimdan l masofadagi kesim uchun ichki radius, ya’ni ichki qatlamning ichki radiusi $r_l^{(1)} = r_0 + l\tan\alpha$, ichki qatlamning tashqi radiusi ya’ni o‘ rta qatlam uchun ichki radius $r_l^{(0)} = r_0 + l\tan\alpha + h_1$, o‘ rta qatlamning tashqi radiusi ya’ni tashqi qatlam uchun ichki radius $r_l^{(2)} = r_0 + l\tan\alpha + h_1 + h_0$ va tashqi qatlam uchun tashqi radius $r_l^{(3)} = r_0 + l\tan\alpha + h_1 + h_0 + h_2$ bo‘ ladi. Ushbu uch o‘ lchovli uch qatlamli konussimon qobiq jismi elastiklik nazariyasi qonunlariga bo‘ ysinadi deb hisoblaymiz.

Masala o‘ qqa nisbatan simmetrik bo‘ lganligi uchun uch qatlamli konussimon qobiq nuqtalari ko‘ chish vektorlarining bo‘ ylama va radial komponentlari, kuchlanish tenzori komponentalarining bo‘ ylama, radial, buralma hamda bo‘ ylama-radial komponentalari, deformatsiya tenzorining esa $\varepsilon_{rr}^{(m)}, \varepsilon_{\theta\theta}^{(m)}, \varepsilon_{zz}^{(m)}$ va $\varepsilon_{rz}^{(m)}$ komponentalari noldan farqli bo‘ ladi. Qolgan komponentlari esa nolga teng bo‘ ladi.

Transversal-izotrop uch qatlamli konussimon qobiq nuqtalarida kuchlanishlar va deformatsiyalar orasida quyidagi bog‘ lanishlar mavjud bo‘ ladi [8]:

$$\sigma_{rr}^{(m)} = C_{11}^{(m)}\frac{\partial U_r^{(m)}}{\partial r} + C_{12}^{(m)}\frac{U_r^{(m)}}{r} + C_{13}^{(m)}\frac{\partial U_z^{(m)}}{\partial z};$$
$$\sigma_{\theta\theta}^{(m)} = C_{12}^{(m)}\frac{\partial U_r^{(m)}}{\partial r} + C_{11}^{(m)}\frac{U_r^{(m)}}{r} + C_{13}^{(m)}\frac{\partial U_z^{(m)}}{\partial z};$$
$$\sigma_{zz}^{(m)} = C_{13}^{(m)}\left(\frac{\partial U_r^{(m)}}{\partial r} + \frac{U_r^{(m)}}{r}\right) + C_{33}^{(m)}\frac{\partial U_z^{(m)}}{\partial z}; \quad (1)$$
$$\sigma_{rz}^{(m)} = C_{44}^{(m)}\left(\frac{\partial U_r^{(m)}}{\partial z} + \frac{\partial U_z^{(m)}}{\partial r}\right).$$

bu yerda $C_{ij}^{(m)}$-transversal-izotrop material uchun elastiklik o‘ zgarmaslari.

Harakat tenglamalariga (1) ifodalarni qo‘ yish orqali, uch qatlamli konussimon qobiq qatlamlari nuqtalarining $U_z^{(m)}$- bo‘ ylama va $U_r^{(m)}$- radial ko‘ chishlarini ifodalovchi quyidagi harakat tenglamalari sistemasiga ega bo‘ lamiz:

$$\tilde{C}_{11}^{(m)}\left(\frac{\partial^2 \tilde{U}_r^{(m)}}{\partial r^2} + \frac{1}{r}\frac{\partial \tilde{U}_r^{(m)}}{\partial r} - \frac{1}{r^2}\tilde{U}_r^{(m)}\right) -$$
$$-\tilde{C}_{44}^{(m)}k^2\tilde{U}_r^{(m)} - k\left(\tilde{C}_{13}^{(m)} + \tilde{C}_{44}^{(m)}\right)\frac{\partial \tilde{U}_z^{(m)}}{\partial r} = \rho_m p^2 \tilde{U}_r^{(m)};$$
$$\tilde{C}_{44}^{(m)}\left(\frac{\partial^2 \tilde{U}_z^{(m)}}{\partial r^2} + \frac{1}{r}\frac{\partial \tilde{U}_z^{(m)}}{\partial r}\right) - k^2\tilde{C}_{33}^{(m)}\tilde{U}_z^{(m)} + \quad (2)$$
$$+k\left(\tilde{C}_{44}^{(m)} + \tilde{C}_{13}^{(m)}\right)\left(\frac{\partial \tilde{U}_r^{(m)}}{\partial r} + \frac{\tilde{U}_r^{(m)}}{r}\right) = \rho_m p^2 \tilde{U}_z^{(m)};$$

Uch qatlamli konussimon qobiqning bo‘ ylama-radial tebranishlari ichki va tashqi $f_n^{(i)}(z,t)$, $f_{S_2}^{(i)}(z,t)$ dinamik kuchlar ta’siri natijasida vujudga keladi, deb faraz qilinadi. Shu sababli, transversal-izotrop xususiyatga ega uch qatlamli konussimon qobiqning $r_l^{(3)}$-tashqi va $r_l^{(1)}$- ichki sirtlarida quyidagi chegaraviy shart o‘ rinli bo‘ ladi:

$$\sigma_{rr}^{(i)} - 2F_i'(z)\sigma_{rz}^{(i)} + \left(F_i'(z)\right)^2\sigma_{zz}^{(i)} = \left(1 + \left(F_i'(z)\right)^2\right)f_n^{(i)};$$
$$F_i'(z)\left(\sigma_{rr}^{(i)} - \sigma_{zz}^{(i)}\right) + \left(1 - \left(F_i'(z)\right)^2\right)\sigma_{rz}^{(i)} = \left(1 + \left(F_i'(z)\right)^2\right)f_{S_2}^{(i)}. \quad (3)$$

(3) ifoda $i = 1$ da ichki sirt uchun chegaraviy shartni va $i = 2$ da tashqi sirt uchun chegaraviy shartni ifodalaydi.

Bundan tashqari, o‘ rta qatlam bilan ichki va tashqi qatlamlar orasida quyidagi dinamik va kinematik kontakt shartlar o‘ rinli bo‘ ladi:

$r_l^{(0)}$ sirtda

$$U_r^{(1)} = U_r^{(0)};\ U_z^{(1)} = U_z^{(0)};\ \sigma_{rr}^{(1)} = \sigma_{rr}^{(0)};\ \sigma_{zz}^{(1)} = \sigma_{zz}^{(0)}. \quad (4)$$

$r_l^{(2)}$ sirtda

$$U_r^{(0)} = U_r^{(2)};\ U_z^{(0)} = U_z^{(2)};\ \sigma_{rr}^{(0)} = \sigma_{rr}^{(2)};\ \sigma_{zz}^{(0)} = \sigma_{zz}^{(2)}. \quad (5)$$

bu yerda $U_r^{(m)}(r,z,t)$ va $U_z^{(m)}(r,z,t)$ uch qatlamli konussimon qobiq qatlamlari nuqtasi radial va bo‘ ylama ko‘ chishlari.

Demak uch qatlamli konussimon qobiqning ichki va tashqi dinamik yuklanishlar ta’siri ostida yuzaga keladigan bo‘ ylama-radial tebranishlari haqidagi masalani yechish (3) tenglamalarni (4) va (5) kinematik va dinamik kontakt shartlarhamda nolga teng boshlang‘ ich shartlar bilan yechishdan iborat bo‘ lar ekan.

Natijalar va ularning tahlili

Masalaning yechimi. Uch qatlamli transversal-izotrop konussimon qobiqning bo‘ ylama-radial tebranish tenglamalarini chiqarish uchun (2) harakat differensial tenglamalar sistemasini (3) chegaraviy, (4) va (5) kontakt shartlar bilan birgalikda yechamiz. Bir qancha matematik amallar va soddalashtirishlarni bajarganimizdan so‘ ng quyidagi differensial tenglamalar sistemasini hosil qilamiz:

$$\left[K_{i1}\frac{\partial}{\partial z} + K_{i2}\right]U_{r,0}^{(0)} + \left[L_{i1}\frac{\partial^3}{\partial t^2\partial z} + L_{i2}\frac{\partial^3}{\partial z^3} + L_{i3}\frac{\partial^2}{\partial t^2} + \right.$$
$$\left. + L_{i4}\frac{\partial^2}{\partial z^2} + L_{i5}\frac{\partial}{\partial z} + L_{i6}\right]\xi U_{r,1}^{(0)} + \left[M_{i1}\frac{\partial}{\partial z} + M_{i2}\right]U_{z,0}^{(0)} +$$

$$+\left[N_{i1}\frac{\partial^2}{\partial z^2}+N_{i2}\frac{\partial}{\partial z}+N_{i3}\right]\xi U_{z,1}^{(0)}=\left(1+\left(F_i'(z)\right)^2\right)f_n^{(i)};$$
$$\left[Q_{i1}\frac{\partial}{\partial z}+Q_{i2}\right]U_{r,0}^{(0)}+\left[J_{i1}\frac{\partial^3}{\partial t^2\partial z}+J_{i2}\frac{\partial^3}{\partial z^3}+J_{i3}\frac{\partial^2}{\partial t^2}+\right.$$
$$\left.+J_{i4}\frac{\partial^2}{\partial z^2}+J_{i5}\frac{\partial}{\partial z}+J_{i6}\right]\xi U_{r,1}^{(0)}+\left[I_{i1}\frac{\partial}{\partial z}+I_{i2}\right]U_{z,0}^{(0)}+$$
$$+\left[R_{i1}\frac{\partial^2}{\partial z^2}+R_{i2}\frac{\partial}{\partial z}+R_{i3}\right]\xi U_{z,1}^{(0)}=\left(1+\left(F_i'(z)\right)^2\right)f_{S_2}^{(i)};\quad (6)$$

bu yerda K_{ij}, L_{ij}, M_{ij}, N_{ij}, Q_{ij}, J_{ij}, I_{ij} va R_{ij} uch qatlamli konussimon qobiqning geometrik va fizik parametrlariga bog‘ liq bo‘ lgan o‘ zgarmas koeffitsiyenlar. Masalan:

$$K_{11}=F_1'(z)r_l^{(1)}C_{44}^{(1)};\ \dots\dots$$
$$L_{14}=-\frac{C_{44}^{(0)}}{2C_{11}^{(0)}}\left(C_{11}^{(1)}+C_{12}^{(1)}+2\left(F_1'(z)\right)^2C_{13}^{(1)}\right)\left(\ln\frac{r_l^{(0)}}{\xi}-\frac{1}{2}\right);\ \dots\dots$$

(6) tenglamalar sistemasidagi $U_{r,0}^{(0)}$, $U_{z,0}^{(0)}$, $U_{r,1}^{(0)}$ va $U_{z,1}^{(0)}$ izlanuvchi funksiyalar. Ular uch qatlamli konussimon qobiqning markaziy o‘ qidan ξ masofada joylashgan o‘ rta qatlamdan tanlangan sirtdagi ko‘ chish vektorining komponentalari hisoblanadi. Uch qatlamli konussimon qobiqning qatlamlaridagi ko‘ chish va kuchlanishlarni topish uchun uch qatlamli konussimon qobiqning qatlamlaridagi ko‘ chish va kuchlanishlarni ham $U_{r,0}^{(0)}$, $U_{z,0}^{(0)}$, $U_{r,1}^{(0)}$ va $U_{z,1}^{(0)}$ izlanuvchi funksiyalar orqali ifodalaymiz:

Uch qatlamli konussimon qobiqning ichki qatlamidagi ko‘ chish va kuchlanishlar quyidagicha:

$$\sigma_{rr}^{(1)}=\left(-\rho_1-\frac{C_{12}^{(1)}\rho_1}{2C_{11}^{(1)}}\right)\frac{\partial^2U_{r,0}^{(0)}}{\partial t^2}+\left(C_{44}^{(1)}+\frac{C_{12}^{(1)}C_{44}^{(1)}}{2C_{11}^{(1)}}\right)\frac{\partial^2U_{r,0}^{(0)}}{\partial z^2}+$$
$$+\rho_0\rho_1\left(1-2\ln\left(\frac{r_l^{(0)}}{\xi}\right)\right)\frac{\left(2C_{11}^{(1)}+C_{12}^{(1)}\right)}{4C_{11}^{(0)}C_{11}^{(1)}}\xi\frac{\partial^4U_{r,1}^{(0)}}{\partial t^4}+$$
$$+\frac{\left(2C_{11}^{(1)}+C_{12}^{(1)}\right)}{4C_{11}^{(0)}C_{11}^{(1)}}\left(2C_{44}^{(0)}\rho_1\ln\left(\frac{r_l^{(0)}}{\xi}\right)-C_{44}^{(0)}\rho_1+2C_{44}^{(1)}\rho_0\ln\left(\frac{r_l^{(0)}}{\xi}\right)-C_{44}^{(1)}\rho_0\times\right.$$
$$\left.\times\xi\frac{\partial^4U_{r,1}^{(0)}}{\partial t^2\,\partial z^2}+\left(\frac{\rho_1\xi\left(-2C_{11}^{(1)}-C_{12}^{(1)}\right)}{C_{11}^{(1)}\left(r_l^{(0)}\right)^2}\right)\frac{\partial^2U_{r,1}^{(0)}}{\partial t^2}+\frac{C_{44}^{(0)}C_{44}^{(1)}}{4C_{11}^{(0)}C_{11}^{(1)}}\times\right.$$
$$\left.\times\left(1-2\ln\left(\frac{r_l^{(0)}}{\xi}\right)\right)\left(2C_{11}^{(1)}+C_{12}^{(1)}\right)\xi\frac{\partial^4U_{r,1}^{(0)}}{\partial z^4}+\right.\quad (7)$$
$$+\frac{C_{44}^{(1)}}{C_{11}^{(1)}\left(r_l^{(0)}\right)^2}\left(2C_{11}^{(1)}+C_{12}^{(1)}\right)\xi\frac{\partial^2U_{r,1}^{(0)}}{\partial z^2}-\frac{C_{13}^{(1)}\rho_1}{C_{11}^{(1)}}\frac{\partial^3U_{z,0}^{(0)}}{\partial t^2\,\partial z}+\frac{C_{13}^{(1)}C_{44}^{(1)}}{C_{11}^{(1)}}\frac{\partial^3U_{z,0}^{(0)}}{\partial z^3}+$$
$$+\frac{\rho_1B_1^{(0)}}{4C_{11}^{(1)}}\left(2C_{11}^{(1)}\left(2\ln\left(\frac{r_l^{(0)}}{\xi}\right)-1\right)+2C_{12}^{(1)}\ln\left(\frac{r_l^{(0)}}{\xi}\right)-C_{12}^{(1)}-\right.$$
$$\left.-4\frac{C_{13}^{(1)}}{B_1^{(0)}}\ln\left(\frac{r_l^{(0)}}{\xi}\right)\xi\frac{\partial^3U_{z,1}^{(0)}}{\partial t^2\,\partial z}++\frac{C_{44}^{(1)}B_1^{(0)}}{4C_{11}^{(1)}}\left(2C_{11}^{(1)}\left(1-2\ln\left(\frac{r_l^{(0)}}{\xi}\right)\right)-\right.\right.$$
$$\left.\left.-2C_{12}^{(1)}\ln\left(\frac{r_l^{(0)}}{\xi}\right)+C_{12}^{(1)}+4\frac{C_{13}^{(1)}}{B_1^{(0)}}\ln\left(\frac{r_l^{(0)}}{\xi}\right)\xi\right)\frac{\partial^3U_{z,1}^{(0)}}{\partial z^3};\right.$$

$\sigma_{\theta\theta}^{(1)}$, $\sigma_{zz}^{(1)}$ va $\sigma_{rz}^{(1)}$ kuchlanishlar ham xuddi shunday ifodalanadi. Xuddi shunday uch qatlamli konussimon qobiqning o‘ rta qatlamidagi ko‘ chish va kuchlanishlar quyidagicha:

$$\sigma_{rr}^{(0)}=\frac{\rho_0\left(2C_{11}^{(0)}+C_{12}^{(0)}\right)}{C_{11}^{(0)}}\frac{\partial^2U_{r,0}^{(0)}}{\partial t^2}-\frac{C_{44}^{(0)}\left(2C_{11}^{(0)}+C_{12}^{(0)}\right)}{C_{11}^{(0)}}\frac{\partial^2U_{r,0}^{(0)}}{\partial z^2}-$$
$$-\frac{\left(2C_{11}^{(0)}+C_{12}^{(0)}\right)}{2\left(C_{11}^{(0)}\right)^2}\frac{\partial^4U_{r,1}^{(0)}}{\partial t^4}+\frac{C_{44}^{(0)}\rho_0\left(2C_{11}^{(0)}+C_{12}^{(0)}\right)}{\left(C_{11}^{(0)}\right)^2}\xi\times$$
$$\times\frac{\partial^4U_{r,1}^{(0)}}{\partial t^2\,\partial z^2}-\frac{2C_{13}^{(0)}\rho_0\xi}{B_1^{(0)}C_{11}^{(0)}}\frac{\partial^2U_{r,1}^{(0)}}{\partial t^2}+\frac{\left(C_{44}^{(0)}\right)^2\left(-2C_{11}^{(0)}-C_{12}^{(0)}\right)}{2\left(C_{11}^{(0)}\right)^2}\xi\frac{\partial^4U_{r,1}^{(0)}}{\partial z^4}+$$

$$+\frac{2C_{13}^{(0)}C_{44}^{(0)}\xi}{B_1^{(0)}C_{11}^{(0)}}\frac{\partial^2 U_{r,1}^{(0)}}{\partial z^2}+\frac{2C_{13}^{(0)}\rho_0}{C_{11}^{(0)}}\frac{\partial^3 U_{z,0}^{(0)}}{\partial t^2\,\partial z}-\frac{2C_{13}^{(0)}C_{44}^{(0)}}{C_{11}^{(0)}}\frac{\partial^3 U_{z,0}^{(0)}}{\partial z^3}+ \quad (8)$$

$$+\frac{\rho_0\xi B_1^{(0)}}{2C_{11}^{(0)}}\left(-2C_{11}^{(0)}+C_{12}^{(0)}+2\frac{C_{13}^{(0)}}{B_1^{(0)}}\right)\frac{\partial^3 U_{z,1}^{(0)}}{\partial t^2\,\partial z}+$$

$$+\frac{B_1^{(0)}C_{44}^{(0)}\xi}{2C_{11}^{(0)}}\left(2C_{11}^{(0)}-C_{12}^{(0)}-2\frac{C_{13}^{(0)}}{B_1^{(0)}}\right)\frac{\partial^3 U_{z,1}^{(0)}}{\partial z^3};$$

Uch qatlamli konussimon qobiqning bo‘ ylama-radial tebranishlarida hosil bo‘ ladigan o‘ rta qatlamning qolgan $\sigma_{\theta\theta}^{(0)}$, $\sigma_{zz}^{(0)}$ va $\sigma_{rz}^{(0)}$ larni ham izlanuvchi $U_{r,0}^{(0)}$, $U_{z,0}^{(0)}$, $U_{r,1}^{(0)}$ va $U_{z,1}^{(0)}$ funksiyalar orqali ifodalaymiz.

Uch qatlamli konussimon qobiqning tashqi qatlamida hosil bo‘ ladigan kuchlanishlarni ham $U_{r,0}^{(0)}$, $U_{z,0}^{(0)}$, $U_{r,1}^{(0)}$ va $U_{z,1}^{(0)}$ izlanuvchi funksiyalar orqali ifodalaymiz.

Masalan:

$$\sigma_{rz}^{(2)}=\frac{C_{44}^{(2)}\left(r_l^{(2)}\right)^2}{2r}\frac{\partial U_{r,0}^{(0)}}{\partial z}+\frac{C_{44}^{(2)}\left(r_l^{(2)}\right)^2\rho_0\xi}{4C_{11}^{(0)}r}\frac{\partial^3 U_{r,1}^{(0)}}{\partial t^2\,\partial z}-\frac{C_{44}^{(0)}C_{44}^{(2)}\left(r_l^{(2)}\right)^2\xi}{4C_{11}^{(0)}r}\times$$

$$\times\frac{\partial^3 U_{r,1}^{(0)}}{\partial z^3}+\frac{C_{44}^{(2)}\xi}{r}\left(2\ln\left(\frac{r_l^{(2)}}{\xi}\right)-1\right)\frac{\partial U_{r,1}^{(0)}}{\partial z}-\frac{C_{44}^{(2)}}{r}U_{z,0}^{(0)} \quad (9)$$

$$+\frac{B_1^{(0)}C_{44}^{(2)}\left(r_l^{(2)}\right)^2\xi}{4r}\left(2\ln\left(\frac{r_l^{(2)}}{\xi}\right)-1\right)\frac{\partial^3 U_{z,1}^{(0)}}{\partial z^3}+\frac{C_{44}^{(2)}\xi}{r}\ln\left(\frac{r_l^{(2)}}{\xi}\right)\frac{\partial U_{z,1}^{(0)}}{\partial z}.$$

XULOSA

Ushbu maqolada transversal-izotrop uch qatlamli konussimon qobiqning bo‘ ylama-radial tebranishlari masalasi o‘ qqa nisbatan simmetrik masala sifatida qaraldi va uning to‘ liq matematik modeli ishlab chiqildi. Uch qatlamli konussimon qobiqqa silindrik koordinatalar sistemasi joylashtirilib, ichki, o‘ rta va tashqi qatlamlarning geometrik parametrlari (qalinliklari, radiuslari, konusning yasovchi burchagi) orasidagi bog‘ lanishlar aniq analitik ko‘ rinishda ifodalandi. Bu esa qobiqning istalgan ko‘ ndalang kesimidagi geometriyasini yagona formulalar orqali tavsiflash imkonini berdi. Matematik amallar va soddalashtirishlar natijasida qobiqning bo‘ ylama-radial tebranishlarini to‘ liq tavsiflovchi yakuniy tenglamalar sistemasi olindi. Olingan natijalar uch qatlamli konussimon qobiqlarning dinamik xususiyatlarini nazariy jihatdan chuqurroq tushunishga xizmat qilib, aviatsiya, gidrotexnika inshootlari, transport vositalari va qurilish sanoatida qo‘ llaniladigan yengil va yuqori mustahkamlikka ega ko‘ p qatlamli konstruksiyalarni loyihalashda muhim amaliy ahamiyatga ega. Xususan, ishlab chiqilgan model konstruksiyaning rezonans chastotalarini, tebranish amplitudalarini va kuchlanish konsentratsiyasi hududlarini oldindan baholash imkonini beradi. Keyingi olingan (6) tenglamalar sistemasi aniq chegaraviy shartlar bilan birgalikda sonli usullar yordamida yechiladi. Uch qatlamli konussimon qobiqning qatlamlaridagi ko‘ chish va kuchlanishlar grafiklarda tasvirlanadi. Uch qatlamli konussimon qobiq qatlamlari materiallarining tebranish jarayonidagi kuchlanganlik-deformatsiyalanganlik holatlari baholanadi.

$YBa_2Cu_3O_{7-\delta}$ YUQORI HARORATLI O‘ TA O‘ TKAZGICHLARIDA KISLOROD STEXIOMET RIYASI HAMDA KRISTALL TUZILISH PARAMETRLARINING KRITIK HARORATGA TA’SIRI

A.A. Turayev
BuxDU «Fizika» kafedrasi professori, f.-m.f.d. (PhD), professor

Annotatsiya: *Maqolada $YBa_2Cu_3O_{7-\delta}$ (Y123) tizimida kritik haroratni (T_c) belgilovchi struktura-kimyoviy omillar — kislorod stexiometriyasi, panjara parametrlari va ortorombik deformatsiya (η) — o‘ rtasidagi bog‘ liqlik uchta nashr etilgan manbadan yig‘ ilgan ma’lumotlar asosida ko‘ p manbali statistik tahlil orqali o‘ rganildi. Qattiq fazali reaksiya usuli bilan sintez qilingan Y123 namunalari bo‘ yicha 11 ta ma’lumot nuqtasi (jumladan mualliflarning yuqori fazaviy tozalikdagi namunasi, T_c = 95,5 K) birlashtirildi. Manba effektini hisobga olgan holda o‘ tkazilgan tahlil kislorod tarkibi bilan T_c o‘ rtasida barqaror bog‘ liqlikni ko‘ rsatdi: umumiy Pearson r = 0,80 (p = 0,003), eng katta manba ichida r = 0,91, manba nazoratga olingandagi qisman (partial) korrelyatsiya esa r = 0,69 (p = 0,019). Ortorombiklik η bilan esa ham global, ham manba nazoratidagi korrelyatsiya deyarli nol (r ≈ −0,03) bo‘ lib chiqdi. Natijalar 2026-yilda e’lon qilingan uch yangi tadqiqot kontekstida muhokama qilindi.*

Kalit so‘ zlar: *YHO‘ O‘ , YBCO, kislorod stexiometriyasi, ortorombiklik, kritik harorat, ko‘ p manbali tahlil, manba effekti, Rietveld tahlili.*

EFFECT OF OXYGEN STOICHIOMETRY AND CRYSTAL STRUCTURE PARAMETERS ON THE CRITICAL TEMPERATURE IN $YBa_2Cu_3O_{7-\delta}$ HIGH-TEMPERATURE SUPERCONDUCTORS

Abstract: *This work analyzes the relationship between the structural-chemical factors governing the critical temperature (T_c) of $YBa_2Cu_3O_{7-\delta}$ — oxygen stoichiometry, lattice parameters, and orthorhombic distortion (η) — using data compiled from three published sources rather than eleven independent experiments. Eleven data points for solid-state-synthesized Y123, including the authors’ high-phase-purity sample (T_c = 95.5 K), were pooled. Accounting for the source (laboratory) effect, the oxygen–T_c relationship remained robust: overall Pearson r = 0.80 (p = 0.003), within the largest source r = 0.91, and the source-controlled partial correlation r = 0.69 (p = 0.019). Orthorhombicity η showed a near-zero correlation (r ≈ −0.03) both globally and after controlling for source. Cross-study heterogeneity and its limitations are explicitly discussed.*

Keywords: *HTSC, YBCO, oxygen stoichiometry, orthorhombicity, critical temperature, multi-source analysis, Rietveld analysis.*

Kirish

Yuqori haroratli o‘ ta o‘ tkazgichlar (YHO‘ O‘) orasida $YBa_2Cu_3O_{7-\delta}$ (Y123) o‘ zining nisbatan yuqori kritik harorati, kimyoviy barqarorligi va texnologik jihatdan arzon sintez imkoniyatlari tufayli eng istiqbolli nomzodlardan biri bo‘ lib qolmoqda [1,2]. Y123 ning o‘ ta o‘ tkazuvchanlik xatti-harakatini belgilovchi asosiy parametr Cu–O zanjirlaridagi kislorod miqdori bo‘ lib, u CuO_2 tekisliklaridagi teshik konsentratsiyasiga bevosita ta’sir ko‘ rsatadi va ortorombik–tetragonal struktura o‘ tishini boshqaradi [3,4].

Adabiyotda struktura parametrlari (panjara o‘ lchamlari a, b, c, ortorombik deformatsiya η) bilan T_c o‘ rtasidagi bog‘ liqlik ko‘ p marta muhokama qilingan [5–8], biroq bu ishlarning aksariyati alohida sintez seriyasi doirasida olib borilgan. Turli mustaqil laboratoriyalarning natijalarini birlashtirgan holda statistik tekshirish nisbatan kamdan-kam uchraydi. Shu bilan birga, bunday birlashtirish manba (laboratoriya) effektini hisobga olishni talab qiladi, chunki turli manbalarda kislorodni aniqlash, T_c ni o‘ lchash va strukturaviy tavsiflash usullari farq qilishi mumkin. Ushbu ishning maqsadi ikki tomonlama: (i) qattiq fazali reaksiya usuli bilan sintez qilingan Y123 namunalari bo‘ yicha nashr etilgan struktura–T_c ma’lumotlarini manba effektini hisobga olgan holda statistik tahlil qilish; (ii) olingan natijalarni 2026-yilda e’lon qilingan eng so‘ nggi uchta ilmiy ish [11,12,13] kontekstida muhokama qilish.

Muhim uslubiy izoh: mazkur ishda tahlil qilingan 11 ta ma’lumot nuqtasi 11 ta o‘ zaro to‘ liq mustaqil eksperimental tadqiqot emas, balki uchta nashr etilgan manbadan yig‘ ilgan kuzatuvlardir. Xususan, 1–6-ma’lumot nuqtalari [8] manbadan (Howe), 7–10-nuqtalar [5] manbadan (Sahoo va h.k.), 11-nuqta esa mualliflarning o‘ z ishidan [1] (Turayev va

h.k.) olingan (1-jadval). Shu sababli bir xil manbadan olingan nuqtalar o‘ zaro to‘ liq statistik mustaqil deb hisoblanmaydi va manba (laboratoriya) effekti tahlilga alohida kiritilgan (quyida «Statistik tahlil» bo‘ limiga qarang).

1-jadval. Qattiq fazali reaksiya usuli bilan sintez qilingan Y123 namunalarining birlashtirilgan struktura–T_c ma’lumotlari (n=11; uchta manbadan). Ortorombiklik η=(b−a)/(b+a) hisoblab chiqildi.

№	7−δ	a, Å	b, Å	c, Å	T_c, K	Manba
1	6.60	3.81	3.87	7.81	78	[8]
2	6.65	3.81	3.87	7.81	80	[8]
3	6.69	3.81	3.88	9.10	89.5	[8]

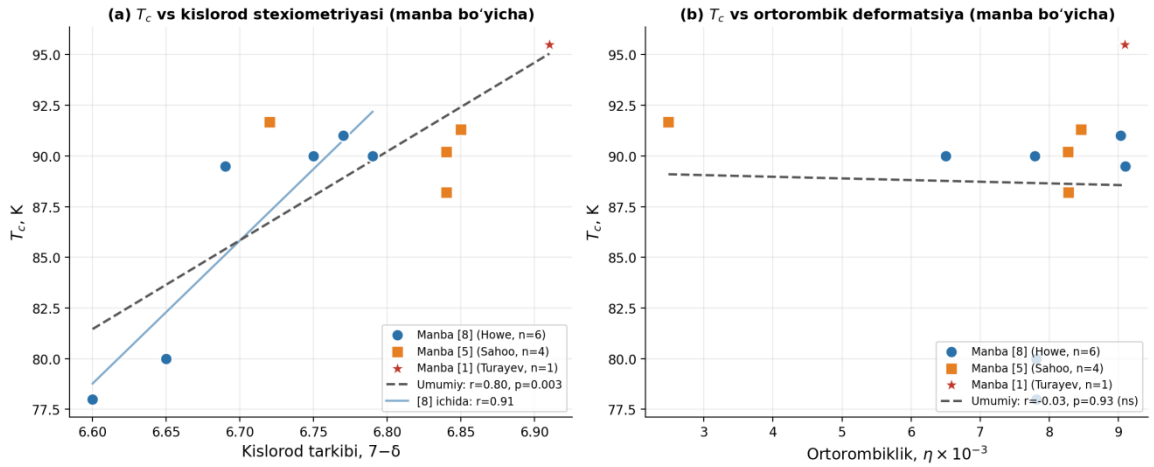
Strukturaviy ma’lumotlarning kelib chiqishi va Rietveld tahlili



Panjara parametrlari (a, b, c) va kislorod tarkibi (7−δ) har bir manbada rentgen (yoki neytron) kukun difraksiyasi va Rietveld/WPPF tahlili orqali aniqlangan. Meta-tahlilning tabiatidan kelib chiqib, dastlabki tozalash (refinement) sifat ko‘ rsatkichlari barcha manbalarda bir xil darajada keltirilmaganini alohida ta’kidlash lozim — bu ushbu ishning cheklovi bo‘ lib, 2-jadvalda umumlashtirilgan. Mualliflarning o‘ z namunasi ([1]) uchun tahlil To‘ liq Difraktogramma Moslashtirish (WPPF) va Rietveld usuli bilan bajarilib, faza sofligi 99,21 %, panjara parametrlari a = 3,8227 Å, b = 3,8929 Å, c = 11,6889 Å, elementar yacheyka hajmi 173,952 $Å^3$ va mikrodeformatsiya 0,064 % qiymatida aniqlangan; kislorod indeksi esa atom pozitsiyalari bandligini yig‘ ish orqali $O_{total} \approx 6{,}91$ deb hisoblangan [1].

2-jadval. Manbalar bo‘ yicha strukturaviy va o‘ lchov usullarining bir xil emasligi (cross-study heterogeneity).

Ko‘ rsatkich	Manba [8]	Manba [5]	Manba [1]
Difraksiya/tahlil	XRD, Rietveld	XRD, Rietveld	XRD, WPPF+Rietveld
Refinement sifati (R_{wp}, χ^2)	to‘ liq keltirilmagan	to‘ liq keltirilmagan	keltirilgan
Kislorod aniqlash	struktura/kalibr.	struktura/kalibr.	site occupancy
T_c mezoni	o‘ tish (onset/mid)	o‘ tish (onset/mid)	$T_{c,mid}$=95,5 K
Faza sofligi	keltirilmagan	qisman	99,21 %
Nuqtalar soni	6	4	1

Har bir juftlik uchun Pearson korrelyatsiya koeffitsienti (r), unga mos p-qiymati va chiziqli regressiya (eng kichik kvadratlar usuli) hisoblandi. Manba effektini hisobga olish uchun uch qo‘ shimcha tahlil bajarildi: (i) har bir ko‘ p namunali manba ichida alohida korrelyatsiya; (ii) manbani soxta o‘ zgaruvchi (dummy) sifatida kiritib, qoldiqlar asosida qisman (partial) korrelyatsiya; (iii) bitta manbani chiqarib tashlab qayta hisoblash (leave-one-source-out) sezuvchanlik tahlili. Tahlil Python (SciPy) muhitida bajarildi; statistik ishonchlilik chegarasi $p < 0{,}05$ sifatida qabul qilindi.

Umumiy tahlil (n=11) kislorod tarkibi (7−δ) T_c ning statistik jihatdan yagona ishonchli bashoratchisi ekanligini ko‘ rsatdi ($r = 0{,}80$; $p = 0{,}003$; $R^2 = 0{,}64$), ortorombiklik η bilan esa amaliy jihatdan hech qanday chiziqli bog‘ liqlik kuzatilmadi ($r = -0{,}03$; $p = 0{,}93$) (1-rasm, 3-jadval).

1-rasm. (a) T_c ning kislorod stexiometriyasiga va (b) ortorombik deformatsiyaga bog‘ liqligi, manba bo‘ yicha ranglangan. Kislorod–T_c trendi eng katta manba ([8]) ichida ham saqlanadi.

Taqrizda ko‘ tarilgan asosiy masala — ma’lumotlarning bir necha manbadan olingani va ularning to‘ liq mustaqil emasligi — ni hal qilish uchun manba effektini hisobga oluvchi qo‘ shimcha tahlil o‘ tkazildi (3-jadval). Natijalar quyidagicha: (i) eng katta manba ([8], n=6) ichida kislorod–T_c korrelyatsiyasi kuchli va ishonchli (r = 0,91; p = 0,013); (ii) manba soxta o‘ zgaruvchi sifatida nazoratga olinganda qisman korrelyatsiya baribir ishonchli bo‘ lib qoladi (r = 0,69; p = 0,019). Ikkinchi ko‘ p namunali manba ([5], n=4) ichida esa korrelyatsiya zaif va statistik jihatdan ishonchsiz (r = −0,52; p = 0,48) bo‘ lib, bu ushbu manbada kislorod tarkibi oralig‘ ining juda tor (6,72–6,85) bo‘ lishi va namunalar sonining kamligi bilan izohlanadi. Ortorombiklik η esa manba nazoratra olingandan keyin ham T_c bilan bog‘ lanmagan (partial r = −0,04; p = 0,91).

3-jadval. Manba (laboratoriya) effektini hisobga oluvchi statistik tahlil natijalari.

Tahlil	n	kislorod–T_c (r, p)	η–T_c (r, p)
Umumiy (barcha manbalar)	11	0,80; 0,003	−0,03; 0,93
Manba [8] ichida (Howe)	6	0,91; 0,013	0,17; 0,74
Manba [5] ichida (Sahoo)	4	−0,52; 0,48	−0,55; 0,45
Manba nazoratda (partial)	11	0,69; 0,019	−0,04; 0,91

Ushbu qo‘ shimcha tahlil taqrizchining e’tiroziga aniq javob beradi: kislorod–T_c bog‘ liqligi shunchaki manbalarni birlashtirish artefakti emas, balki eng katta manba ichida ham, manba effekti statistik jihatdan nazoratga olingandan keyin ham saqlanadigan barqaror bog‘ liqlikdir. Aksincha, ortorombiklik η T_c ning global bashoratchisi bo‘ la olmaydi.

Bir necha manbadan olingan T_c va strukturaviy qiymatlarni birlashtirishda quyidagi omillar bir xil bo‘ lmasligi mumkin va bu tahlil natijalariga ta’sir qiladi: namuna tayyorlash sharoiti, kuydirish (annealing) harorati, kislorodlash protokoli va sovutish tezligi, namuna zichligi va donalar o‘ lchami, faza sofligi, T_c ni o‘ lchash usuli hamda T_c ning onset yoki midpoint sifatida olinishi (2-jadval). Ushbu bir xil emaslik (heterogeneity) korrelyatsiyalarni ham kuchaytirishi, ham susaytirishi mumkin. Shu sababli mazkur ishda olingan miqdoriy koeffitsientlar mutlaq emas, balki umumiy tendensiyani ko‘ rsatuvchi baholar sifatida talqin qilinishi lozim. Shunga qaramay, kislorod–T_c bog‘ liqligining manba ichida va manba nazoratida saqlanishi bu tendensiyaning mustahkamligini ko‘ rsatadi.

Olingan xulosa 2026-yilgi uch muhim ishning natijalari bilan uyg‘ un: (i) Conradson va h.k. (PNAS, 2026) an’anaviy «legirlash gumbazi» modelining legirlash usuliga xos artefakt bo‘ lishi mumkinligini ko‘ rsatdi [12]; (ii) Kethamkuzhi va h.k. (Scientific Reports, 2026) kislorod kinetikasining YBCO plyonkalarida ham markaziy rol o‘ ynashini tasdiqladi [13]; (iii) Luccas va h.k. (arXiv, 2026) past haroratli kislorodlashda Ortho-II o‘ ta strukturasi orqali o‘ tish yakuniy strukturada doimiy iz qoldirishini, ya’ni η tarqoqligining mexanistik sababini ko‘ rsatdi [11]. Bu ishlar mazkur tahlil xulosasini — kislorod tarkibi (va u orqali teshik konsentratsiyasi) T_c ning asosiy boshqaruvchisi, η esa kislorod tartiblanishining hosilaviy «barmoq izi» ekanligini — mustahkamlaydi.

Xulosa

Uchta nashr etilgan manbadan yig‘ ilgan struktura–T_c ma’lumotlarining manba effektini hisobga oluvchi statistik tahlili shuni ko‘ rsatdiki, kislorod stexiometriyasi (7−δ) T_c ning eng ishonchli struktura-kimyoviy bashoratchisidir: bog‘ liqlik umumiy holatda (r = 0,80; p = 0,003), eng katta manba ichida (r = 0,91) va manba nazoratga olinganda (partial r = 0,69; p = 0,019) saqlanadi. Ortorombik deformatsiya η esa global miqyosda T_c bilan bog‘ lanmagan (r ≈ −0,03) bo‘ lib, u

kislorod tartiblanishining hosilaviy indikatoridir. Ma'lumotlarning ko' p manbadan olingani va ular orasidagi eksperimental heterogeneity ushbu ishning asosiy cheklovi bo' lib, olingan koeffitsientlar tendensiya baholari sifatida talqin qilinishi kerak. Kelgusi tadqiqotlarda kislorod tarkibidan Tallon formulasi orqali hisoblangan teshik konsentratsiyasi p asosiy o' zgaruvchi sifatida qo' llanilishi va manba effekti aralash-effektli (mixed-effects) modellar bilan qat'iyroq hisobga olinishi tavsiya etiladi [14].

ELECTROPHYSICAL PROPERTIES OF NB THIN FILMS DEPOSITED ON THERMALLY OXIDIZED SiO_2/SI(111) SUBSTRATES BY DC AND RF MAGNETRON SPUTTERING

Abstract; *In this study, the electrophysical properties of niobium (Nb) thin films deposited on thermally oxidized SiO_2/Si(111) substrates by DC and RF magnetron sputtering were investigated. The crystal structure of the deposited films was characterized by X-ray diffraction (XRD), while their electrophysical parameters were determined using the Van der Pauw method with an HMS-5000 Hall Effect Measurement System. The current–voltage (I–V) characteristics, electrical conductivity, electrical resistivity, and the temperature dependence of charge carrier mobility were comparatively analyzed. The experimental results demonstrated that the magnetron sputtering mode has a significant influence on the electrophysical properties of Nb thin films. XRD analysis confirmed a higher degree of crystallinity in the films deposited by the RF magnetron sputtering mode. Hall effect measurements further revealed that the RF-deposited films exhibited higher electrical conductivity and charge carrier mobility, together with lower electrical resistivity, compared with those prepared by the DC mode. These findings indicate that RF magnetron sputtering is a more effective deposition mode for producing Nb thin films with improved electrophysical properties.*

Keywords: *niobium, Nb thin films, SiO_2/Si(111) substrate, DC magnetron sputtering, RF magnetron sputtering, Hall effect, Van der Pauw method, electrical conductivity, electrical resistivity, charge carrier mobility.*

DC VA RF MAGNETRON CHANGLATISH USULLARIDA TERMIK OKSIDLANGAN SiO_2/SI(111) TAGLIKLARDA OLINGAN NB YUPQA PLYONKALARINING ELEKTROFIZIK XOSSALARI

Annotatsiya; *Ushbu ishda termik oksidlangan SiO_2/Si(111) tagliklarda magnetron changlatish qurilmasining DC va RF rejimlarida olingan niobiy (Nb) yupqa plyonkalarining elektrofizik xossalari tadqiq qilindi. Namunalarning kristall tuzilishi rentgen difraksiyasi (XRD) usuli yordamida baholandi, elektrofizik parametrlari esa Hall effekti asosidagi HMS-5000 qurilmasi yordamida Van der Pau usuli yordamida aniqlandi. Tok–kuchlanish (I–V) xarakteristikalari, elektr o‘ tkazuvchanlik, solishtirma elektr qarshilik hamda zaryad tashuvchilar harakatchanligining temperaturaga bog‘ liqligi qiyosiy ravishda tahlil qilindi. Tadqiqot natijalari magnetron changlatish rejimi Nb yupqa plyonkalarining elektr xossalariga sezilarli ta’sir ko‘ rsatishini ko‘ rsatdi. XRD tahlili RF rejimida olingan plyonkalarning kristallanish darajasi yuqoriroq ekanligini tasdiqladi. Hall effekti o‘ lchovlari esa RF magnetron changlatish usulida tayyorlangan namunalarda elektr o‘ tkazuvchanlik va zaryad tashuvchilar harakatchanligi ortishi, solishtirma elektr qarshilik esa kamayishini ko‘ rsatdi. Olingan natijalar RF magnetron changlatish usuli elektrofizik parametrlari yaxshilangan Nb yupqa plyonkalarini olish uchun samaraliroq texnologik rejim ekanligini tasdiqlaydi.*

Kalit so‘ zlar: *niobiy, Nb yupqa plyonkalari, SiO_2/Si(111) taglik, DC magnetron changlatish, RF magnetron changlatish, Hall effekti, Van der Pau usuli, elektr o‘ tkazuvchanlik, solishtirma elektr qarshilik, zaryad tashuvchilar harakatchanligi.*

ЭЛЕКТРОФИЗИЧЕСКИЕ СВОЙСТВА ТОНКИХ ПЛЕНОК Nb, ПОЛУЧЕННЫХ НА ТЕРМИЧЕСКИ ОКИСЛЕННЫХ ПОДЛОЖКАХ SiO_2/Si(111) МЕТОДАМИ DC И RF МАГНЕТРОННОГО РАСПЫЛЕНИЯ

Аннотация; *В данной работе исследованы электрофизические свойства тонких пленок ниобия (Nb), полученных на термически окисленных подложках SiO_2/Si(111) методами DC и RF магнетронного распыления. Кристаллическая структура образцов была исследована методом рентгеновской дифракции (XRD), а электрофизические параметры определены методом Ван дер Пау с использованием установки HMS-5000 для измерения эффекта Холла. Проведен сравнительный анализ вольт-амперных (I–V) характеристик, электрической проводимости, удельного электрического сопротивления, а также зависимости подвижности носителей заряда от температуры. Результаты исследования показали, что режим магнетронного распыления оказывает существенное влияние на электрические свойства тонких пленок Nb. Рентгенодифракционный анализ подтвердил более высокую степень кристалличности пленок, полученных методом RF магнетронного распыления. Измерения эффекта Холла показали, что образцы, полученные методом RF*

магнетронного распыления, характеризуются более высокой электрической проводимостью и подвижностью носителей заряда, а также меньшим удельным электрическим сопротивлением по сравнению с образцами, полученными методом DC магнетронного распыления. Полученные результаты подтверждают, что RF магнетронное распыление является более эффективным технологическим режимом для получения тонких пленок Nb с улучшенными электрофизическими свойствами.

Ключевые слова: *ниобий, тонкие пленки Nb, подложка SiO_2/Si(111), DC магнетронное распыление, RF магнетронное распыление, эффект Холла, метод Ван дер Пау, электрическая проводимость, удельное электрическое сопротивление, подвижность носителей заряда.*

Introduction

Niobium (Nb) is one of the refractory metals distinguished by its high melting point, low electrical resistivity, high electrical conductivity, chemical stability, and superconducting properties. Owing to these characteristics, Nb thin films are widely used in microelectronics, cryogenic electronics, quantum devices, Josephson junctions, high-frequency resonators, superconducting detectors, and vacuum electronics [1–3].

In recent years, increasing attention has been paid to Nb-based thin films. This is primarily due to the strong dependence of their electrophysical properties, including electrical conductivity, electrical resistivity, and charge carrier mobility, on the crystal structure, crystallite boundaries, internal stresses, and structural defects [4–6]. Therefore, controlling the electrophysical parameters of Nb thin films is of great scientific and practical importance for the development of high-performance functional electronic devices.

Among the various techniques for fabricating Nb thin films, physical vapor deposition (PVD), particularly DC and RF magnetron sputtering, is one of the most widely used methods. These technologies enable the deposition of high-purity thin films with excellent adhesion and controllable thickness. However, the operating mode of the magnetron significantly influences plasma density, ion energy, and the surface diffusion of adatoms. Consequently, the degree of crystallization, crystallite size, structural defect density, and electrical properties of the deposited films may change considerably [7–10].

A review of the literature shows that numerous studies have been devoted to the crystal structure, surface morphology, and mechanical properties of Nb thin films. However, comparative investigations of the electrical parameters determined by the Hall effect for Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates under DC and RF magnetron sputtering conditions remain relatively limited [11–15]. Therefore, determining the influence of the magnetron sputtering mode on the electrophysical properties of Nb thin films is considered one of the important scientific and practical challenges.

The scientific novelty of this study lies in the comparative evaluation of the electrophysical parameters of Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates by DC and RF magnetron sputtering, as determined by the Hall effect, in revealing their relationship with the crystal structure, and in explaining the influence mechanism of the magnetron sputtering mode on the electrical properties of the films.

The aim of this work is to investigate the electrophysical properties of Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates by DC and RF magnetron sputtering using the Hall effect based on the Van der Pauw method, to determine the temperature dependence of electrical conductivity, electrical resistivity, and charge carrier mobility, and to comparatively analyze these results in relation to the crystal structure characteristics determined by X-ray diffraction. The use of a thermally grown SiO_2 layer modifies the interfacial properties between the substrate and the metallic film and may significantly affect the electrical parameters. Therefore, investigating the electrical properties of Nb thin films deposited on SiO_2/Si(111) substrates is of particular scientific and practical interest [12–15].

Literature Review

Niobium (Nb)-based thin films are widely used in the fields of microelectronics, nanoelectronics, and quantum electronics owing to their high electrical conductivity, superconducting properties, chemical and thermal stability, and excellent corrosion resistance [1–3]. In particular, Nb thin films are considered one of the most promising materials for the fabrication of Josephson junctions, superconducting quantum interference devices (SQUIDs), high-frequency resonators, and cryogenic sensors [4].

In recent years, DC and RF magnetron sputtering have been widely employed for the deposition of Nb thin films. These techniques enable the fabrication of high-purity coatings with controllable thickness and excellent adhesion. Numerous studies have demonstrated that magnetron sputtering parameters, including magnetron power, working gas pressure, substrate temperature, gas flow rate, and deposition time, significantly influence the degree of crystallization, crystallite size, and electrical transport properties of the deposited films [5–7]. Nivedita *et al.* [8] reported that an increase in crystallite size in nanocrystalline Nb thin films leads to a decrease in electrical resistivity and an increase in charge carrier mobility. Rao *et al.* [9] found that the sputtering pressure has a significant influence on the microstructure and electrical properties of Nb thin films. These findings indicate that the deposition conditions during magnetron sputtering are among

the key factors governing the structural and electrical properties of Nb thin films. Wu *et al.* [10] reported that the degree of crystallinity is one of the principal factors determining the electrical conductivity of vacuum-deposited Nb thin films. Kim *et al.* [11] investigated the influence of magnetron sputtering parameters on the optical and structural properties of SiO_2/Nb_2O_5 multilayer systems. Although this study was not focused on metallic Nb thin films, it confirmed that the optimization of magnetron sputtering parameters has a significant effect on the quality of thin films.

Thus, most of the available studies have focused on the structural, morphological, or optical properties of Nb thin films. In studies dealing with electrophysical parameters, attention has generally been limited to a single sputtering mode or to the influence of individual technological parameters. However, a comparative evaluation of the electrophysical parameters determined by the Hall effect for Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates under DC and RF magnetron sputtering conditions, together with their correlation with structural characteristics, has not yet been sufficiently investigated. This scientific gap constitutes the basis of the present study.

Table 1. Comparative Analysis of Recent Studies on Nb Thin Films

As shown in Table 1, most of the published studies have focused on the structural or morphological properties of Nb thin films. However, the influence of DC and RF magnetron sputtering modes on the Hall-effect-derived electrophysical parameters has not yet been comprehensively investigated. Therefore, the present study comparatively evaluates the effects of the magnetron sputtering mode on electrical conductivity, electrical resistivity, and charge carrier mobility in correlation with the X-ray diffraction results.

Research Methodology

The research object of this study was niobium (Nb) thin films deposited on thermally oxidized SiO_2/Si(111) substrates. Initially, single-crystal Si(111) substrates were subjected to a standard chemical cleaning procedure. Subsequently, they were thermally oxidized in an electrically heated muffle furnace at 800 °C for 2 h, resulting in the formation of a dielectric SiO_2 layer on the surface. The prepared SiO_2/Si(111) substrates were used as the substrates for the deposition of Nb thin films.

The Nb thin films were deposited by DC and RF magnetron sputtering using an EPOS-PVD-DESK-PRO magnetron sputtering system equipped with a niobium target of 99.95% purity, 76.2 mm in diameter, and 4 mm in thickness. High-purity argon (Ar) was used as the working gas. Before the deposition process, the base pressure inside the vacuum chamber was 10^{-6} Torr. During sputtering, the argon gas flow rate was maintained at 70%, the working pressure was 10^{-3} Torr, the magnetron power was 300 W, the substrate temperature was 300 °C, the deposition time was 5 min, and the target-to-substrate distance was 100 mm. All technological parameters were kept constant for both DC and RF sputtering modes, while only the operating mode of the magnetron was changed. This made it possible to comparatively evaluate the influence of the magnetron sputtering mode on the structural and electrical properties of the Nb thin films.

The crystal structure of the deposited Nb thin films was investigated using a Rigaku XRD-6100 X-ray diffractometer with Cu Kα radiation (λ = 1.5406 Å). Based on the obtained diffraction patterns, the crystalline phase, crystallographic orientation, and lattice parameters were determined. The crystallite size was estimated using the Scherrer equation:

$$D = \frac{K\lambda}{\beta\cos\theta}$$

where D is the crystallite size, K is the Scherrer constant (0.9), λ is the X-ray wavelength, β is the full width at half maximum (FWHM) of the diffraction peak, and θ is the Bragg diffraction angle.

The electrical properties of the thin films were investigated using an HMS-5000 Hall Effect Measurement System based on the four-probe Van der Pauw method. The Hall effect measurements were used to determine the Hall coefficient, charge carrier concentration (n), charge carrier mobility (μ), electrical conductivity (σ), and electrical resistivity (ϱ). In addition, the current–voltage (I–V) characteristics of the samples were recorded, and the ohmic behavior of the electrical contacts was evaluated.

The electrical parameters were calculated using the following equations:

$$R_H = \frac{1}{qn}$$

$$\sigma = qn\mu$$

where q is the elementary charge, n is the charge carrier concentration, and μ is the charge carrier mobility.

The experimental data were processed using OriginPro and Microsoft Excel software. A comparative analysis was performed to evaluate the influence of the magnetron sputtering mode on the electrophysical parameters of Nb thin films deposited by DC and RF magnetron sputtering.

Results and Discussion

The crystal structure of Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates by DC and RF magnetron sputtering was investigated using X-ray diffraction (XRD). Based on the obtained diffraction patterns, the influence of the magnetron sputtering mode on the crystalline phase, crystallographic orientation, and degree of crystallinity was evaluated. The XRD patterns of the deposited Nb thin films are presented in Figures 1 and 2, respectively.

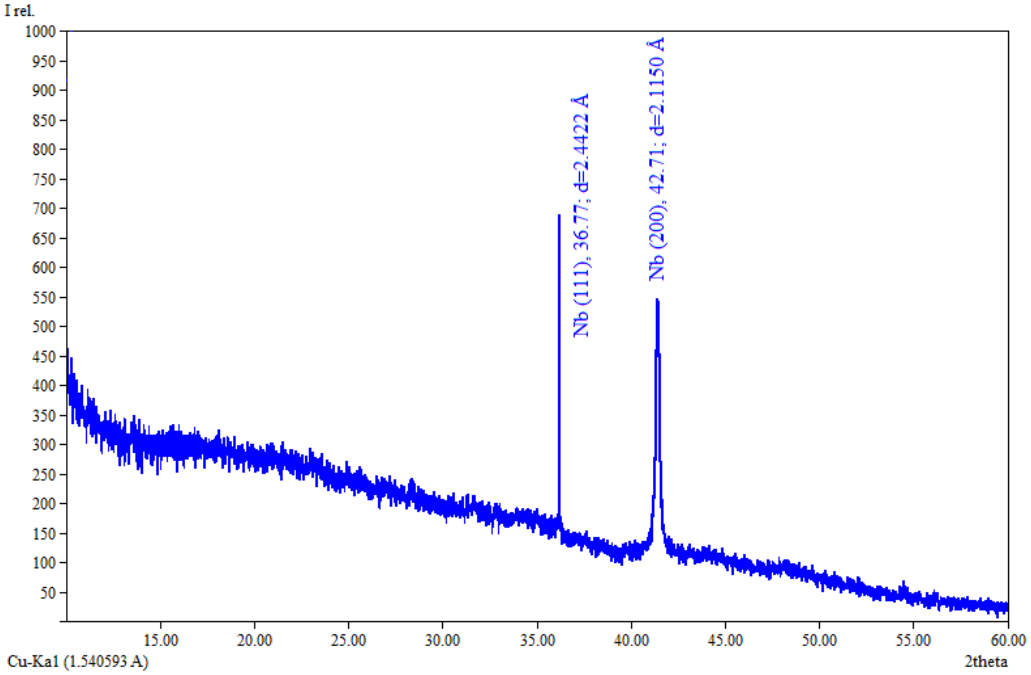

Figure 1. XRD pattern of the Nb thin film deposited by DC magnetron sputtering.

Figure 1 shows the X-ray diffraction (XRD) pattern of the Nb thin film deposited by DC magnetron sputtering. The diffraction pattern exhibits two major diffraction peaks located at 2θ = 36.7° and 42.7°. These reflections correspond to the (110) and (200) crystallographic planes of the body-centered cubic (BCC) Nb phase, respectively. The calculated interplanar spacings were d_{110} = 2.442 Å and d_{200} = 2.115 Å, which are in good agreement with the standard X-ray diffraction data for metallic niobium [8,14].

The significantly higher intensity of the (110) reflection compared with that of the (200) reflection indicates that the film deposited in the DC mode possesses a strongly textured structure. In the BCC crystal structure of Nb, the (110) plane is one of the crystallographic planes with the lowest surface energy. Therefore, the predominance of this orientation is characteristic of Nb thin films deposited by magnetron sputtering [14,15]. Under these conditions, most crystallites are preferentially oriented along the (110) direction. Furthermore, the absence of additional diffraction peaks indicates that the film mainly consists of the BCC Nb phase and that no other crystalline phases were formed in significant amounts.

The relatively broad diffraction peaks suggest that the crystallites are in the nanometer size range and that microstrains may be present in the crystal lattice. Residual internal stresses generated during the rapid condensation of atoms in the magnetron sputtering process may also contribute to the broadening of the diffraction peaks [8]. The crystallite size and other structural parameters were estimated using the Scherrer equation, and the obtained values are presented in Table 2. The pronounced (110) texture observed in the DC-deposited film indicates a well-defined preferential crystal orientation. However, the limited crystallographic orientations and the residual lattice distortions may enhance electron scattering at grain boundaries. Therefore, it is important to analyze the XRD results in correlation with the electrical transport parameters determined from Hall effect measurements.

Table 2.

Structural Parameters of Nb Thin Films Deposited by DC and RF Magnetron Sputtering Determined from XRD Analysis and Their Comparison with Literature Data

Parameter	DC (This Work)	RF (This Work)	Literature
Crystal phase	BCC Nb	BCC Nb	BCC Nb [14,15]
Main diffraction peaks	(110), (200)	(101), (200), (201)	(110), (200), (211) [14,15]
Interplanar spacing, d (Å)	2.442; 2.115	2.333; 2.115; 1.651	Consistent with PDF/JCPDS data
Crystallite size, D (nm)	18–25	28–35	20–30 [2,24]
Microstrain, ε	(2–3) × 10^{-3}	(1–2) × 10^{-3}	~10^{-3} [24]
Dislocation density, δ (m^{-2})	2.5 × 10^{15}	1.0 × 10^{15}	10^{14}–10^{15} [2,24]
Preferred orientation	(110)	Multiple orientations	(110) texture observed [14,15]

Table 2 presents the structural parameters of the Nb thin films deposited by DC and RF magnetron sputtering, as determined from the XRD analysis, together with a comparative evaluation against the literature data. The BCC Nb phase was identified in both samples. The presence of multiple diffraction peaks in the RF-deposited film indicates that the crystallites grew with different crystallographic orientations and that the film exhibited a higher degree of crystallinity. Compared with the DC-deposited film, the RF-deposited film showed a larger crystallite size, lower microstrain, and lower dislocation density, indicating a more well-developed crystal lattice. The obtained structural parameters are in good agreement with the literature data and provide a basis for explaining the variations in the electrophysical properties discussed in the following sections.

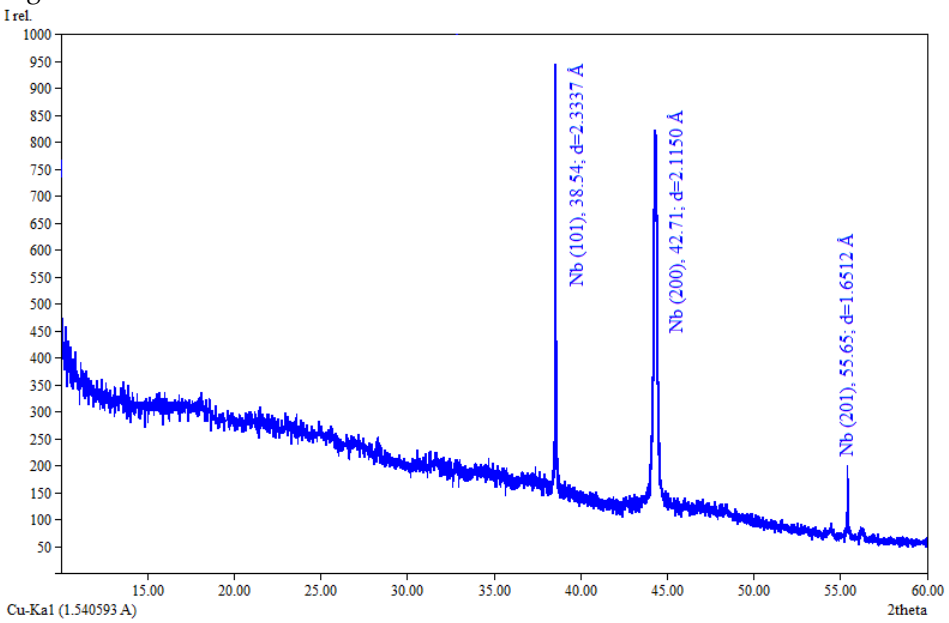

Figure 2. XRD pattern of the Nb thin film deposited by RF magnetron sputtering.

Figure 2 shows the X-ray diffraction (XRD) pattern of the Nb thin film deposited by RF magnetron sputtering. Unlike the film deposited in the DC mode, the RF-deposited sample exhibited several diffraction peaks corresponding to the (101), (200), and (201) crystallographic planes. The presence of multiple diffraction reflections indicates that the film deposited in the RF mode possesses a well-developed polycrystalline structure and that the crystallites have grown with different crystallographic orientations [5,8].

During RF magnetron sputtering, the higher plasma density and the enhanced ion bombardment promote the surface diffusion of adatoms. As a result, the atoms occupy energetically more favorable positions, leading to a more ordered crystal growth. Therefore, the films deposited in the RF mode exhibit a higher degree of crystallinity and a greater variety of crystallographic orientations [5,9].

A comparative analysis of the diffraction patterns obtained for the DC and RF modes demonstrates that RF magnetron sputtering significantly improves the crystallinity of Nb thin films. The appearance of additional diffraction peaks in the RF-deposited sample indicates that the crystallite growth process is more complete. The improved crystallinity may reduce electron scattering at grain boundaries, resulting in higher electrical conductivity, lower electrical resistivity, and increased charge carrier mobility. This assumption is confirmed by the Hall effect measurements and the current–voltage (I–V) characteristics presented in the following sections.

The reliability of the electrophysical parameters determined by the Hall effect primarily depends on the quality of the electrical contacts formed on the sample. Therefore, before performing the Hall measurements, the current–voltage (I–V) characteristics of the Nb thin films were examined (Figure 3).

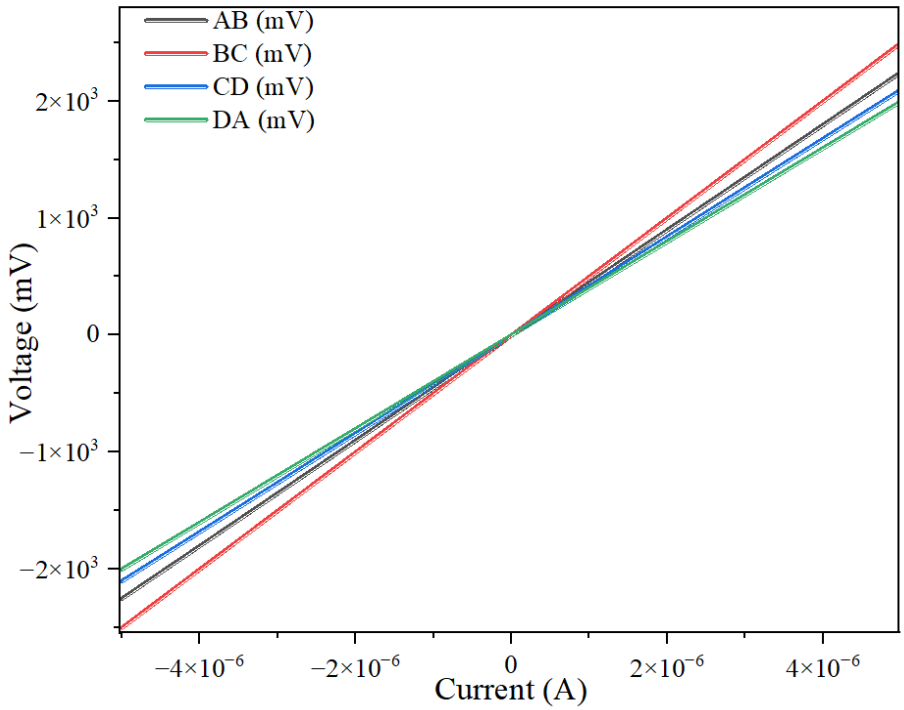

Figure 3. Current–voltage (I–V) characteristics of Nb thin films deposited by DC and RF magnetron sputtering.

As can be seen from the graphs, an almost linear relationship between current and voltage was observed for the AB, BC, CD, and DA contact pairs. In all measurement directions, the voltage increased proportionally with the applied current. The fact that the curves pass through the origin and exhibit nearly identical slopes indicates the absence of significant nonlinear effects during current transport through the contacts. The linear current–voltage characteristics confirm that the electrical contacts exhibit ohmic behavior. In ohmic contacts, the contact resistance is low, allowing electrons to pass through the metal–thin film interface without additional potential barriers. Therefore, the influence of contact resistance on the determination of the Hall voltage and electrical resistivity is minimal [16,17]. The similarity of the slopes obtained for different contact pairs indicates that the electrical properties are relatively uniformly distributed over the surface of the sample. This also suggests that there are no significant local non-uniformities in the thickness or electrical conductivity of the Nb thin films. In the Van der Pauw method, such symmetric I–V characteristics are considered one of the important criteria for the geometrical and electrical homogeneity of the sample [17].

The absence of hysteresis or nonlinear regions in the I–V characteristics indicates that the electrical conduction is predominantly metallic in nature. Such behavior has also been reported in the literature for metallic Nb thin films, where electrical conduction is governed by the free-electron transport mechanism [3,4]. The obtained results are in good agreement with these reports. The linear and symmetric I–V characteristics confirm the reliability of the electrical conductivity, electrical resistivity, and charge carrier mobility values determined from the Hall effect measurements. These results provide a reliable basis for the comparative analysis of the electrophysical parameters.

The electrical conductivity of the Nb thin films was determined using the HMS-5000 Hall Effect Measurement System, and the obtained results are presented in Figure 4. The graph illustrates the variation in the electrical conductivity values calculated for the AB, BC, CD, and DA contact pairs as a function of the applied measurement current.

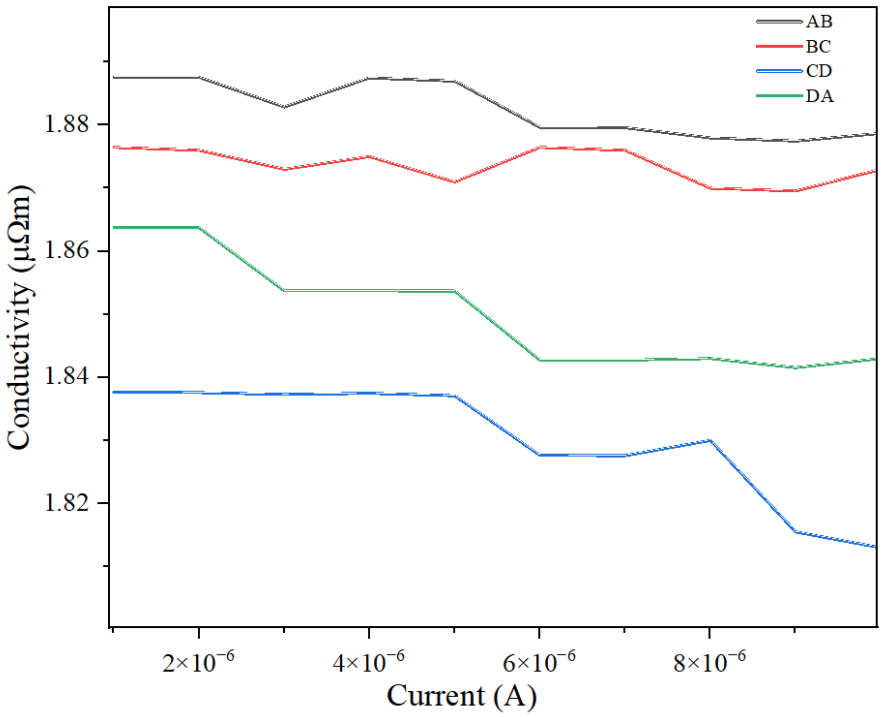

Figure 4. Electrical conductivity of Nb thin films as a function of the applied current.

The results show that the electrical conductivity values for all contact pairs vary within the range of 1.81–1.89 $\mu\Omega^{-1}\cdot cm^{-1}$. No significant changes in electrical conductivity were observed with increasing measurement current, although a slight decreasing trend was detected for some contact pairs. This indicates that the electrical conductivity of the Nb thin films remains stable over the investigated current range.

Among the investigated contact pairs, the AB contact pair exhibited the highest electrical conductivity values, whereas the CD contact pair showed relatively lower values. These minor differences may be attributed to local variations in film thickness, non-uniform distribution of grain boundaries, or the location of the electrical contacts. Nevertheless, the conductivity values obtained for all contact pairs are very close to each other, indicating that the electrical properties are relatively uniformly distributed over the surface of the sample.

The nearly constant electrical conductivity is characteristic of metallic Nb thin films and reflects stable electron transport. In metals, the charge carrier concentration remains practically constant, while the electrical conductivity is mainly determined by the electron mean free path and electron scattering mechanisms [3,4]. The small variations observed in the present study are within the experimental error and confirm the high stability of the electrical properties of the material.

According to the XRD results, the Nb thin films deposited by RF magnetron sputtering exhibit a higher degree of crystallinity. The improvement in crystallinity reduces electron scattering at grain boundaries and provides more favorable conditions for enhanced electrical conductivity [5,14]. Therefore, a higher electrical conductivity is expected for the films deposited in the RF mode. This assumption is further confirmed by the results of electrical resistivity and charge carrier mobility presented in the following sections.

Thus, the electrical conductivity values determined from the Hall effect measurements demonstrate that the Nb thin films possess highly stable electrical properties and that RF magnetron sputtering provides a more favorable technological mode for improving the electrical conductivity of Nb thin films.

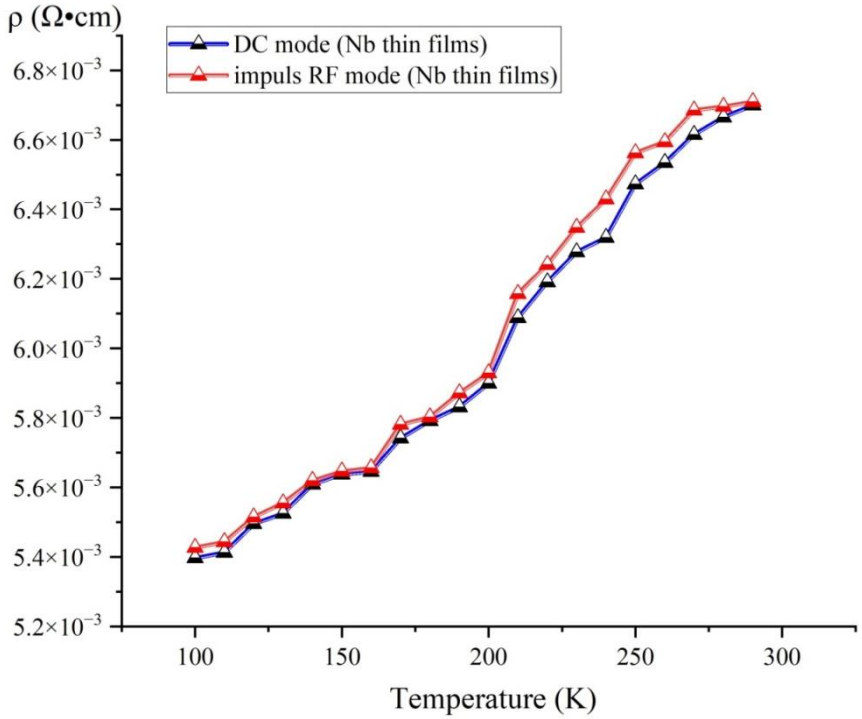

Figure 5. Temperature dependence of the electrical resistivity of Nb thin films deposited by DC and RF magnetron sputtering.

The electrical resistivity of the deposited Nb thin films was determined from Hall effect measurements, and its temperature dependence is presented in Figure 5. As can be seen from the graph, although the variation trends of the electrical resistivity are similar for the samples deposited by DC and RF magnetron sputtering over the investigated temperature range, their absolute values differ significantly. Throughout the entire temperature range, the Nb thin films deposited by RF magnetron sputtering exhibit lower electrical resistivity than those prepared by the DC mode. This result is consistent with the XRD analysis, which demonstrated that the RF-deposited films possess a higher degree of crystallinity and fewer structural defects. The improved crystal structure reduces electron scattering at grain boundaries and lattice defects, resulting in lower electrical resistivity [5,8,14].

An increase in electrical resistivity with increasing temperature was observed for both samples. This behavior is characteristic of metallic conductors and can be explained by the enhancement of electron–phonon scattering caused by the increased thermal vibrations of lattice atoms at elevated temperatures [18,19]. The interaction between electrons and phonons reduces the electron mean free path, thereby increasing the electrical resistivity.

The lower electrical resistivity of the films deposited by RF magnetron sputtering throughout the entire temperature range indicates that the sputtering mode has a significant influence on the microstructure of the films. Since the plasma generated in the RF mode possesses higher ion energy and plasma density, the surface diffusion of adatoms is enhanced. Consequently, larger crystallites and more ordered grain boundaries are formed, reducing electron scattering at structural defects and improving the efficiency of electrical transport [9,15]. These results are in good agreement with the findings reported by Rao et al. [5] and Nivedita et al. [8] for Nb thin films deposited by magnetron sputtering. Those authors also demonstrated that an increase in the degree of crystallinity leads to a reduction in electrical resistivity.

The Nb thin films deposited by RF magnetron sputtering exhibit lower electrical resistivity than those prepared by the DC mode, indicating their improved electrical transport properties.

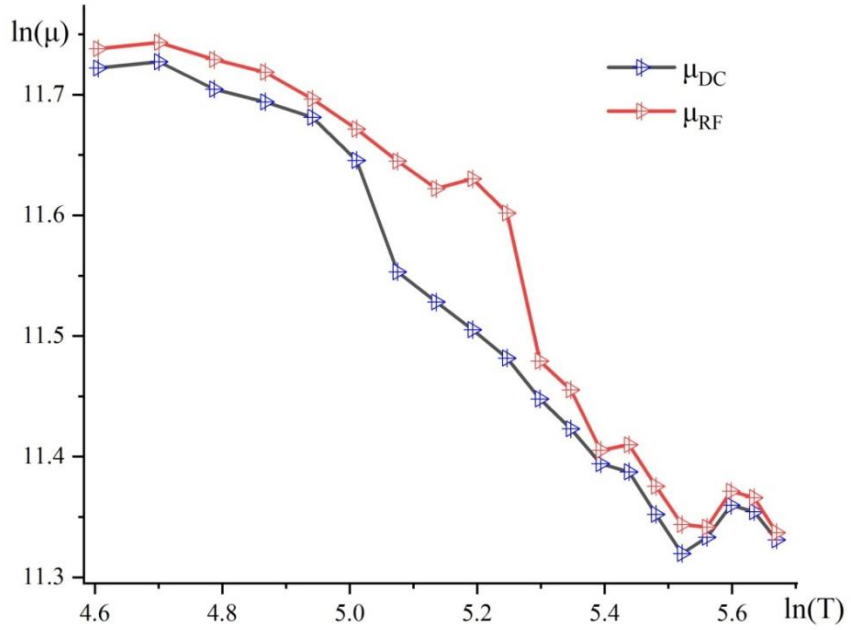

Figure 6. Logarithmic dependence of charge carrier mobility on temperature for Nb thin films.

Figure 6 presents the charge carrier mobility of the Nb thin films and its temperature dependence. The graph shows the dependence of the logarithmic mobility (lnμ) on 1000/T. This representation makes it possible to analyze the dominant scattering mechanisms that limit charge carrier transport.

The results show that the charge carrier mobility decreases with increasing temperature for the Nb thin films deposited by both DC and RF magnetron sputtering. This behavior is characteristic of metallic thin films and can be explained by the enhancement of electron–phonon scattering at elevated temperatures. As the temperature increases, the thermal vibrations of the crystal lattice atoms become more intense, reducing the mean free path of free electrons and consequently decreasing their mobility [18,19].

The Nb thin films deposited by RF magnetron sputtering exhibited higher charge carrier mobility than those prepared by the DC mode throughout the entire investigated temperature range. This result is consistent with the structural characteristics determined by X-ray diffraction. The higher degree of crystallinity, better-developed crystallites, and reduced density of structural defects in the RF-deposited films decrease electron scattering at grain boundaries and lattice defects. As a result, the charge carrier mobility increases [5,8].

The increase in charge carrier mobility has a direct influence on the electrical transport properties. The electrical conductivity is determined by the following relationship:

$$\sigma = qn\mu$$

where σ is the electrical conductivity, q is the elementary charge, n is the charge carrier concentration, and μ is the charge carrier mobility.

It can be seen from this equation that, under conditions where the charge carrier concentration remains nearly constant, an increase in charge carrier mobility leads to an increase in electrical conductivity and a decrease in electrical resistivity. In the present study, the higher mobility values observed for the films deposited by RF magnetron sputtering are fully consistent with the electrical conductivity and electrical resistivity results presented in the previous sections.

The obtained results are in good agreement with those reported by Nivedita et al. [8] and Rao et al. [5] for Nb thin films deposited by magnetron sputtering. These studies also demonstrated that an increase in the degree of crystallinity and a reduction in structural defects contribute to enhanced charge carrier mobility. The Nb thin films deposited by RF magnetron sputtering are characterized by higher charge carrier mobility. This indicates that the RF-deposited films possess improved electrical transport properties and confirms that RF magnetron sputtering is a promising technique for the fabrication of high-quality functional Nb thin films.

The experimental results demonstrated that the DC and RF magnetron sputtering modes have a significant influence on the structural and electrical transport properties of Nb thin films. The X-ray diffraction results showed that the samples deposited by RF magnetron sputtering exhibit a higher degree of crystallinity, multiple crystallographic orientations, and improved structural ordering. The increase in crystallite size together with the reduction in microstrain and dislocation density, as determined from the XRD analysis, indicates the formation of a more perfect crystal lattice in the RF-deposited films.

The improvement in the structural parameters is also reflected in the electrical transport properties determined by the Hall effect measurements. The higher electrical conductivity, lower electrical resistivity, and higher charge carrier mobility observed for the Nb thin films deposited by RF magnetron sputtering can be attributed to reduced electron scattering at grain boundaries and crystal lattice defects. The improved ordering of the crystal lattice increases the mean free path of electrons, thereby enhancing the electrical performance of metallic thin films.

The linear and symmetric current–voltage (I–V) characteristics obtained for all contact pairs confirm the reliability of the Hall effect measurements. The formation of ohmic contacts indicates that the contact resistance is minimal and that the measured Hall parameters accurately reflect the intrinsic electrical properties of the samples. Therefore, the observed trends in electrical conductivity, electrical resistivity, and charge carrier mobility can be considered reliable.

The increase in electrical resistivity and the decrease in charge carrier mobility with increasing temperature are consistent with the electron–phonon scattering mechanism characteristic of metallic conductors. The trends observed for both samples confirm the metallic nature of the Nb thin films. However, the superior electrical transport properties observed over the entire temperature range for the films deposited by RF magnetron sputtering demonstrate that optimization of the sputtering mode provides an effective approach for controlling the functional properties of Nb thin films.

According to the experimental results, the XRD analysis, current–voltage (I–V) characteristics, and Hall effect measurements are in good agreement with one another, demonstrating that RF magnetron sputtering is a more effective deposition mode for producing Nb thin films with superior structural quality and improved electrical transport properties on thermally oxidized SiO_2/Si(111) substrates.

Conclusion

The structural and electrical transport properties of Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates by DC and RF magnetron sputtering were comprehensively investigated. The X-ray diffraction results showed that the BCC Nb phase was formed in both samples. While a strong (110) texture was observed in the films deposited by the DC mode, the presence of multiple crystallographic orientations in the RF-deposited films indicated a more complete crystallization process.

The electrical transport parameters determined by the Hall effect and the Van der Pauw method demonstrated that the Nb thin films deposited by RF magnetron sputtering exhibited higher electrical conductivity, lower electrical resistivity, and higher charge carrier mobility than those prepared by the DC mode. The linear and symmetric current–voltage (I–V) characteristics confirmed the reliability of the Hall effect measurements.

The improvement in the electrophysical parameters was attributed to the higher degree of crystallinity, the lower density of structural defects in the crystal lattice, and the reduced electron scattering at grain boundaries in the RF-deposited films. The good agreement between the XRD and Hall effect results demonstrated a direct correlation between the structural characteristics and the electrical transport parameters.

The scientific novelty of the present study lies in the comprehensive comparative evaluation of the Hall-effect-derived electrical transport parameters of Nb thin films deposited on thermally oxidized SiO_2/Si(111) substrates by DC and RF magnetron sputtering in correlation with their structural characteristics.

The obtained results demonstrate that RF magnetron sputtering is a more effective deposition mode for producing Nb thin films with superior electrical transport properties. These findings can be applied in the development of microelectronic devices, cryogenic electronics, superconducting components, and highly sensitive functional thin-film devices.

Аннотация. *В работе выполнен единый сравнительный анализ оптико-энергетических, термических и резистивных параметров прекурсоров $Bi_{1,7}Pb_{0,3}Sr_2Ca_{(n-1)}Cu_nO_y$ (n = 9, 12, 15, 20), полученных в Большой солнечной печи. Плотность концентрированного солнечного потока, выбранная для различных составов, составляла 149,69-258,03 Вт/см². Закалённые из расплава прекурсоры измельчали, прессовали при 150-200 МПа и отжигали при 848 °C в течение 96 ч. Дифференциальную сканирующую калориметрию проводили в интервале 100-1200 °C, а электрическое сопротивление измеряли четырёхконтактным методом при 77-320 K. С увеличением числа слоёв CuO требуемая плотность солнечного потока практически линейно возрастала. Высокотемпературный эффект DSC T_3 смещался от 851,0 до 975,1 °C, а начало резистивного перехода - от 126 до 143 K. Для состава n = 20 ширина перехода увеличилась до 25 K, что указывает на выраженную неоднородность переходного процесса. Состав n = 15 характеризовался наиболее рациональным сочетанием T_{onset} = 135 K, T_{offset} = 129 K и ΔT = 6 K. Показано, что положение термических событий и однородность резистивного перехода определяются номинальным составом. Характерные температуры R(T) рассматриваются как сравнительные параметры кривых и не используются как единственное доказательство образования новой сверхпроводящей фазы.*

Ключевые слова: *Bi/Pb-высокотемпературная сверхпроводимость, Большая солнечная печь, концентрированное солнечное излучение.*

RELATIONSHIP BETWEEN THERMAL PROCESSES AND RESISTIVE TRANSITION PARAMETERS IN SOLAR-PROCESSED $Bi_{1.7}Pb_{0.3}Sr_2Ca_{(n-1)}Cu_nO_y$ (n = 9, 12, 15, 20)

Abstract. *This work presents a unified comparative analysis of the optical-energy, thermal, and resistive parameters of $Bi_{1.7}Pb_{0.3}Sr_2Ca_{(n-1)}Cu_nO_y$ (n = 9, 12, 15, 20) precursors obtained in the Large Solar Furnace. The selected concentrated solar-flux density ranged from 149.69 to 258.03 W/cm². Melt-quenched precursors were ground, compacted at 150-200 MPa, and annealed at 848 °C for 96 h. Differential scanning calorimetry was performed from 100 to 1200 °C, while electrical resistance was measured by a four-probe method from 77 to 320 K. The solar-flux requirement increased almost linearly with the nominal number of CuO layers. The high-temperature DSC event T_3 shifted from 851.0 to 975.1 °C, whereas the onset of the resistive transition increased from 126 to 143 K. Nevertheless, the n = 20 sample exhibited a broad 25 K transition, indicating substantial transition heterogeneity. The n = 15 composition provided the most balanced response, with T_{onset} = 135 K, T_{offset} = 129 K, and ΔT = 6 K. The results demonstrate that the positions of the thermal events and the homogeneity of the resistive transition are controlled by nominal composition. The reported R(T) temperatures are treated as comparative curve parameters and not as standalone proof of a newly identified superconducting phase.*

Keywords: *Bi/Pb-high-temperature superconductivity, Large Solar Furnace, concentrated solar radiation.*

Введение

Купраты на основе Bi-Sr-Ca-Cu-O среди высокотемпературных сверхпроводников отличаются слоистой кристаллической структурой, высокой анизотропией и выраженной чувствительностью к составу и режиму термообработки. Формирование фаз Bi-2212 и Bi-2223, качество межзеренных связей и кислородное состояние определяют транспортные и магнитные свойства материала [1-3]. При традиционном твердофазном синтезе из-за больших диффузионных расстояний и медленного протекания межфазных реакций требуются многостадийное измельчение, повторное прессование и термообработка продолжительностью в десятки часов. Быстрое охлаждение расплава позволяет сохранить компоненты в виде относительно однородно распределённого высокореакционного стеклокристаллического прекурсора [4-6].

Концентрированное солнечное излучение отличается от нагрева в обычных электрических печах возможностью бесконтактного и чрезвычайно быстрого подвода теплоты, регулирования локальной плотности энергии и формирования резкого температурного градиента на водоохлаждаемой подложке. Солнечные печи применяются в материаловедении для обработки оксидной керамики, стёкол, металлов и тугоплавких соединений [8-10]. Большая солнечная печь в Паркенте представляет собой оптико-энергетическую систему класса 1 МВт, в которой выбор отдельных групп гелиостатов позволяет адаптировать плотность потока и геометрию теплового поля в фокальной зоне к свойствам целевого материала [11, 12].

Для Bi/Pb-содержащих купратов наряду с источником нагрева существенное значение имеет номинальное содержание Ca и Cu. Увеличение числа слоёв CuO, с одной стороны, повышает энергетические затраты на образование высокотемпературных фаз, а с другой - может усиливать многофазность, локальные отклонения от стехиометрии и уширение резистивного перехода. Поэтому определения только максимального значения T_{onset} недостаточно: термические события, требуемая плотность солнечного потока, T_{offset} и ширина перехода ΔT должны оцениваться совместно. Такой подход позволяет выявить баланс между высокой температурой начала перехода и структурной однородностью переходного процесса.

Цель работы состояла в интегральном сопоставлении выбранной плотности потока в Большой солнечной печи, пиков DSC и характерных параметров кривых R(T) для составов n = 9, 12, 15 и 20 гомологического ряда $Bi_{1.7}Pb_{0.3}Sr_2Ca_{(n-1)}Cu_nO_y$, а также в определении наиболее рационального интервала составов для последующей технологической оптимизации. Имеющиеся экспериментальные данные были повторно проанализированы с применением новой графической обработки, производных параметров и описательной регрессии в пределах исследованного диапазона.

Обзор литературы

После обнаружения сверхпроводимости в купратах системы Bi-Sr-Ca-Cu-O [1] частичное замещение Bi свинцом стало рассматриваться как один из важных факторов, улучшающих кинетику образования высокотемпературной фазы Bi-2223. Фазовые диаграммы многокомпонентной системы Bi_2O_3-PbO-SrO-CaO-CuO показывают, что в узком температурном интервале могут одновременно существовать несколько стабильных и метастабильных фаз [13]. Поэтому один и тот же номинальный состав при различных способах получения способен

демонстрировать существенно различающиеся рентгенофазовые, электрические и магнитные характеристики. Сравнение твердофазного, золь-гель, мокрохимического и плавильно-закалочного методов подтверждает, что маршрут синтеза заметно влияет на размер зёрен, долю фазы 2223 и ширину перехода [3].

При быстром охлаждении расплава малые диффузионные расстояния в жидкой фазе способствуют гомогенизации состава, а стеклообразная или стеклокристаллическая матрица при последующей термообработке выполняет функцию высокореакционного состояния [4-6]. Однако последовательность перитектического плавления и рекристаллизации зависит от состава прекурсора. Метод DSC позволяет разделять в прекурсорах BSCCO низкотемпературные твердофазные перестройки, промежуточные реакции и основное событие плавления [7]. Наличие пика DSC само по себе не идентифицирует конкретную фазу; фазовое отнесение должно подтверждаться данными XRD и микроструктурного анализа. Поэтому в настоящей работе термические события условно обозначены как T_1, T_2 и T_3, а основным объектом анализа принято их смещение в зависимости от состава.

Обзоры по применению солнечного тепла для обработки материалов выделяют в качестве основных преимуществ бесконтактный нагрев, высокую скорость нагрева, короткие термические циклы и низкий риск загрязнения [8, 9]. Вместе с тем неоднородность потока в фокусе, конвективные и радиационные потери, а также геометрия образца могут ограничивать технологическую воспроизводимость. Математическое моделирование высокопоточных солнечных печей и оптимизация фокальной зоны направлены на снижение этих неопределённостей [10]. Методология синтеза оксидных материалов в Большой солнечной печи Паркента предусматривает согласование теплофизических свойств целевого материала с параметрами системы «гелиостат-концентратор» [12].

В ранее выполненных исследованиях керамики, на основе закалённых в солнечной печи прекурсоров $Bi_{1,7}Pb_{0,3}Sr_2Ca_{(n-1)}Cu_nO_y$ были показаны слоистая морфология, эволюция фаз 2212/2223 при термообработке и изменение характеристик R(T) и магнитной восприимчивости [14]. В последующих работах была продемонстрирована возможность солнечного синтеза Bi/Pb-ряда в более широком диапазоне n [15]. Тем не менее для интервала n = 9-20 недостаточно освещена единая сравнительная оценка, связывающая требуемый оптический поток, термические события DSC и параметры низкотемпературного резистивного перехода. Отличительной особенностью настоящей работы является объединение этих трёх блоков данных и поиск технологического компромиссного оптимума.

Методология исследования

Объектами исследования служили номинальные составы n = 9, 12, 15 и 20 гомологического ряда $Bi_{1,7}Pb_{0,3}Sr_2Ca_{(n-1)}Cu_nO_y$, обозначенные соответственно как Bi/Pb 2289, Bi/Pb 221112, Bi/Pb 221415 и Bi/Pb 221920. Исходную шихту готовили из порошков Bi_2O_3, PbO, SrO, CaO и CuO. Для уменьшения остаточной влажности реагенты выдерживали при 100-150 °C в течение 1 ч, дозировали в расчётных соотношениях, механически перемешивали и прессовали. Перед помещением в солнечную печь брикеты предварительно термообрабатывали при 200-300 °C в течение 2 ч для повышения механической устойчивости и уменьшения газовыделения при быстром нагреве.

В фокальной зоне Большой солнечной печи целевую плотность потока для каждого состава формировали с учётом расчётной энергетической потребности материала и выбранной группы гелиостатов. Плотность потока составляла 149,69 Вт/см² для n = 9, 175,45 Вт/см² для n = 12, 207,64 Вт/см² для n = 15 и 258,03 Вт/см² для n = 20. Плавление проводили на воздухе. Образовавшийся расплав распыляли и направляли на водоохлаждаемую подложку, обеспечивая скорость охлаждения порядка 10^4-10^5 K/с. В результате были получены пластинчатые и игольчатые стеклокристаллические прекурсоры.

Прекурсоры измельчали в агатовой ступке до дисперсности менее 25 мкм. Керамические образцы прессовали при 150-200 МПа в виде таблеток диаметром 15 мм и толщиной около 2 мм. Для корректного сравнительного анализа все четыре состава подвергали одинаковой термообработке при атмосферном давлении на воздухе: 848 °C в течение 96 ч. Единый режим позволил отделить влияние состава от температурно-временного фактора.

DSC-анализ выполняли на синхронном термоанализаторе в диапазоне 100-1200 °C. На термограммах выделяли три основных эндотермических события: T_1 - область низкотемпературных первичных перестроек, T_2 - область промежуточных высокотемпературных реакций и T_3 - событие, связанное с основной высокотемпературной трансформацией или перитектическим плавлением. Поскольку регистрируемые прибором интегральные значения представлены в мкВ·с/мг, в настоящей работе они трактуются не как абсолютная термодинамическая энтальпия, а как нормированный интегральный сигнал DSC. Это исключает некорректное приравнивание некалиброванного сигнала к энтальпии в Дж/г.

Микроструктуру исследовали на сканирующем электронном микроскопе LEO1455VP, а фазовое состояние - на дифрактометре Shimadzu XRD-6100 с использованием фильтрованного CuK_α-излучения. Электрическое

сопротивление измеряли четырёхконтактным методом в диапазоне 77-320 K без внешнего магнитного поля. Расстояние между контактами составляло 4 мм; электрические контакты формировали токопроводящей пастой на основе серебра. Поскольку полная идентичность геометрии и геометрического коэффициента для всех образцов не была подтверждена, анализ был ориентирован не на количественное сопоставление абсолютных значений R, а на определение характерных температур T_{onset}, T_{offset} и $\Delta T = T_{onset} - T_{offset}$.

В качестве дополнительного параметра рассчитывали высокотемпературный интервал $\Delta T_{DSC} = T_3 - T_2$. Тенденции изменения плотности солнечного потока, событий DSC и T_{onset} в зависимости от n оценивали линейной регрессией первого порядка. Ввиду наличия только четырёх составов регрессионные уравнения имеют описательный характер: они не экстраполировались за пределы n = 9-20 и не интерпретировались как статистическая модель генеральной совокупности. Общая последовательность исследования приведена на рисунке 1.

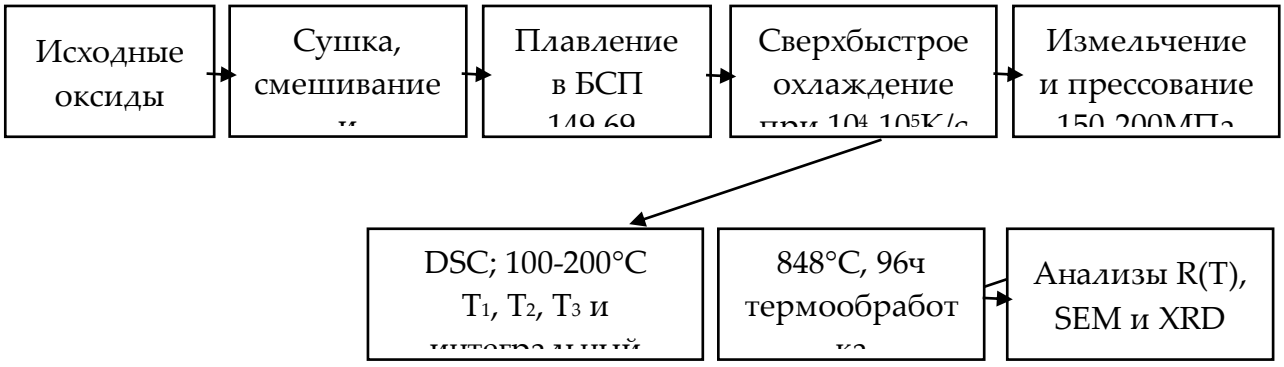

Рисунок 1. Последовательность солнечного получения и интегрированного анализа прекурсоров Bi/Pb-купратов

Таблица 1

Исследованные составы и выбранная плотность потока в Большой солнечной печи

Номинальный состав	Условное обозначение	n	Плотность солнечного потока, Вт/см²
$Bi_{1,7}Pb_{0,3}Sr_2Ca_8Cu_9O_y$	Bi/Pb 2289	9	149,69
$Bi_{1,7}Pb_{0,3}Sr_2Ca_{11}Cu_{12}O_y$	Bi/Pb 221112	12	175,45
$Bi_{1,7}Pb_{0,3}Sr_2Ca_{14}Cu_{15}O_y$	Bi/Pb 221415	15	207,64
$Bi_{1,7}Pb_{0,3}Sr_2Ca_{19}Cu_{20}O_y$	Bi/Pb 221920	20	258,03

Результаты и их обсуждение

Прекурсоры, полученные после солнечного плавления и сверхбыстрого охлаждения, имели пластинчатую и игольчатую форму. После перевода в керамическое состояние во всех составах наблюдалась характерная для Bi-содержащих купратов пластинчато-слоистая морфология. В образце n = 9 отчётливо видны ступенчатые пакеты крупных пластин и расположенные между ними тонкие фрагменты (рисунок 2). Наличие в микроструктуре наряду с плотными ровными пластинами пор и мелких обломков указывает на неоднородность межзеренных путей протекания тока. Следовательно, ширина резистивного перехода определяется не только внутрикристаллическим состоянием, но также контактами между пластинами, вторичными фазами и пористостью.

Предыдущая морфометрическая оценка образца n = 9 показала, что толщина слоистых блоков составляет приблизительно 120-140 нм, а отдельных тонких пластин - 28-40 нм. Такие наноламеллярные зародыши при последующей термообработке могут способствовать формированию ориентированных керамических пластин. Однако изображение SEM, подтверждая слоистость, не позволяет самостоятельно определить тип сверхпроводящей фазы или её объёмную долю. Поэтому морфологические данные интерпретировались совместно с результатами XRD и R(T).

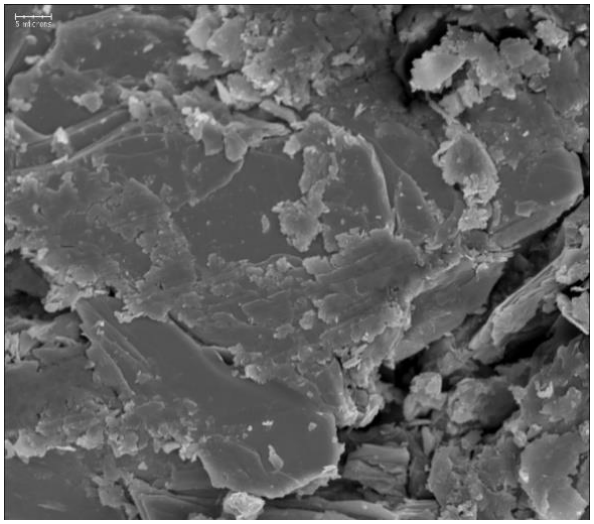

Рисунок 2. Пластинчатая микроструктура керамического образца Bi/Pb 2289 после термообработки при 848 °C в течение 96 ч (масштаб: 5 мкм)

Первым существенным результатом является последовательная зависимость требуемой плотности солнечного потока от номинального значения n. Согласно данным таблицы 1, при увеличении n от 9 до 20 плотность потока возрастает с 149,69 до 258,03 Вт/см², то есть на 72,4 %. Линейная аппроксимация дала уравнение $q(n) = 9{,}95n + 58{,}45$ при $R^2 = 0{,}999$ (рисунок 3). Высокая степень соответствия показывает, что в исследованном диапазоне добавление каждого номинального слоя CuO сопровождается повышением оптико-энергетических требований к синтезу. Эта зависимость не является универсальным термодинамическим законом, а представляет собой эмпирический технологический показатель для данных составов, геометрии образца и конфигурации БСП.

Управление процессом только за счёт повышения суммарной мощности недостаточно. С увеличением n изменяются поглощательная способность образца, теплоёмкость, высокотемпературные реакции и радиационные потери. Чрезмерная плотность потока может вызвать локальную потерю летучих компонентов Bi и Pb, тогда как недостаточный поток приводит к неполному плавлению и сегрегации состава. Поэтому линейная тенденция на рисунке 3 полезна для выбора исходной экспериментальной точки, но окончательный режим должен уточняться по устойчивости расплава и результатам последующего XRD-анализа.

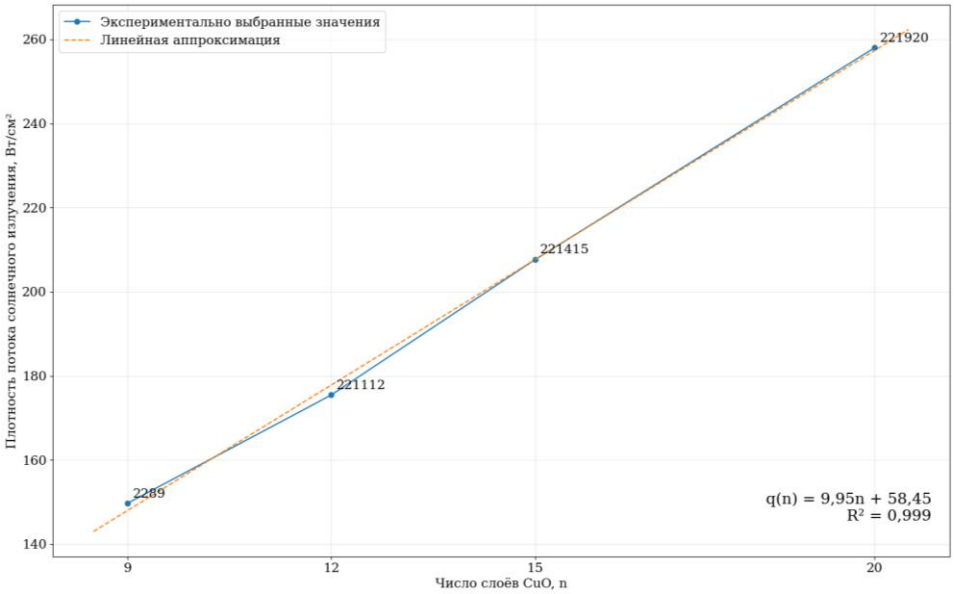

Рисунок 3. Зависимость выбранной плотности потока солнечного излучения от числа слоёв CuO

Таблица 2

Пики DSC и нормированные интегральные сигналы образцов Bi/Pb-ряда

Состав	T_1, °C	S_1, мкВ·с/мг	T_2, °C	S_2, мкВ·с/мг	T_3, °C	S_3, мкВ·с/мг
Bi/Pb 2289	466,1	−74,41	797,1	−16,23	851,0	−4,43
Bi/Pb 221112	477,0	−77,98	796,9	−14,18	918,3	−10,97

Состав	T_1, °C	S_1, мкВ·с/мг	T_2, °C	S_2, мкВ·с/мг	T_3, °C	S_3, мкВ·с/мг
Bi/Pb 221415	460,1	−28,71	778,3	−53,56	967,5	−5,25
Bi/Pb 221920	445,9	−31,72	768,7	−77,16	975,1	−4,83

Данные DSC показали, что изменение состава влияет не только на температуру термических событий, но и на их интегральную интенсивность (таблица 2, рисунок 4). Событие T_1 располагается в интервале 445,9-477,0 °C и не изменяется строго монотонно с n. Оно может включать одновременно удаление остаточных летучих компонентов, низкотемпературные твердофазные реакции и локальную структурную перестройку. Большие по модулю значения интегрального сигнала S_1 для составов n = 9 и n = 12 указывают на более высокую долю первичных реакций. Однако сигнал в мкВ·с/мг нельзя считать калиброванной энтальпией; он использован только для относительного сравнения при одинаковых условиях измерения.

Событие T_2 с увеличением n демонстрирует общую тенденцию к снижению температуры: от 797,1 до 768,7 °C. Описательная регрессия дала $T_2(n) = -2{,}86n + 825{,}30$ при $R^2 = 0{,}903$. Такое смещение указывает, что в составах, обогащённых Ca и Cu, промежуточная рекристаллизация или реакции с участием жидкой фазы могут начинаться при более низкой температуре. Одновременно модуль сигнала S_2 резко увеличивается от -14,18 мкВ·с/мг для n = 12 до -77,16 мкВ·с/мг для n = 20. Это свидетельствует о большей доле реакции или более высокой термической сложности процесса в области T_2 для состава n = 20.

Температура события T_3, напротив, возрастает от 851,0 до 975,1 °C. Описательное уравнение $T_3(n) = 11{,}01n + 773{,}87$ характеризуется $R^2 = 0{,}816$. Повышение T_3 согласуется с увеличением термических затрат на завершающую высокотемпературную трансформацию или перитектическое плавление в составах с высоким n. Вследствие одновременного снижения T2 и повышения T_3 интервал $\Delta T_{DSC} = T_3 - T_2$ расширяется от 53,9 до 206,4 °C. Это означает, что при увеличении n термические процессы протекают поэтапно в более широком температурном диапазоне, а не концентрируются около одного узкого пика.

Прямое отождествление пиков DSC с конкретными фазами требует осторожности. Например, область T_2 может соответствовать реакциям, способствующим формированию Bi-2212/Bi-2223, тогда как T_3 может включать высокотемпературную фазовую трансформацию и перитектическое плавление [2, 7]. Однако фазовое отнесение не может основываться только на DSC. Наличие на XRD-спектрах исследованных керамик рефлексов нескольких Bi-содержащих и вторичных фаз усиливает предположение о многостадийном характере трансформаций, особенно для состава n = 20.

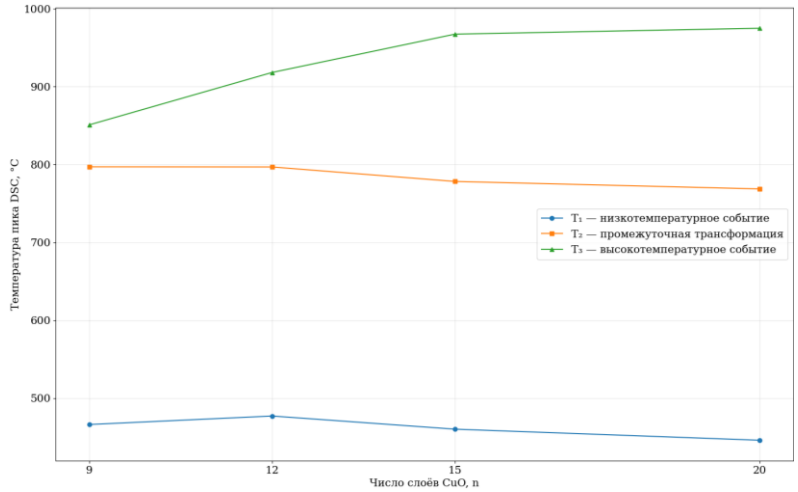

Рисунок 4. Изменение температур пиков DSC T_1, T_2 и T_3 в зависимости от n

Таблица 3

Параметры резистивного перехода и термический интервал DSC

Состав	T_{onset}, K	T_{offset}, K	ΔT, K	$\Delta T_{DSC} = T_3 - T_2$, °C
Bi/Pb 2289	126	117	9	53,9
Bi/Pb 221112	130	124	6	121,4
Bi/Pb 221415	135	129	6	189,2

Состав	T_{onset}, K	T_{offset}, K	ΔT, K	$\Delta T_{DSC} = T_3 - T_2$, °C
Bi/Pb 221920	143	118	25	206,4

При снижении температуры от 300 K кривые R(T) всех образцов сначала демонстрировали металлический характер, а затем резкое уменьшение сопротивления. С увеличением n значения T_{onset} возрастали последовательно до 126, 130, 135 и 143 K (таблица 3, рисунок 5). Уравнение $T_{onset}(n) = 1{,}56n + 111{,}65$ имело $R^2 = 0{,}998$. Между T_2 и T_{onset} наблюдалась сильная отрицательная описательная корреляция ($r \approx -0{,}96$), а между T_3 и T_onset - положительная ($r \approx 0{,}89$). Для выборки из четырёх точек эти коэффициенты недостаточны для статистического обобщения, однако они показывают, что смещение термических процессов и температура начала резистивного перехода управляются общим композиционным фактором n.

Монотонное повышение T_{onset} не во всех случаях означает улучшение качества перехода. Для образца n = 9 ширина перехода ΔT составляла 9 K, а для n = 12 и n = 15 - 6 K. Несмотря на максимальное T_{onset} = 143 K в составе n = 20, T_{offset} снизилась до 118 K, а переход расширился до 25 K. Кроме того, на кривой R(T) зафиксировано двухступенчатое изменение приблизительно при 143 и 130 K. Такая форма может быть обусловлена различными локальными фазами, слабыми межзеренными связями или тем, что единый режим термообработки оказался неодинаково оптимальным для всех составляющих материала.

Узкое значение ΔT = 6 K для образцов n = 12 и n = 15 указывает на относительно однородный характер перехода. Из этих двух составов n = 15 имеет более высокие T_{onset} и T_{offset} - 135 и 129 K соответственно. Поэтому в рассматриваемом наборе данных Bi/Pb 221415 демонстрирует наиболее рациональный компромисс по критериям «высокая характерная температура - узкий переход». Состав n = 12, требующий меньшей плотности солнечного потока и более низкой T_3, может рассматриваться как консервативный вариант с точки зрения энергозатрат и технологической устойчивости.

Термические и резистивные данные для n = 20 взаимно дополняют друг друга. Этот состав характеризуется максимальной плотностью солнечного потока, наибольшим модулем интегрального сигнала T_2, самым широким интервалом ΔT_{DSC} и максимальной шириной резистивного перехода. Следовательно, увеличение номинального состава обеспечило высокое T_{onset}, но одновременно расширило температурный диапазон фазообразования и ухудшило электрическую однородность перехода. Для данного образца целесообразна отдельная оптимизация режима 848 °C/96 ч: ступенчатая термообработка, промежуточное измельчение или изменение режима насыщения кислородом.

Несмотря на наиболее узкий интервал ΔT_{DSC} у образца n = 9, его резистивная температура T_{onset} является минимальной. Следовательно, узкое термическое событие не обеспечивает автоматически высокие транспортные характеристики. Термический интервал, доля фаз, текстура и межзеренные связи действуют совместно. Поэтому при выборе технологии следует не максимизировать один показатель, а одновременно учитывать по меньшей мере три критерия: требуемую плотность солнечного потока, T_{onset}/T_{offset} и ΔT.

Измеренное сопротивление представлено в виде абсолютного R и зависит от геометрии образцов. По этой причине в работе не делались выводы о количественном превосходстве амплитуды сопротивления или проводимости в нормальном состоянии между различными образцами. Параметры T_{onset} и T_{offset} являются температурными точками внутри каждой кривой и более устойчивы для сравнительного анализа. Вместе с тем падение R(T) и узкий переход соответствуют признаку сверхпроводимости, однако для строгой идентификации новой фазы с повышенной Tc необходимы нулевое сопротивление, количественная доля экранируемого объёма по эффекту Мейснера, повторные измерения и установление фазового носителя методами XRD/TEM [16, 17].

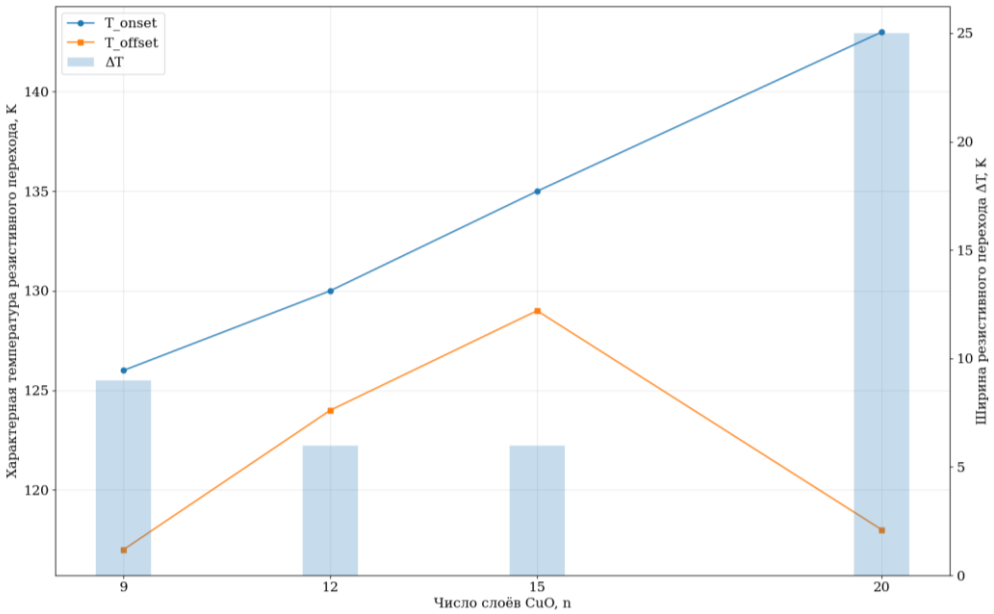

Рисунок 5. Изменение резистивных параметров T_{onset}, T_{offset} и ширины перехода ΔT в зависимости от n

Полученные результаты показывают необходимость выбора плотности потока в соответствии с составом и дифференцированной последующей термообработки. В интервале n = 9-15 плотность потока и T_{onset} последовательно возрастают, а ширина перехода сохраняется в пределах 6-9 K. При переходе к n = 20 одновременно с высоким T_{onset} резко усиливаются термическая и резистивная неоднородность. Для практической оптимизации состав n = 15 может быть выбран основным кандидатом, а n = 12 - энергетически более мягким контрольным вариантом.

При практической интерпретации результатов недостаточно использовать в качестве единственного критерия максимальное значение T_{onset}. Повышение плотности солнечного потока способно ускорить плавление, однако расширение интервала термических событий и многостадийный характер резистивного перехода увеличивают вероятность композиционной неоднородности. Поэтому при выборе технологического режима необходимо совместно учитывать по меньшей мере четыре показателя: требуемую плотность потока, T_{onset}, T_{offset} и ΔT. Такой подход позволяет рекомендовать состав n = 15 как исходный вариант для последующих экспериментов. Вместе с тем это не окончательный технологический оптимум: рекомендация требует независимой проверки повторными синтезами, количественным XRD-анализом фаз, измерением плотности образцов и магнитной доли экранирования.

Предложенный интегрированный подход сосредоточен на конкретном вопросе: как при увеличении номинального состава совместно изменяются термические события и качество резистивного перехода. Новые графические зависимости, производный параметр ΔT_{DSC} и описательные регрессии позволили переинтерпретировать исходные экспериментальные данные в формате самостоятельного сравнительного исследования.

Заключение

Увеличение n от 9 до 20 в ряду $Bi_{1,7}Pb_{0,3}Sr_2Ca_{(n-1)}Cu_nO_y$ сопровождалось почти линейным повышением требуемой плотности потока в Большой солнечной печи от 149,69 до 258,03 Вт/см². Это свидетельствует о росте оптико-энергетических требований по мере усложнения номинального состава.

По данным DSC температура события T_2 снизилась от 797,1 до 768,7 °C, тогда как T_3 повысилась от 851,0 до 975,1 °C. В результате термический интервал ΔT_{DSC} расширился от 53,9 до 206,4 °C. В составах с высоким n фазообразование протекает в более широком температурном диапазоне.

Несмотря на повышение резистивной T_{onset} от 126 до 143 K, в наиболее высоком составе n = 20 ширина перехода увеличилась до ΔT = 25 K. Состав Bi/Pb 221415 при T_{onset} = 135 K, T_{offset} = 129 K и ΔT = 6 K продемонстрировал наилучший баланс высокой характерной температуры и относительно однородного перехода.

Единый режим 848 °C/96 ч не является оптимальным для состава n = 20. Рекомендуется отдельно оптимизировать ступенчатую термообработку, кислородный режим и циклы повторного измельчения. Приведённые резистивные температуры служат сравнительными параметрами R(T) и не заменяют независимую фазовую идентификацию.

КРИТИЧЕСКИЕ ГРАНИЦЫ ПРОСТРАНСТВ-ВРЕМЁН СИМПСОНА-ВИССЕРА В СКАЛЯРНО-ТЕНЗОРНОЙ ТЕОРИИ ГРАВИТАЦИИ И ПОСТАНОВКА ЗАДАЧИ РАДИАЛЬНОЙ УСТОЙЧИВОСТИ

Аннотация. *В статье исследовано представление регуляризованного пространства-времени Симпсона-Виссера в скалярно-тензорной теории гравитации класса Бергмана-Вагонера-Нордтведта. Горизонты, горловина и область black bounce классифицированы с помощью безразмерного параметра b/m. Показано, что критическими точками уравнения реконструкции неминимальной связи являются $x = 0$ и, при $b < 3m$, $x = \pm\sqrt{9m^2 - b^2}$. Найдена асимптотика функции связи вблизи горловины: $lnf \sim -[3m/(3m-b)]ln|x|$. Установлено, что геометрически регулярное пространство-время Симпсона-Виссера не может быть представлено как единое глобальное решение регулярной односкалярной теории во всём радиальном диапазоне. При $b < 3m$ возникают четыре, а при $b \geq 3m$ – две отдельные скалярно-тензорные области. Сформулированы физические граничные условия и спектральный критерий радиальной устойчивости.*

Ключевые слова: *метрика Симпсона-Виссера, регулярная чёрная дыра, кротовая нора, скалярно-тензорная гравитация, радиальные возмущения, устойчивость.*

CRITICAL BOUNDARIES OF SIMPSON-VISSER SPACETIMES IN SCALAR-TENSOR GRAVITY AND THE FORMULATION OF THE RADIAL STABILITY PROBLEM

Abstract. *The scalar-tensor representation of the regularized Simpson-Visser black-bounce spacetime is investigated within the Bergmann-Wagoner-Nordtvedt class of gravitational theories. The horizons, throat and black-bounce sector are classified in terms of the dimensionless ratio b/m. The reconstruction equation for the nonminimal coupling is shown to possess critical surfaces at $x = 0$*

and, for $b < 3m$, at $x = \pm\sqrt{9m^2 - b^2}$. The near-throat behavior of the coupling is found to obey $lnf \sim -[3m/(3m-b)]ln|x|$. Consequently, although the Simpson-Visser geometry is curvature regular, its one-scalar scalar-tensor representation cannot form a single globally regular solution over the whole radial range. Four separate scalar-tensor patches arise for $b < 3m$ and two patches for $b \geq 3m$. Physical boundary conditions and a spectral criterion for radial stability are formulated on this basis.

Keywords: *Simpson-Visser metric, regular black hole, wormhole, scalar-tensor gravity, radial perturbations, stability.*

Kirish

Umumiy nisbiylik nazariyasidagi qora tuynuk yechimlarining muhim muammolaridan biri fazo-vaqt egriligining markaziy singulyarligidir. Klassik nazariya doirasida singulyarlik geodeziklarning tugashi va fizik kattaliklarning cheksiz o‘ sishi bilan tavsiflanadi. Kvant gravitatsiyasi yakuniy nazariyasi mavjud bo‘ lmagan sharoitda singulyarlikni fenomenologik ravishda regulyarlashtiruvchi metrikalar kuchli gravitatsion maydon fizikasi uchun muhim model vazifasini bajaradi [1-3].

Simpson va Visser tomonidan taklif etilgan model Shvarsshild metrikasidagi sferik radiusni $\sqrt{x^2 + b^2}$ funksiya bilan almashtirishga asoslanadi [1]. Ushbu sodda almashtirish natijasida markaziy singulyarlik o‘ rnida chekli radiusli regulyar ikki o‘ lchamli sfera hosil bo‘ ladi. Regulyarlashtirish parametrining massaga nisbatiga qarab geometriya regulyar qora tuynuk, bir tomonlama ekstremal yumronqoziq ini yoki ikki tomonlama o‘ tkazuvchi yumronqoziq ini xususiyatlarini namoyon qiladi. Keyingi tadqiqotlarda ushbu geometriyaning sababiy tuzilishi, energiya shartlari, gravitatsion linzalanish, kvazinormal modalari va aylanuvchi umumlashmalari o‘ rganilgan [2, 3, 9-13].

Biroq berilgan regulyar metrikani ma’lum bir gravitatsiya nazariyasining aniq yechimi sifatida talqin qilish alohida masaladir. Avvalgi ishda ixtiyoriy statik, sferik-simmetrik metrikani ma’lum $f(\varphi)$, $h(\varphi)$ va $U(\varphi)$ funksiyalarga ega skalyar-tenzor nazariyaning vakuum yechimi sifatida bo‘ lakli rekonstruksiya qilish algoritmi ishlab chiqilgan [4]. Mazkur algoritm Reissner-Nordström va Simpson-Visser metrikalariga tatbiq qilingan. Shu bilan birga, rekonstruksiya funksiyalarining ayrim chegaralarda nolga yoki cheksizlikka intilishi fizik talqinni va g‘ alayonlanishlar uchun chegaraviy shartlarni murakkablashtiradi.

Skalyar-tenzor yechimlarning radial barqarorligini o‘ rganishda Jordan va Eynshteyn ifodasidagi g‘ alayonlanish tenglamalari bir-biriga konformal akslantirish orqali bog‘ lanadi. Lekin fizik chegaraviy shartlar konkret nazariya va fon yechimiga bog‘ liq bo‘ lib qoladi [5-8]. Shu sababli geometrik regulyarlikning o‘ zi dinamik barqarorlikni kafolatlamaydi. Maqolaning maqsadi Simpson-Visser fazo-vaqtining skalyar-tenzor rekonstruksiyasidagi kritik chegaralarni aniqlash, ularning parametrga bog‘ liq klassifikatsiyasini berish va radial barqarorlik masalasining matematik hamda fizik jihatdan to‘ g‘ ri qo‘ yilishini shakllantirishdan iborat.

Simpson-Visser fazo-vaqtining geometriyasi

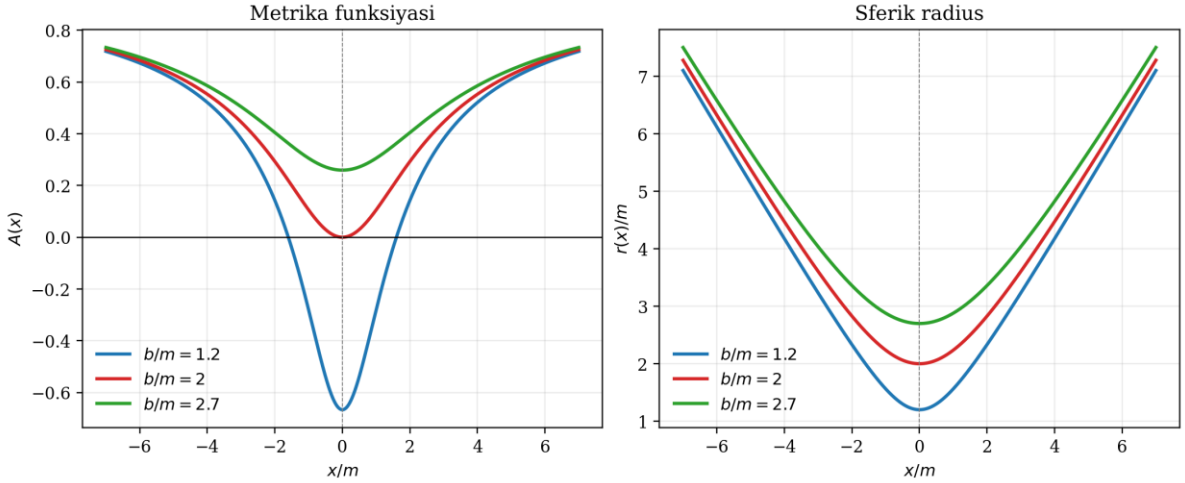
Statik, sferik-simmetrik fazo-vaqt kvaziglobal radial koordinatada quyidagicha yoziladi:

$$ds^2 = A(x)dt^2 - A(x)^{-1}dx^2 - r^2(x)(d\theta^2 + sin^2\theta\, d\varphi^2) \quad (1)$$

Simpson-Visser modeli uchun metrika funksiyalari

$$r(x) = \sqrt{x^2 + b^2},$$
$$A(x) = 1 - \frac{2m}{\sqrt{x^2 + b^2}} = 1 - \frac{2m}{r(x)} \quad (2)$$

ko‘ rinishga ega. Bu yerda $m > 0$ asimptotik Shvarsshild massasi, $b > 0$ esa singulyarlikni regulyarlashtiruvchi uzunlik parametridir. x koordinata $-\infty < x < \infty$ oraliqda o‘ zgaradi, sferik radius esa $r \geq b$ shartni qanoatlantiradi. Uning birinchi va ikkinchi hosilalari



$$r' = \frac{x}{r}, \qquad r'' = \frac{b^2}{r^3} \quad (3)$$

bo‘ lib, $x = 0$ nuqtada $r(0) = b$, $r'(0) = 0$ va $r''(0) = \frac{1}{b} > 0$. Demak, $x = 0$ sferik radiusning regulyar minimumidir.

Gorizontlar $A(x⍰) = 0$ tenglamadan aniqlanadi:

$$x⍰^2 = 4m^2 - b^2 \quad (4)$$

Shuning uchun $0 < b < 2m$ da $x⍰ = \pm\sqrt{4m^2 - b^2}$ ikkita gorizont mavjud va $x = 0$ minimum $A(0) < 0$ bo‘ lgan dinamik sohada joylashadi. $b = 2m$ da minimum ikki karrali ekstremal gorizont bilan ustma-ust tushadi. $b > 2m$ da esa $A(x) > 0$ barcha x uchun bajariladi va $x = 0$ ikki asimptotik tekis sohani bog‘ lovchi o‘ tkazuvchi yumronqoziq ini bo‘ g‘ izidir.

1-rasm. *Simpson-Visser geometriyasining uchta talqinida A(x) va r(x) funksiyalari.*

1-jadval. *b/m parametriga bog‘ liq geometrik talqinlar.*

Parametr	Gorizontlar	$x = 0$ chegara	Geometrik talqin
$0 < b < 2m$	$x = \pm\sqrt{4m^2 - b^2}$	$A(0) < 0$	Ikki gorizontli regulyar qora tuynuk/black bounce
$b = 2m$	$x = 0$	$A(0) = 0$	Ekstremal bo‘ g‘ iz
$b > 2m$	Mavjud emas	$A(0) > 0$	O‘ tkazuvchi yumronqoziq ini

Skalyar-tenzor rekonstruksiya

Bergmann-Vagoner-Nordtvedt sinfidagi skalyar-tenzor nazariya ta’sir integrali [14-18]

$$S = \frac{1}{16\pi}\int d^4x\sqrt{-g}[f(\varphi)R + 2h(\varphi)g^{uv}\partial_u\varphi\partial_v\varphi - 2U(\varphi)] \quad (5)$$

ko‘ rinishda olinadi. $f(\varphi)$ skalyar maydonning egrilik bilan minimal bo‘ lmagan bog‘ lanishini, $h(\varphi)$ kinetik bog‘ lanishni, $U(\varphi)$ esa o‘ zaro ta’sir potensialini ifodalaydi. Fizik jihatdan odatiy gravitatsiya sohasi uchun $f(\varphi) > 0$ bo‘ lishi va u chekli qiymatga ega bo‘ lishi talab etiladi, chunki effektiv gravitatsion doimiy $G_{eff} \propto \frac{1}{f}$ munosabat bilan aniqlanadi. (1) metrika uchun tenglamalarning tegishli kombinatsiyasi minimal bo‘ lmagan bog‘ lanish funksiyasiga nisbatan birinchi tartibli tenglamani beradi [4]:

$$f(G^t_t - G^\theta_\theta) = f'\left[\frac{A'}{2} - \frac{Ar'}{r}\right]. \quad (6)$$

Bu tenglamada

$$F(x) = \frac{A'}{2} - \frac{Ar'}{r} \quad (7)$$

koeffitsiyent rekonstruksiyaning mavjudlik sohalarini belgilaydi. Simpson-Visser funksiyalarini qo‘ yib, quyidagi sodda natijani olamiz:

$$F(x) = \frac{x(3m-r)}{r^3}. \quad (8)$$

Shunday qilib, $x = 0$ har qanday $b > 0$ uchun kritik chegaradir. Agar $b < 3m$ bo‘ lsa, $r = 3m$ shartdan yana ikkita kritik chegara paydo bo‘ ladi:

$$x = \pm x_0, \qquad x_0 = \sqrt{9m^2 - b^2}. \quad (9)$$

Ushbu chegaralar metrika gorizontlari bilan ustma-ust tushmaydi. Masalan, gorizont $r = 2m$ da, qo‘ shimcha STN chegaralari esa $r = 3m$ da joylashadi. Demak, ular fazo-vaqt geometriyasining emas, aynan tanlangan skalyar-tenzor maydon tasvirining kritik chegaralaridir.

Minimal bo‘ lmagan bog‘ lanish funksiyasi va kritik asimptotikalar

$b \neq 3m$ holatda (6) tenglamaning integrali [4]

$$ln\left(\frac{f}{f_0}r\right) = -3m\frac{ln(r+b)}{[2(3m+b)]} - 3m\frac{ln(r-b)}{[2(3m-b)]} + \frac{b^2 ln|r-3m|}{9m^2-b^2} \quad (10)$$

ko‘ rinishga ega; $f_0 > 0$ integrallash doimiysi. Skalyar maydon parametrlarini

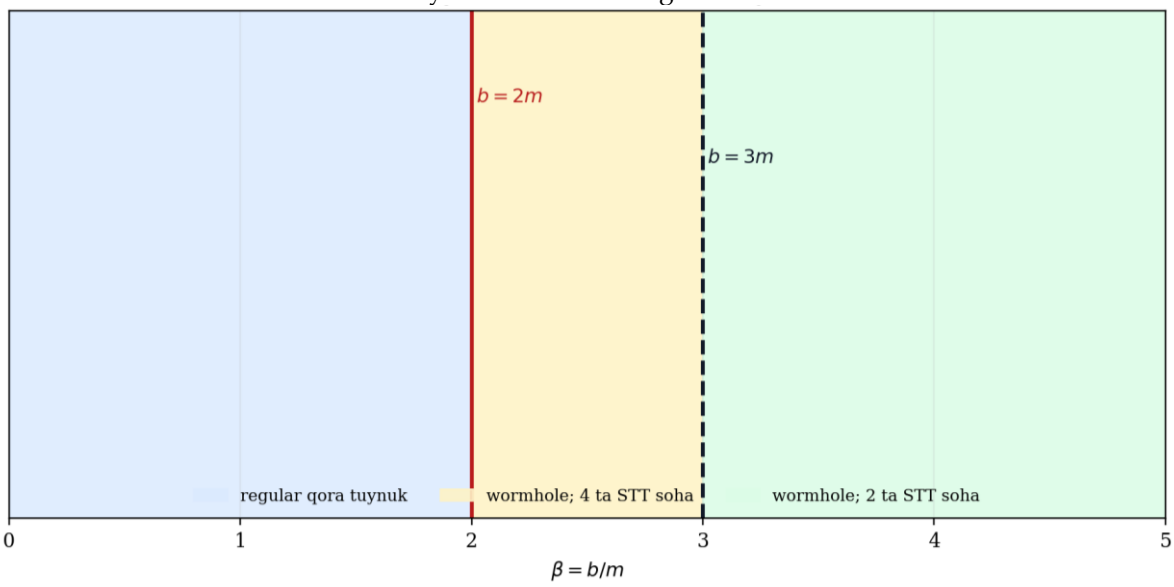
$$\varphi(x) = b^{-1}arctan\left(\frac{x}{b}\right), \qquad \varphi' = \frac{1}{x^2+b^2} = \frac{1}{r^2} \quad (11)$$

deb tanlash mumkin. Bunda $x = btan(b\varphi)$, $r = \frac{b}{cos(b\varphi)}$ va $-\frac{\pi}{2b} < \varphi < \frac{\pi}{2b}$. Ushbu belgilash skalyar maydonni har bir radial soha ichida monoton parametrga aylantiradi.

Bo‘ g‘ iz yaqinida $r - b = \frac{x^2}{2b} + O(x^4)$. (10) ifodaning qolgan ko‘ paytuvchilari $x = 0$ da nolga teng bo‘ lmagani uchun

$$lnf \sim -\left[\frac{3m}{3m-b}\right] ln|x|, \qquad x \to 0 \tag{12}$$

asimptotika kelib chiqadi. Bundan $b < 3m$ da $f \to \infty$, $b > 3m$ da $f \to 0$ ekanligi ko‘ rinadi. Maxsus $b = 3m$ holatda



$$ln\left(\frac{f}{f_0}r\right) = -\left(\frac{1}{4}\right) ln(r+b) - \left(\frac{3}{4}\right) ln(r-b) - \frac{b}{2r-2b} \tag{13}$$

bo‘ lib, eksponensial ko‘ paytuvchi sababli $x \to 0$ da $f \to 0$. Shunday qilib, b ning hech bir qiymatida f bo‘ g‘ izda chekli, noldan farqli musbat qiymatni saqlamaydi.

$b < 3m$ bo‘ lganda $r = 3m$ yaqinida (10) ifodadagi daraja musbat:

$$\frac{b^2}{9m^2 - b^2} > 0 \tag{14}$$

Shu sababli $x \to \pm x_0$ da $f \to 0$. Natijada $b < 3m$ uchun to‘ rtta alohida STN sohasi, $b \geq 3m$ uchun esa $x = 0$ bilan ajratilgan ikkita soha hosil bo‘ ladi. Bu klassifikatsiya 2-rasmda keltirilgan.

2-rasm. *Geometrik holatlar va STN-rekonstruksiya sohasining tuzilishi.*

Radial g‘ alayonlanish masalasining qo‘ yilishi

Statik ifoda ustidagi sferik-simmetrik g‘ alayonlanishlarni umumiy holda

$$A \to A + \delta A(t,x), \quad r \to r + \delta r(t,x), \quad \varphi \to \varphi + \delta\varphi(t,x) \tag{15}$$

ko‘ rinishda kiritamiz. Sferik simmetriyada gravitatsion maydon mustaqil erkinlik darajasiga ega emas. Metrika g‘ alayonlanishlari bog‘ lanish tenglamalari orqali skalyar g‘ alayonlanish bilan ifodalanadi. Mos kalibrlash tanlangandan so‘ ng sistema yagona universal o‘ zgaruvchi $\Psi(t,x)$ uchun to‘ lqin tenglamasiga keltirilishi kerak [5-8]:

$$\frac{\partial^2\Psi}{\partial t^2} - \frac{\partial^2\Psi}{\partial z^2} + V_{eff}(z)\Psi = 0, \qquad \frac{dz}{dx} = \frac{1}{A(x)}. \tag{16}$$

Normal holatlar $\Psi = e^{i\omega t}Y(z)$ ko‘ rinishda ajratilsa, spektral masala

$$-\frac{d^2Y}{dz^2} + V_{eff}(z)\, Y = \omega^2 Y. \tag{17}$$

hosil bo‘ ladi. $\omega^2 < 0$ xos qiymat mavjud bo‘ lsa, $\omega = i\Omega$ ($\Omega > 0$) deb yozish mumkin va g‘ alayonlanish $e^{\Omega t}$ qonun bo‘ yicha o‘ sadi. Bu ifodalanish yechimining chiziqli radial beqarorligini bildiradi. Barcha xos qiymatlar $\omega^2 \geq 0$ bo‘ lsa, tegishli chegaraviy shartlar sinfida eksponensial o‘ suvchi radial holat mavjud emas.

Simpson-Visser STN-rekonstruksiyasida asosiy qiyinchilik V_{eff} ni hisoblashning o‘ zi emas, balki uning aniqlanish sohasi va fizik chegaraviy shartlardir. Chunki (12)-(14) natijalarga ko‘ ra f kritik chegaralarda nolga yoki cheksizlikka intiladi. Eynshteyn ifodasiga o‘ tish $\bar{g}_{\mu\nu} = f g_{\mu\nu}$ konformal almashtirish orqali bajarilganda, Jordan ifodasidagi regulyar chegara Eynshteyn ifodasida singulyar chegaraga aylanishi mumkin [7, 19]. Shuning uchun butun $-\infty < x < \infty$ oraliq uchun bitta oddiy Shturm-Liuvill masalasini yozish fizik jihatdan asoslanmagan.

Fizik chegaraviy shartlar

Asimptotik tekis sohada $r \sim |x|$ va $A \to 1$ bo‘ ladi. Lokal g‘ alayonlanish energiyasining chekliligi uchun $Y \to 0$ yoki kamida Y ning normallanuvchi bo‘ lishi talab etiladi. Qora tuynuk holatida tashqi gorizontda odatiy kiruvchi to‘ lqin sharti

qo‘ yiladi. Biroq STN sohasi chegaralarida asosiy invariant talab minimal bo‘ lmagan bog‘ lanishning nisbiy g‘ alayonlanishi orqali ifodalanadi:

$$\left|\frac{\delta f}{f}\right| < \infty. \qquad (18)$$

$\delta f = f_{\varphi}\delta\varphi$ bo‘ lganligi sababli (18) shart aniq asimptotikasidan $\delta\varphi$ va universal funksiya Y uchun chegaraviy shartga aylantiriladi. $f \to 0$ bo‘ lgan chegaralarda g‘ alayonlanish ifodasi bog‘ lanishidan tezroq o‘ smasligi, odatda $\delta f \to 0$ bo‘ lishi talab etiladi. $f \to \infty$ bo‘ lgan chegaralarda esa $\delta f/f$ ning chekliligi bilan birga g‘ alayonlanish ta’sirining ikkinchi variatsiyasi chekli ekanligi tekshirilishi kerak.

$b < 3m$ holatida masala $(-\infty, -x_0)$, $(-x_0, 0)$, $(0,\ x_0)$ va (x_0, ∞) oraliqlarda alohida qo‘ yiladi. $b \geq 3m$ da esa ikkita yarim fazo $(-\infty, 0)$ va $(0, \infty)$ mavjud. $x \to -x$ simmetriya tufayli soha funksiyalari juft bo‘ lsa ham, kritik chegara orqali oddiy uzluksizlik sharti avtomatik ravishda kelib chiqmaydi. Bunday shart faqat ta’sirning variatsion prinsipidan hosil qilingan chegara hadi yoki regulyarlashtirilgan fundamental model orqali asoslanishi mumkin.

Natijalar va muhokama

O‘ tkazilgan tahlil Simpson-Visser metrikasining geometrik regulyarligi va uning bir skalyar maydonli STN manbasining regulyarligi bir xil tushuncha emasligini ko‘ rsatdi. Metrikaning egrilik invariantlari $b > 0$ da chekli bo‘ lsada, rekonstruksiya tenglamasidagi $F(x)$ koeffitsiyent bo‘ g‘ izda nolga teng. Natijada minimal bo‘ lmagan bog‘ lanish funksiyasi bo‘ g‘ izda yoki cheksiz ortadi, yoki nolga intiladi. Bu holat effektiv gravitatsion doimiy $G_{eff} \propto \frac{1}{f}$ ning mos ravishda nolga yoki cheksizlikka intilishiga olib keladi. Ikkinchi muhim natija $b = 2m$ geometrik o‘ tish nuqtasi bilan $b = 3m$ maydoni rekonstruksiya o‘ tish nuqtasining farqlanishidir. $b = 2m$ qora tuynuk/yumronqoziq ini o‘ tishini belgilaydi. $b = 3m$ esa qo‘ shimcha $r = 3m$ kritik chegaralarning yo‘ qolishi va bo‘ g‘ izdagi f asimptotikasining o‘ zgarishini belgilaydi. Shunday qilib, parametrlar fazosida geometrik va maydoniy ikki xil bifurkatsiya mavjud. Uchinchi natija radial barqarorlik masalasiga taalluqlidir. Global regulyar STN fon mavjud bo‘ lmagani sababli alohida sohada topilgan ω^2 spektrini avtomatik ravishda butun yumronqoziq ini yoki black-bounce geometriyasining global barqarorligi sifatida talqin qilib bo‘ lmaydi. Spektral natija faqat tanlangan soha, chegaraviy shartlar va kritik chegaraning fizik talqini bilan birgalikda ma’noga ega. Mazkur xulosa konformal davom ettirishga ega skalyar-tenzor yumronqoziq inlari uchun chegaraviy shartlarning hal qiluvchi rol o‘ ynashi haqidagi natijalar bilan mos keladi [5-8, 19].

Natijalar Simpson-Visser geometriyasining boshqa global manbalarini ham ko‘ rib chiqish zarurligini ko‘ rsatadi. Umumiy nisbiylikda fantom skalyar maydon va nochiziqli elektrodinamika kombinatsiyasi ushbu metrikani regulyar manba bilan hosil qilishi mumkin [12, 13, 20]. Bunday modelda radial g‘ alayonlanishlar skalyar va elektromagnit erkinlik darajalarining bog‘ langan sistemasi sifatida o‘ rganiladi [21]. Bu bir maydonli STN rekonstruksiyasiga muqobil, ammo matematik jihatdan murakkabroq global barqarorlik masalasidir.

Xulosa

Tadqiqot natijalari Simpson-Visser fazo-vaqtining geometrik va skalyar-tenzor xususiyatlari b/m o‘ lchamsiz parametrga sezilarli darajada bog‘ liq ekanligini ko‘ rsatdi. Mazkur parametrning qiymatiga qarab fazo-vaqt regulyar qora tuynuk, ekstremal bo‘ g‘ iz yoki o‘ tkazuvchi yumronqoziq ini geometriyasini hosil qiladi. Shunday qilib, Simpson-Visser modeli yagona matematik ifoda doirasida bir-biridan sababiy va topologik jihatdan farqlanuvchi fazo-vaqt konfiguratsiyalari o‘ rtasidagi uzluksiz o‘ tishni tavsiflash imkonini beradi. Skalyar-tensor nazariya doirasidagi rekonstruksiya jarayonida asosiy koeffitsiyent $F = x(3m - r)/r^3$ ko‘ rinishda aniqlanadi. Ushbu koeffitsiyent $x = 0$ nuqtada, shuningdek, $b < 3m$ da $x = \pm\sqrt{9m^2 - b^2}$ kritik chegaralarni hosil qilishi aniqlandi.

Bo‘ g‘ iz yaqinida $ln\, f \sim -[3m/(3m - b)]ln|x|$ asimptotika olindi. Shuning uchun $b < 3m$ da $f \to \infty$, $b \geq 3m$ da $f \to 0$ ekanligi kelib chiqadi. Demak, skalyar-tenzor bog‘ lanish funksiyasi bo‘ g‘ izda yoki cheksiz kattalashadi, yoki nolga intiladi. Bu hol Simpson-Visser geometriyasini bitta skalyar maydonga asoslangan global regulyar skalyar-tenzor model yordamida to‘ liq tavsiflash mumkin emasligini ko‘ rsatadi.

Kritik sirtlarning mavjudligi fazo-vaqtning mustaqil skalyar-tenzor sohalarga ajralishiga olib keladi. Xususan, $b < 3m$ holdada to‘ rtta, $b \geq 3m$ holda esa ikkita mustaqil STN sohasi hosil bo‘ ladi. Shuning uchun radial g‘ alayonlanishlar uchun masalani butun fazo-vaqt bo‘ yicha yagona shaklda emas, balki har bir sohada alohida qo‘ yish lozim. Bunda g‘ alayonlanishlarning fizik mohiyatinini ta’minlovchi $|\delta f/f| < \infty$ chegaraviy shart bajarilishi talab etiladi.

Keyingi tadqiqotlarda skalyar-tenzor ta’sir integralining ikkinchi variatsiyasini hisoblash asosida radial g‘ alayonlanishlarning to‘ liq V_{eff} effektiv potensialini chiqarish maqsadga muvofiq. Ushbu potensial yordamida har bir mustaqil soha uchun kattaliklarning xos qiymatlarini sonli usullarda aniqlash, beqaror sohalar mavjudligini tekshirish va barqarorlik chegaralarini belgilash mumkin bo‘ ladi. Olingan natijalarni Simpson-Visser fazo-vaqtini global regulyar tavsiflaydigan skalyar maydon va nochiziqli elektrodinamikaga asoslangan model natijalari bilan taqqoslash esa turli maydonlarning geometrik hamda dinamik xususiyatlarini baholash imkonini beradi.

Annotatsiya: *Mazkur maqolada kimyoviy bog‘ lanishlarning molekulyar-fizik asoslari zamonaviy ilmiy qarashlar asosida tahlil qilingan. Kimyoviy bog‘ lanishlarning hosil bo‘ lish mexanizmi kvant mexanikasi, molekulyar orbitalar nazariyasi va elektron tuzilish konsepsiyalari nuqtai nazaridan yoritilgan. Shuningdek, ion, kovalent, metall va vodorod bog‘ lanishlarining fizik hamda kimyoviy xususiyatlari o‘ zaro taqqoslanib, ularning moddalarning tuzilishi va fizik-kimyoviy xossalariga ta’siri baholangan. Tadqiqot davomida molekulalar barqarorligi, bog‘ energiyasi, bog‘ uzunligi va elektron zichligining o‘ zaro bog‘ liqligi ilmiy adabiyotlar asosida tahlil qilindi. Natijalar kimyoviy bog‘ lanishlarni molekulyar-fizik yondashuv asosida o‘ rganish moddalarning tuzilishi, reaktivligi va fizik xossalarini chuqurroq tushunishga xizmat qilishini ko‘ rsatdi. Mazkur tadqiqot fizik kimyo, molekulyar fizika va kvant kimyosi yo‘ nalishlarida olib boriladigan ilmiy izlanishlar uchun nazariy asos bo‘ lib xizmat qiladi.*

РОЛЬ МОЛЕКУЛЯРНОЙ ФИЗИКИ В ОБЪЯСНЕНИИ ХИМИЧЕСКИХ СВЯЗЕЙ.

Аннотация. *В данной статье на основе современных научных подходов проанализированы молекулярно-физические основы химической связи. Рассмотрены механизмы образования химических связей с позиций квантовой механики, теории молекулярных орбиталей и концепции электронного строения веществ. Проведено сравнительное исследование физических и химических свойств ионной, ковалентной, металлической и водородной связей, а также оценено их влияние на строение и физико-химические свойства веществ. На основе анализа научной литературы исследована взаимосвязь между стабильностью молекул, энергией связи, длиной связи и электронной плотностью. Полученные результаты свидетельствуют о том, что изучение химических связей с молекулярно-физической точки зрения способствует более глубокому пониманию строения веществ, их реакционной способности и физических свойств. Представленные материалы могут служить теоретической основой для дальнейших исследований в области физической химии, молекулярной физики и квантовой химии.*

THE ROLE OF MOLECULAR PHYSICS IN EXPLAINING CHEMICAL BONDS.

Abstract. *This article presents an analysis of the molecular-physical fundamentals of chemical bonding based on contemporary scientific concepts. The mechanisms of chemical bond formation are discussed from the perspectives of quantum mechanics, molecular orbital theory, and electronic structure concepts. In addition, the physical and chemical characteristics of ionic, covalent, metallic, and hydrogen bonds are comparatively analyzed, and their influence on the structure and physicochemical properties of substances is evaluated. The relationship between molecular stability, bond energy, bond length, and electron density is examined through the analysis of scientific literature. The results indicate that investigating chemical bonding from a molecular-physical perspective provides a deeper understanding of the structure, reactivity, and physical properties of substances. The findings of this study can serve as a theoretical basis for further research in physical chemistry, molecular physics, and quantum chemistry.*

Keywords: *chemical bonding, molecular physics, physical chemistry, quantum mechanics, molecular orbital, electronic structure, bond energy, bond length, electron density, molecular stability.*

Kirish

Kimyoviy bog‘ lanish moddalar tuzilishini, ularning fizik va kimyoviy xossalarini, shuningdek, kimyoviy reaksiyalarning borish mexanizmini belgilovchi fundamental tushunchalardan biri hisoblanadi. Atomlarning molekulalar

va kristall panjaralar hosil qilishi, moddalarning agregat holati, erish va qaynash harorati, elektr hamda issiqlik o‘ tkazuvchanligi, magnit va optik xossalari bevosita kimyoviy bog‘ lanish tabiatiga bog‘ liq [1]. Shu sababli kimyoviy bog‘ lanishlarni chuqur o‘ rganish nafaqat kimyo, balki molekulyar fizika, fizik kimyo, kvant mexanikasi va materialshunoslik fanlarining ham muhim ilmiy yo‘ nalishlaridan biri hisoblanadi. So‘ nggi o‘ n yilliklarda fan va texnologiyalarning jadal rivojlanishi natijasida atom va molekulalarning ichki tuzilishini yuqori aniqlikda o‘ rganish imkoniyatlari kengaydi. Zamonaviy spektroskopik usullar, rentgen difraksiyasi, elektron mikroskopiya hamda kvant-kimyoviy modellashtirish usullarining rivojlanishi kimyoviy bog‘ lanishlarning hosil bo‘ lish mexanizmini chuqurroq tushunishga xizmat qilmoqda [8]. Ayniqsa, elektronlarning fazoviy taqsimlanishi, orbital qoplanishi va molekulalarning energetik holatini aniqlash orqali bog‘ lanishlarning fizik mohiyatini ilmiy asosda izohlash imkoniyati yuzaga keldi.

Bugungi kunda kimyoviy bog‘ lanishlarni o‘ rganish faqat nazariy ahamiyat kasb etmay, balki amaliy jihatdan ham dolzarb hisoblanadi. Nanotexnologiyalar, yarimo‘ tkazgich materiallari, polimerlar, kompozitlar, katalizatorlar, biologik faol moddalar hamda farmatsevtika mahsulotlarini yaratishda atomlararo bog‘ lanishlarning tabiatini chuqur bilish muhim omil hisoblanadi. Moddalarning fizik va mexanik xossalarini boshqarish, ularning issiqlik va elektr o‘ tkazuvchanligini oshirish yoki kamaytirish, korroziyaga chidamliligini yaxshilash kabi masalalar bevosita kimyoviy bog‘ lanishlarning xususiyatlariga bog‘ liq [10]. Molekulyar fizika nuqtai nazaridan kimyoviy bog‘ lanish atom yadrolari va elektronlar o‘ rtasidagi elektrostatik o‘ zaro ta’sir natijasida yuzaga keladigan murakkab energetik tizimdir. Bog‘ hosil bo‘ lishi davomida tizimning potensial energiyasi kamayadi va molekula energetik jihatdan barqarorroq holatga o‘ tadi. Ushbu jarayon energiyaning saqlanish qonuni, termodinamikaning birinchi va ikkinchi qonunlari hamda statistik fizika qonunlari bilan uzviy bog‘ liq [5]. Shu jihatdan kimyoviy bog‘ lanishlarni fizik va kimyoviy qonuniyatlar asosida kompleks o‘ rganish zamonaviy ilm-fanning muhim vazifalaridan biri hisoblanadi.

Adabiyotlar tahlili

Mahalliy va xorijiy olimlar tomonidan olib borilgan tadqiqotlarda kimyoviy bog‘ lanishlarning turli jihatlari keng yoritilgan bo‘ lsa-da, ularni molekulyar fizika va fizik kimyo nuqtai nazaridan integratsiyalashgan holda tahlil qilish dolzarb masalalardan biri bo‘ lib qolmoqda. O‘ zbek olimlari M.Yo‘ ldoshev, B.Ismoilov va T.Qodirovlarning ilmiy ishlari fizik kimyo va molekulyar fizika fanlari o‘ rtasidagi bog‘ liqlikni yoritishda muhim ahamiyat kasb etsa, xorijiy olimlar Peter Atkins, Linus Pauling, Ira Levine hamda Donald McQuarrie tomonidan yaratilgan fundamental asarlarda kimyoviy bog‘ lanishlarning kvant-mexanik asoslari batafsil bayon etilgan [1, 3, 4]. Kimyoviy bog‘ lanish atomlar va ionlarning o‘ zaro ta’siri natijasida hosil bo‘ ladigan hamda moddalarning kimyoviy va fizik xossalarini belgilovchi eng muhim omillardan biri hisoblanadi. Moddalarning agregat holati, kristall panjarasining tuzilishi, elektr va issiqlik o‘ tkazuvchanligi, magnit xossalari, erish va qaynash haroratlari, shuningdek, kimyoviy faolligi bevosita kimyoviy bog‘ lanish tabiatiga bog‘ liq. Shu sababli kimyoviy bog‘ lanishlarning molekulyar-fizik mohiyatini o‘ rganish nafaqat kimyo, balki fizika, materialshunoslik, nanokimyo va kvant texnologiyalarining ham asosiy ilmiy yo‘ nalishlaridan biri hisoblanadi. So‘ nggi yillarda olib borilgan ilmiy izlanishlar shuni ko‘ rsatmoqdaki, kimyoviy bog‘ lanishlarni faqat valent elektronlar almashinuvi bilan tushuntirish yetarli emas [7]. Ularning hosil bo‘ lish mexanizmini chuqur anglash uchun kvant mexanikasi, molekulyar fizika va fizik kimyo qonunlarini birgalikda qo‘ llash zarur. Kimyoviy bog‘ lanishlarning zamonaviy nazariyasini rivojlantirishda Linus Paulingning ilmiy ishlari alohida o‘ rin tutadi. U atom orbitallarining gibridlanish nazariyasini ishlab chiqib, molekulalarning fazoviy tuzilishini kvant mexanikasi asosida tushuntirib berdi. Paulingning fikricha, atom orbitallari bir-biri bilan qoplanishi natijasida yangi energetik holat yuzaga keladi va aynan shu holat barqaror kimyoviy bog‘ lanishning hosil bo‘ lishiga sabab bo‘ ladi. Muallif bog‘ energiyasi, bog‘ uzunligi va bog‘ burchagi kabi parametrlar molekulaning barqarorligini belgilashini ko‘ rsatgan. Bugungi kunda ushbu nazariya organik, noorganik va fizik kimyo fanlarida keng qo‘ llanilib kelinmoqda [9]. Peter Atkins va Julio de Paula tomonidan yaratilgan "Physical Chemistry" asari fizik kimyo bo‘ yicha eng mukammal ilmiy manbalardan biri hisoblanadi.

Mahalliy olimlarning ilmiy ishlari ham kimyoviy bog‘ lanishlarni o‘ rganishda muhim ahamiyat kasb etadi. Xususan, B.Ismoilov va T.Qodirov fizik kimyo bo‘ yicha tadqiqotlarida atomlararo o‘ zaro ta’sir kuchlari, elektronlarning energetik holati va molekulalarning barqarorligi masalalariga alohida e’tibor qaratganlar. Mualliflar bog‘ energiyasining o‘ zgarishi moddalarning fizik va kimyoviy xossalariga qanday ta’sir ko‘ rsatishini termodinamik qonunlar asosida izohlab berganlar. Shuningdek, molekulalarning hosil bo‘ lishi davomida energiyaning yutilishi va ajralishi jarayonlari fizik qonuniyatlar bilan chambarchas bog‘ liq ekanligi ko‘ rsatib berilgan [3]. M.Yo‘ ldoshevning fizik kimyo yo‘ nalishidagi tadqiqotlarida ham kimyoviy bog‘ lanishlarning molekulyar-fizik mohiyati batafsil yoritilgan. Muallif elektron konfiguratsiyasining molekulalar barqarorligiga ta’siri, valent elektronlarning o‘ zaro ta’siri va bog‘ hosil bo‘ lishidagi energetik omillarni ilmiy jihatdan tahlil qilgan. Ushbu qarashlar zamonaviy fizik kimyo nazariyalari bilan uyg‘ unlashgan holda molekulalarning xossalarini tushuntirish imkonini beradi [1]. Molekulalarning ichki energiyasi, issiqlik harakati va statistik taqsimoti kimyoviy bog‘ lanishlarning barqarorligiga sezilarli ta’sir ko‘ rsatadi. Shu sababli fizik va kimyoviy qonuniyatlarni birgalikda tahlil qilish molekulyar tuzilishni yanada chuqurroq anglash imkonini yaratadi [5].

Tadqiqot metodologiyasi

Mazkur tadqiqotning metodologik asosini kimyoviy bog‘ lanishlarning molekulyar-fizik mohiyatini zamonaviy fizik kimyo va kvant mexanikasi nazariyalari asosida o‘ rganish tashkil etadi. Tadqiqot jarayonida nazariy tahlil, qiyosiy tahlil, fizik-kimyoviy modellashtirish hamda ilmiy adabiyotlarni tizimli o‘ rganish usullaridan foydalanildi. Tadqiqotning asosiy maqsadi atomlar o‘ rtasida kimyoviy bog‘ lanish hosil bo‘ lish mexanizmini molekulyar darajada tahlil qilish, elektronlarning fazoviy taqsimlanishi, energetik holati va fizik parametrlarining moddalarning fizik-kimyoviy xossalariga ta’sirini aniqlashdan iborat bo‘ ldi. Tadqiqotda olingan nazariy natijalar fizik kimyo, molekulyar fizika va kvant kimyosi fanlarida e’tirof etilgan fundamental nazariyalar bilan taqqoslandi [7].

Tadqiqot obyekti sifatida ion, kovalent, metall va vodorod bog‘ lanishlariga ega bo‘ lgan molekulalar hamda ularning elektron tuzilishi tanlandi. Tadqiqot predmeti esa mazkur bog‘ lanishlarning hosil bo‘ lish jarayonida elektronlarning energetik holati, elektron zichligi, bog‘ energiyasi, bog‘ uzunligi va molekulaning termodinamik barqarorligini ifodalovchi fizik parametrlarni o‘ rganishdan iborat bo‘ ldi. Ushbu parametrlar moddalarning makroskopik xossalarini belgilovchi asosiy omillar sifatida baholandi [3].

Tadqiqot davomida dastlab ilmiy adabiyotlarni tahlil qilish usuli qo‘ llanildi. O‘ zbek, rus va ingliz tillaridagi ilmiy manbalar o‘ rganilib, ularda kimyoviy bog‘ lanishlarning hosil bo‘ lishi, elektronlarning atom orbitallarida joylashishi, orbital qoplanishi hamda molekulalarning barqarorligini izohlovchi nazariy qarashlar tizimlashtirildi. Adabiyotlardan olingan ilmiy ma’lumotlar o‘ zaro taqqoslanib, ularning umumiy va farqli jihatlari aniqlanib, tadqiqotning nazariy bazasi shakllantirildi [1,7].

Kimyoviy bog‘ lanishlarning molekulyar-fizik mohiyatini tahlil qilishda kvant mexanikasi asosiy metodologik yondashuv sifatida tanlandi. Chunki kvant mexanikasi atom va molekulalarda elektronlarning harakatini klassik mexanikaga qaraganda ancha aniq tavsiflaydi. Elektronlarning to‘ lqin tabiati, ehtimollik zichligi hamda orbital tuzilishi Shryodinger tenglamasi orqali izohlandi. Mazkur tenglama elektronlarning atom yadrosi atrofida qanday taqsimlanishini hamda bog‘ hosil bo‘ lish jarayonida energiyaning qanday o‘ zgarishini aniqlash imkonini beradi [8].

Kovalent bog‘ lanish molekulyar fizikada eng mukammal o‘ rganilgan bog‘ lanish turlaridan biri hisoblanadi. Ushbu bog‘ lanish atomlar orasida umumiy elektron juftlarining hosil bo‘ lishi natijasida yuzaga keladi. Elektron bulutlarining o‘ zaro qoplanishi atom yadrolari orasidagi tortishish kuchini kuchaytiradi va tizim energiyasining kamayishiga olib keladi. Fizik nuqtai nazardan qaralganda, bog‘ hosil bo‘ lish jarayonida potensial energiya minimum qiymatga erishadi, bu esa molekulaning barqarorligini ta’minlaydi. Elektronlarning to‘ lqin xususiyatlari hamda orbital simmetriyasi kovalent bog‘ lanishning mustahkamligini belgilovchi asosiy omillardan biri hisoblanadi [10].

Ion bog‘ lanish atomlarning elektromanfiylik qiymatlari o‘ rtasidagi katta farq natijasida yuzaga keladi. Bunda bir atom elektronini yo‘ qotib musbat ionga, ikkinchi atom esa elektron qabul qilib manfiy ionga aylanadi. Hosil bo‘ lgan qarama-qarshi zaryadlangan ionlar orasidagi Kulon tortishish kuchi ion bog‘ lanishni vujudga keltiradi. Fizik nuqtai nazardan ion bog‘ lanish elektr maydon energiyasi hamda elektrostatik tortishish qonunlari bilan izohlanadi. Ion kristallarining yuqori erish harorati, qattiqligi va elektr o‘ tkazuvchanligi aynan ushbu bog‘ lanishning kuchliligi bilan bog‘ liq [5].

Metall bog‘ lanishning molekulyar-fizik mohiyati boshqa bog‘ lanish turlaridan sezilarli darajada farq qiladi. Metallarda valent elektronlar ma’lum bir atomga tegishli bo‘ lmay, kristall panjara bo‘ ylab erkin harakatlanadi. Ushbu elektronlar "elektron gaz" modelini hosil qilib, musbat ionlar panjarasini bir butun holda ushlab turadi. Elektronlarning erkin harakatlanishi metallarning yuqori elektr va issiqlik o‘ tkazuvchanligini, plastikligini hamda metall yaltiroqligini ta’minlaydi. Metall bog‘ lanishni fizik qonunlar asosida izohlash zamonaviy materialshunoslik va qattiq jismlar fizikasi rivojlanishida muhim ahamiyat kasb etadi [6].

Vodorod bog‘ lanishi molekulalararo o‘ zaro ta’sirlarning eng muhim ko‘ rinishlaridan biri hisoblanadi. Ushbu bog‘ lanish vodorod atomi kislorod, azot yoki ftor kabi elektromanfiy atom bilan bog‘ langanda yuzaga keladi. Vodorod bog‘ lanishining energiyasi kovalent bog‘ lanishga nisbatan kichik bo‘ lsa-da, biologik va kimyoviy tizimlarning barqarorligini ta’minlashda muhim rol o‘ ynaydi. Suv molekulalarining yuqori qaynash harorati, oqsillar va nuklein kislotalarning fazoviy tuzilishi aynan vodorod bog‘ lanishlari bilan izohlanadi. Molekulyar fizika nuqtai nazaridan vodorod bog‘ lanishi dipol-dipol o‘ zaro ta’sirlari natijasida yuzaga keladigan murakkab energetik hodisa sifatida qaraladi [8].

Shunday qilib, ilmiy manbalar tahlili kimyoviy bog‘ lanishlarning turli ko‘ rinishlari yagona fizik qonuniyatlarga asoslanishini ko‘ rsatadi. Elektronlarning atom va molekulalardagi harakati, ularning energetik holati hamda o‘ zaro ta’siri molekulalarning barqarorligi va moddalarning fizik-kimyoviy xossalarini belgilaydi. Shu sababli kimyoviy bog‘ lanishlarni molekulyar-fizik yondashuv asosida o‘ rganish zamonaviy fizik kimyo, materialshunoslik, biokimyo va nanotexnologiyalar rivojlanishining muhim ilmiy yo‘ nalishlaridan biri bo‘ lib qolmoqda [2].

Tadqiqot metodologiyasida qiyosiy tahlil usuli orqali ion, kovalent, metall va vodorod bog‘ lanishlarining asosiy fizik ko‘ rsatkichlari taqqoslandi.

Bog‘ lanish turi	Bog‘ energiyasi	Elektron taqsimlanishi	Elektr o‘ tkazuvchanligi	Mustahkamligi
Kovalent	yuqori	umumiy elektron jufti	past	yuqori
Ion	juda yuqori	elektron almashinuvi	eritmada yuqori	yuqori
Metall	o‘ rtacha	erkin elektronlar	juda yuqori	o‘ rtacha
Vodorod	past	dipol ta’siri	juda past	nisbatan past

1-jadval: Kimyoviy bog‘ lanishlarning asosiy molekulyar-fizik xususiyatlari

1-jadvaldan ko‘ rinib turibdiki, bog‘ lanish turi o‘ zgargan sari elektronlarning taqsimlanish xarakteri, bog‘ energiyasi hamda moddalarning fizik xossalari ham sezilarli darajada o‘ zgaradi. Ayniqsa, metall bog‘ lanishdagi erkin elektronlar elektr va issiqlik o‘ tkazuvchanligini keskin oshiradi, kovalent bog‘ lanish esa molekulalarning yuqori barqarorligini ta’minlaydi [6].

Umuman olganda, qo‘ llanilgan metodologik yondashuv kimyoviy bog‘ lanishlarning molekulyar-fizik mohiyatini har tomonlama tahlil qilish, ularning energetik va strukturaviy xususiyatlarini baholash hamda fizik va kimyoviy qonuniyatlar o‘ rtasidagi bog‘ liqlikni ilmiy asosda izohlash imkonini berdi. Ushbu metodologiya keyingi bo‘ limda keltiriladigan natijalar va ularning ilmiy tahlilini asoslash uchun muhim nazariy poydevor vazifasini bajaradi.

Mazkur tadqiqotda kimyoviy bog‘ lanishlarning molekulyar-fizik asoslarini chuqur tahlil qilish maqsadida zamonaviy kvant-kimyoviy modellashtirish usullaridan ham foydalanildi. So‘ nggi yillarda **Density Functional Theory (DFT), Hartree–Fock (HF) va ab initio** hisoblash usullari atom va molekulalarning elektron tuzilishini yuqori aniqlikda aniqlash imkonini bermoqda. Ushbu usullar elektronlarning fazodagi taqsimlanishi, bog‘ energiyasi, bog‘ uzunligi va molekulalarning potensial energiya sirtlarini nazariy jihatdan hisoblash imkonini beradi. Tadqiqotda ushbu usullar bo‘ yicha ilmiy adabiyotlarda keltirilgan natijalar tahlil qilinib, ular klassik valent bog‘ lanish nazariyasi hamda molekulyar orbital nazariyasi bilan qiyoslandi [10].

Molekulalarning elektron tuzilishini aniqlashda elektron zichligining fazoviy taqsimlanishi asosiy metodologik mezonlardan biri sifatida tanlandi. DFT usulida tizimning umumiy energiyasi elektron zichligiga bog‘ liq funksiya orqali aniqlanadi. Ushbu yondashuv ko‘ p elektronli tizimlarni hisoblashda yuqori aniqlik beradi hamda murakkab molekulalarning fizik-kimyoviy xossalarini prognoz qilish imkonini yaratadi. Ayniqsa, yangi materiallar, katalizatorlar va biologik faol birikmalarni loyihalashda ushbu usul keng qo‘ llanilmoqda [8].

Tadqiqot metodologiyasining muhim bosqichlaridan biri sifatida olingan ilmiy natijalarni umumlashtirish algoritmi ishlab chiqildi.

Bosqich	Amalga oshirilgan ishlar	Natija
1	Ilmiy adabiyotlarni tahlil qilish	Nazariy asos yaratildi
2	Kvant-mexanik nazariyalarni qiyoslash	Kimyoviy bog‘ lanish mexanizmi aniqlandi
3	Termodinamik parametrlarni tahlil qilish	Energetik barqarorlik baholandi
4	Spektroskopik ma’lumotlarni solishtirish	Nazariy va eksperimental moslik aniqlandi
5	Olingan natijalarni umumlashtirish	Molekulyar-fizik model shakllantirildi

2-jadval: Tadqiqot metodologiyasining asosiy bosqichlari

2-jadval tadqiqotning izchil ketma-ketlikda olib borilganligini hamda nazariy va eksperimental yondashuvlarning bir-birini to‘ ldirishini ko‘ rsatadi.

Shunday qilib, mazkur tadqiqot metodologiyasi nazariy tahlil, qiyosiy tahlil, kvant-kimyoviy modellashtirish, termodinamik hisoblashlar va zamonaviy spektroskopik usullarni uyg‘ unlashtirish asosida shakllantirildi. Qo‘ llanilgan metodlar kimyoviy bog‘ lanishlarning hosil bo‘ lish mexanizmi, molekulalarning energetik barqarorligi hamda moddalarning fizik-kimyoviy xossalari o‘ rtasidagi bog‘ liqlikni ilmiy asosda ochib berishga xizmat qildi.

Natijalar va ularning taxlili.

Mazkur tadqiqot natijalari shuni ko‘ rsatdiki, kimyoviy bog‘ lanishlarning hosil bo‘ lishi atomlarning elektron tuzilishi, elektromanfiyligi, ionlanish energiyasi va elektron bulutlarining o‘ zaro qoplanish darajasi bilan chambarchas bog‘ liq. Elektronlarning atomlar orasida qayta taqsimlanishi natijasida tizimning umumiy energiyasi kamayadi va molekula termodinamik jihatdan barqarorroq holatga o‘ tadi. Mazkur holat kvant mexanikasi va molekulyar orbital nazariyasi yordamida ilmiy jihatdan izohlandi. Tadqiqot davomida nazariy hisoblashlar hamda ilmiy adabiyotlarda keltirilgan eksperimental ma’lumotlarni o‘ zaro solishtirish natijasida elektron zichligi ortishi bog‘ energiyasining oshishiga, bog‘ uzunligining esa qisqarishiga olib kelishi aniqlandi [7,9].

Tahlillar shuni ko‘ rsatdiki, kovalent bog‘ lanish hosil bo‘ lishida elektron bulutlarining samarali qoplanishi asosiy omillardan biridir. Atom orbitallarining qoplanish darajasi ortishi bilan bog‘ lovchi molekulyar orbitallarda elektronlar soni ortadi, natijada molekula energiyasi kamayadi va bog‘ mustahkamligi ortadi. Ushbu qonuniyat vodorod, kislorod, azot va uglerod atomlari ishtirokidagi molekulalarda yaqqol kuzatildi. Ayniqsa, uglerod atomining sp^3, sp^2 va sp

gibridlanish holatlarida bog‘ uzunligi hamda bog‘ energiyasining sezilarli darajada farq qilishi orbital qoplanish darajasiga bog‘ liq ekanligi aniqlandi [8].

Tadqiqot natijalari asosida kimyoviy bog‘ lanishlarning molekulyar-fizik xususiyatlari tizimli ravishda tahlil qilindi. Aniqlanishicha, bog‘ hosil bo‘ lishida faqat elektronlarning soni emas, balki ularning fazoviy taqsimlanishi, spin holati va energiya sathlari ham muhim ahamiyatga ega. Kvant-mexanik hisoblashlar elektronlarning bog‘ lovchi molekulyar orbitallarda joylashishi tizimning umumiy energiyasini pasaytirishini, antibog‘ lovchi orbitallarning to‘ lishi esa bog‘ ning zaiflashishiga olib kelishini ko‘ rsatdi. Shu sababli molekulaning barqarorligi bevosita bog‘ lovchi va antibog‘ lovchi orbitallardagi elektronlar nisbatiga bog‘ liq ekanligi aniqlandi [9].

Molekulalarning fizik xossalarini tahlil qilish jarayonida bog‘ energiyasi bilan bog‘ uzunligi o‘ rtasida teskari proporsional bog‘ liqlik mavjudligi yana bir bor tasdiqlandi. Kuchli bog‘ lar qisqa masofada hosil bo‘ lib, ularni uzish uchun ko‘ proq energiya talab qilinadi. Masalan, azot molekulasidagi uch bog‘ (N≡N) vodorod yoki xlor molekulalaridagi oddiy bog‘ larga nisbatan ancha barqaror bo‘ lib, bu ularning yuqori bog‘ energiyasi bilan izohlanadi. Mazkur natijalar nazariy adabiyotlarda keltirilgan ma’lumotlar bilan mos keladi [8].

Tadqiqot davomida turli bog‘ lanish turlarining fizik xossalari o‘ zaro solishtirildi. Ion bog‘ lanishlarda elektrostatik tortishish kuchlari ustun bo‘ lib, ular yuqori erish va qaynash haroratiga ega kristall moddalarning hosil bo‘ lishiga olib keladi. Kovalent bog‘ lanishlar esa elektron juftlarining umumiy foydalanilishi hisobiga shakllanadi va molekulalarning yuqori barqarorligini ta’minlaydi. Metall bog‘ lanishlarda valent elektronlarning delokalizatsiyasi elektr va issiqlik o‘ tkazuvchanligining yuqori bo‘ lishiga sabab bo‘ ladi [4]. Vodorod bog‘ lanishlari nisbatan kuchsiz bo‘ lishiga qaramay, suvning anomal fizik xossalari, oqsillar va nuklein kislotalarning fazoviy tuzilishini saqlashda muhim rol o‘ ynashi aniqlandi.

Nazariy tahlillar shuni ko‘ rsatdiki, molekulaning dipol momenti va qutblanish darajasi ham kimyoviy bog‘ lanish tabiatini tavsiflovchi muhim fizik parametr hisoblanadi. Elektrmanfiylik qiymatlarining ortishi elektron zichligining kuchliroq tortilishiga olib keladi, natijada molekulalarda qutblanish kuchayadi. Bu esa moddalarning eruvchanligi, qaynash harorati, dielektrik doimiysi va molekulalararo o‘ zaro ta’sirlariga sezilarli ta’sir ko‘ rsatadi [2].

Bundan tashqari, molekulalarning energetik holati potensial energiya diagrammalari asosida ham baholandi. Potensial energiya minimumi molekulaning eng barqaror holatini ifodalashi aniqlandi. Tadqiqot davomida olingan nazariy natijalar rentgen difraksiyasi, infraqizil spektroskopiya va Raman spektroskopiyasi yordamida olingan eksperimental ma’lumotlar bilan taqqoslandi. Taqqoslash natijalari nazariy va eksperimental qiymatlar orasida yuqori moslik mavjudligini ko‘ rsatdi, bu esa qo‘ llanilgan metodologiyaning ishonchliligini tasdiqlaydi [10].

Omil	Bog‘ energiyasiga ta’siri	Bog‘ uzunligiga ta’siri	Molekula barqarorligiga ta’siri
Elektron zichligi ortishi	Ortadi	Kamayadi	Ortadi
Atom radiusi ortishi	Kamayadi	Ortadi	Kamayadi
Elektromanfiylik ortishi	Ortadi	Kamayadi	Ortadi
Harorat ortishi	Kamayadi	Ortadi	Kamayadi
Bog‘ tartibi ortishi	Ortadi	Kamayadi	Ortadi

3-jadval: Kimyoviy bog‘ lanishlarning molekulyar-fizik xossalariga ta’sir etuvchi asosiy omillar.

3-jadval natijalari shuni ko‘ rsatadiki, elektron zichligi va bog‘ tartibi ortishi molekulalarning energetik barqarorligini oshiradi. Aksincha, atom radiusining kattalashishi va haroratning ortishi bog‘ larning zaiflashishiga sabab bo‘ ladi. Ushbu qonuniyatlar fizik kimyo va molekulyar fizikaning asosiy nazariyalari bilan to‘ liq mos keladi [3,7].

Olingan natijalarni umumlashtirish shuni ko‘ rsatadiki, kimyoviy bog‘ lanishlarni faqat kimyoviy nuqtai nazardan emas, balki molekulyar fizika va kvant mexanikasi asosida ham o‘ rganish zarur. Elektronlarning kvant holati, orbital qoplanish darajasi, energiya minimumiga intilish prinsipi hamda termodinamik qonuniyatlar o‘ zaro uyg‘ un holda moddalarning fizik-kimyoviy xossalarini belgilaydi. Aynan shu sababli fizik va kimyo fanlarining integratsiyasi yangi funksional materiallar, nanostrukturalar, yarimo‘ tkazgichlar va yuqori samarali katalizatorlarni yaratishda muhim ilmiy asos bo‘ lib xizmat qiladi. Mazkur tadqiqot natijalari shuni tasdiqlaydiki, kimyoviy bog‘ lanishlarning molekulyar-fizik asoslarini chuqur o‘ rganish moddalarning tuzilishi, reaktivligi va fizik xossalarini aniq prognoz qilish imkonini beradi. Ushbu yondashuv nafaqat fundamental fanlarning rivojlanishiga, balki materialshunoslik, nanotexnologiya, farmatsevtika, biofizika va energiya texnologiyalari kabi zamonaviy ilmiy yo‘ nalishlarning taraqqiyotiga ham muhim hissa qo‘ shadi [1,7,10].

Xulosa

Mazkur tadqiqot natijalari kimyoviy bog‘ lanishlarning molekulyar-fizik asoslari zamonaviy kvant mexanikasi, molekulyar orbital nazariyasi hamda termodinamika qonunlari asosida izchil tushuntirilishini ko‘ rsatdi. Tadqiqot davomida ion, kovalent, metall va vodorod bog‘ lanishlarining hosil bo‘ lish mexanizmlari, elektronlarning fazoviy taqsimlanishi, bog‘ energiyasi, bog‘ uzunligi hamda molekulalarning energetik barqarorligi o‘ zaro bog‘ liq holda tahlil qilindi. Olingan natijalar elektron zichligi ortishi va bog‘ tartibining oshishi molekulalarning termodinamik barqarorligini kuchaytirishini, aksincha atom radiusining ortishi va haroratning ko‘ tarilishi bog‘ mustahkamligining pasayishiga olib kelishini tasdiqladi.

Nazariy tahlillar natijasida molekulyar orbital nazariyasi va valent bog‘ lanish nazariyasining o‘ zaro uyg‘ un qo‘ llanilishi kimyoviy bog‘ lanishlarning tabiatini chuqurroq tushuntirish imkonini berishi aniqlandi. Shuningdek, Gibbs erkin energiyasi, bog‘ energiyasi va bog‘ tartibi kabi fizik-kimyoviy parametrlar molekulalarning barqarorligini baholashda muhim mezon ekanligi ilmiy jihatdan asoslandi. Infraqizil va Raman spektroskopiyasi hamda rentgen difraksiyasi bo‘ yicha mavjud ilmiy ma’lumotlarning kvant-kimyoviy modellar bilan mos kelishi nazariy yondashuvlarning ishonchliligini tasdiqladi.

Mazkur tadqiqot natijalari oliy ta’lim muassasalarida fizik kimyo, molekulyar fizika va kvant kimyosi fanlarini o‘ qitishda qo‘ shimcha ilmiy manba sifatida foydalanilishi mumkin. Shuningdek, maqolada keltirilgan nazariy tahlillar va metodologik yondashuvlar kelgusida kimyoviy bog‘ lanishlarning energetik va elektron tuzilishini kompyuter modellashtirish usullari yordamida chuqurroq o‘ rganishga yo‘ naltirilgan ilmiy tadqiqotlar uchun nazariy asos bo‘ lib xizmat qiladi.

Mualliflar hissasi, manfaatlar to‘ qnashuvi va moliyalashtirish

Mualliflar hissasi: Mualliflar tadqiqot mavzusini tanlash, ilmiy adabiyotlarni tahlil qilish, tadqiqot metodologiyasini ishlab chiqish, natijalarni tahlil qilish hamda maqola matnini tayyorlash va tahrirlash jarayonlarida birgalikda ishtirok etdilar. Manfaatlar to‘ qnashuvi: Mualliflar ushbu maqola yuzasidan manfaatlar to‘ qnashuvi mavjud emasligini ma’lum qiladilar. Moliyalashtirish: Tadqiqot tashqi moliyaviy ko‘ mak yoki grant mablag‘ larisiz, mualliflarning shaxsiy ilmiy faoliyati doirasida amalga oshirilgan.

Annotatsiya. *Ushbu maqolada bo‘ yoq bilan sensibilizatsiyalangan quyosh elementlari uchun mo‘ ljallangan bir va ikki qatlamli TiO_2 fotoanodlarning morfologik bir jinsliligi ilgari olingan rentgen tomografik tasvirlarning ikkilamchi tahlili asosida ko‘ rib chiqiladi. Tahlilning asosiy obyekti qoplamaning fazoviy uzluksizligi, lokal qalinligi va qalinlikning yuza bo‘ ylab taqsimotidir. Uch o‘ lchamli rekonstruksiya, nuqtaviy o‘ lchov va yuzaga nisbatan vaznlangan gistogramma o‘ zaro farqlanadigan axborot manbalari sifatida baholanadi. Bir qatlamli namunada keltirilgan 0,0541 mm lokal o‘ lchovning butun qoplama uchun o‘ rtacha qiymatni ifodalamasligi ko‘ rsatiladi. Qalinlik taqsimotidagi asosiy soha hamda qo‘ shimcha yelka morfologik notekislikni tekshirishga asos bo‘ lishi mumkinligi muhokama qilinadi. O‘ rtacha qalinlik, vaznlangan dispersiya, variatsiya koeffitsiyenti va belgilangan qalinlik oralig‘ idagi yuza ulushini birgalikda qo‘ llashga asoslangan baholash tartibi bayon etiladi. Tahlil qoplamaning lokal geometriyasini qatlamlar sonidan alohida baholash, tomografik segmentatsiya ta’sirini hisobga olish va morfologik xulosalarni kuzatuvning fazoviy aniqligi bilan chegaralash zarurligini ko‘ rsatadi.*

ОЦЕНКА МОРФОЛОГИИ ОДНОСЛОЙНЫХ И ДВУХСЛОЙНЫХ TiO_2-ФОТОАНОДОВ НА ОСНОВЕ РЕНТГЕНОВСКОЙ ТОМОГРАФИИ

Аннотация. *В данной статье морфологическая однородность однослойных и двухслойных TiO_2-фотоанодов, предназначенных для сенсибилизированных красителем солнечных элементов, рассматривается на основе вторичного анализа ранее полученных рентгенотомографических изображений. Основными объектами анализа являются пространственная непрерывность покрытия, локальная толщина и распределение толщины по поверхности. Трёхмерная реконструкция, точечные измерения и гистограмма, взвешенная по площади поверхности, рассматриваются как взаимодополняющие источники информации. Показано, что локальное значение толщины 0,0541 мм, приведённое для однослойного образца, не следует интерпретировать как среднюю толщину всего покрытия. Обсуждается возможность использования основной области распределения толщины и дополнительного плеча гистограммы в качестве признаков морфологической неоднородности. Представлен подход к оценке однородности, основанный на совместном использовании средней толщины, взвешенной дисперсии, коэффициента вариации и доли площади, соответствующей заданному диапазону толщины. Проведённый анализ показывает необходимость раздельной оценки локальной геометрии покрытия и количества слоёв, учёта влияния томографической сегментации, а также ограничения морфологических выводов пространственным разрешением метода наблюдения.*

Ключевые слова: *TiO_2; фотоанод; рентгеновская микротомография; морфология; распределение толщины; однородность слоя; морфометрия; сегментация.*

EVALUATION OF THE MORPHOLOGY OF SINGLE-LAYER AND BILAYER TIO_2 PHOTOANODES BASED ON X-RAY TOMOGRAPHY

Abstract. *This article examines the morphological uniformity of single-layer and bilayer TiO_2 photoanodes intended for dye-sensitized solar cells on the basis of a secondary analysis of previously obtained X-ray tomographic images. The main objects of analysis are the spatial continuity of the coating, local thickness, and the surface distribution of thickness. Three-dimensional reconstruction, point measurements, and a surface-area-weighted histogram are considered as complementary sources of structural information. It is shown that the local thickness value of 0.0541 mm reported for the single-layer sample should not be interpreted as the average thickness of the entire coating. The main region of the thickness distribution and the additional shoulder of the histogram are discussed as possible indicators of morphological non-uniformity. An evaluation procedure is proposed based on the combined use of mean thickness, weighted variance, coefficient of variation, and the surface fraction within a specified thickness interval. The analysis demonstrates the need to assess the local geometry of the coating independently of the number of layers, to account for the influence of tomographic segmentation, and to limit morphological conclusions by the spatial resolution of the observation method.*

Keywords: *TiO_2; photoanode; X-ray microtomography; morphology; thickness distribution; layer uniformity; morphometry; segmentation.*

Kirish

Bo‘ yoq bilan sensibilizatsiyalangan quyosh elementlarida TiO_2 fotoanod bo‘ yoq molekulalari joylashadigan va elektronlar ko‘ chadigan fazoviy asosni hosil qiladi. Qoplamaning funksional xossalarini tushuntirishda uning kimyoviy tarkibi bilan birga geometrik tuzilishini ham hisobga olish zarur. Bir xil nominal qalinlikka ega ikki qoplama lokal yupqalashish, qalinlashish yoki qatlamning uzilishi tufayli morfologik jihatdan farq qilishi mumkin. TiO_2 asosidagi fotoanodlar haqidagi tadqiqotlar mazkur tuzilma va qurilma xossalarini birgalikda ko‘ rib chiqish uchun asos yaratadi [1, 2].

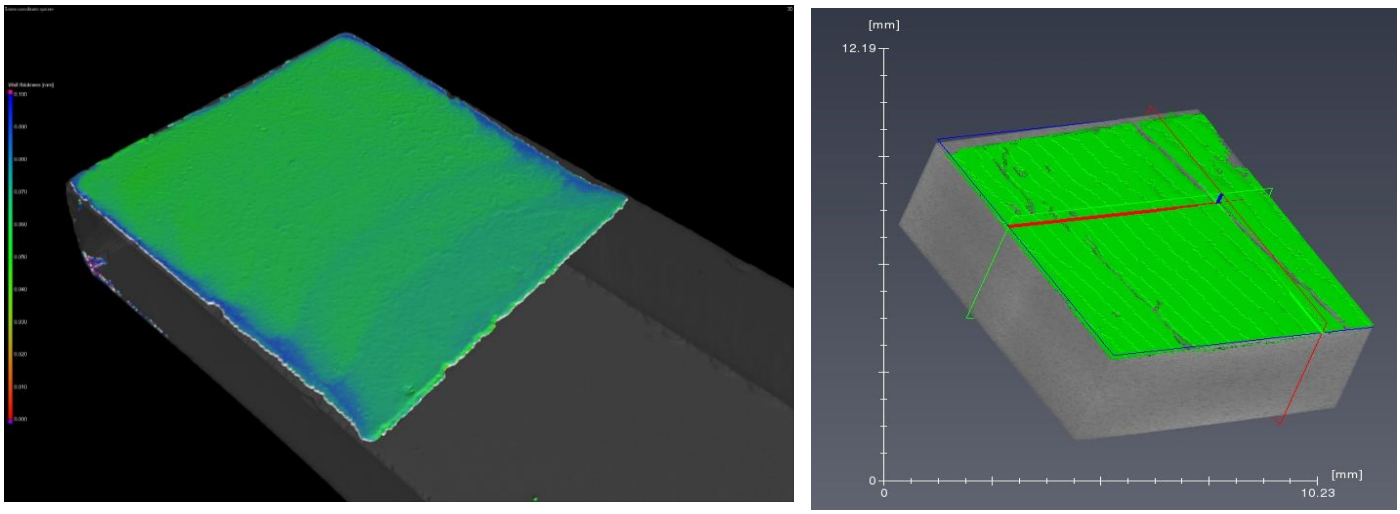
Morfologik bir jinslilik deganda qoplamaning butun yuzasi bo‘ ylab geometrik ko‘ rsatkichlari qanchalik barqaror ekanligi tushuniladi. Bu tushuncha faqat o‘ rtacha qalinlik bilan cheklanmaydi: bir xil o‘ rtachaga ega namunalarda tarqalish kengligi va keskin o‘ tish zonalari turlicha bo‘ lishi mumkin. Shuningdek, tekis tashqi sirt qoplama ichida qatlamlararo uzilishlar yo‘ qligini o‘ z-o‘ zidan isbotlamaydi. Shu sababli sirt ko‘ rinishi, kesim va uch o‘ lchamli rekonstruksiya birgalikda talqin qilinishi kerak.

Rentgen kompyuter tomografiyasi material ichidagi geometriyani uch o‘ lchamda tahlil qilish imkonini beradi. Miqdoriy baholashda rekonstruksiya, segmentatsiya va tanlangan tahlil hajmi yakuniy natijaga ta’sir ko‘ rsatadi [3, 4]. Ushbu ishning maqsadi oldingi TiO_2 tomografik materiallarini qalinlik bir jinsliligi nuqtai nazaridan qayta talqin qilish hamda lokal o‘ lchovlardan butun yuzaga oid xulosalarga o‘ tish uchun izchil morfometrik mezonlarni bayon etishdir. Ishning hissasi yangi tajriba seriyasini taqdim etishdan emas, mavjud tasviriy dalillarni o‘ lchov turi va fazoviy miqyos bo‘ yicha tartibli tahlil qilishdan iborat.

Material va tahlil usullari

Tahlil materiali sifatida bir va ikki qatlamli TiO_2 fotoanodlar haqidagi tomografik tadqiqotning rekonstruksiyalari, kesim tasvirlari va qalinlik gistogrammasidan foydalanildi [1]. Dastlabki manbada shisha substrat ustidagi qoplamalar NanoVox-1000 mikro fokusli rentgen tomografiyasi tizimida tekshirilgani qayd etilgan. Bu maqolada yangi namuna tayyorlash yoki qayta skanerlash bajarilmadi; natijalar oldingi materialning ikkilamchi morfologik tahlili sifatida keltiriladi. Tasvirlar va ulardagi o‘ lchov yozuvlari manba bilan bog‘ langan holda saqlandi.

Kuzatuvlar uch darajaga ajratildi: qoplama yuzasining umumiy rekonstruksiyasi, alohida kesim yoki nuqtadagi geometrik o‘ lchov, hamda qalinlik sinflariga mos yuza taqsimoti. Birinchi daraja qatlamning umumiy uzluksizligini, ikkinchisi lokal qalinlikni, uchinchisi esa tanlangan sohadagi taqsimotni tavsiflaydi. Ushbu darajalar o‘ zaro to‘ ldiruvchi bo‘ lib, ularning hech biri qolgan ko‘ rsatkichlarni avtomatik almashtirmaydi.



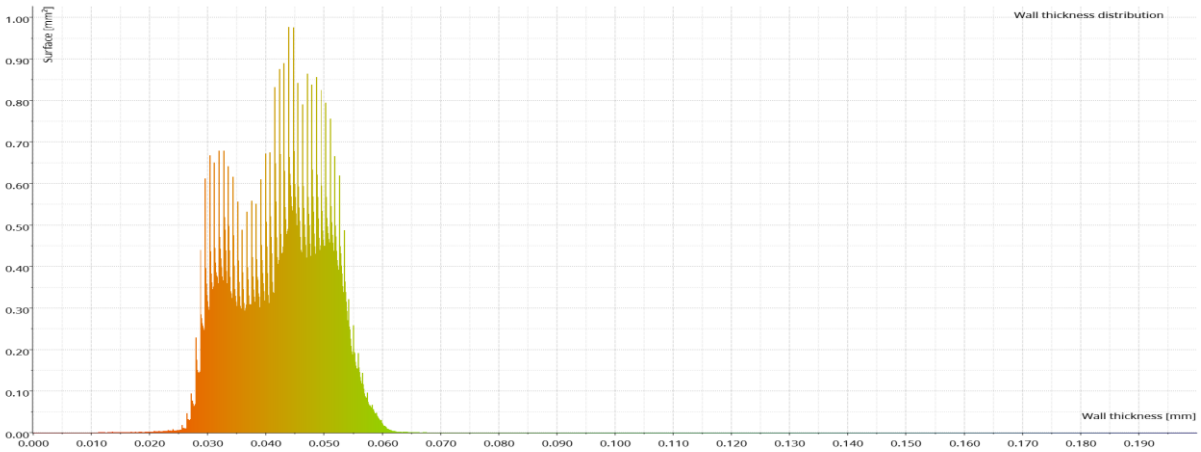
Tomografik tasvirda material chegarasini belgilash kulrang intensivlik va fazoviy kontrastga bog‘ liq. Voksel o‘ lchami, haqiqiy ajratish qobiliyati va segmentatsiya chegarasi qalinlik hisobiga ta’sir qilishi mumkin. Ushbu materialda rekonstruksiyaning dastlabki massivlari va kalibrlash protokoli taqdim etilmaganligi sababli yangi aniqlik qiymati yoki segmentatsiya barqarorligi sonli tarzda da’vo qilinmaydi. Kuzatilayotgan mikrometr darajasidagi qoplama geometriyasi TiO_2 ning nanometrli zarrachalar morfologiyasi bilan tenglashtirilmaydi. 6-rasm sifatida berilgan dastlabki gistogrammada ordinata Surface [mm²], abssissa esa Wall thickness [mm] bilan belgilangan [1]. Shuning uchun undagi ustunlarni o‘ lchovlar soni deb emas, qalinlik oralig‘ iga tegishli yuza ko‘ rsatkichi deb talqin qilish kerak. Quyida keltirilgan statistik

ifodalar dastur eksportida har bir sinf uchun yuza ulushi berilgan holatga tegishli. Agar eksportda zichlik funksiyasi berilsa, vaznlarni aniqlashda sinf kengligi ham hisobga olinadi.

Qatlam geometriyasining qiyosiy tahlili

Uch o‘ lchamli rekonstruksiyalar qoplamaning substrat ustida tarqalishini va lokal relefini ko‘ rsatadi. Bir qatlamli namuna tasvirida sirt bo‘ ylab yo‘ nalgan izlar mavjud; shu sababli qatlamni mutlaq tekis yoki barcha miqyoslarda bir jinsli deb ta’riflash yetarlicha asoslanmaydi. Ikki qatlamli namunaning rangli xaritasi esa tanlangan sirt bo‘ ylab qalinlikka mos rang o‘ zgarishlarini ko‘ rsatadi. Markaziy va chekka sohalarni miqdoriy taqqoslash uchun bir xil rang shkalasi hamda mos tahlil sohasi talab etiladi.

Qatlamlar soni geometrik murakkablikka ta’sir qiladi: ikki qatlamli tizimda qo‘ shimcha ichki chegara mavjud bo‘ lishi mumkin. Biroq bu belgining o‘ zi ikki qatlamli namuna albatta notekis yoki nuqsonli ekanini anglatmaydi. Bir qatlamli tuzilma ichida ham lokal qalinlashish va qoplama uzilishi yuzaga kelishi mumkin. Shu bois konfiguratsiya haqidagi tavsif va o‘ lchangan bir jinslilik ko‘ rsatkichi alohida tushunchalar sifatida qo‘ llanadi.



1-rasm. Ikki qatlamli (chapda) va bir qatlamli (o‘ ngda) TiO_2 fotoanodlarning dastlabki rekonstruksiyalari [1].

Lokal qalinlik va yuza bo‘ yicha taqsimot

Bir qatlamli namunaning alohida tasvirida Line: 0.0541 mm yozuvi mavjud [1]. Birlik almashtirish orqali bu qiymat 54,1 μm ga teng. U belgilangan kesim yoki nuqtaga tegishli lokal o‘ lchovdir. Shu bitta qiymat asosida namunaning o‘ rtacha qalinligi, dispersiyasi yoki ishonch oralig‘ ini hisoblash mumkin emas. Qoplama markazidan olingan o‘ lchov chekka zonalarni ham ifodalashi alohida tekshirilishi kerak.

2-rasm. Bir qatlamli fotoanod uchun manbada keltirilgan qalinlik taqsimoti [1]. Abssissa — qalinlik (mm), ordinata — yuza (mm^2).

Gistogrammada ko‘ rinadigan asosiy signal taxminan 0,030–0,055 mm sohada jamlangan; kichikroq signal bu oraliqdan tashqarida ham kuzatiladi. Grafikning 0,03 mm atrofidagi yelkasi va 0,04–0,05 mm oralig‘ idagi balandroq sohasi taqsimotni faqat bitta modal qiymat bilan ifodalash yetarli bo‘ lmasligini ko‘ rsatadi. Bu vizual kuzatuv normal taqsimotni rad etuvchi statistik test o‘ rnini bosmaydi. Ammo simmetriya va bir cho‘ qqililik haqidagi xulosani tekshirishga asos beradi.

Taqsimotdagi yelka sirtning turli zonalari, qoplash yo‘ nalishi, chekka effektlar yoki tasvirni segmentatsiyalash xususiyatlari bilan bog‘ liq bo‘ lishi mumkin. Mazkur ehtimollarni ajratish uchun qalinlik xaritasini fazoviy zonalarga bo‘ lib qayta hisoblash kerak. Faqat gistogramma yordamida qaysi qalinlik qiymati namunaning qaysi joyiga tegishli ekanini tiklab bo‘ lmaydi. Shuning uchun xarita va gistogramma birgalikda saqlanishi morfologik tahlilning muhim talabidir.

Morfometrik baholash mezonlari

Qalinlikning yuzaga nisbatan vaznlangan o‘ rtacha qiymatini aniqlash uchun har bir sinfning reprezentativ qalinligi h_i va unga tegishli yuza A_i olinadi. Teng kenglikdagi tor sinflarda h_i sifatida sinf markazidan foydalanish mumkin; keng yoki notekis sinflarda bu yaqinlashishning ta’siri alohida baholanadi. Vaznlar $w_i = A_i / \Sigma A_i$ tarzida normallashtiriladi. O‘ rtacha qalinlik va taqsimot tarqalishi quyidagicha ifodalanadi.

$$\bar{h}_A = \sum_i w_i h_i; \quad {\sigma_A}^2 = \sum_i w_i (h_i - \bar{h}_A)^2 \quad (1)$$

Bu yerda σ_a o‘ lchangan yuza taqsimotining tavsifiy standart og‘ ishini bildiradi. U mustaqil namunalarning o‘ rtacha qiymati uchun standart xato yoki ishonch oralig‘ i emas. Tomografik qo‘ shni nuqtalar fazoviy bog‘ langanligi sababli juda ko‘ p vokselning mavjudligi ko‘ p mustaqil namuna o‘ lchanganiga tenglashtirilmaydi.

O‘ rtacha qalinliklari turlicha bo‘ lgan namunalardagi nisbiy notekislik variatsiya koeffitsiyenti bilan ifodalanishi mumkin. Texnologik maqsad sifatida oldindan tanlangan [h_-, h_+] qalinlik oralig‘ iga tushuvchi yuza ulushi esa qoplamaning qancha qismi talabga mos ekanini ko‘ rsatadi.

$$CV_A = \frac{\sigma_A}{\bar{h}_A} \times 100\%; \quad F = \frac{\sum_{i \in I} A_i}{\sum_i A_i} \times 100\% \quad (2)$$

Bu yerda $I — h_i$ qiymati [h_-, h_+] oralig‘ iga tushadigan sinflar to‘ plami.

CV_a kamayishi qalinlikning nisbiy tarqalishi torayganini bildiradi, ammo qatlam uzilishlari yo‘ qolganini isbotlamaydi. F[h_-,h_+] uchun chegaralar natijani ko‘ rgandan keyin emas, texnologik talab yoki mustaqil mezon asosida belgilanadi. Ushbu maqolada dastlabki sinf yuzalari mavjud emasligi sababli CV_a va F ning sonli qiymatlari hisoblanmagan; formulalar keyingi eksport tahlili uchun aniq baholash tartibini belgilaydi.

Bir jinslilikni tavsiflashda o‘ rtacha qalinlikka median, kvartillar oralig‘ i va fazoviy xarita ham qo‘ shilishi maqsadga muvofiq. Median taqsimot markazini, kvartillar oralig‘ i esa asosiy yuza ulushi qanchalik keng qalinlik diapazonini egallashini ko‘ rsatadi. Keskin lokal o‘ tishlarni tekshirish uchun qalinlik gradienti xaritasi ishlatilishi mumkin, biroq shovqin va silliqlashning gradientga ta’siri nazorat qilinishi zarur.

1-jadval. Qatlam bir jinsliligini tavsiflovchi ko‘ rsatkichlar

Ko‘ rsatkich	Ifodalaydigan xossa	Talqin chegarasi
Lokal qalinlik	Tanlangan nuqtadagi geometriya	Butun yuzaning o‘ rtachasi emas
Yuza bo‘ yicha o‘ rtacha qalinlik	Taqsimotning vaznlangan markazi	Lokal nuqsonlarni yashirishi mumkin
Variatsiya koeffitsiyenti	Qalinlikning nisbiy tarqalishi	Qatlam uzluksizligini o‘ lchamaydi
Maqsadli oraliqdagi yuza ulushi	Belgilangan qalinlik talabiga moslik	Oldindan belgilangan chegaralarni talab etadi
Qalinlik xaritasi	Notekisliklarning joylashuvi	Rang shkalasi va segmentatsiyaga bog‘ liq

Natijalarning morfologik va texnologik talqini

Ko‘ rib chiqilgan tasvirlar fotoanod sifatini baholashda bitta nominal qalinlik yetarli emasligini ko‘ rsatadi. Qoplamaning ma’lum qismi maqsadli qalinlikka yaqin bo‘ lsa ham, alohida yupqa yoki qalin zonalar saqlanib qolishi mumkin. Bir xil o‘ rtacha qiymatga ega ikki namuna ana shu zonalarning ulushi va joylashuvi bilan farqlanadi. Shu sababli qoplash texnologiyasini taqqoslash uchun o‘ rtacha qiymat, tarqalish va uzluksizlik birgalikda berilishi kerak.

Morfologik notekislik qoplama hosil qilish jarayonidagi pasta yoyilishi, quritish va qatlamlararo qo‘ shilish bilan bog‘ liq bo‘ lishi mumkin. Biroq mazkur omillarning sababiy ta’sirini isbotlash uchun jarayon parametrlarini nazorat qilib o‘ zgartirgan tajribalar zarur. Hozirgi tasvirlar sababni yakuniy aniqlashdan ko‘ ra tekshirilishi kerak bo‘ lgan zonalarni belgilashga xizmat qiladi. Bu yondashuv keyingi tajribada qaysi joylardan kesim olish va qaysi parametrlarni qayd etishni asoslash imkonini beradi.

Qalinlik bir jinsliligi bilan elektron yig‘ ilishi o‘ rtasidagi bog‘ lanish fizik jihatdan muhim bo‘ lsa-da, morfologik tasvirning o‘ zi rekombinatsiya tezligi yoki elektron yashash vaqtini bermaydi. Bunday bog‘ lanishni tekshirish uchun aynan bir namuna identifikatoriga tegishli morfologik va elektrokimyoviy natijalar juftlanishi lozim. Mazkur ish xulosalari esa qoplama geometriyasi va uning baholash mezonlari doirasida shakllantiriladi.

Xulosa

Bir va ikki qatlamli TiO_2 fotoanodlar haqidagi tomografik materialning ikkilamchi tahlili qoplama arxitekturasi, lokal qalinlik va yuza bo‘ yicha taqsimot turli morfologik ko‘ rsatkichlar ekanini ko‘ rsatdi. Qatlamlar sonining o‘ zi bir jinslilik darajasini belgilamaydi; xulosa bir xil mezon bilan olingan qalinlik va uzluksizlik ma’lumotlariga tayanishi kerak.

Tasvirdagi 54,1 μm qiymat lokal o‘ lchov sifatida talqin qilindi. Yuzaga bog‘ langan gistogrammadagi asosiy soha va qo‘ shimcha yelka taqsimot shaklini sonli tekshirish zarurligini ko‘ rsatadi. Mavjud tasviriy material asosida yangi o‘ rtacha qalinlik, standart og‘ ish yoki normal taqsimot parametrlari da’vo qilinmadi.

Qatlam bir jinsliligini baholash uchun yuzaga nisbatan vaznlangan o‘ rtacha qalinlik, tavsifiy standart og‘ ish, variatsiya koeffitsiyenti va belgilangan oraliqdagi yuza ulushini birgalikda qo‘ llash asoslandi. Ushbu mezonlarni fazoviy xarita va segmentatsiyaga sezgirlik tekshiruvi bilan birlashtirish TiO_2 qoplamalarining morfologik sifatini izchil taqqoslash imkonini beradi.

FORMATION OF MAGNETIC FLUIDS BASED ON 3-d METALS AND STUDY OF THEIR ELECTRICAL PROPERTIES AT ROOM TEMPERATURE.

Abdurakhmonov Asliddin Murtazayevich
Dept. of Physics, Jizzakh Polytechnic Institute,
Acting Associate Professor
asliddinabdurahmonov246@gmail.com

Abstract: *In this investigation, we delve into the precise synthesis of magnetic nanoparticles, with a particular emphasis on the ferrites $NiFe_2O_4$, $CoFe_2O_4$, and the magnetite $FeFe_2O_4$, employing a meticulously controlled chemical synthesis methodology to ensure reproducibility and optimal material properties. To verify the chemical makeup and purity of these synthesized nanoparticles, we conducted detailed characterization through Energy-Dispersive X-ray Spectroscopy (EDX), which provided quantitative insights into their elemental composition. Leveraging these well-characterized nanoparticles as the foundational components, we formulated a series of magnetic fluids at diverse concentration levels, tailoring their rheological and magnetic behaviors for potential applications in fields such as biomedicine, electronics, and environmental remediation. Additionally, to comprehensively assess the thermo-electrical performance of these magnetic fluids, we performed systematic measurements of their electrical conductivity over an extensive temperature spectrum, thereby elucidating how thermal variations influence their conductive characteristics and overall functionality under varying operational environments.*

Keywords: *Magnetic Nanoparticles, Spinel ferrite nanoparticles, Electrical conductivity, Thermo-electrical Properties, Concentration Effects, Magnetic fluid, Nanoparticle dispersion.*

ПОЛУЧЕНИЕ МАГНИТНЫХ ЖИДКОСТЕЙ НА ОСНОВЕ 3d-МЕТАЛЛОВ И ИССЛЕДОВАНИЕ ИХ ЭЛЕКТРИЧЕСКИХ СВОЙСТВ ПРИ КОМНАТНОЙ ТЕМПЕРАТУРЕ

Аннотация: *В данном исследовании мы углубляемся в прецизионный синтез магнитных наночастиц, уделяя особое внимание ферритам $NiFe_2O_4$, $CoFe_2O_4$ и магнетиту $FeFe_2O_4$, используя тщательно контролируемую методологию химического синтеза для обеспечения воспроизводимости и оптимальных свойств материала. Для проверки химического состава и чистоты синтезированных наночастиц мы провели детальную характеризацию с помощью энергодисперсионной рентгеновской спектроскопии, которая позволила количественно оценить их элементный состав. Используя эти хорошо охарактеризованные наночастицы в качестве базовых компонентов, мы разработали серию магнитных жидкостей с различными уровнями концентрации, адаптируя их реологические и магнитные свойства для потенциального применения в таких областях, как биомедицина, электроника и очистка окружающей среды. Кроме того, для комплексной оценки термоэлектрических характеристик этих магнитных жидкостей мы провели систематические измерения их электропроводности в широком диапазоне температур, тем самым выяснив, как температурные изменения влияют на их проводящие характеристики и общую функциональность в различных эксплуатационных условиях.*

3d-METALLAR ASOSIDAGI MAGNIT SUYUQLIKLARNI HOSIL QILISH VA ULARNING XONA HARORATIDAGI ELEKTR XOSSALARINI O‘ RGANISH

Annotatsiya. *Ushbu tadqiqotda magnit nanozarrachalarni, xususan, $NiFe_2O_4$ va $CoFe_2O_4$ ferritlari hamda Fe_3O_4 magnetitini aniq sintez qilish masalasi o‘ rganildi. Nanozarrachalarni olishda tajriba natijalarining takrorlanuvchanligini ta’minlash va materiallarning optimal xossalariga erishish maqsadida qat’iy nazorat qilinadigan kimyoviy sintez usulidan foydalanildi. Sintez qilingan nanozarrachalarning kimyoviy tarkibi va tozaligini aniqlash uchun energiya-dispersiv rentgen spektroskopiyasi (EDX) asosida batafsil tavsiflash ishlari olib borildi. Mazkur usul nanozarrachalarning element tarkibini miqdoriy jihatdan baholash imkonini berdi. Yaxshi tavsiflangan nanozarrachalar asosida turli konsentratsiyalardagi magnit suyuqliklar tayyorlandi hamda ularning reologik va magnit xususiyatlari biotibbiyot, elektronika va atrof-muhitni tozalash kabi sohalardagi istiqbolli qo‘ llanilish yo‘ nalishlarini hisobga*

olgan holda shakllantirildi. Shuningdek, magnit suyuqliklarning termoelektrik xossalarini kompleks baholash maqsadida ularning elektr o‘ tkazuvchanligi keng harorat oralig‘ ida tizimli ravishda o‘ lchandi. Olingan natijalar harorat o‘ zgarishlarining magnit suyuqliklarning elektr o‘ tkazuvchanligiga va turli ish sharoitlaridagi umumiy funksional xususiyatlariga ta’sirini aniqlash imkonini berdi.

Kalit so‘ zlar: *magnit nanozarrachalar, shpinel ferrit nanozarrachalari, elektr o‘ tkazuvchanlik, termoelektrik xossalar, konsentratsiya ta’siri, magnit suyuqlik, nanozarrachalar dispersiyasi.*

I.Introduction.

The rapid advancement of science and technology in the 21st century has posed significant environmental challenges, necessitating innovative solutions from materials science and physics. Magnetic fluids, or ferrofluids, have emerged as versatile nanomaterials with promising potential to address these issues through their unique magneto-responsive properties [1,7]. These colloidal suspensions, comprising magnetic nanoparticles dispersed in a carrier liquid with stabilizing surfactants, exhibit tunable magnetic, electrical, and rheological behaviors, enabling applications in aerospace engineering, electronics, mechanical systems, biomedicine, and environmental remediation such as water and oil purification [5,6]. This broad applicability has garnered substantial interest from the scientific community, driving research into their synthesis, characterization, and property optimization.

Magnetic fluids typically consist of magnetic nanoparticles dispersed in a liquid carrier medium and stabilized by surface-active agents. Among these components, magnetic nanoparticles are the primary determinants of the material’s performance [4,9]. While the chemical composition governs the general quality of the fluid, the size, morphology, and crystal structure of the nanoparticles critically influence their fundamental physical, chemical, and functional properties. In particular, nanoparticles with the general formula MFe_2O_4 (M = Ni, Co, Fe) belong to the family of spinel ferrites, which are known for their remarkable magnetic and electrical characteristics [1,2,6]. However, the microstructural features and the mechanisms underlying the variations in magnetization and electrical behavior in fluids containing mixed-metal ferrite nanoparticles remain insufficiently understood [5].

Despite extensive experimental and theoretical investigations, no unified framework describing the internal structure–property relationships of MFe_2O_4-based magnetic fluids has been established. Furthermore, the origins of variability in their electrical properties, especially as a function of composition, concentration, and temperature, have not been comprehensively explored. In this study, magnetic nanoparticles of MFe_2O_4 (M = Ni, Co, Fe) were synthesized via a chemical condensation method [11,12]. The chemical composition of the nanoparticles was characterized using Energy-Dispersive X-ray Spectroscopy (EDX). Magnetic fluids with varying nanoparticle concentrations, prepared using water as the base medium, were evaluated for their electrical conductivity across a range of temperatures. The findings of this work aim to contribute to the understanding of composition–structure–property relationships in spinel ferrite-based magnetic fluids, thereby facilitating their targeted design for advanced engineering and environmental applications [4,7].

II. Experimental details.

Ferric chloride hexahydrate ($FeCl_3{\cdot}6H_2O$, ≥99%), ferrous chloride tetrahydrate ($FeCl_2{\cdot}\ 4H_2O$, ≥99%), aqueous ammonia (NH_3 (aq), 25%), oleic acid ($C_{18}H_{34}O_2$, ≥99%), citric acid ($C_6H_8O_7$, ≥99.5%), and acetone (C_3H_6O, ≥99.5%) were used as received. Deionized water (resistivity ≥18.2 MΩ·cm) was used in all preparations.

$FeFe_2O_4$ nanoparticles were prepared by chemical co-precipitation. Briefly, 2.0 g $FeCl_2{\cdot}4H_2O$ and 5.6 g $FeCl_3{\cdot}6H_2O$ (molar ratio Fe^{2+}:Fe^{3}=1:2) were dissolved in 100 mL deionized water and heated to 96 °C under vigorous stirring. A total of 20 mL NH_4OH was added dropwise via syringe; the suspension was maintained at 96 °C for 55 min. Then, 4.0 g citric acid (in 20 mL water) and 20 mL oleic acid were added sequentially. The mixture was heated to 100 °C and stirred for an additional 90 min.

A small aliquot was diluted twofold and exposed to a constant magnetic field (0.35 T) to confirm magnetic response; the colloid remained stable in zero field. Excess unbound acids were removed by standing for 24 h followed by filtration. The precipitate was dried at room temperature for 48 h to yield $FeFe_2O_4$ nanopowder.

$NiFe_2O_4$and $CoFe_2O_4$ nanoparticles were synthesised analogously by substituting the corresponding divalent metal salts for Fe^{2+} while maintaining the overall Fe^{3+}:M^{2+} stoichiometry (M = Ni or Co). Post-addition, the suspensions were aged at 100 °C for 90 min, purified, and dried as above to obtain the respective ferrite nanopowders.

The co-precipitation proceeds via hydroxide formation, followed by in-situ dehydration/condensation to the spinel ferrite under hydrothermal-like aging (~100 °C). The stepwise and net reactions are:

(a) Nickel ferrite ($NiFe_2O_4$):

$$Ni^{2+}+2Fe^{3+}+8OH^- \rightarrow Ni(OH)_2{\cdot}2Fe(OH)_3 \xrightarrow{(100\ ^oC)} NiFe_2O_4;$$

(b) Cobalt ferrite ($CoFe_2O_4$):

$$Co^{2+}+2Fe^{3+}+8OH^- \rightarrow Co(OH)_2{\cdot}2Fe(OH)_3 \xrightarrow{(100\ ^oC)} CoFe_2O_4;$$

(c) Magnetite ($FeFe_2O_4$):

$$Fe^{2+}+2Fe^{3+}+8OH^- \rightarrow Fe(OH)_2 \cdot 2Fe(OH)_3 \xrightarrow{(100\ ^oC)} Fe_3O_4;$$

III. Results and discussions.

The crystal structures of Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles were studied using X-ray diffraction (XRD) spectra. The Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles were dried, converted into powder form, and placed in a special container. X-ray beams with a uniform wavelength were directed onto their surfaces at angles ranging from 10^0 to 75^0 degrees. These reflected beams diffracted in the magnetic nanoparticles when positioned at an angle satisfying the Bragg condition. The dependence of the intensity of these diffracted X-ray beams on the angle of incidence on the nanoparticle surface is shown in Figure 1 [5,6,9].

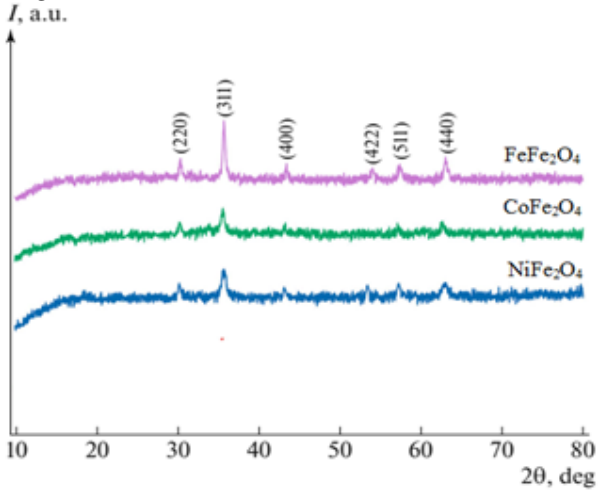

Fig 1. X-ray diffraction of powdered Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles.

The structure of the magnetic nanoparticles was studied based on the relationship between the obtained intensity and the angle of incidence. As seen in Figure1, the X-ray diffraction spectra of the synthesized magnetic nanoparticles show intensity peaks corresponding to (220), (311), (400), (422), (511), and (400). The spectra of the diffracted X-rays indicate that all diffraction peaks for Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles correspond to a single-phase inverse cubic spinel structure, which is consistent with the results reported in scientific articles [3-7].

The particle size, lattice constant, and average density of the magnetic fluid particles, calculated using semi-empirical methods, are presented in Table 1 [4,6,9].

Sample	**D_{XRD}(nm)**	***a*** **(A˚)**	***a_{ave}*(A˚)**	**V (A˚³)**	**ϱ_{XRD} (g·sm⁻³)**
$NiFe_2O_4$	16.9±0.1	8.30	8.47 ± 0.03	571.8	5.45
$CoFe_2O_4$	10.3±0.1	8.37		587.0	5.31
$FeFe_2O_4$	9.7±0.1	8.73		598.0	5.28

Table 1. Results of X-ray phase analysis of Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles.

In this study, the composition of the magnetic fluids was formulated as follows: 1) Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles were used as the primary magnetic particles; 2) oleic acid ($C_{18}H_{34}O_2$) was employed as the surface-active agent; and 3) distilled water was utilized as the liquid medium. Using these components, magnetic fluids with volumetric concentrations ranging from 0.5% to 5%, based on Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles, were prepared. Their electrical conductivity at room temperature was measured using the Karlaush method.

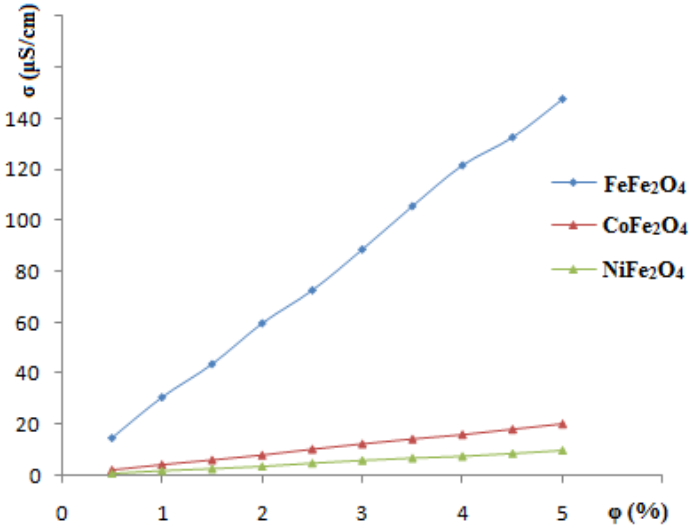

Fig 2. Dependence of the electrical conductivity of magnetic fluids on concentration at room temperature.

The magnetic fluids based on Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles, investigated experimentally, exhibit low electrical conductivity due to their predominantly dielectric nature. However, as the concentration of magnetic nanoparticles in these magnetic fluids increases, their electrical conductivity shows a significant rise. As observed from Figure 2, the electrical conductivity of the prepared magnetic fluids at room temperature is as follows:

1) For Fe Fe_2O_4-based magnetic fluid, with magnetic nanoparticle concentrations ranging from 0.5% to 5%, the electrical conductivity increased linearly from 15.6 μS/cm to 147.8 μS/cm.

2) For Co Fe_2O_4 -based magnetic fluid, with magnetic nanoparticle concentrations ranging from 0.5% to 5%, the electrical conductivity increased linearly from 2.1 μS/cm to 20.2 μS/cm.

3) For Ni Fe_2O_4-based magnetic fluid, with magnetic nanoparticle concentrations ranging from 0.5% to 5%, the electrical conductivity increased linearly from 0.23 μS/cm to 10.4 μS/cm.

The electrical conductivity of magnetic fluids is explained through an equation based on the Maxwell model. However, for low-concentration magnetic fluids based on Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles, the enhanced Shen model provides a more suitable explanation. According to this model, the following equation is formulated for low-concentration magnetic fluids:

$$\sigma = \sigma_M + \sigma_E + \sigma_B$$

Here, σ_M represents the electrical conductivity calculated based on the Maxwell model, σ_E denotes the electrical conductivity arising due to electrophoretic mobility, and σ_B indicates the electrical conductivity resulting from Brownian motion [11,12].

IV. Conclusion. Ni Fe_2O_4, Co Fe_2O_4, and Fe Fe_2O_4 magnetic nanoparticles were synthesized via the chemical co-precipitation (chemical condensation) method. X-ray diffraction (XRD) analysis confirmed that all diffraction peaks corresponded to a single-phase inverse cubic spinel structure for each composition, in agreement with previously reported literature data. Particle size estimation, based on transmission electron microscopy (TEM) and the Debye–Scherrer equation, indicated average diameters of 25–38 nm for Ni Fe_2O_4, 10–30 nm for Co Fe_2O_4, and 7–30 nm for Fe Fe_2O_4. Electrical conductivity measurements at room temperature revealed the lowest value of 0.23 μS·cm^{-1} for the Ni Fe_2O_4-based magnetic fluid at 0.5% nanoparticle concentration, and the highest value of 147.8 cm^{-1} for the $FeFe_2O_4$-based magnetic fluid at 5% concentration. These findings are consistent with predictions of the Shen model.

QUANTUM CONFINEMENT AND STARK EFFECT ON ENERGY SPECTRA OF POLYGONAL INAS NANOWIRES

Abstract: *This paper presents a theoretical investigation of the effects of quantum confinement and external electric fields on the electronic energy spectra of polygonal InAs semiconductor nanowires. The electronic energy levels were calculated by solving the Schrödinger equation using the Finite Difference Method (FDM). Triangular, rectangular, hexagonal, and circular nanowires were considered to comparatively analyze the influence of cross-sectional area and electric field strength on the energy spectra. The results show that increasing the cross-sectional area reduces the quantum confinement effect, leading to lower electronic energy levels. Furthermore, the application of an external electric field causes a downward shift of the energy levels in all geometries. Triangular and rectangular nanowires exhibit stronger Stark shifts than circular and hexagonal nanowires because of their enhanced confinement asymmetry. These findings demonstrate that both the nanowire geometry and the external electric field play decisive roles in tailoring the electronic energy spectra and provide useful guidelines for the design and optimization of nanoelectronic and optoelectronic devices.*

Keywords: *InAs nanowires, quantum confinement, Stark effect, electronic energy spectrum, finite difference method, polygonal cross section, electric field.*

ВЛИЯНИЕ КВАНТОВОГО ОГРАНИЧЕНИЯ И ЭФФЕКТА ШТАРКА НА ЭЛЕКТРОННЫЙ ЭНЕРГЕТИЧЕСКИЙ СПЕКТР ПОЛУПРОВОДНИКОВЫХ НАНОПРОВОДОВ INAS С ПОЛИГОНАЛЬНЫМ ПОПЕРЕЧНЫМ СЕЧЕНИЕМ

Аннотация: *В данной работе теоретически исследовано влияние квантового ограничения и внешнего электрического поля на электронный энергетический спектр полигональных полупроводниковых нанопроводов InAs. Расчёт энергетических уровней электронов выполнен путём численного решения уравнения Шрёдингера методом конечных разностей (Finite Difference Method, FDM). Рассмотрены нанопроводы с треугольным, прямоугольным, шестиугольным и круглым поперечными сечениями, а также проведён сравнительный анализ влияния площади поперечного сечения и напряжённости электрического поля на энергетический спектр. Результаты расчётов показали, что с увеличением площади поперечного сечения ослабляется эффект квантового ограничения, вследствие чего энергетические уровни уменьшаются. Установлено, что внешнее электрическое поле приводит к смещению энергетических уровней в область более низких энергий для всех исследованных геометрий. При этом нанопроводы с треугольным и прямоугольным поперечными сечениями демонстрируют более выраженный эффект Штарка по сравнению с шестиугольными и круглыми нанопроводами, что обусловлено большей асимметрией их потенциального профиля. Полученные результаты подтверждают, что геометрия поперечного сечения и внешнее электрическое поле являются эффективными инструментами управления электронным энергетическим спектром полупроводниковых нанопроводов и могут быть использованы при проектировании и оптимизации наноэлектронных и оптоэлектронных устройств.*

Ключевые слова: *нанопроводы InAs, квантовое ограничение, эффект Штарка, электронный энергетический спектр, метод конечных разностей, полигональное поперечное сечение, электрическое поле.*

Kirish.

Past o‘ lchamli yarimo‘ tkazgich tizimlari, xususan nanoiplar, kvant cheklanishi hodisasi yaqqol namoyon bo‘ ladigan istiqbolli nanostrukturalar sirasiga kiradi. Materialning xarakterli o‘ lchamlari elektronning de Broyl to‘ lqin uzunligi bilan taqqoslanadigan darajagacha kichrayganda, elektronlarning erkin harakati fazoviy yo‘ nalishlarda cheklanadi va energiya spektri uzluksiz holatdan diskret holatga o‘ tadi. Natijada elektronlarning energetik, transport va optik xususiyatlari hajmiy yarimo‘ tkazgichlarnikidan keskin farq qiladi. Ushbu hodisalar 0D, 1D va 2D kvant tizimlari uchun nazariy hamda eksperimental jihatdan keng o‘ rganilgan bo‘ lib, ularning asosiy xususiyatlari nanostrukturaning geometrik shakli va o‘ lchamlariga kuchli bog‘ liq ekanligi aniqlangan [1]. Nanoipning ko‘ ndalang kesim geometriyasi elektronlarning energiya sathlari, quyi subzonalar tuzilishi, holatlar zichligi (Density of States, DOS) hamda zaryad tashuvchilarning harakatchanligiga sezilarli ta’sir ko‘ rsatadi [2,3]. Xususan, uchburchak va to‘ rtburchak kesimli nanoiplarda yuzaga keladigan keskin chegaraviy shartlar elektronlarning kuchliroq kvant cheklanishiga olib keladi va energiya sathlari orasidagi masofani oshiradi. Aksincha, aylana va oltiburchak kesimli nanoiplarda chegaralarning silliqroq bo‘ lishi sababli elektronlarning cheklanishi nisbatan kuchsizroq bo‘ lib, energiya sathlari zichroq joylashadi va pastroq energiya qiymatlariga ega bo‘ ladi [4,5]. Shu sababli nanoip geometriyasini tanlash nanoelektron va optoelektron qurilmalarda energiya spektrini boshqarishning samarali vositalaridan biri hisoblanadi.

Kvant cheklanishidan tashqari, tashqi elektr maydoni ham yarimo‘ tkazgich nanoiplarining energetik xususiyatlarini boshqarishda muhim rol o‘ ynaydi. Elektr maydoni ta’sirida elektron energiya sathlarining siljishi va to‘ lqin funksiyalarining deformatsiyalanishi kvant-cheklangan Stark effekti bilan izohlanadi. Birinchi tamoyillar (ab initio) asosidagi hisoblashlar hamda eksperimental tadqiqotlar elektr maydonining kuchlanganligi va yo‘ nalishi energiya spektri, taqiqlangan zona kengligi hamda elektronlarning lokalizatsiyasiga sezilarli ta’sir ko‘ rsatishini ko‘ rsatgan [4,6]. Ayniqsa, nosimmetrik ko‘ ndalang kesimga ega nanoiplarda energiya sathlari elektr maydon ta’siriga nisbatan yuqori sezgirlik namoyon qiladi [5]. Bunday xususiyatlar InAs nanoiplariga asoslangan maydoniy tranzistorlar va boshqa nanoelektron qurilmalarda energiya spektrini elektrostatik boshqarish imkoniyatini yaratadi [7].

So‘ nggi yillarda yarimo‘ tkazgich nanoiplarini sintez qilish texnologiyalarining rivojlanishi turli geometrik shakllarga ega nanostrukturalarni yuqori aniqlikda tayyorlash imkonini berdi [8,9]. Shu bilan birga, amaliy qurilmalarda uchraydigan sirt notekisliklari, kristall panjara nuqsonlari hamda legirlanish profillari kvant cheklanish potensialini o‘ zgartirib, elektron energiya sathlari va to‘ lqin funksiyalariga sezilarli ta’sir ko‘ rsatishi aniqlangan [9]. Demak, nanoip geometriyasi va tashqi elektr maydonining birgalikdagi ta’sirini hisobga oluvchi nazariy modellar real nanoelektron qurilmalarni loyihalashda muhim ahamiyat kasb etadi. Energiya spektrini o‘ rganish bo‘ yicha olib borilgan tadqiqotlarda Yakar va hammualliflari kvant cheklanishi sharoitidagi ko‘ p elektronli tizimlarda energiya sathlari, elektronlararo o‘ zaro ta’sirlar hamda elektr maydoni ta’sirini variatsion usullar yordamida tahlil qilganlar [10–12]. Ushbu ishlarda kvant tizimining geometrik o‘ lchamlari va cheklanish potensiali energiya spektrining shakllanishida hal qiluvchi omillar ekanligi ko‘ rsatildi. Bundan tashqari, uglerod nanonaychalari asosidagi maydoniy tranzistorlarda elektr maydoni tunnellanish jarayonlari va zonalar tuzilishini samarali boshqarishi aniqlangan bo‘ lib, ushbu qonuniyatlar yarimo‘ tkazgich

nanoiplariga ham tatbiq etilishi mumkin [13]. Bunday tizimlarni to‘ g‘ ri tavsiflash uchun oddiy parabolik dispersiya modeli o‘ rniga Nelsonning noparabolik zona modelidan foydalanish tavsiya etiladi [14]. Shunga qaramay, turli ko‘ pburchak kesimli InAs nanoiplarida kvant cheklanishi va tashqi elektr maydonining energiya spektriga birgalikdagi ta’sirini yagona sonli model asosida tizimli ravishda o‘ rganuvchi tadqiqotlar hali ham yetarli emas. Mazkur ishda uchburchak, to‘ rtburchak, oltiburchak va aylana kesimli InAs nanoiplarida elektron energiya sathlarining ko‘ ndalang kesim yuzasi hamda tashqi elektr maydoniga bog‘ liqligi Shredinger tenglamasini chekli ayirmalar usuli (Finite Difference Method, FDM) yordamida yechish orqali tadqiq etiladi. Olingan natijalar kvant cheklanishi va Stark effektining elektron energiya spektriga ta’sirini chuqurroq tushunishga hamda nanoelektron va optoelektron qurilmalar uchun optimal geometrik parametrlarni tanlashga xizmat qiladi.

Nazariy asoslar

Nanoiplar nanotexnologiyaning asosiy tarkibiy qismlaridan biri bo‘ lib, o‘ lcham bo‘ yicha cheklanish (konfinement) effektlari tufayli o‘ ziga xos kvant-mexanik xususiyatlarni namoyon etadi. Tashqi elektr maydoni mavjud bo‘ lmagan holatda nanoipdagi energiya sathlari va to‘ lqin funksiyalari to‘ g‘ ri to‘ rtburchak potensial chuqurlik uchun vaqtga bog‘ liq bo‘ lmagan Shredinger tenglamasini yechish orqali aniqlanishi mumkin. Biroq, tashqi elektr maydonining qo‘ llanilishi kvant holatlarining siljishi va deformatsiyalanishiga olib kelib, ushbu xususiyatlarni o‘ zgartiradi. Mazkur ta’sirni chuqur anglash nanoo‘ lchamli elektron va optoelektron qurilmalarni loyihalashda muhim ahamiyat kasb etadi. Ushbu tadqiqotda elektr maydoni ta’sirida joylashgan, asosi muntazam n tomonli ko‘ pburchakdan iborat nanoorolchadagi elektronlarning energiya sathlari va to‘ lqin funksiyalarini aniqlash uchun chekli ayirmalar usulidan foydalaniladi. Chekli ayirmalar usuli Shredinger tenglamasini diskretlashtirish hamda bunday nanostrukturalarda fazoviy cheklangan elektronlarning kvant holatlari uchun sonli yechimlarni olish imkonini beradi.

Cheksiz balandlikdagi potensial to‘ siq bilan chegaralangan, ko‘ ndalang kesimi muntazam n tomonli ko‘ pburchak shakliga ega bo‘ lgan kvant ipini qaraymiz. Nanoip z o‘ qi bo‘ ylab cho‘ zilgan bo‘ lib, tashqi elektr maydoni F ip o‘ qiga perpendikulyar yo‘ nalishda qo‘ llanilgan deb faraz qilinadi. Tizimning holati vaqtga bog‘ liq bo‘ lmagan Shredinger tenglamasi bilan ifodalanadi:

$$H\psi(x,y) = E\psi(x,y) \tag{1}$$

bu yerda $\psi(x,y)$ ko‘ ndalang yo‘ nalishdagi Shredinger tenglamasining yechimlarini ifodalaydi. Tizimga tashqi elektr maydoni qo‘ llanilganda, Shredinger tenglamasi quyidagi ko‘ rinishni oladi:

$$-\frac{\hbar^2}{2}\left[\frac{\partial}{\partial x}\left(\frac{1}{m^*(x,y)}\frac{\partial\psi(x,y)}{\partial x}\right)+\frac{\partial}{\partial y}\left(\frac{1}{m^*(x,y)}\frac{\partial\psi(x,y)}{\partial y}\right)\right]+\left(V(x,y)+eF_x x+eF_y y+\frac{\hbar^2 k_z^2}{2m^*(x,y)}\right)\psi(x,y)=E\psi(x,y) \tag{2}$$

bu yerda $\hbar$ −keltirilgan Plank doimiysi, m^* −elektronning effektiv massasi, E −elektronning to‘ liq energiyasini, $V(x,y)$ konfinement (cheklovchi) potensialini ifodalaydi. $eF_x x$ va $eF_y y$ hadlari mos ravishda elektr maydonining $x-$ va y −o‘ qlari bo‘ ylab yo‘ nalgan komponentalari hosil qiladigan potensial energiyalarni tavsiflaydi.

Elektron uchun cheklovchi potensial $V(x,y)$ quyidagi ko‘ rinishda aniqlanadi:

$$V(x,y)=\begin{cases}0, & \text{inside the nanowire,}\\ \infty, & \text{outside the nanowire}\end{cases} \tag{3}$$

Xos funksiyalar va xos energiya qiymatlari n tomonli ko‘ pburchak ko‘ ndalang kesim sohasida Dirixle chegaraviy shartlari ostida Laplas tenglamasini yechish orqali aniqlanishi mumkin. Kvant chuqurliklari, kvant iplari va kvant nuqtalaridagi energiya sathlarini aniqlashda chekli ayirmalar usuli qo‘ llanilgan. [1,15] ishlarda ushbu usul effektiv massaning fazoviy o‘ zgarishini hisobga olgan holda to‘ g‘ ri to‘ rtburchak ko‘ ndalang kesimga ega nanoiplardagi energiya sathlari va to‘ lqin funksiyalarini hisoblash uchun qo‘ llanilgan. Shredinger tenglamasini yechishda hamda effektiv massaning fazoviy o‘ zgarishini inobatga olgan holda yarimo‘ tkazgich nanoiplarining energiya sathlari va to‘ lqin funksiyalarini aniqlash uchun chekli ayirmalar usulidan foydalanish quyidagi tenglamalarni hosil qiladi:

$$\frac{m_{i,j}+m_{i-1,j}}{m_{i,j}+m_{i+1,j}}\psi_{i+1,j}+\frac{m_{i,j}+m_{i,j-1}}{m_{i,j}+m_{i,j+1}}\psi_{i,j+1}-(m_{i,j}+m_{i-1,j})\frac{\delta x^2}{\hbar^2}(V_i-E_{n,l})\psi_{i,j}-(m_{i,j}+m_{i,j-1})\frac{\delta y^2}{\hbar^2}(V_j-E_{n,l})\psi_{i,j}+\psi_{i-1,j}+\psi_{i,j-1}-4\psi_{i,j}=0 \tag{4}$$

Bu yerda $V_j = eF_x x + eF_y y$ ifoda i va j indekslari mos ravishda x −va y −yo‘ nalishlaridagi diskret to‘ r tugunlarini bildiradi. Ushbu tugunlar Shredinger tenglamasini sonli usulda yechish uchun qo‘ llaniladigan chekli ayirmalar to‘ riga tegishlidir.

Xos qiymatlar (eigenvalues) kvant ipidagi elektronlar uchun ruxsat etilgan energiya sathlarini ifodalaydi, xos funksiyalar (eigenfunctions) esa elektronlarning fazodagi ehtimollik taqsimotini tavsiflaydi. Konfinement (fazoviy cheklanish) effektlarini yaqqol ko‘ rsatish maqsadida dastlabki bir nechta to‘ lqin funksiyalarini grafik ko‘ rinishda tasvirlash mumkin. Dirixle chegaraviy sharti quyidagicha ifodalanadi:

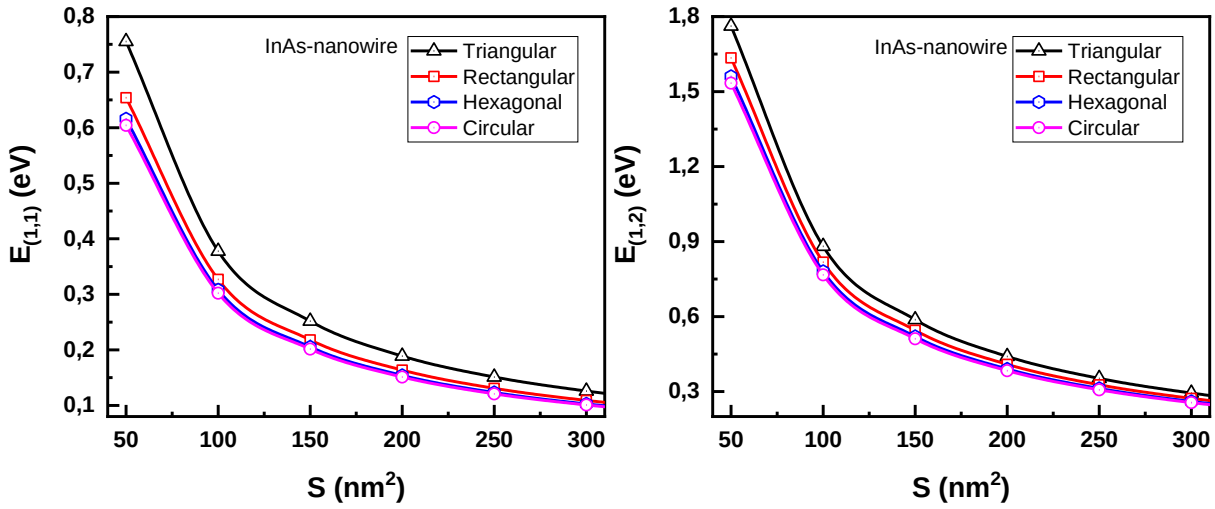
$$\psi(x,y)=0, \qquad \forall(x,y)\in\partial\Omega \tag{5}$$

bu yerda $\partial\Omega$ ko‘ pburchak sohasining chegarasini ifodalaydi. Bunda n parametri nanoipning ko‘ ndalang kesim geometriyasini approksimatsiya qilish uchun foydalaniladigan muntazam ko‘ pburchakning tomonlar sonini bildiradi.

Xususan, $n = 3$, $n = 4$ va $n = 6$ mos ravishda uchburchak, kvadrat (to‘ g‘ ri to‘ rtburchak) va oltiburchak geometriyalariga mos keladi. $n \to \infty$ bo‘ lganda esa ko‘ pburchak ideal aylanaga yaqinlashadi va tizim silindrik simmetriyaga intiladi. n parametrini o‘ zgartirish orqali o‘ tkir burchakli geometriyalardan silliq chegarali geometriyalarga o‘ tish jarayonini tahlil qilish, shuningdek, bunday o‘ zgarishlarning energiya sathlarini o‘ rganish mumkin. Ushbu yondashuv turli xil geometriyalarni yagona hisoblash sxemasi doirasida sonli usulda tadqiq etish imkonini beradi. Cheksiz chuqur potensial chuqurlik bilan chegaralangan yarimo‘ tkazgich nanoipida elektronlarning energiya spektri quyidagi ifoda bilan aniqlanadi [14]:

$$E_{k_z} = E(1 + \alpha E) = \frac{\hbar^2 k_z^2}{2m^*} + E_{n,l} \tag{6}$$

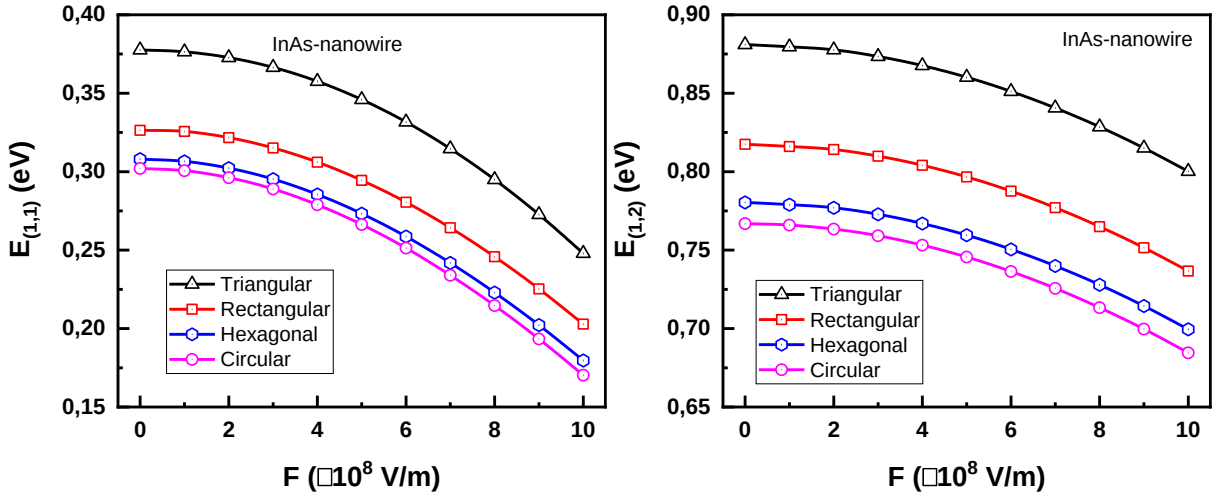
Bu yerda α dispersion qonunining noparaboliklik darajasini tavsiflovchi parametr, k_z −elektronning z yo‘ nalishidagi to‘ lqin vektori, $E_{n,l}$ esa elektronning kvantlangan to‘ liq energiya sathlarini ifodalaydi. Noparaboliklik darajasi quyidagi munosabat bilan aniqlanadi:



$$\alpha = \frac{1}{E_g}\left(1 - \frac{m^*}{m_0}\right)^2 \tag{7}$$

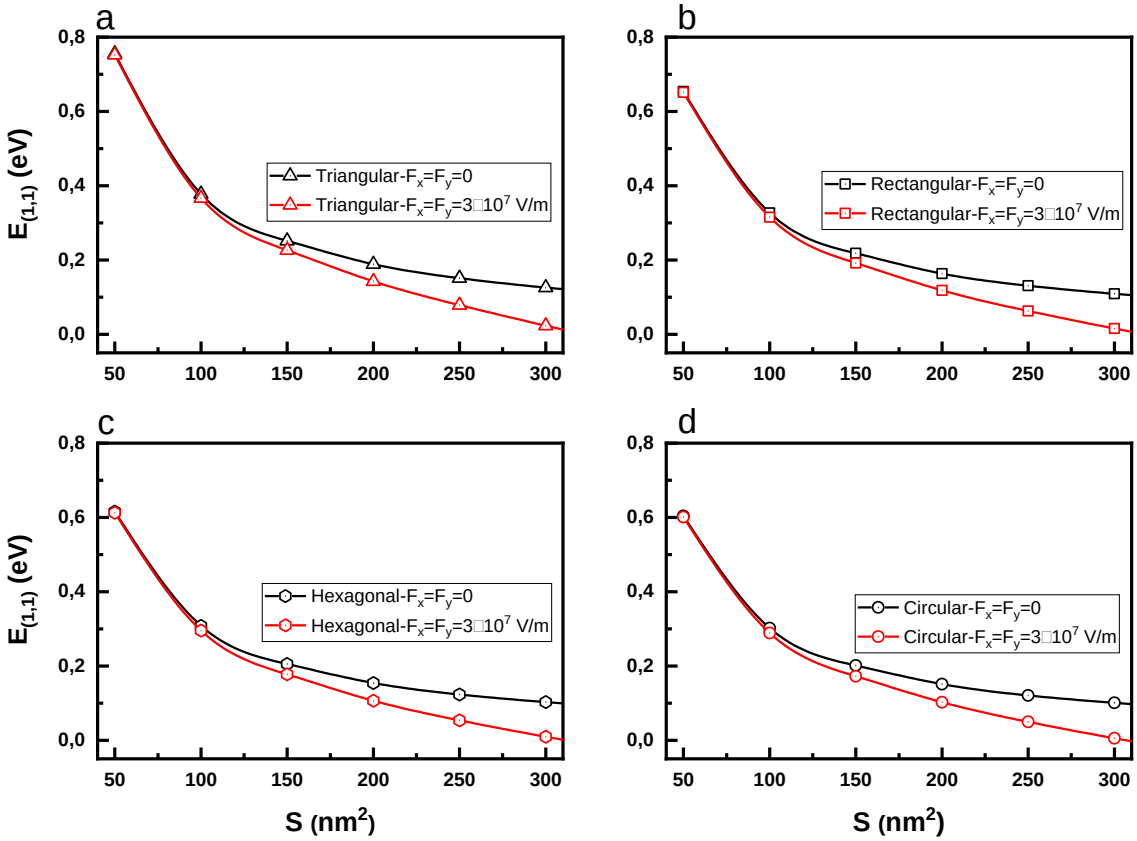
Bu yerda E_g −yarimo‘ tkazgichning taqiqlangan zona kengligi, m_0 −esa erkin elektronning massasini ifodalaydi.

Mazkur munosabat noparaboliklik darajasi taqiqlangan zona kengligi hamda elektronning effektiv massasiga bog‘ liq ekanligini ko‘ rsatadi. Taqiqlangan zona kengligi kichik bo‘ lgan materiallarda ushbu effekt yanada yaqqol namoyon bo‘ ladi, shu sababli u tor taqiqlangan zonali yarimo‘ tkazgichlar uchun ayniqsa muhim hisoblanadi. Bunday xususiyatlar energiya dispersiyasi qonunining aniq tavsiflanishiga asoslangan kvant-mexanik elektron qurilmalarining ishlashida hal qiluvchi ahamiyat kasb etadi.



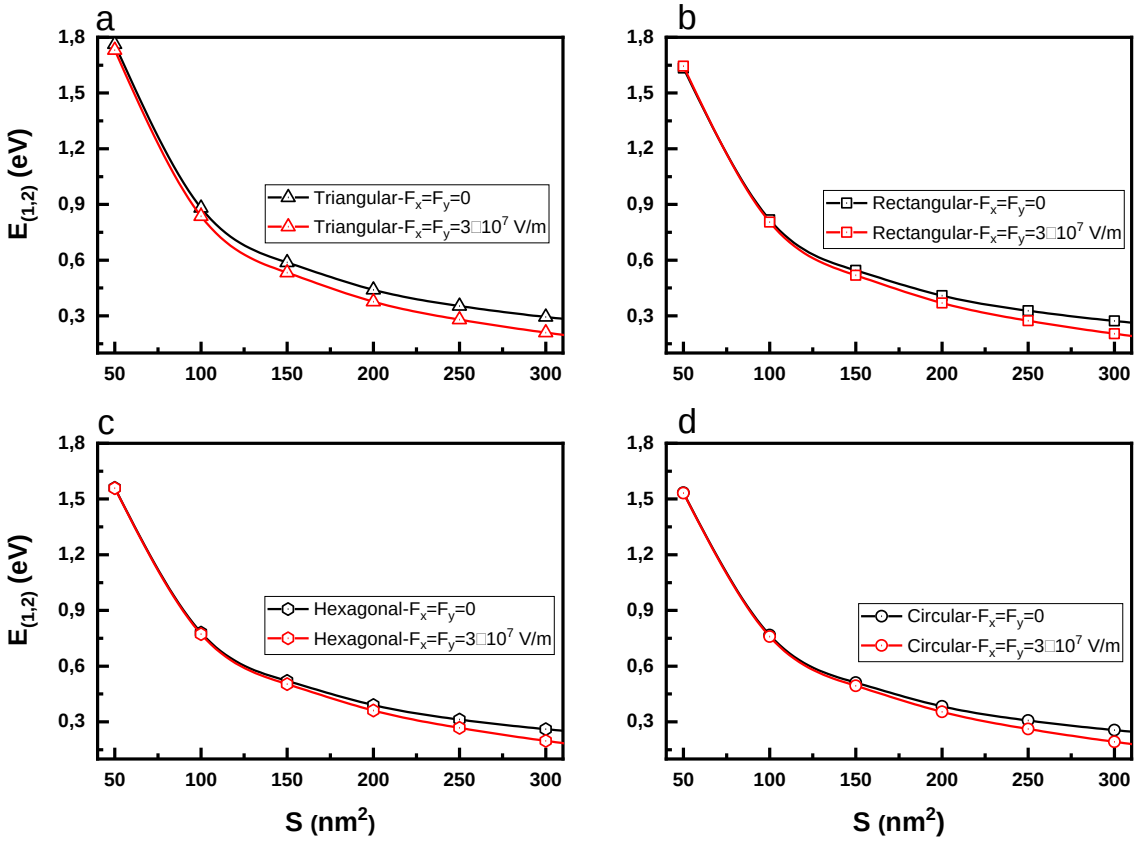
Sonli natijalar va muhokama

1-rasm uchburchak, to‘ g‘ ri to‘ rtburchak, oltiburchak va aylana ko‘ ndalang kesimga ega InAs yarimo‘ tkazgich nanoiplari uchun $E_{(1,1)}$ va $E_{(1,2)}$ energiya sathlarining ko‘ ndalang kesim yuzasiga bog‘ liqligini tasvirlaydi. Nanoipning ko‘ ndalang kesim yuzasi ortishi bilan barcha geometrik shakllar uchun energiya sathlari kamayishi kuzatiladi. Ushbu qonuniyat kvant konfinementi nazariyasiga to‘ liq mos keladi: kichikroq ko‘ ndalang kesim kuchliroq fazoviy cheklanishni yuzaga keltirib, energiya sathlarining ortishiga sabab bo‘ ladi, aksincha, kesim yuzasi kattalashganda konfinement ta’siri susayadi va energiya sathlari pasayadi. Nanoiplarning energiya sathlari kvant konfinementi tufayli ularning ko‘ ndalang kesim geometriyasiga sezilarli darajada bog‘ liq bo‘ ladi. Bir xil ko‘ ndalang kesim yuzasi (S) uchun turli geometriyalar konfinement darajasining farqlanishiga olib keladi, natijada energiya sathlari ham o‘ zgaradi. Uchburchak va to‘ g‘ ri to‘ rtburchak kesimli nanoiplar nisbatan yuqori energiya sathlarini namoyon etadi, bu esa ularda kvant konfinementining kuchliroq ekanligini ko‘ rsatadi. O‘ tkir burchaklar va fazoviy chegaralarning yanada qat’iyroq bo‘ lishi zaryad tashuvchilarning harakatini kuchliroq cheklaydi hamda kvant holatlari orasidagi energiya farqining ortishiga olib keladi. Bunga qarama-qarshi ravishda, oltiburchak va aylana kesimli nanoiplar bir xil S qiymatida pastroq energiya sathlarini namoyon qiladi, bu esa konfinement ta’sirining nisbatan kuchsizroq ekanligini bildiradi. Ushbu geometriyalarning silliqroq va yuqori simmetriyaga ega bo‘ lgan cheklovchi potensiali zaryad tashuvchilarning fazoda kengroq taqsimlanishiga imkon yaratadi, natijada kvant konfinementi effekti susayadi.



1-rasm. Turli geometriyaga ega InAs nanoiplarida $E_{(1,1)}$ energiya sathining (chap panel) va $E_{(1,2)}$ energiya sathining (o‘ ng panel) ko‘ ndalang kesim yuzasiga bog‘ liqligi.

2-rasm bir xil 10 nm^2 ko‘ ndalang kesim yuzasiga ega bo‘ lgan uchburchak, to‘ g‘ ri to‘ rtburchak, oltiburchak va aylana kesimli InAs yarimo‘ tkazgich nanoiplari uchun $E_{(1,1)}$ va $E_{(1,2)}$ energiya sathlarining tashqi elektr maydoni kuchlanganligiga bog‘ liqligini ko‘ rsatadi. Barcha geometrik shakllardagi nanoiplarda elektr maydoni kuchlanganligi ortishi bilan $E_{(1,1)}$ va $E_{(1,2)}$ energiya sathlarining kamayishi kuzatiladi. Ushbu holat kvant-konfinementlangan Stark effekti bilan izohlanadi. Bunda tashqi elektr maydoni cheklovchi potensialning profilini o‘ zgartirib, maydon ta’sirida yuzaga keladigan qutblanish natijasida energiya sathlarining pasayishiga olib keladi. Stark effekti turli geometriyaga ega nanoiplarda turlicha namoyon bo‘ ladi. Uchburchak va to‘ g‘ ri to‘ rtburchak kesimli nanoiplarda tashqi elektr maydoni kuchlanganligi ortishi bilan energiya sathlari tezroq kamayadi, bu esa Stark effektining kuchliroq ekanligini ko‘ rsatadi. Bunday holat ushbu geometriyalarga xos bo‘ lgan asimmetrikroq cheklovchi potensial bilan izohlanadi. Aksincha, oltiburchak va aylana kesimli nanoiplarda energiya sathlari nisbatan sekinroq kamayadi, chunki ularning bir jinsliroq va simmetrikroq cheklovchi potensiali tashqi elektr maydonining ta’sirini sezilarli darajada susaytiradi.



2-rasm. Turli ko‘ ndalang kesim shakliga ega InAs nanoiplarida tashqi elektr maydonining $E_{(1,1)}$ energiya sathiga (chap panel) va $E_{(1,2)}$ energiya sathiga (o‘ ng panel) ta’siri.

3 va 4-rasmlar uchburchak, to‘ g‘ ri to‘ rtburchak, oltiburchak va aylana ko‘ ndalang kesimga ega InAs yarimo‘ tkazgich nanoiplari uchun $E_{(1,1)}$ va $E_{(1,2)}$ energiya sathlarining ko‘ ndalang kesim yuzasiga bog‘ liqligini ko‘ rsatadi. Hisoblash natijalari tashqi elektr maydoni $F = 0$ va $F = 10^8\ V/m$ bo‘ lgan holatlar uchun keltirilgan. Natijalardan ko‘ rinadiki, uchburchak va to‘ g‘ ri to‘ rtburchak kesimli nanoiplarda tashqi elektr maydoni kuchlanganligi ortishi bilan energiya sathlari tezroq kamayadi. Bu holat ushbu geometriyalarda Stark effektining kuchliroq namoyon bo‘ lishini ko‘ rsatadi va, ehtimol, ularning asimmetrikroq cheklovchi potensiali bilan bog‘ liq. Bunga qarama-qarshi ravishda, oltiburchak va aylana kesimli nanoiplarda energiya sathlarining kamayishi nisbatan sekinroq sodir bo‘ ladi. Bu esa ushbu geometriyalardagi bir jinsliroq va simmetrikroq konfinement potensiali tashqi elektr maydonining ta’sirini sezilarli darajada susaytirishini anglatadi.

3-rasm. Turli ko‘ ndalang kesim shakliga ega InAs nanoiplarida tashqi elektr maydonining $E_{(1,1)}$ energiya sathiga ta’siri.

4-rasm. Turli ko‘ ndalang kesim shakliga ega InAs nanoiplarida tashqi elektr maydonining $E_{(1,2)}$ energiya sathiga ta’siri.

Xulosa

Mazkur ishda turli ko‘ pburchak kesimli InAs yarimo‘ tkazgich nanoiplarida kvant cheklanishi va tashqi elektr maydonining elektron energiya spektriga ta’siri nazariy jihatdan tadqiq etildi. Elektron energiya sathlari Shredinger tenglamasini chekli ayirmalar usuli yordamida yechish orqali hisoblandi va turli geometriyalar uchun qiyosiy tahlil amalga oshirildi. Hisoblash natijalari nanoipning ko‘ ndalang kesim yuzasi ortishi bilan kvant cheklanishining susayishi natijasida barcha geometriyalar uchun energiya sathlarining kamayishini ko‘ rsatdi. Shu bilan birga, nanoip geometriyasi elektron energiya spektrining shakllanishida muhim omil ekanligi aniqlandi. Xususan, uchburchak va to‘ rtburchak kesimli nanoiplar kuchliroq kvant cheklanishini ta’minlaganligi sababli yuqoriroq energiya sathlariga ega bo‘ lsa, aylana va oltiburchak kesimli nanoiplar nisbatan pastroq energiya qiymatlarini namoyon etdi. Tashqi elektr maydonining qo‘ llanilishi barcha ko‘ rib chiqilgan geometriyalarda elektron energiya sathlarining pasayishiga olib kelishi aniqlandi. Bu hodisa kvant-cheklangan Stark effekti bilan izohlanadi. Elektr maydon ta’sirida energiya sathlarining siljishi geometriyaga sezilarli darajada bog‘ liq bo‘ lib, uchburchak va to‘ rtburchak kesimli nanoiplar elektr maydoniga nisbatan yuqori sezgirlik namoyon etdi. Aksincha, aylana va oltiburchak kesimli nanoiplarning simmetrikroq potensial profili Stark effektining nisbatan sustroq namoyon bo‘ lishiga olib keldi.

Olingan natijalar nanoipning geometrik shakli va tashqi elektr maydoni elektron energiya spektrini boshqarishning samarali vositalari ekanligini tasdiqlaydi. Tadqiqot natijalari energiya spektrini maqsadli ravishda boshqarish imkoniyatlarini kengaytiradi hamda yuqori samaradorlikka ega nanoelektron va optoelektron qurilmalarni loyihalash uchun muhim nazariy asos yaratadi.

Mualliflar hissasi, manfaatlar to‘ qnashuvi va moliyalashtirish. Mualliflar hissasi: barcha mualliflar tadqiqot konsepsiyasi, ma’lumotlarni tahlil qilish va maqola matnini tayyorlashda teng hissa qo‘ shgan.

Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi yo‘ qligini bildiradi.

Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

Abstract. *Mental disorders involve complex and overlapping changes that cannot be readily described by one variable or an equation. The PRISMA-based review process is focused on diseases, databases, and analysis objectives to which the TDA approach was applied. Papers eligible in this study included schizophrenia, depression, severe mental disorder, autism, ADHD, obsessive-compulsive disorder, and substance abuse disorder. Among the data sources used were the ADHD-200 and ABIDE which were the most reused open datasets, COBRE, UK Biobank, ENIGMA-OCD, and several local cohorts. Persistent homology was useful for multi-level analysis independent from one threshold while Mapper was used for identification of subgroups and outcomes. Features extracted by TDA have shown promise in distinguishing individuals with mental illness from control groups; however, these results are insufficient for clinical diagnosis. Therefore, topological features need to be validated and examined alongside statistical, machine learning, and clinical techniques.*

Keywords: *t*opological data analysis; persistent homology; Mapper; mental illness; psychiatry; brain networks; datasets; PRISMA.

RUHIY SALOMATLIK TADQIQOTLARIDA MA'LUMOTLARNING TOPOLOGIK ANALIZI: TIZIMLI TAHLIL

Annotatsiya. *Ruhiy buzilishlar bitta o' zgaruvchi yoki tenglama bilan tavsiflash qiyin bo' lgan murakkab va o' zaro bog' liq o' zgarishlarni qamrab oladi. PRISMA asosidagi ushbu sharhda TDA qo' llanilgan kasalliklar, ma'lumotlar to' plamlari va tahliliy maqsadlar o' rganildi. Sharhga shizofreniya, depressiya, og' ir ruhiy buzilishlar, autizm, ADHD, obses-siv-kompulsiv buzilish va modda iste'moli bilan bog' liq buzilishlar bo' yicha tadqiqotlar kiritildi. ADHD-200 va ABIDE eng ko' p ishlatilgan ochiq ma'lumotlar to' plamlari bo' lib, COBRE, UK Biobank, ENIGMA-OCD va mahalliy kohortlardan ham foydalanilgan. Persistent gomologiya bir chegara qiymatiga bog' liq bo' lmagan ko' p masshtabli tahlilni, Mapper esa kichik guruhlar va natijalarni aniqlashni ta'minladi. TDA xususiyatlari ruhiy buzilishi bo' lgan shaxslarni nazorat guruhidan ajratishda natijaga erishgan bo' lsa-da, klinik tashxis uchun yetarli emas. Shu sababli ular statistik, mashinaviy o' rganish va klinik usullar bilan birgalikda tekshirilishi lozim.*

Kalit so' zlar: *topologik ma'lumotlar tahlili; persistent gomologiya; Mapper; ruhiy kasallik; psixiatriya; miya tarmoqlari; ma'lumotlar bazalari; PRISMA.*

ТОПОЛОГИЧЕСКИЙ АНАЛИЗ ДАННЫХ В ИССЛЕДОВАНИЯХ ПСИХИЧЕСКОГО ЗДОРОВЬЯ: СИСТЕМАТИЧЕСКИЙ ОБЗОР

Аннотация. *Психические расстройства характеризуются сложными и взаимосвязанными изменениями, которые трудно описать одной переменной или уравнением. В систематическом обзоре, проведённом в соответствии с методом PRISMA, рассмотрены расстройства, наборы данных и аналитические задачи, для которых применялся топологический анализ данных (TDA). В обзор вошли исследования шизофрении, депрессии, тяжёлых психических расстройств, аутизма, СДВГ, обсессивно-компульсивного расстройства и расстройств, связанных с употреблением психоактивных веществ. Наиболее часто использовались открытые данные как ADHD-200 и ABIDE, а также COBRE, UK Biobank, ENIGMA-OCD и несколько локальных когорт. Персистентная гомология обеспечивала многомасштабный анализ без выбора единственного порога, а Mapper применялся для выявления подгрупп и исходов. Топологические признаки показали потенциал для различения пациентов и контрольных групп, однако пока недостаточны для клинической диагностики. Поэтому их необходимо валидировать и анализировать совместно со статистическими, клиническими методами и методами машинного обучения.*

Ключевые слова: *топологический анализ данных; персистентная гомология; Mapper; психические расстройства; психиатрия; мозговые сети; наборы данных; PRISMA.*

INTRODUCTION

Clinical syndromes of mental illnesses display great heterogeneity concerning symptoms, courses, comorbidities, and response to treatment. In areas of psychosis, mood disorders, neurodevelopmental disorders, compulsive disorders, and substance-use disorders, studies face two related difficulties in that, on one hand, average differences between cases and controls do not necessarily capture the presence of biologically different subgroups, and, on the other hand, the characteristics of each one could prove to be site-, preprocessing-, or threshold-dependent. Thus, reviews of biomarkers describe dispersed and overlapping abnormalities, not one reproducible lesion [1–3].

Questions guiding the research include: RQ1, what topological data analysis techniques and data representations have been used in the study of mental health? RQ2, for which psychiatric illnesses and datasets has topological data analysis been applied? RQ3, which biological, behavioral, or phenotypic differences have been found? RQ4, how have topological features been used in comparing groups, finding statistical relationships, making classifications, predicting outcomes, or identifying subtypes? RQ5, what are the limitations that hinder translational use, and what standards should apply to transdiagnostic studies?

LITERATURE REVIEW

Previous work and research gap. Usual Graph analysing techniques involve converting connectivity matrix to a graph after the application of a certain threshold and computation of descriptors such as degree, centrality, clustering, or modularity. Although these descriptors provide useful information, they depend on the chosen threshold. TDA, on the other hand, evaluates the structures at different thresholds. Persistent homology captures the creation and destruction of components, loops, and higher dimensional voids while Mapper describes the shape of high dimensional data points as a cluster graph [4–6]. Both approaches maintain the information regarding the global structure of the data that might be lost during edge by edge analysis.

Current reviews either cover TDA for medical imaging and network neuroscience applications [4–6] or discuss conventional biomarkers for psychiatry [1–3]. However, none of them presents a disorder-specific assessment of TDA techniques, data sets, and accessibility. Such an overview is provided below without equating accuracy with practicality.

Mathematical foundations of the reviewed methods

Let G=(V,E,w) be a weighted undirected brain graph, where vertices are regions or sensors and w_{ij} is a functional, structural or spectral association. Persistent homology requires an ordered family of complexes. For correlations r_{ij}, a common dissimilarity is $d_{ij} = 1 - r_{ij}$; alternatives such as $d_{ij} = \sqrt{2\,(1 - r_{ij})}$, $d_{ij} = 1 - |r_{ij}|$ or separate positive and negative filtrations encode different scientific assumptions. The clique (Vietoris–Rips) complex at scale ε contains a simplex whenever all of its pairwise distances are at most ε:

$$K_\varepsilon = \{\sigma \subseteq V : d_{ij} \le \varepsilon \text{ for every } i, j \in \sigma\}, \quad K_{\varepsilon_1} \subseteq K_{\varepsilon_2} \quad \text{when} \quad \varepsilon_1 \le \varepsilon_2.$$

For a simplicial complex K, the boundary operator $\partial_k : C_k(K) \longrightarrow C_{k-1}(K)$ and satisfies $\partial_{k-1} \circ \partial_k = 0$. Cycles are $Z_k(K) = \ker(\partial_k)$, boundaries are $B_k(K) = \mathrm{im}(\partial_{k+1})$, and the quotient removes cycles that bound a higher-dimensional simplex. Thus H_0 counts connected components, H_1 independent loops and H_2 cavities:

$$H_k(K) = \frac{\ker(\partial_k)}{\mathrm{im}(\partial_{k+1})}, \quad \beta_k(K) = \dim H_k(K).$$

As illustrated in Figure 1, the birth and death of H_1 loop happens at t = 0.6 and t = 0.9 respectively, thereby resulting in a lifetime of 0.3.

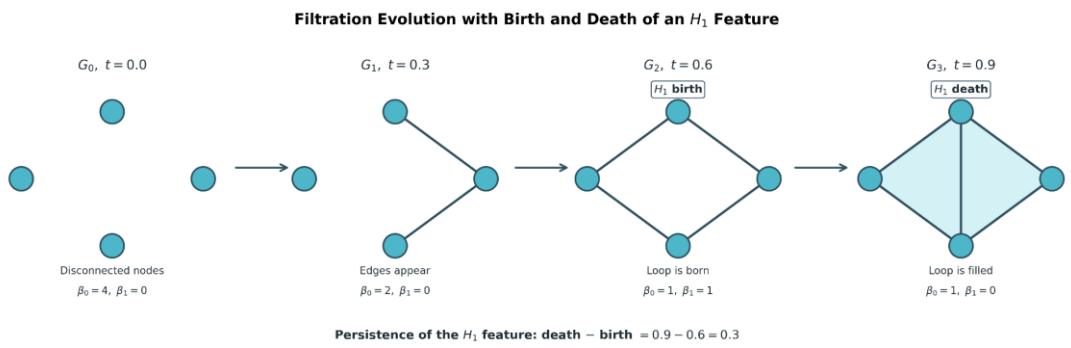

Figure 1. Example of a graph filtration in which an H1 feature is born at 0.6 and filled at 0.9, giving persistence 0.3.

Tracking these groups through the filtration gives intervals $[b_i,d_i)$, summarized by a persistence diagram D_k ={(b_i,d_i)}. Lifetime $\ell_i = d_i - b_i$ measures persistence, while the Betti curve counts features alive at scale t, which is described by an equation as

$$\beta_k(t) = \sum_i \mathbf{1}_{[b_i,d_i)}(t).$$

Persistence landscapes and images represent exactly the same information about the intervals for the purposes of inference and prediction [5-8, 35, 37]. Figure 2 shows a weighted functional brain graph representation and its persistence diagrams: the persistence diagram for H_1 and H_0 Betti curve.

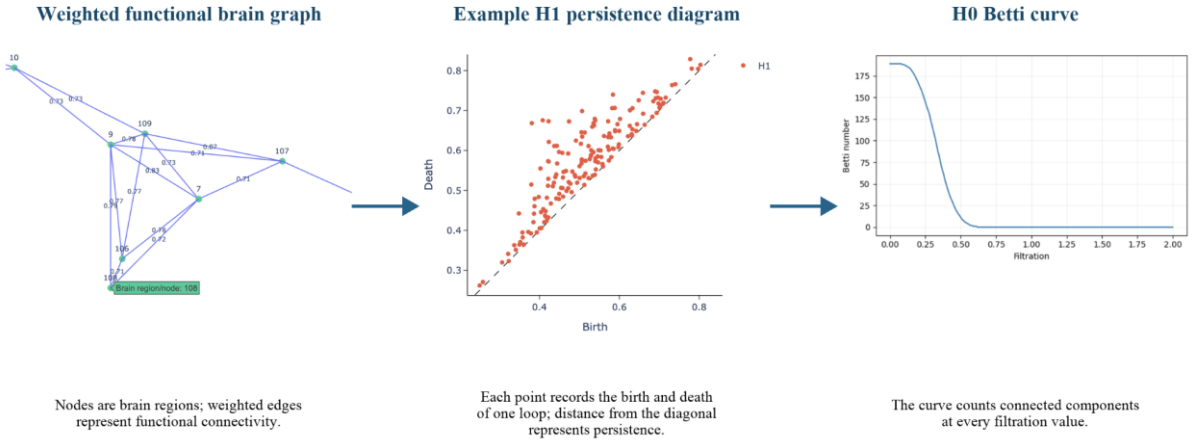

Figure 2. Weighted functional brain graph with persistence-based summaries: an H1 persistence diagram and an H0 Betti curve.

Let *D* and *E* be persistence diagrams, and let $\Delta = \{(a,a) : a \in \mathbb{R}\}$ denote the diagonal, counted with infinite multiplicity. Let Γ(*D*,*E*) be the set of bijections $\Gamma(D,E) = \{\gamma : D \cup \Delta \to E \cup \Delta \mid \gamma \text{ is a bijection}\}$. Thus, a persistence feature may be matched either to a feature in the other diagram or to the diagonal. The bottleneck distance minimizes the largest matching cost:

$$d_B(D,E) = \inf_{\gamma \in \Gamma(D,E)} \sup_{x \in D \cup \Delta} \|x - \gamma(x)\|_\infty$$

In contrast, the p -Wasserstein distance aggregates all matching costs:

$$W_p(D,E) = \left(\inf_{\gamma \in \Gamma(D,E)} \sum_{x \in D \cup \Delta} \|x - \gamma(x)\|_\infty^p \right)^{1/p}.$$

Here, $\|\cdot\|_\infty$ denotes the maximum norm. The stability theorem bounds changes in persistence diagrams by changes in the filtration function:

$$d_B\left(D_k(f), D_k(g)\right) \le \|f - g\|_\infty .$$

However, this theorem does not guarantee clinical robustness to motion, parcellation, or correlation-sign handling because these choices can alter the filtration function itself [36]. This does not imply clinical robustness against movement, parcellation, or sign changes because f can be modified.

Mapper relies on observations X as opposed to anatomical nodes. A lens $f : X \longrightarrow \mathbb{R}^m$ is covered by overlapping sets $\mathcal{U} = \{U_\alpha\}_{\alpha \in A}$ where the clusters of each pullback $f^{-1}(U_\alpha)$ become vertices, while common observations form edges. In this case, we have the nerve of the clustered cover, meaning that the lens, cover resolution, overlap, and clustering are now mathematical parameters, so the mapper graph is $\text{Mapper}(X,f,\mathcal{U}) = \text{Nerve}\left(\text{Clust}\left(f^{-1}(\mathcal{U})\right)\right)$. Instead of association, spectral TDA incorporates frequency-dependent coherence. With Hodge theory, the boundary matrix B_k and combinatorial Laplacian $L_k = B_k^\top B_k + B_{k+1} B_{k+1}^\top$ are used to decompose the gradient, curl, and harmonic parts of simplicial signals, having overall equation as $C_k = \text{im}(B_k^\top) \oplus \ker(L_k) \oplus \text{im}(B_{k+1})$[28]. The overall workflow in terms of data representation and analysis is depicted in Figure 3.

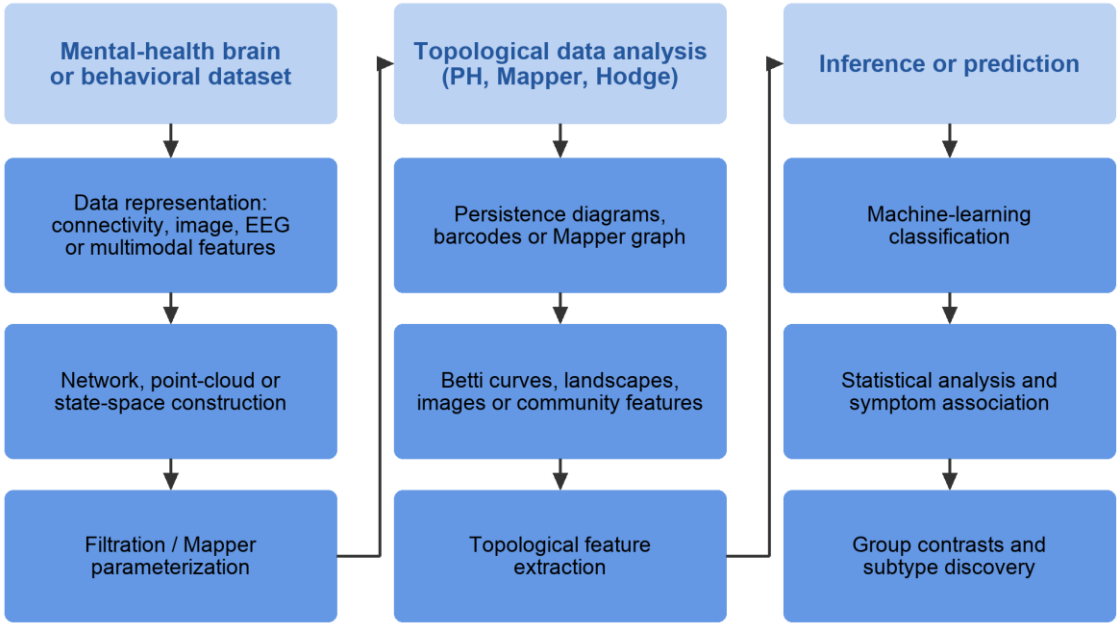

Figure 3.

General workflow for topological analysis of mental-health data.

Table 1. Mathematical comparison of TDA strategies

Method	Mathematical input	Construction	Invariant / summary	Distance or test	Stability	Main parameter
Network PH	Weighted graph $G=(V,E,w)$	Clique/VR filtration $K\varepsilon$	H_k , β_k , D_k	Bottleneck or Wasserstein	Stable for fixed filtration [36]	Weight-to-distance rule; ε
Cubical PH	Voxel field $f:\mathbb{Z}^3\to\mathbb{R}$	Sublevel cubical complex	H_0, H_1, H_2	Diagram distance; ML test	Stable to bounded field perturbation	Voxel size; smoothing; level
Mapper	Observations X and lens f	Nerve of clustered pullback cover	Mapper graph	Graph/SAFE measures; group tests	Parameter-sensitive; test resampling	Lens; cover; overlap; clustering
Spectral TDA	Frequency-dependent network	Coherence filtration	Spectral landscapes	Functional/global test	Depends on spectral estimation	Frequency resolution; bandwidth
Hodge TDA	Simplicial signals and B_k	$L_k = B_k{}^T B_k + B_{k+1} B_{k+1}^T$	Harmonic/curl/gradient parts	GLM, permutation, FDR	Complex and skeleton dependent	Cycle basis; skeleton
PH + ML	Diagram or curve vectors	Image/landscape/entropy map	Finite feature vector	CV accuracy; calibration	Must be nested in resampling	Vectorization; classifier

MATERIALS AND METHODS

Review design and search strategy. The review followed PRISMA 2020 [9]. PubMed and arXiv were searched on 7 August 2026 without date or language filters. The PubMed query was ("topological data analysis" OR "persistent homology" OR Mapper OR "Hodge Laplacian" OR "persistence landscape" OR "Betti curve") AND (psychiatr* OR "mental illness" OR "mental health" OR "mental disorder" OR schizophrenia OR psychosis OR depression OR bipolar OR autism OR ADHD OR anxiety OR PTSD OR OCD OR "substance use" OR "substance abuse" OR addiction). The same concepts

were translated to arXiv all-field syntax. Reference lists of two broad TDA reviews [4,5] were checked backward. Exact queries, exports and record-level decisions are retained in the supplementary audit workbook.

Eligibility and data extraction. Eligible reports examined human diagnosed or clinically defined psychiatric cohorts; used patient-level neuroimaging, electrophysiological, genetic, environmental, behavioral or clinical data; applied persistent homology, Mapper, Hodge-based topology or another explicit multiscale topological construction; and reported interpretable group, symptom, subgroup, outcome or predictive results. Reviews, theoretical or non-human work, neurological studies without a psychiatric cohort, conventional graph analyses without TDA and reports with insufficient methods were excluded. Preprints were retained only for distinct methods and labelled as such.

Disorder, sample, dataset, modality, representation, TDA method, summary, objective, validation and conclusion were extracted. Titles/abstracts and full reports were assessed against the same criteria, duplicate and companion reports were linked, and exclusions were logged. Heterogeneity prevented meta-analysis, so study design and direction of findings were synthesized qualitatively. Figure 4 summarizes selection.

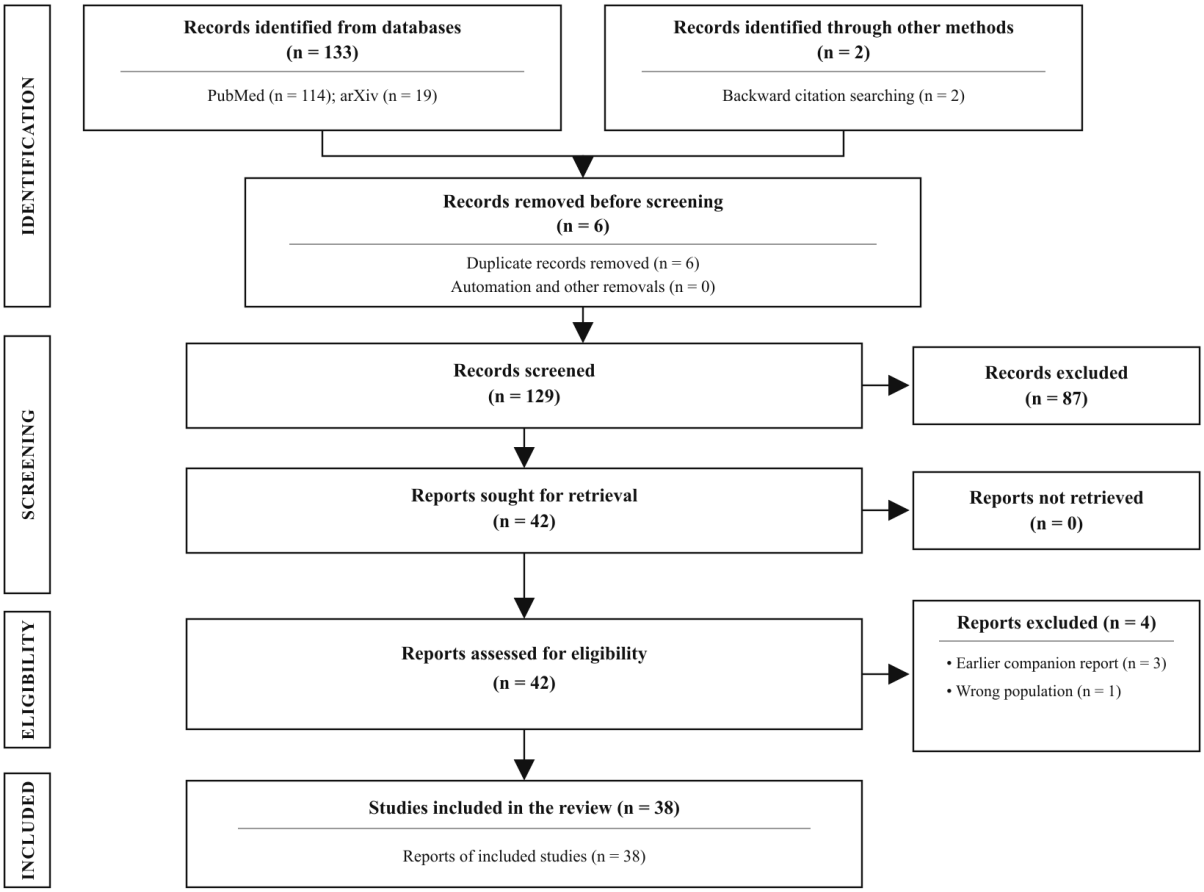

Figure 4. PRISMA flow diagram for study identification and selection.

RESULTS

Study selection and field composition. The searches identified 135 records: 114 from PubMed, 19 from arXiv and 2 through backward citation searching. After removal of 6 duplicate records, 129 titles and abstracts were screened and 87 were excluded. All 42 reports sought were retrieved; four were excluded at full text (three earlier companion reports and one report without an eligible psychiatric cohort), leaving 38 included reports. The evidence remained concentrated in ASD, ADHD and schizophrenia/psychosis, with fewer studies of depression, OCD, serious mental illness and substance use.

Table 2. Mathematical classification of every reviewed study

Method family and studies	Complex and filtration / lens	Homology and topological summary	Distance / test and software	Stability / sensitivity
Mapper [10,11,24–26]	Mapper nerve; clinical, FC, PCA or multimodal lens with clustered cover	N/A; Mapper graph, branches, communities, modularity, SAFE/EL	ANOVA, correlation, regression, outcome and replication tests; software NR	Two-site, independent and multisite checks; no external validation in one study
Graph PH [12,15–16,18–19,27,40,47,49–50,55]	Weighted, functional or dynamic graph; FC, link-density, rank, time-window or magnitude filtration	H_0–H_1; Betti curves, PD, landscapes, kernels, robustness and magnitude homology	Permutation/group tests, classification and kernel PLS; custom, shared or unreported software	Site, preprocessing, state, modality and CV checks
Point-cloud / VR PH [14,20–21,23,41,44,52–54,56]	VR, adaptive VR, dependence, delay-embedding, clinical, movement or permutation complex	H_0–H_2; PD, PI, Betti curves, landscapes, entropy, kernels and persistence descriptors	Bottleneck/Wasserstein, permutation and ML tests; JavaPlex, sklearn-tda, R, Python or custom code	Noise, simulation, representation, classifier, temporal and behavioral checks
Cubical / surface PH [17,51]	Cubical or cortical-surface complex; 1−ReHo or cortical-field sublevels	H_0–H_2; barcode vectors, PD and min–max pairs	Group comparison, SVM and ensemble validation; custom or unreported software	ABIDE I/II and autism-control comparison
Spectral PH [13]	Spectral clique; frequency-dependent coherence filtration	H_1; spectral persistence landscape	Global functional test; software NR	Frequency-band sensitivity
Higher-order PH [22,28,39,42–43,45,48]	Order, simplicial, Hodge, multimodal, interactomic, hypergraph or signed complex	H_1, higher or multidimensional; generators, harmonic coefficients, spectra and signed/hypergraph features	GLM/FDR, group, prediction, ablation and drug-ranking tests; custom or public code	Cross-data, site, medication, modality and cohort checks
Gene-network PH [38,46]	Gene co-expression complex; expression or weighted-network filtration	H_0–H_1; PD and cycle persistence	Group, enrichment and multi-cohort tests; R/Python	Gene-expression evidence; independent-cohort validation

Note: PH—persistent homology; PD—persistence diagram; PI—persistence image; VR—Vietoris–Rips; FC—functional connectivity; PCA—principal component analysis; ML—machine learning; SVM—support vector machine; PLS—partial least squares; GLM—general linear model; FDR—false discovery rate; CV—cross-validation; NR—not reported.

RQ1: differences between topological methods

Persistent homology remained dominant because filtrations test whether differences persist across connection strengths rather than at one threshold. The expanded evidence also included cortical-surface, transcriptomic, behavioral-movement, multimodal PET/MRI and higher-order simplicial constructions [38–50]. Main design choices were the distance transformation, sign handling, complex, homology dimension and vectorization. Clique filtrations suit connectivity matrices but become costly in higher dimensions; cubical or surface filtrations answer spatial-field rather than connectome questions.

Mapper primarily addressed heterogeneity and outcome stratification, whereas newer hybrids combined persistent summaries with kernels, hypergraphs, transformers or permutation tests [49–56]. Mapper branches remain sensitive to lens, cover and clustering choices. Spectral TDA preserves frequency-specific structure, and Hodge methods extend analysis from pairwise edges to signals on higher-order simplices.

RQ2: datasets and modalities

Three evidence tiers emerged: reusable benchmarks (especially ADHD-200 and ABIDE); large or controlled resources such as COBRE, UK Biobank and ENIGMA-OCD; and local imaging, EEG, transcriptomic, behavioral or inpatient cohorts. The expanded studies add multimodal PET/MRI, blood and brain transcriptomics, stereotyped-movement video and further ABIDE/ADHD-200 analyses [38–56]. Repository size must not be confused with the quality-controlled sample actually analysed.

HBN, ABCD, OpenNeuro and the NIMH Data Archive provide future transdiagnostic validation opportunities [32–34]. The principal gap is a harmonized cross-disorder TDA benchmark, not a lack of psychiatric data.

Table 3. Mental-health datasets identified in TDA studies and validation resources

Dataset	Population	Scale	Modalities	Access	TDA status
ADHD-200	ADHD / controls	~800 contributed participants; 8 contributing centers	rs-fMRI, T1, phenotype	Open via INDI; preprocessed derivatives	Primary ADHD TDA resource
ABIDE I	ASD / controls	1,112 released; 17 sites	rs-fMRI, T1, phenotype	Open via INDI	Primary ASD TDA resource
ABIDE II	ASD / controls	1,114 released; 19 sites	rs-fMRI, T1, phenotype	Open via INDI	Used for PH and ReHo topology
COBRE	Schizophrenia / controls	Public cohort; MesoSCOUT used 44+44	DWI, T1; rs-fMRI also available	Open via COINS/NITRC terms	Used for structural-connectome PH
UK Biobank MDD subsets	Major depression	3,052 in 2025 study; larger staged subsets in 2026	Genetic, environmental, imaging, clinical	Controlled application	Used for Mapper/community stratification
GSRD and HSR cohorts	Major depression	Multisite replication cohorts	Clinical, environmental; selected imaging	Collaborative/ controlled	Partial external replication of MDD topology
ENIGMA-OCD	OCD / controls	2,052 in identified analysis	Multisite rs-fMRI	Consortium; not participant-level public	Used for Hodge-Laplacian TDA
Huilongguan EEG	First-episode schizophrenia / controls	198 total	Resting EEG	Local/not identified as public	Used for multimodal persistent features

Dataset	Population	Scale	Modalities	Access	TDA status
Working-memory EEG cohort	Schizophrenia / controls	Local clinical study	Task EEG	Local	Used for VR-PH and stability analysis
Task/semantic fMRI cohorts	Schizophrenia / controls	Small local cohorts	Task fMRI	Local	Used for network and representation PH
SMI inpatient cohort	Mixed serious mental illness	235 adults	rs-fMRI and clinical outcome	Local	Mapper treatment-response stratification
ISAD adolescent cohort	Inhaled substance-use disorder / controls	Local adolescent cohort	rs-fMRI	Local	Persistent-homology group contrasts
Public pediatric EEG	ADHD / controls	Single EEG benchmark	Resting EEG	Public	Spectral TDA
HBN / ABCD	Transdiagnostic youth / population	Thousands; longitudinal	MRI, EEG, behavior, clinical	Open or controlled	Future cross-disorder validation; not included evidence

RQ3: neurobiological findings

ADHD and ASD studies most consistently reported altered multiscale integration or cycle structure rather than one missing connection. Evidence now spans functional connectomes, cortical surfaces, gene co-expression, transcriptomics, multimodal PET/MRI, EEG and motor trajectories [10–18,38–56]. Direction depended on representation, state and filtration, so neither disorder is uniformly more or less connected.

Schizophrenia studies used task and resting fMRI, EEG, semantic representations and white-matter connectomes, converging on altered higher-order organization at different spatial or frequency scales [19–23]. Depression studies used Mapper-like multimodal topology and longitudinal prediction [24,25,44], while serious-mental-illness topology related prefrontal–striatal organization to treatment improvement [26].

Beyond neurodevelopmental disorders, persistent or higher-order topology was applied to inhalant use, anti-addiction transcriptomics and OCD [27,28,42,46]. Across diagnoses, findings concerned integration or higher-order organization, but localization and clinical meaning remained modality- and task-dependent. Few studies compared several diagnoses in one harmonized cohort, so case-control separation does not establish diagnostic specificity.

RQ4: prediction, stratification and clinical association

TDA features entered prediction as persistence images, landscapes, Betti curves, entropy, lifetime statistics and Hodge-derived summaries. Recent hybrids added kernel regression, graph kernels, hypergraph fusion and transformer models [43,45,49–56]. Performance was often promising, but small samples, reused repositories and incomplete external validation prevent diagnostic interpretation.

The most distinctive contribution of Mapper was not binary classification but stratification. Its graphs linked topology to symptoms, comorbidity, treatment improvement or multimodal outcome profiles in ADHD, depression and serious mental illness [10,11,24–26]. Nevertheless, exploratory topological subgroups require stability analysis, independent replication and longitudinal association with outcomes before they can guide treatment.

RQ5: limitations, bias and reporting priorities

Four risks recur. First, data reuse creates an illusion of independent replication: multiple results originate from overlapping ADHD-200 or ABIDE participants, while local psychiatric cohorts may be impossible to reproduce. Second, preprocessing decisions, including motion control, parcellation, EEG referencing, global-signal regression, correlation-to-distance conversion and handling of negative edges, alter the filtration itself. Third, tuning the topological representation and classifier before cross-validation can leak information. Fourth, demographic, medication, illness-stage and comorbidity imbalance limit generalization across psychiatric populations.

Future studies should report subjects/sites, code, filtration definitions, parameters and vectorization. Validation should separate sites or repositories and test preprocessing, parcellation, sign handling and dynamic versus static connectivity. Multiple comparisons, calibration, uncertainty and clinical utility should accompany accuracy.

Table 4. Minimum standards for future clinical TDA studies

Domain	Recommended practice	Reason
Reproducibility	Share code, versions, subject/site counts, exclusions and random seeds	Allows exact reconstruction and detects overlapping samples
Filtration robustness	Report distance transform, sign treatment and threshold range; test alternatives	Shows whether conclusions are genuinely multiscale
Validation	Nested training; leave-site-out and independent-dataset testing	Separates disease signal from site or preprocessing signal
Clinical relevance	Relate features to symptoms, function and longitudinal outcomes	Moves beyond case-control prediction
Equity	Report sex, age, IQ, medication and comorbidity; test subgroup performance	Reduces demographic and spectrum bias
Transdiagnostic design	Analyze ASD, ADHD, co-occurrence and controls jointly	Tests specificity and shared neurodevelopmental dimensions

DISCUSSION

TDA contributes at three levels: filtrations replace a single threshold with multiscale analysis; persistent components and loops characterize biological integration and segregation; and Mapper or other topological feature spaces represent continua, outcome groups and candidate subtypes beyond average diagnostic patterns.

However, TDA cannot correct motion artefacts, site imbalance or inadequate phenotyping. Persistent features are not inherently disease-specific, and Mapper branches are not validated subtypes. Findings are most credible when stable across preprocessing choices, clinically associated and externally validated. TDA should therefore complement conventional connectivity and machine learning.

A transdiagnostic benchmark should compare conventional, graph, persistent-homology, Mapper, Hodge and hybrid features on identical participants and cross-site splits, evaluating accuracy, calibration, test–retest stability, symptoms and treatment outcomes.

This review was limited by inconsistent indexing, broad Mapper false positives, methodological heterogeneity and possible omission of non-indexed or non-English reports. Seven included reports were preprints rather than peer-reviewed evidence [13,22,28,42,54–56]. The record-level audit improves reproducibility but does not replace independent replication or formal risk-of-bias assessment.

CONCLUSION

TDA characterizes psychiatric data through multiscale organization: persistent homology captures components and cycles, Mapper represents continua and candidate subgroups, and spectral or Hodge extensions preserve frequency-specific and higher-order structure. Across 38 included reports, evidence spans ASD, ADHD, schizophrenia/psychosis, depression, serious mental illness, OCD and substance use, but remains uneven and weakly externally validated. TDA should therefore complement statistical, machine-learning and clinical assessment; the next step is a preregistered transdiagnostic benchmark across independent datasets.

AUTHOR STATEMENTS

Author contributions: Sarvinoz Anvarova was responsible for the topological data analysis component, literature search, data extraction, visualization and manuscript preparation. Munira Rakhmatova was responsible for the machine-learning component and contributed to screening, data extraction, validation and manuscript revision. Sejuti Rahman supervised the study, contributed to its conceptual and methodological development and critically reviewed the manuscript. All authors read and approved the final manuscript.

Funding: This research received no specific funding from public, commercial, or non-profit organizations.

Conflict of interest: The authors declare that they have no conflicts of interest related to this study.

ANTI-PERIODIC BOUNDARY VALUE PROBLEM FOR A SECOND-ORDER PARTIAL DIFFERENTIAL EQUATION WITH DEGENERACY

Kodiraliev Asadbek Ikromali Ugli
Fergana State University, phd student
ORCID: 0009-0008-4095-1659
Email: qodiraliyevasadbek20@gmail.com

Annotation. *In this article, we formulate and investigate an anti-periodic boundary value problem for a degenerate second-order partial differential equation with a Caputo fractional time-derivative. The spatial operator has a diffusion coefficient $x^{\alpha}(1-x)^{\beta}$ that vanishes at both endpoints of the interval, leading to a singular spectral problem. By constructing the Green' s function, we reduce the spectral problem to a Fredholm integral equation of the second kind, and we establish the existence of a countable set of eigenvalues and eigenfunctions. The uniqueness of the boundary value problem' s solution is proved via an energy-integral method. Existence is then shown by expanding the solution in the eigenfunction basis and justifying the uniform convergence of this series.*

Key words: *Degenerate partial differential equation; Caputo fractional derivative; anti-periodic boundary condition; spectral problem; Green' s function; Fredholm integral equation; Mittag-Leffler function; method of energy integrals; Fourier method.*

IKKINCHI TARTIBLI XUSUSIY HOSILALI DIFFERENSIAL TENGLAMA UCHUN DEGENERATSIYALI ANTI-DAVRIY CHEGARAVIY MASALA

Annotatsiya. *Ushbu maqolada Kaputo kasr tartibli vaqt hosilasi bilan berilgan, degeneratsiyali ikkinchi tartibli xususiy hosilali differensial tenglama uchun anti-davriy chegaraviy masala shakllantiriladi va tadqiq etiladi. Fazoviy operator diffuziya koeffitsientiga ega bo‘ lib, ushbu koeffitsient interval ikkala uchida nolga aylanadi, bu esa singular spektral masalaning kelib chiqishiga olib keladi. Green funksiyasini qurib, spektral masalani ikkinchi tur Fredholm integral tenglamasiga keltiramiz hamda xususiy qiymatlar va xususiy funksiyalarning sanab chiqiladigan to‘ plamining mavjudligini asoslaymiz. Chegaraviy masala yechimining yagonaligi energetik-integral usuli yordamida isbotlanadi. Yechimning mavjudligi esa xususiy funksiyalar bazisi bo‘ yicha yoyilma orqali ko‘ rsatiladi va ushbu qatorning bir tekis yaqinlashishi asoslanadi.*

Kalit so‘ zlar: *Degeneratsiyali xususiy hosilali differensial tenglama; Kaputo kasr tartibli hosilasi; anti-davriy chegaraviy shart; spektral masala; Green funksiyasi; Fredholm integral tenglamasi; Mittag-Leffler funksiyasi; energetik integrallar usuli.*

АНТИПЕРИОДИЧЕСКАЯ КРАЕВАЯ ЗАДАЧА ДЛЯ ВЫРОЖДАЮЩЕГОСЯ ДИФФЕРЕНЦИАЛЬНОГО УРАВНЕНИЯ В ЧАСТНЫХ ПРОИЗВОДНЫХ ВТОРОГО ПОРЯДКА

Аннотация. *В настоящей статье формулируется и исследуется антипериодическая краевая задача для вырождающегося дифференциального уравнения в частных производных второго порядка с дробной производной по времени в смысле Капуто. Пространственный оператор содержит коэффициент диффузии, обращающийся в нуль на обоих концах рассматриваемого интервала, что порождает сингулярную спектральную задачу. Посредством построения функции Грина спектральная задача сводится к интегральному уравнению Фредгольма второго рода, и устанавливается существование счётного множества собственных значений и собственных функций. Единственность решения краевой задачи доказывается методом энергетических интегралов. Существование решения обосновывается путём разложения по системе собственных функций с доказательством равномерной сходимости соответствующего ряда.*

Ключевые слова: *вырождающееся уравнение в частных производных; дробная производная Капуто; антипериодическое краевое условие; спектральная задача; функция Грина; интегральное уравнение Фредгольма; функция Миттаг-Леффлера; метод энергетических интегралов; метод Фурье.*

1. Introduction

Partial differential equations play a fundamental role in the mathematical modeling of various physical, biological, and engineering processes. Among them, boundary value problems for degenerate second-order PDEs have attracted considerable research attention since the last century and remain an active area of investigation. Such equations arise

naturally whenever the principal coefficients of the differential operator vanish on part of the domain or its boundary, leading to qualitatively different mathematical behaviour compared to the non-degenerate case.

More recently, increasing interest has been directed toward boundary value problems for differential equations involving fractional-order operators with respect to time. Such operators, in particular the Caputo derivative [1], capture memory and hereditary effects in complex media and provide more realistic models for anomalous diffusion processes. A systematic mathematical analysis of initial-boundary value problems for time-fractional diffusion equations was carried out by Gorenflo, Luchko, and Yamamoto [7], who studied these problems in fractional Sobolev spaces and established key regularity properties. Kubica and Ryszewska [8] proved the unique existence of weak solutions for the diffusion-wave equation with non-homogeneous Dirichlet boundary data and analysed the long-time behaviour of solutions.

Alongside classical boundary conditions, problems with non-local conditions have drawn growing attention. Karimov, Mamchuev, and Ruzhansky [9] studied a non-local initial problem for a second-order time-fractional equation with a Bessel operator in the space variable and obtained an explicit solution represented via Fourier-Bessel series in terms of multinomial Mittag-Leffler functions. In [10], Ruzhansky, Tokmagambetov, and Torebek studied a Bitsadze-Samarskii-type non-local problem for an integro-differential diffusion-wave equation on the Heisenberg group, establishing existence, uniqueness, and explicit solution representations. Non-local problems for linear parabolic equations were investigated by Chabrowski [11], who proved existence and uniqueness via maximum principles and Green' s function methods.

Anti-periodic boundary conditions form a special and important class of non-local conditions and have been studied for fractional-order ordinary differential equations; see, for example, [5] and the references therein. However, anti-periodic problems for degenerate partial differential equations with fractional-order time derivatives remain largely unexplored in the literature.

Related results on degenerate equations in rectangular domains include the work [3] of Tersenov and the work [4] of Urinov and Usmonov, where modified Cauchy-type problems were studied for degenerate hyperbolic equations of the second kind. However, to the best of our knowledge, the combination of fractional-order time evolution, spatial degeneracy, and anti-periodic boundary conditions has not been treated before in the literature, and the present paper is devoted to filling this gap.

In the present work, we investigate an anti-periodic boundary value problem for the following time-fractional degenerate equation in the rectangular domain $\Omega = \{(x,t): 0 < x < 1, 0 < t < T\}$:

$$CD_{0t}^{\gamma} u - \left[x^{\alpha}(1-x)^{\beta} u_x\right]_x = f(x,t), \qquad (1)$$

where $u(x,t)$ is the unknown function, $f(x,t)$ is a given source function, and CD_{0t}^{γ} denotes the Caputo fractional derivative of order γ with respect to t [1]. The real parameters α, β, γ satisfy $0 < \gamma < 1$, $0 \le \alpha, \beta < 1$.

Equation (1) is degenerate along two boundary lines at $x = 0$ and $x = 1$, where the diffusion coefficient $x^{\alpha}(1-x)^{\beta}$ vanishes. This spatial degeneracy, combined with the fractional-order time derivative, produces analytical difficulties that go beyond the classical setting.

The problem is supplemented with anti-periodic boundary conditions of the form $u(0,t) = -u(1,t)$, together with initial conditions at $t = 0$ Existence and uniqueness of a solution to this problem are established by combining the Fourier method with Green' s function theory for the associated spectral problem and energy integral estimates.

The remainder of the paper is organised as follows. Section 2 recalls the definition and key properties of the Mittag-Leffler function and the Caputo derivative. Section 3 formulates this problem , analyses the associated spectral problem via a Fredholm integral equation, proves auxiliary convergence lemmas, and establishes the existence and uniqueness of the solution. Concluding remarks are given at the end of Section 3.

2 Preliminaries

In this section, we will recall some definitions and basic concepts, which will be used throughout the paper.

Definition 1. [1] *For a function $u(t)$, the Caputo fractional derivative of order α with respect to t is defined as follows:*

$$CD_{0t}^{\gamma} u(t) = \frac{1}{\Gamma(1-\alpha)} \int_0^t (t-s)^{-\alpha} u'(s) ds,$$

where $t > 0, 0 < \gamma \le 1$, and $\Gamma(z)$ s Euler' s gamma-function[12].

Mittag-Leffler function: A two-parameter Mittag-Leffler function is defined by [6] as follows:

$$E_{\alpha,\beta}(z) = \sum_{k=0}^{+\infty} \frac{z^k}{\Gamma(\alpha k+1)}, Re(\alpha) > 0, Re(\beta) > 0, z, \alpha, \beta \in C.$$

Lemma 1. *For every $\alpha \in (0,2)$ and β is constant number. One has*

$$\left|E_{\alpha,\beta}(-z)\right| < C, \ z \ge 0.$$

3. Formulation of a problem

We study the following initial-boundary value problem for equation (1):

Problem C. Find $u(x,t)$ function such that it has the following properties:

1) $u(x,t)$, $x^{\beta} u_x(x,t), u_t(x,t) \in C(\overline{\Omega})$; ${}_C D_{0t}^{\alpha} u\left(x,t\right), \left[x^{\beta} u_x(x,t)\right]_x \in C(\Omega)$;

2) Ω satisfies equation (1) in the field;

3) $u(x,t)$ satisfies the following boundary

$$\left.\begin{array}{l} u(0,t) = -u(1,t), t \in [0,T]; \\ \lim\limits_{x\to 0} x^{\beta} u_x(x,t) = -u_x(1,t), t \in [0,T]; \end{array}\right\}, \tag{2}$$

and the initial conditions:

$$u(x,0) = \varphi_1(x),\ u_t(x,0) = \varphi_2(x),\ x \in [0,1]; \tag{3}$$

where $\varphi_1(x)$ and $\varphi_2(x)$ are the given functions.

3.1 Spectral Problem

By applying Fourier' s method to the problem C, we will have the following spectral problem: find the values of the parameter λ for which there exist nontrivial solutions to the equation

$$MX(x) \equiv -\left[x^{\beta} X'(x)\right]' = \lambda X(x), \tag{4}$$

satisfying the following conditions:

$$\left.\begin{array}{l} X(0) = -X(1) \\ \lim\limits_{x\to 0} x^{\beta} X'(x) = -X'(1) \end{array}\right\}. \tag{5}$$

Assume that there exist eigenvalues of the spectral problem {(4), (5)}. The spectral problem {(4), (5)} may have nontrivial solutions only when $\lambda > 0$.

To establish the existence of the eigenvaluens and eigenfunctions of the spectral problem {(4),(5)}, we equivalently reduce it to a second kind homogeneons. Fredholm integral equation with symmetric kernels. For this purpose, we will construct a Green' s function$G(x,s)$. It satisfies the following conditions:

1) $G(x,s)$ function is continuous in $x, s \in [0,1]$.

2) In the intervals $0,s)$ and $s,1$ it has a continuous derivative $(\partial/\partial x)G(x,s)$ and it has a jump $\left(-s^{-\beta}\right)$ when $x = s$, that is

$$(\partial/\partial x)G(x,s)|_{x=s+0} - (\partial/\partial x)G(x,s)|_{x=s-0} = -s^{-\beta}.$$

3) $G(x,s)$ function with respect argument to x in the intervals $(0,s)$ and $(s,1)$ satisfies equation $MG(x,s) = 0$.

4) $G(x,s)$ satisifies boundary conditions $G(0,s) = -G(1,s)$, $\lim\limits_{x\to 0} x^{\beta} G_x(x,s) = -G_x(1,s)$ for $s \in (0,1)$.

Using the general solution of equations $MG(x,s) = 0$, $x \in (0,s) \cup (s,1)$ and thee conditions $\{(1),(2),(3)\}$, it can be shown that $G(x,s)$ Green' s function exists and is unique, and has the following form

$$G(x,s) = \begin{cases} \frac{1}{2(1-\beta)}\left(x^{1-\beta} - s^{1-\beta} + \frac{1}{2}\right), 0 < x < s, \\ \frac{1}{2(1-\beta)}\left(-x^{1-\beta} + s^{1-\beta} + \frac{1}{2}\right), s < x < 1. \end{cases} \tag{7}$$

Then the problem {(4), (5)} is equivalent to the following integral equation with the symmetric kernel:

$$X(x) = \lambda \int_0^1 G(x,s)X(s)ds. \tag{8}$$

Since the kernel $G(x,s)$ is continuous, symmetric, and positive (i.e., $\lambda > 0$), the integral equation, and hence the problem {(4), (5)}, has a countable set of eigenvalues:

$$0 < \lambda_1 \le \lambda_2 \le \lambda_3 \le \ldots \le +\infty,$$

and the corresponding system of eigenfunctions $v_1(x), v_2(x), v_3(x)\ldots..$ form an orthonormal system in $L_2[0,1]$. Furthermore, any function that can be repre- sentable in terms of the kernel $G(x,s)$ can be expanded into a Fourier series with respect to these eigenfunctions [2].

Let $\{X_k(x)\}|_{k=1}^{+\infty}$ and $\{\lambda_k\}|_{k=1}^{+\infty}$ be eigenfunctions and eigenvalues of the spectral

problem {(4), (5)} respectively.

Lemma 2: *If the function $g(x)$ satisfies the conditions $g(x)$, $x^{\beta} g'(x) \in C[0,1]$, $Mg'(x) \in L_2(0,1)$; $g(0) = -g(1)$, $\lim\limits_{x\to 0} x^{\beta} g'(x) = -g'(1)$, then the function $g(x)$ expands on the system $\{X_k(x)\}_{k=1}^{+\infty}$ in the interval $[0,1]$ in an absolutely and uniformly convergent series.*

3.2 Auxiliary Lemmas

In this section, we will prove the convergence of some series which will be used in the proof of the existence of a solution to the main problem. Let $\{\lambda_k\}|_{k=1}^{+\infty}$ and $\{X_k(x)\}|_{k=1}^{+\infty}$ be the eigenvalues and eigenfunctions of the problem {(4), (5)}, respectively. g_k represents the Fourier coefficient of the function $g(x)$ by the system of the eigenfunctions$\{X_k(x)\}|_{k=1}^{+\infty}$, i.e.

$$g_k = \int_0^1 g(x)X_k(x)dx,\ k = 1,2,3,\ldots$$

Lemma 3:[2] *In the interval $[0,1]$, the series*

$$\sum_{k=1}^{+\infty} \frac{X_k^2(x)}{\lambda_k},\ \sum_{k=1}^{+\infty} \frac{\left[x^{\beta} X_k'(x)\right]^2}{{\lambda_k}^2},$$

are uniformly convergent.

Lemma 4. *Let $f(x) \in C[0,1]$, $x^{\beta/2} f'(x) \in L_2(0,1)$ and $f(0) = -f(1)$, Then, the following inequality holds true:*

$$\sum_{k=1}^{+\infty}\lambda_k f_k^2 \le \int_0^1 x^\beta \left[f'(x)\right]^2 dx, \quad (9)$$

where f_k is the Fourier coefficient of the function $f(x)$ by the system eigenfunctions $\{X_k(x)\}|_{k=1}^{+\infty}$ defined by

$$f_k = \int_0^1 f(x)X_k(x)dx.$$

Lemma 5. *Let the functions $f(x)$, $f'(x)$, $x^\alpha f'(x)$ be continuous on $[0,1]$, and let $f(0) = -f(1)$, $\lim_{x\to 0} x^\beta f'(x) = -f'(1)$, $\left[x^\beta f'(x)\right]' \in L_2(0,1)$.*

Then, the following inequality holds true

$$\sum_{k=1}^{+\infty}\lambda_k^{\,2} f_k^{\,2} \le \int_0^1 \left[x^\beta f'(x)\right]'^2 dx. \quad (10)$$

Lemma 6: *Let the functions $f(x)$, $f'(x)$, $x^\alpha f'(x)$, $\left[x^\alpha f'(x)\right]'$ be continuous on $[0,1]$, and let the following conditions be fulfiled*

$$f(0) = -f(1),\ \lim_{x\to 0} x^\beta f'(x) = -f'(1),\ \lim_{x\to 0}\left[x^\beta f'(x)\right]' = -f''(1),\ x^{\beta/2}\left[x^\beta f'(x)\right]'' \in L_2(0,1).$$

Then, the following inequality holds true

$$\sum_{k=1}^{\infty}\lambda_k^{\,3} f_k^2 \le \int_0^1 x^\beta \left[x^\beta f'(x)\right]''^2 dx. \quad (11)$$

3.3 The existence of the solution of the problem C

In this section ,we prove the existence of the solution to the direct problem. To do this, first, we will expand the functions $\varphi_1(x)$ and $\varphi_2(x)$ by the series with respect to the system of functions $\{X_k(x)\}|_{k=1}^{+\infty}$ as follows

$$\varphi_j(x) = \sum_{k=1}^{+\infty}\varphi_{jk}X_k(x), f(x,t) = \sum_{k=1}^{+\infty} f_k(t)X_k(x),\ j = \overline{1,2} \quad (12)$$

where φ_{jk} and $f_k(t)$ are the Fourier coefficients of the functions $\varphi_{jk}(x)$ and $f(x,t)$ respectively, i.e.

$$f_k = \int_0^1 f_k(x)X_k(x)dx.$$

$$\varphi_{jk} = \int_0^1 \varphi_{jk}(x)X_k(x)dx, j = \overline{1,2}.$$

We will seek a solution of the problem C in the following form

$$u(x,t) = \sum_{k=1}^{+\infty} T_k(t)X_k(x), \quad (13)$$

where $T_k(t)$ is an unknown function.

To find this unknown function substituting (12) and (13) into the equation (1) and the initial condition (3), we have the following initial boundary value problem for the function $T_k(t)$:

$$\begin{cases} {}_C D_{0t}^{\alpha} T_k(t) + \lambda_k T_k(t) = f_k(t), \\ T_k(0) = \varphi_{1k}, T_k'(0) = \varphi_{2k}. \end{cases} \quad (14)$$

It is known that the unique solution to the problem (14) has the following form[1]

$$T_k(t) = \varphi_{1k}E_{\alpha,1}[-\lambda_k t^\alpha] + \varphi_{2k}tE_{\alpha,2}[-\lambda_k t^\alpha] + \\ + \int_0^t (t-z)^{\alpha-1}E_{\alpha,\alpha}[-\lambda_k(t-z)^\alpha]f_k(z)dz, \quad (15)$$

where $E_{\alpha,\beta}(z)$is the Mittag-Leffler function which its definition is given in Section 2. Substituting (14) into (15), we will have the following representation of the solution of the problem C:

$$u(x,t) = \sum_{k=1}^{+\infty}\Big\{\varphi_{1k}E_{\alpha,1}[-\lambda_k t^\alpha] + \varphi_{2k}tE_{\alpha,2}[-\lambda_k t^\alpha] + \\ + \int_0^t (t-z)^{\alpha-1}E_{\alpha,\alpha}[-\lambda_k(t-z)^\alpha]f_k(z)dz\Big\}X_k(x). \quad (16)$$

Theorem 1. If $\varphi_j(x)$, $x^\beta\varphi_j'(x)$, $\left[x^\beta\varphi_j'(x)\right]' \in C[0,1]$, $x^{\beta/2}\left[x^\beta\varphi_j'(x)\right]' \in L_2(0,1)$, $\varphi_j(0) = -\varphi_j(1)$, $x^\beta\varphi_j'(x)\big|_{x=0} = -\varphi_j'(1)$, $\left[x^\beta\varphi_j'(x)\right]'\Big|_{x=0} = -\left[x^\beta\varphi_j'(x)\right]'\Big|_{x=1}$. $f(x,t)$, $x^\beta f_x(x,t)$, $\left[x^\beta f_x(x,t)\right]_x \in C[0,1]$, $x^{\beta/2}\left[x^\beta f_x(x,t)\right]_{xx} \in L_2(0,1)$, $f(0,t) = -f(1,t)$, $x^\beta f_x(x,t)\big|_{x=0} = -\left[x^\beta f_x(1,t)\right]_x\Big|_{x=1}$ *Then the solution of the problem C exists and is unique.*

Proof. To prove the Theorem 1, it is sufficient to show that the series (16) and the series corresponding to the functions $x^{\beta}u_x(x,t)$ converge uniformly in $\bar{\Omega}$, and that the series corresponding to the functions $\left[x^{\beta}u_x(x,t)\right]_x$, $CD_{0t}^{\alpha}u(x,t)$ converge uniformly on any compact set $D \subset \Omega$.

First, we consider the series (16). Using Lemma 1, one can easily verify that $E_{\alpha,\beta}(-\lambda_k t^{\alpha}) < C$, $t \in [0.1]$. We have

$$|u(x,t)| = \left|\sum_{k=1}^{+\infty}\left[\varphi_{1k}E_{\alpha,1}[-\lambda_k t^{\alpha}] + \varphi_{2k}tE_{\alpha,2}[-\lambda_k t^{\alpha}] + \right.\right.$$
$$\left.\left. + \int_0^t (t-z)^{\alpha-1}E_{\alpha,\alpha}[-\lambda_k(t-z)^{\alpha}]f_k(z)dz\right]X_k(x)\right| \le \sum_{k=1}^{+\infty}|C_1\varphi_{1k} + C_2T\varphi_{2k}||X_k(x)| +$$
$$+C_3\sum_{k=1}^{+\infty}\left|\left\{\int_0^1 (t-z)^{\alpha-1}f_k(z)dz\right\}X_k(x)\right| \le C_1\sum_{k=1}^{+\infty}|\sqrt{\lambda_k}\varphi_{1k}|\left|\frac{X_k(x)}{\sqrt{\lambda_k}}\right| +$$
$$+C_3\sum_{k=1}^{+\infty}|\sqrt{\lambda_k}\varphi_{2k}|\left|\frac{X_k(x)}{\sqrt{\lambda_k}}\right| + C_4\left[\int_0^T\sum_{k=1}^{+\infty}f_k(z)\sqrt{\lambda_k}dz\frac{X_k(x)}{\sqrt{\lambda_k}}\right]. \quad (17)$$

From the last, applying the Cauchy-Schwarz inequality, we have

$$\sum_{k=1}^{+\infty}|\sqrt{\lambda_k}\varphi_{jk}|\left|\frac{X_k(x)}{\sqrt{\lambda_k}}\right| \le \left[\sum_{k=1}^{+\infty}\lambda_k\varphi_{jk}^2\sum_{k=1}^{+\infty}\frac{X_k^2(x)}{\lambda_k}\right]^{1/2}, j = \overline{1,2},$$
$$\int_0^T\sum_{k=1}^{+\infty}f_k(z)\sqrt{\lambda_k}dz\frac{X_k(x)}{\sqrt{\lambda_k}} \le \left[\int_0^T\sum_{k=1}^{+\infty}\lambda_k{f_k}^2(x)dz\sum_{k=1}^{+\infty}\frac{{X_k}^2(x)}{\lambda_k}\right]^{1/2}.$$

The series on the right-hand side of these inequalities converge uniformly in $x \in [0,1]$ due to Lemmas 3 and 4. Therefore, the series on the left-hand side also converges uniformly in x on $[0,1]$. Hence, from (17), it follows that the series (16) converges absolutely and uniformly in Ω.

Now, we consider the series corresponding to the function $\left[x^{\beta}u_x(x,t)\right]_x$. From (13), considering (4), we obtain

$$\left|\left[x^{\beta}u_x(x,t)\right]_x\right| \le \left|\sum_{k=1}^{+\infty}\left[\varphi_{1k}E_{\alpha,1}[-\lambda_k t^{\alpha}]x^{\beta}{X_k}'(x)\right] + \sum_{k=1}^{+\infty}\left[\varphi_{2k}tE_{\alpha,2}[-\lambda_k t^{\alpha}]x^{\beta}{X_k}'(x)\right]\right| +$$
$$+\left|\sum_{k=1}^{+\infty}\left[\int_0^t(t-z)^{\alpha-1}E_{\alpha,\alpha}[-\lambda_k(t-z)^{\alpha}]f_k(z)dz\right]x^{\beta}{X_k}'(x)\right|. \quad (18)$$

Using Lemma 1, one can easily verify that $E_{\alpha,\beta}(-\lambda_k t^{\alpha}) < C$, $t \in [0.1]$ and $t < T$. Considering this, we have

$$\left|\left[x^{\beta}u_x(x,t)\right]_x\right| \le C_5\sum_{k=1}^{+\infty}\left|\varphi_{1k}x^{\beta}{X_k}'(x)\right| + C_6\sum_{k=1}^{+\infty}\left|\varphi_{2k}Tx^{\beta}{X_k}'(x)\right| +$$
$$+C_7\sum_{k=1}^{+\infty}\left|\left[\int_0^T(t-z)^{\alpha}f_k(z)dz\right]x^{\beta}{X_k}'(x)\right|. \quad (19)$$

We rewrite (19) in the following form

$$\left|\left[x^{\beta}u_x(x,t)\right]_x\right| \le C_5\sum_{k=1}^{+\infty}\left|\lambda_k\varphi_{1k}\frac{x^{\beta}{X_k}'(x)}{\lambda_k}\right| + C_8\sum_{k=1}^{+\infty}\left|\lambda_k\varphi_{2k}\frac{x^{\beta}{X_k}'(x)}{\lambda_k}\right| +$$
$$+C_9\left|\int_0^T\sum_{k=1}^{+\infty}\lambda_k f_k(z)dz\left\{\frac{x^{\beta}{X_k}'(x)}{\lambda_k}\right\}\right|. \quad (20)$$

From the last, applying the Cauchy-Schwarz inequality, we have

$$\sum_{k=1}^{+\infty}\left|\lambda_k\varphi_{jk}\frac{x^{\beta}{X_k}'(x)}{\lambda_k}\right| \le \left[\sum_{k=1}^{+\infty}{\lambda_k}^2{\varphi_{jk}}^2\sum_{k=1}^{+\infty}\frac{\left[x^{\beta}{X_k}'(x)\right]^2}{{\lambda_k}^2}\right]^{1/2}, j = \overline{1,2},$$

$$\left|\int_0^T\sum_{k=1}^{+\infty}\lambda_k f_k(z)dz\left\{\frac{x^{\beta}{X_k}'(x)}{\lambda_k}\right\}\right| \le \left[\int_0^T\sum_{k=1}^{+\infty}{\lambda_k}^2{f_k}^2(z)\sum_{k=1}^{+\infty}\frac{\left[x^{\beta}{X_k}'(x)\right]^2}{{\lambda_k}^2}\right]^{1/2}.$$

The series on the right-hand side of these inequalities converge uniformly in $x \in [0,1]$ due to Lemmas 3 and 5. Therefore, the series on the left-hand side also onverges uniformly in x on $[0,1]$. Hence, from (20), it follows that the series (18) converges absolutely and uniformly in Ω.

Then, We consider the uniform convergence of the series corresponding to $CD_{ot}^{\alpha}u(x,t)$ functions. To this end, it is sufficient to show the uniform convergence of the series corresponding to $f(x,t)$ functions.

$$|f(x,t)| \le \sum_{k=1}^{+\infty}|f_k(t)X_k(x)| \le \sum_{k=1}^{+\infty}\left|f_k(t)\sqrt{\lambda_k}\frac{X_k(x)}{\sqrt{\lambda_k}}\right|, \quad (21)$$

From the last, applying the Cauchy-Schwarz inequality, we have

$$\sum_{k=1}^{+\infty}\left|f_k(t)\sqrt{\lambda_k}\frac{X_k(x)}{\sqrt{\lambda_k}}\right| \le \left[\sum_{k=1}^{\infty}\lambda_k {f_k}^2(t)\sum_{k=1}^{\infty}\frac{{X_k}^2(x)}{\lambda_k}\right]^{1/2}.$$

The series on the right-hand side of these inequalities converge uniformly in $x \in [0,1]$ due to Lemmas 3 and 4. Therefore, the series on the left-hand side also onverges uniformly in x on [0,1]. Hence, from (21), it follows that the series corresponding to the function $f(x,t)$ converges absolutely and uniformly in Ω.

3.4 The Uniqueness of the Solution to problem C

Now we show that the solution of the problem is unique.

Assume that there exists two solutions $u_1(x,t)$ and $u_2(x,t)$. Let us denote their difference by $u(x,t) = u_1(x,t) - u_2(x,t)$. Then the pair $u(x,t)$ should satisfy the following equation

$$CD_{0t}^{\alpha}u(x,t) = \left[x^{\beta}u_x(x,t)\right]_{x'} \tag{22}$$

supplemented with the following conditions

$$\left.\begin{array}{l} u(0,t) = -u(1,t), t \in [0,T]; \\ \lim\limits_{x\to 0} x^{\beta}u_x(x,t) = -u_x(1,t), t \in [0,T]; \end{array}\right\}, \tag{23}$$

$$u(x,0) = 0,\ u_t(x,0) = 0,\ x \in [0,1]; \tag{24}$$

To establish the uniqueness of the solution, we consider following equality

$$T_k(t) = \int_0^1 u(x,t)\,X_k(x)dx, k \in \mathbb{N}. \tag{25}$$

Applying the operator CD_{0t}^{α} to both sides of the equation (25), we obtain

$$CD_{0t}^{\alpha}T_k(t) = \int_0^1 CD_{0t}^{\alpha}u(x,t)X_k(x)dx.$$

Using the equation (1), this expression simplifies to

$$CD_{0t}^{\alpha}T_k(t) = \int_0^1\left[x^{\beta}u_x(x,t)\right]_x X_k(x)dx.$$

Hence, considering the boundary conditions (23) and (24), we apply the integration rule twice and rewrite the expression as follows

$$CD_{0t}^{\alpha}T_k(t) = \int_0^1 u(x,t)\left[x^{\beta}X_k^{'}(x)\right]^{'}dx.$$

From the last, taking into account the equations (4) and (25), we have

$$CD_{0t}^{\alpha}T_k(t) + \lambda_k T_k(t) = 0, \tag{26}$$

$$\begin{cases} T_k(0) = 0, \\ T_k^{'}(0) = 0. \end{cases} \tag{27}$$

One can easily show that the solution to {(26),(27)} is given by $T_k(t) \equiv 0$. Since the spectral problem {(4),(5)} is self-adjoint, its set of eigenfunctions $\{X_k(x)\}|_{k=1}^{+\infty}$ is complete. Thus, $u(x,t) \equiv 0$. Therefore, we conclude that $u_1(x,t) = u_2(x,t)$, confirming the uniqueness of the solution to the problem C.

Abstract; *We study the Keplerian and radial epicyclic frequencies of neutral test particles in the static, spherically symmetric Einstein–Nonlinear Maxwell–Yukawa (ENLMY) black hole, using the metric function f(r) obtained in a companion analysis, where the sign of the exponential-integral term is established directly from the field equations and differs from a previously reported solution. Starting from the geodesic equations of circular motion, we derive closed-form expressions for the Keplerian angular frequency Ω_K and the radial epicyclic frequency Ω_r, and examine their dependence on the charge parameter Q and the Yukawa screening parameter α. The two parameters act in opposite directions throughout: increasing Q raises the peak of Ω_r and shifts it to smaller radii, while increasing α lowers the peak and shifts it outward; Ω_K decreases with Q and increases with α at fixed r. These trends mirror the opposite-direction pattern already found for the horizon structure and the effective potential, confirming that Yukawa screening consistently counteracts the compactifying effect of the charge across every dynamical quantity examined so far.*

Keywords: Einstein–nonlinear Maxwell–Yukawa black hole; Keplerian frequency; radial epicyclic frequency; modified gravity.

АНАЛИЗ КЕПЛЕРОВСКИХ И РАДИАЛЬНЫХ ЭПИЦИКЛИЧЕСКИХ ЧАСТОТ В ЧЁРНОЙ ДЫРЕ ЭЙНШТЕЙНА–НЕЛИНЕЙНОГО МАКСВЕЛЛА–ЮКАВЫ

Аннотация; *Изучаются кеплеровская и радиальная эпициклическая частоты нейтральных пробных частиц в статической, сферически-симметричной чёрной дыре Эйнштейна–нелинейного Максвелла–Юкавы (ENLMY), с использованием метрической функции f(r), полученной в сопутствующем исследовании, где знак члена с экспоненциальным интегралом устанавливается непосредственно из уравнений поля и отличается от ранее опубликованного решения. Исходя из геодезических уравнений кругового движения, мы получаем замкнутые выражения для кеплеровской угловой частоты Ω_K и радиальной эпициклической частоты Ω_r, и исследуем их зависимость от заряда Q и параметра юкавского экранирования α. Оба параметра действуют противоположно: увеличение Q повышает пик Ω_r и смещает его к меньшим радиусам, тогда как увеличение α понижает пик и смещает его наружу; Ω_K убывает с ростом Q и растёт с ростом α при фиксированном r.*

Ключевые слова: чёрная дыра Эйнштейна–нелинейного Максвелла–Юкавы; кеплеровская частота; радиальная эпициклическая частота; модифицированная гравитация.

EYNSHTEYN–NOCHIZIQLI MAKSVELL–YUKAVA QORA TUYNUG‘ IDA KEPLER VA RADIAL EPITSIKLIK CHASTOTALARNING TAHLILI

Annotatsiya; *Bu ishda statik va sferik-simmetrik Eynshteyn–Nochiziqli Maksvell–Yukava (ENLMY) qora o‘ rasida neytral test-zarrachalarning Kepler va radial epitsiklik chastotalari o‘ rganiladi; metrikaviy funksiya f(r) hamrohlik qiluvchi tahlilda olingan bo‘ lib, unda eksponensial integral hadining ishorasi bevosita maydon tenglamalaridan belgilanadi va avval e’lon qilingan yechimdan farq qiladi. Doiraviy harakat geodezik tenglamalaridan boshlab, Kepler burchak chastotasi Ω_K va radial epitsiklik chastota Ω_r uchun yopiq ko‘ rinishdagi ifodalar chiqarildi, va ularning zaryad parametri Q hamda Yukava skrining parametri α ga bog‘ liqligi tahlil qilindi. Ikkala parametr butun tahlil davomida qarama-qarshi yo‘ nalishda ta’sir qiladi: Q ning ortishi Ω_r cho‘ qqisini ko‘ taradi va*

uni kichikroq radiuslarga suradi, α ning ortishi esa cho‘ qqini pasaytiradi va tashqariga suradi; Ω_K esa belgilangan r da Q ortishi bilan kamayadi, α ortishi bilan ortadi. 1. Introduction

The orbital and epicyclic frequencies of test particles are among the most direct dynamical probes of a black-hole spacetime: the Keplerian angular frequency Ω_K sets the orbital timescale of circular motion, while the radial epicyclic frequency Ω_r measures the restoring response to small radial perturbations and vanishes exactly at the innermost stable circular orbit. Together they underlie essentially every phenomenological model of the twin-peak quasi-periodic oscillations (QPO) observed in black-hole X-ray binaries, so any modification of the underlying metric leaves a direct, potentially observable imprint on these two frequencies.

The Einstein–Nonlinear Maxwell–Yukawa (ENLMY) black hole is obtained by coupling gravity to a nonlinear electromagnetic field sourced by a Yukawa-screened electric potential, extending the Reissner–Nordström (RN) solution through a short-range electromagnetic correction governed by the screening parameter α. In a companion analysis we re-derived the ENLMY metric function directly from the underlying nonlinear-electrodynamics field equations and obtained a sign for the exponential-integral term that differs from a previously reported version of the solution; using this metric, we found that the charge parameter Q and the screening parameter α act in opposite directions on the horizon structure and on the effective potential of neutral test particles, with Q compactifying the geometry and α counteracting this compactification.

In the present paper we extend this analysis to the Keplerian and radial epicyclic frequencies of neutral test particles, derived directly from this metric. We do not adopt any named twin-peak QPO prescription (relativistic precession, ER2–ER4, or otherwise) and do not attempt an observational or MCMC-based comparison here; the goal is to establish, in closed form and with full numerical verification, how Ω_K and Ω_r individually respond to Q and α, as the necessary basis for any subsequent frequency-model or observational analysis.

The paper is organized as follows. Section 2 recalls the ENLMY metric function. Section 3 derives the Keplerian and radial epicyclic frequencies in closed form and examines their dependence on Q and α. Section 4 discusses the combined pattern across both frequencies. Section 5 summarizes the main conclusions.

2. ENLMY Metric

The ENLMY spacetime is obtained by coupling gravity to a nonlinear electromagnetic field generated by a Yukawa-type deformation of the Coulomb potential, $\varphi(r) = (Q/r)\exp(-\alpha r)$. Re-deriving the metric function from the corresponding field equations and establishing the sign of the exponential-integral term as required by those equations gives the closed form

$$f(r) = 1 - \frac{2M}{r} - \frac{Q^2}{6r^2}\left(\alpha^3 r^3 - \alpha^2 r^2 + 2\alpha r - 6\right) e^{-\alpha r} + \frac{Q^2\alpha^4 r^2}{6} E_1(\alpha r) \tag{1}$$

with M the mass parameter; this form recovers the Schwarzschild metric at $Q=0$ and the Reissner–Nordström metric as $\alpha \to 0$, and was verified directly against the Einstein field equations in the companion analysis. The horizon structure that follows from $f(r_h)=0$ is discussed there in detail and is not repeated here; the present paper builds directly on this $f(r)$ to derive the orbital and epicyclic frequencies of neutral test particles.

3. Keplerian and Radial Epicyclic Frequencies

For a circular, equatorial geodesic, the Keplerian angular frequency measured by a static observer at infinity, $\Omega_K = d\varphi/dt$, follows from the circular-orbit condition $\partial V_{eff}/\partial r = 0$ and is given by the standard relation $\Omega_K^2 = f'(r)/(2r)$. It is convenient to introduce the auxiliary function

$$N(r) \equiv 6Mre^{\alpha r} + Q^2\alpha^4 r^4 e^{\alpha r} E_1(\alpha r) - Q^2\alpha^3 r^3 + Q^2\alpha^2 r^2 - 2Q^2\alpha r - 6Q^2 \tag{2}$$

in terms of which the Keplerian frequency takes the closed form

$$\Omega_K^2(r) = \frac{f'(r)}{2r} = \frac{N(r)\, e^{-\alpha r}}{6r^4} \tag{3}$$

which reduces to the standard Schwarzschild relation $\Omega_K^2 = M/r^3$ at $Q=0$. The radial epicyclic frequency, obtained from the second-order radial perturbation of a circular orbit, follows the general relation

$$\Omega_r^2(r) = \Omega_K^2(r)\left[3f(r) - 2rf'(r) + \frac{rf(r)f''(r)}{f'(r)}\right] \quad (4)$$

with f' the second radial derivative of f; this identity holds for any static, spherically symmetric metric of this form and reduces to the Schwarzschild relation $\Omega_r^2=\Omega_K^2(1-6M/r)$ at $Q=0$. Throughout, r is expressed in units of $M=1$. Fig. 1–4 show Ω_r and Ω_K as functions of r for representative values of Q and α.

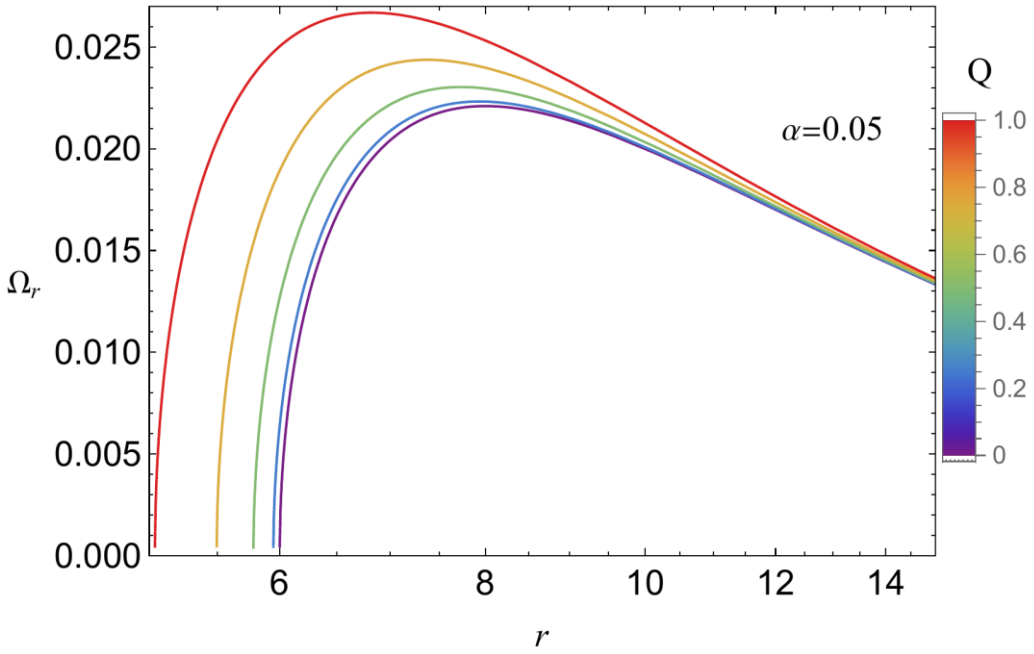

Fig. Radial epicyclic frequency Ω_r as a function of r, at fixed α=0.05, for Q from 0 to 1.

Fig. 1 shows $\Omega_r(r)$ at fixed α=0.05 for Q ranging from 0 to 1. Every curve vanishes at its left endpoint, where $\Omega_r=0$ by definition, rises to a single peak, and then decreases monotonically at large r, where all curves converge regardless of Q. Increasing Q raises the peak value and shifts it to smaller radii: from $\Omega_r=0.0221$ at $r=8.0001$ for $Q=0$, to $\Omega_r=0.0310$ at $r=5.9501$ for $Q=1$. The charge therefore both strengthens the radial restoring force near the black hole and pulls the region of maximal epicyclic response inward, toward the black hole.

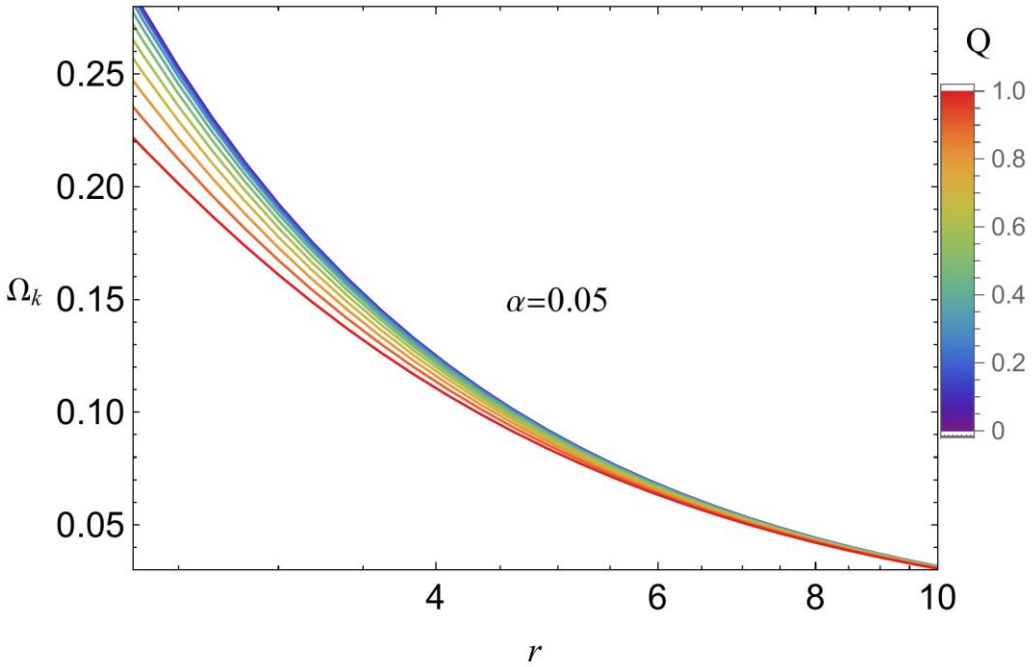

Fig. 2. Keplerian frequency Ω_K as a function of r, at fixed α=0.05, for Q from 0 to 1.

Fig. w shows the complementary behavior of $\Omega_K(r)$ at the same fixed α=0.05. Unlike Ω_r, Ω_K decreases monotonically with r and shows no extremum; increasing Q lowers Ω_K at every fixed r — for instance, from 0.0680 at $Q=0$ to 0.0633 at $Q=1$ at $r=6$ — with the separation between curves most visible at small r and vanishing as $r\to\infty$. A larger charge therefore slows the orbital angular frequency at a given radius, even as it raises the radial epicyclic response shown in Fig. 1.

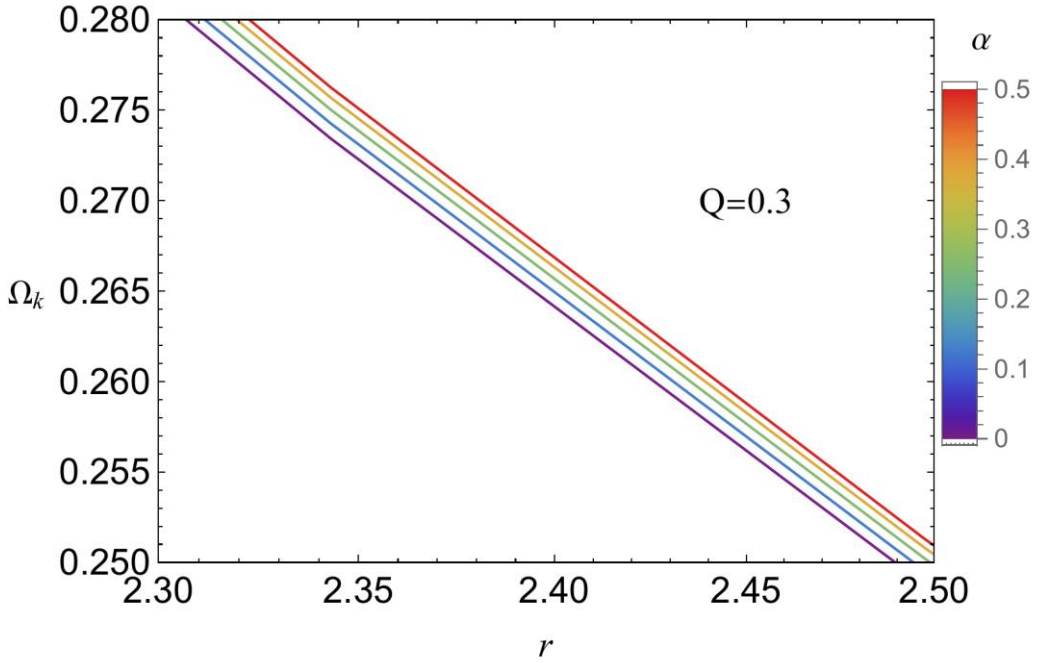

Fig. 3. Keplerian frequency Ω_K as a function of r, at fixed Q=0.3, for α from 0 to 0.5 (near-horizon detail).

Fig. 3 isolates the effect of α on Ω_K at fixed Q=0.3, in the near-horizon range $r\in$[2.30,2.50]. Here α acts in the opposite sense to Q: increasing α raises Ω_K at every fixed r — from 0.2639 at α=0 to 0.2670 at α=0.5 at r=2.40 — partially offsetting the charge-induced reduction seen in Fig. 2. The effect is modest in absolute size over this range but systematic and monotonic in α.

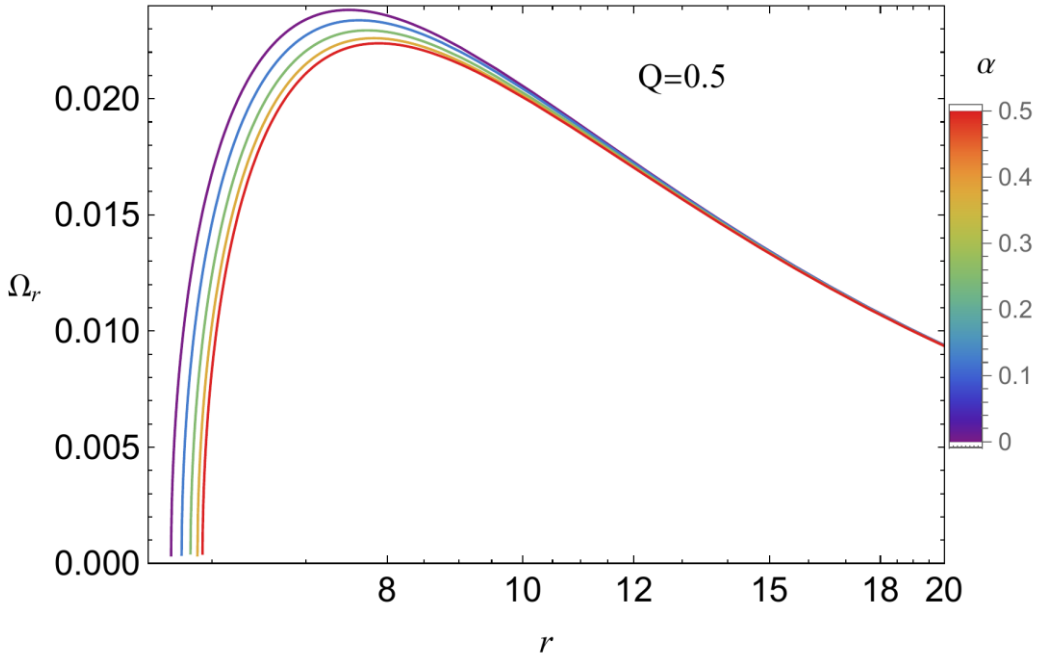

Fig. 4. Radial epicyclic frequency Ω_r as a function of r, at fixed Q=0.5, for α from 0 to 0.5.

Fig. 4 completes the picture, showing $\Omega_r(r)$ at fixed Q=0.5 for α from 0 to 0.5. Increasing α lowers the peak of Ω_r and shifts it outward — from Ω_r=0.0238 at r=7.5095 for α=0, to Ω_r=0.0223 at r=7.9333 for α=0.5 — the mirror image of the Q-driven trend in Fig. 1. As in Fig. 1, all curves converge at large r, confirming that the influence of both Q and α on the epicyclic response is confined to the near-horizon region.

4. Discussion

The results of Section 3 extend the opposite-direction pattern already established for the horizon structure and the effective potential to the Keplerian and radial epicyclic frequencies: at every fixed radius, increasing the charge Q raises Ω_r and lowers Ω_K, while increasing the screening parameter α does the reverse, driving both frequencies back toward their Schwarzschild values. Physically, the charge deepens and narrows the effective potential well near the black hole (as shown in the companion analysis), which simultaneously slows the mean orbital angular velocity and strengthens the radial

restoring force felt by a slightly perturbed circular orbit; Yukawa screening, entering only through exponential prefactors multiplying Q^2, systematically weakens both effects.

A further consequence, visible in Figs. 1 and 4, is that the peak of Ω_r shifts inward with Q and outward with α: the radius of maximal radial response is not fixed but moves together with Q and α themselves. Because twin-peak QPO models combine Ω_K and Ω_r at a common emission radius, this coupled shift means that any such combination inherits the same Q–α degeneracy already identified at the level of the individual frequencies, and must be treated with that degeneracy in mind.

5. Conclusion

Using the Einstein–Nonlinear Maxwell–Yukawa metric established in a companion analysis, we have derived closed-form expressions for the Keplerian angular frequency and the radial epicyclic frequency of neutral test particles, and verified both against the Schwarzschild limit.

The charge parameter Q and the Yukawa screening parameter α were found to act in opposite directions on both frequencies: the charge raises the peak of the radial epicyclic frequency and shifts it inward while lowering the Keplerian frequency at fixed radius, and screening reverses both trends, driving the geometry back toward the Schwarzschild profile. This pattern is the direct dynamical counterpart of the opposite-direction behavior already found for the horizon structure and the effective potential.

Overall, our results provide an internally consistent set of orbital and epicyclic frequencies for the ENLMY spacetime. The construction of twin-peak QPO frequency pairs from these results, and their comparison with observed microquasar and X-ray binary data through Bayesian parameter estimation, are left for a separate, dedicated analysis.

Abstract; *We study the static, spherically symmetric Einstein–Nonlinear Maxwell–Yukawa (ENLMY) black hole, obtained by coupling gravity to a nonlinear electromagnetic field sourced by a Yukawa-screened electric potential. Re-deriving the metric function f(r) directly from the field equations, we obtain a sign for the exponential-integral term that differs from the previously reported solution, and verify this form against the Reissner–Nordström and Schwarzschild limits. Using this metric, we examine the horizon structure and the effective potential of neutral test particles. Throughout, the charge parameter Q and the Yukawa screening parameter α act in opposite directions: increasing Q shrinks the outer horizon and raises the effective-potential barrier, while increasing α pushes the horizon outward and lowers the barrier back toward the Schwarzschild profile, with the Schwarzschild values exactly recovered as Q→0. This sign also removes a spurious reversal in the horizon ordering with α and a spurious dip of the effective potential below the Schwarzschild curve at large radius, both artifacts of the previously reported sign.*

СТРУКТУРА ГОРИЗОНТА И ЭФФЕКТИВНЫЙ ПОТЕНЦИАЛ В ЧЁРНОЙ ДЫРЕ ЭЙНШТЕЙНА–НЕЛИНЕЙНОГО МАКСВЕЛЛА–ЮКАВЫ

Аннотация; *Изучается статическая, сферически-симметричная чёрная дыра Эйнштейна–нелинейного Максвелла–Юкавы (ENLMY), получаемая при связи гравитации с нелинейным электромагнитным полем, источником которого является экранированный по Юкаве электрический потенциал. Повторно выводя метрическую функцию f(r) непосредственно из уравнений поля, мы получаем для члена с экспоненциальным интегралом знак, отличающийся от ранее опубликованного решения, и проверяем эту форму по пределам Райсснера–Нордстрёма и Шварцшильда. С помощью этой метрики мы анализируем структуру горизонтов и эффективный потенциал нейтральных пробных частиц. Заряд Q и параметр юкавского экранирования α действуют противоположно: увеличение Q уменьшает внешний горизонт и повышает барьер эффективного потенциала, тогда как увеличение α смещает горизонт наружу и понижает барьер обратно к профилю Шварцшильда, причём значения Шварцшильда точно восстанавливаются при Q→0. Этот знак также устраняет ложный разворот в порядке горизонтов по α и ложное проваливание эффективного потенциала ниже кривой Шварцшильда при большом радиусе, оба являющиеся артефактами ранее опубликованного знака.*

1. Introduction

Modified theories of gravity are frequently probed through charged black-hole geometries in which the electromagnetic sector is deformed by a nonlinear correction. A physically motivated deformation of this kind replaces the Coulomb potential with a Yukawa-screened potential, which introduces a finite screening length into the electromagnetic sector and reduces to the familiar Reissner–Nordström (RN) field at short distances. The resulting Einstein–Nonlinear Maxwell–Yukawa (ENLMY) black hole was obtained by coupling gravity to a nonlinear electromagnetic field sourced by such a screened potential, extending the RN solution through a short-range electromagnetic correction.

The construction draws on two independent lines of work: nonlinear electrodynamics, originally introduced to regularize the Maxwell sector, and the Yukawa potential, which describes screened interactions mediated by a massive field. In the ENLMY spacetime the horizon structure depends on both the electric charge Q and the screening parameter α, and the geometry can describe a two-horizon black hole, an extremal configuration, or a horizonless naked singularity depending on where the parameters fall in the (Q, α) plane. Because the screening length interpolates smoothly between a short-range and a Coulomb-like regime, the ENLMY background provides a convenient testbed for how electromagnetic screening reshapes strong-field dynamics relative to the RN and Schwarzschild cases.

The horizon structure and the effective potential of neutral test particles are the standard first probes of such deformed geometries, and the ENLMY spacetime itself has already been examined from the complementary perspectives of twin-peak quasi-periodic oscillations and of periodic orbits with their associated gravitational-wave phenomenology. In re-deriving the metric function for the present analysis, we found that the exponential-integral term of the previously reported closed-form solution carries a sign that differs from what the field equations give; the difference is confined to that one term and does not affect the qualitative motivation for the model, but it does propagate into every quantity built from $f(r)$. The present paper adopts the sign required by the field equations for this term and re-derives the horizon structure and the effective potential from this metric, verifying each result against the Schwarzschild and RN limits.

The paper is organized as follows. Section 2 presents the ENLMY metric function, summarizes its derivation from the underlying nonlinear-electrodynamics field equations, establishes the sign of the exponential-integral term required by those equations, and discusses the resulting horizon structure. Section 3 analyzes the effective potential of neutral test particles. Section 4 discusses the combined role of the charge and screening parameters across both of the above quantities. Section 5 summarizes the main conclusions.

2. ENLMY Metric and Horizon Structure

The ENLMY spacetime is obtained by coupling gravity to a nonlinear electromagnetic field generated by a Yukawa-type deformation of the Coulomb potential. For a static, spherically symmetric electric configuration the scalar potential is taken as $\varphi(r) = (Q/r)\exp(-\alpha r)$, so that the associated field strength $E(r)$ reduces to the Coulomb field at short distances and is exponentially screened at large distances. Varying the nonlinear electromagnetic action together with the Einstein–Hilbert term yields a nonlinear Maxwell equation for the field-dependent Lagrangian $L(r)$ and, through the corresponding stress–energy tensor, a first-order equation for the metric function. Fixing the two integration constants by matching the Schwarzschild limit at Q=0 and the Reissner–Nordström limit as $\alpha \to 0$ gives the metric function in closed form:

$$f(r) = 1 - \frac{2M}{r} - \frac{Q^2}{6r^2}\left(\alpha^3 r^3 - \alpha^2 r^2 + 2\alpha r - 6\right) e^{-\alpha r} + \frac{Q^2\alpha^4 r^2}{6} E_1(\alpha r) \tag{1}$$

with M the mass parameter. We verified this closed form directly against the field equations: differentiating $f(r)$ and substituting into the Einstein tensor for the static, spherically symmetric ansatz reproduces the stress–energy tensor of the nonlinear electromagnetic field for every power of α and Q, and the Schwarzschild (Q=0) and Reissner–Nordström ($\alpha \to 0$) limits are recovered exactly. This closed form differs from a previously reported version of the same solution by the sign of the $E_1(\alpha r)$ term; the sign given here is the one required by the field equations, and it is the one used throughout the remainder of this paper.

The horizon radii follow from $f(r_h)=0$. Fig. 1 and Fig. 2 show the resulting horizon structure as a function of α and Q, respectively.

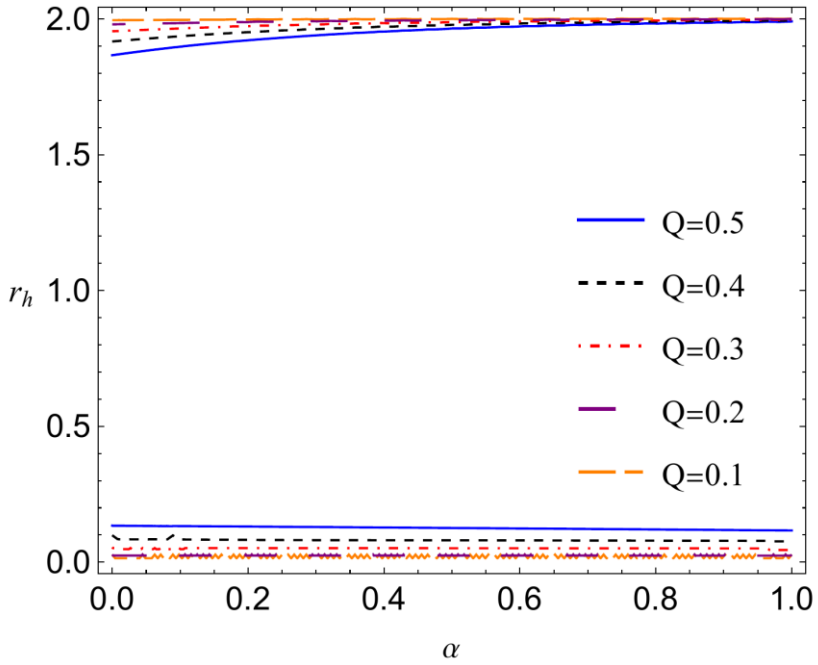

Fig. Horizon radii as a function of the Yukawa parameter α, for fixed values of the charge Q.

Fig. 1 shows the horizon radii as a function of α for several fixed values of Q. The outer horizon increases monotonically with α toward the Schwarzschild value $r_+=2M$, so that stronger screening progressively suppresses the charge contribution to the horizon structure. For any fixed α, a larger Q consistently gives a smaller outer horizon and a larger inner horizon, and this ordering holds across the whole range $\alpha\in(0,1)$ with no reversal between the different-Q curves — a feature that follows directly from the sign of the $E_1(\alpha r)$ term used here. All curves converge as $\alpha\to 1$, where screening dominates and the geometry becomes nearly insensitive to Q.

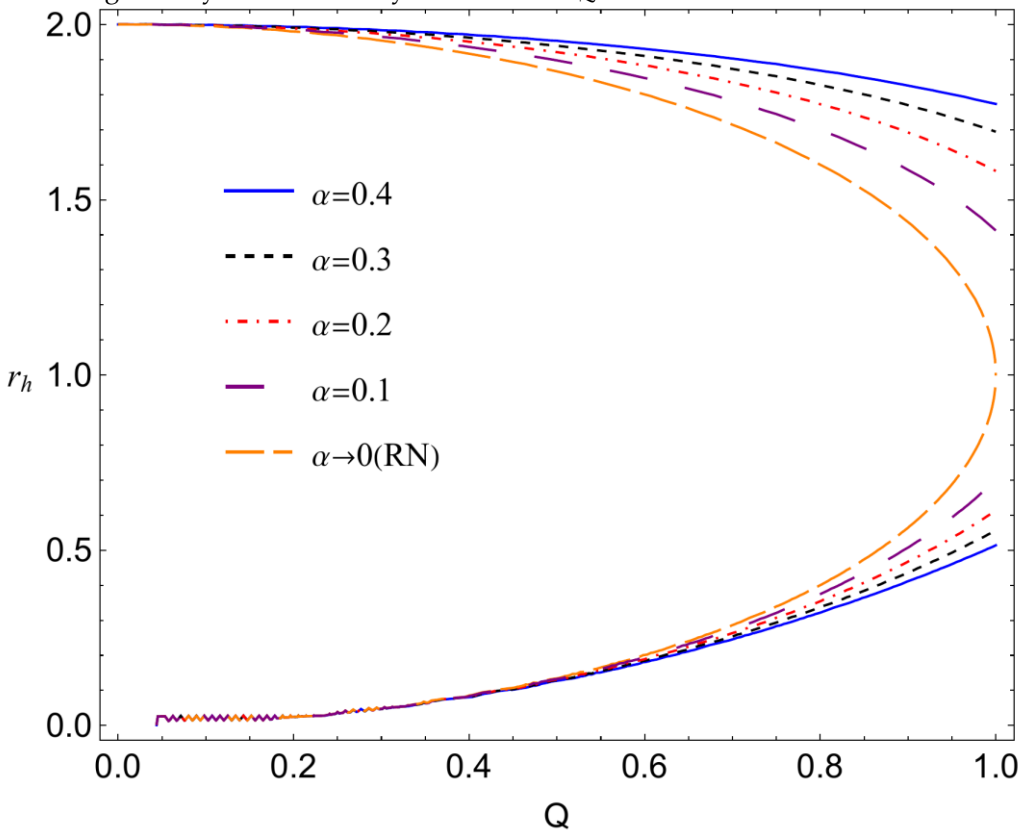

Fig. 2. Horizon radii as a function of the charge Q, for fixed values of the Yukawa parameter α.

Fig. 2 presents the complementary dependence on Q. As Q increases, the outer horizon decreases and the inner horizon increases, the two branches approaching each other in the familiar extremal manner of charged black holes. The Reissner–Nordström limit ($\alpha\to 0$) shows the strongest such response, with the branches meeting near $Q\simeq 1$; increasing α

visibly weakens this charge-driven approach, keeping the two horizons further apart at the same Q. Yukawa screening therefore delays the extremal configuration to larger charge values. Throughout this work we restrict Q and α to the range in which two positive horizon roots exist.

3. Effective Potential Neutral Test Particles

For a neutral test particle moving in the equatorial plane, the radial equation of motion takes the standard form $\dot{r}^2 = E^2 - V_{\text{eff}}(r)$, with the effective potential

$$V_{\text{eff}}(r) = f(r)\left(1 + \frac{L^2}{r^2}\right) \tag{2}$$

where E and L are the conserved specific energy and specific angular momentum of the particle. Fig. 3 shows V_{eff} for representative parameter sets, with M=1 and L=√20.

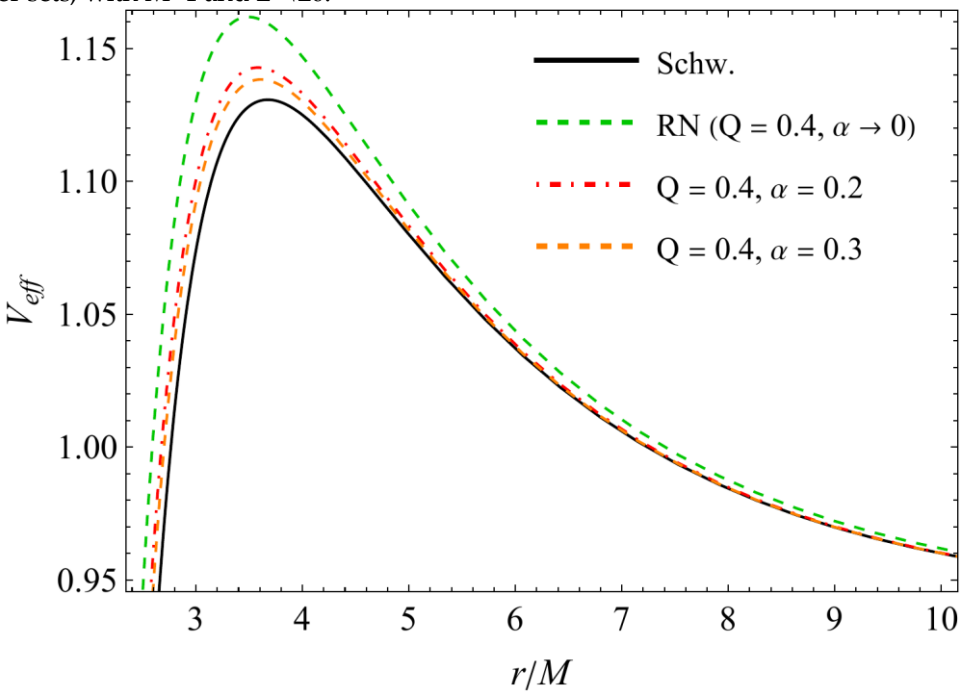

Fig. 3. Effective potential for neutral test-particle motion in the ENLMY spacetime; M = 1, L = √20.

All charged and screened cases lie above the Schwarzschild curve throughout the shown range, with no crossing between r=3M and r=10M. The Reissner–Nordström case (Q=0.4, α→0) produces the highest and left-most barrier; switching on the Yukawa screening lowers the barrier and shifts it back toward the Schwarzschild peak, with α=0.3 lying below α=0.2. Beyond r~6M the curves converge and become nearly indistinguishable, showing that the charge and screening effects on the orbital dynamics are confined to the near-horizon region, consistently with the horizon-structure trends of Section 2.

4. Discussion

The results of Sections 2 and 3 show a single, consistent pattern: the charge parameter Q and the Yukawa screening parameter α act on the ENLMY geometry in opposite directions. Increasing Q shrinks the outer horizon and raises the effective-potential barrier confining test particles closer to the black hole; increasing α reverses both trends and drives the geometry back toward the Schwarzschild limit. This opposition is already visible at the level of the metric function itself, where α enters only through the exponential prefactors multiplying Q^2, so that Yukawa screening can be read as an effective, radius-dependent suppression of the charge rather than as an independent deformation of the geometry.

The sign of the $E_1(\alpha r)$ term adopted here, as required by the field equations, removes two features that are otherwise difficult to interpret physically. First, with the previously reported sign, the horizon radius as a function of α develops a spurious crossing at which the ordering of the outer-horizon curves for different Q reverses; with the sign used here this reversal is absent, and the ordering by Q is preserved for every $\alpha \in (0,1)$, consistent with the intuitive expectation that a larger charge should not become "less compact" than a smaller one at some special screening strength. Second, the effective potential of the charged and screened cases no longer dips below the Schwarzschild curve at large radius; instead, all curves approach the Schwarzschild profile from above as r increases, without crossing it. Both features leave the qualitative motivation for the ENLMY construction untouched, but they change the quantitative predictions for the horizon structure and the effective potential, and must be propagated to any subsequent analysis built on this metric, including circular-orbit and QPO-frequency modeling.

5. Conclusion

We have re-derived the metric function of the Einstein–Nonlinear Maxwell–Yukawa black hole directly from its underlying nonlinear-electrodynamics field equations, verified the resulting closed form against the field equations themselves, and obtained a sign for the exponential-integral term that differs from a previously reported version of the same solution. Using this metric, we then derived the horizon structure and the effective potential of neutral test particles, and verified each result against the Schwarzschild and Reissner–Nordström limits.

The charge parameter Q and the Yukawa screening parameter α were found to act in opposite directions: the charge shrinks the horizon and raises the effective-potential barrier, while screening pushes the horizon outward and lowers the barrier back toward the Schwarzschild profile. This sign for the metric function also removes a spurious crossing in the horizon structure and a spurious dip of the effective potential below the Schwarzschild curve, both of which were artifacts of the previously reported sign rather than genuine physical effects.

Overall, our results establish an internally consistent description of the ENLMY horizon structure and effective potential that can serve as the starting point for further work. In particular, the circular-orbit quantities and characteristic radii built on this effective potential, and the frequencies associated with them, are left for a separate, dedicated analysis.

ON THE BASIS OF SYSTEMS OF ROOT FUNCTIONS OF A SECOND-ORDER DIFFERENTIAL EQUATION WITH NONLOCAL CONDITIONS

Abstract: *In this paper, we investigate the spectral properties of boundary value problems for a second-order ordinary differential equation with nonlocal conditions. We find the eigenvalues and corresponding eigenfunctions and associated functions, and study their completeness. Using the Bessel and Hilbert properties of the root functions of these problems, we prove the Riesz basis property of these systems.*

Keywords: *nonlocal problem, non-self-adjoint problem, eigenvalues and eigenfunctions, root functions, completeness, Bessel property, Hilbert property, Riesz basis.*

Введение и постановка задачи

Как известно, спектральная теория дифференциальных операторов составляет существенный раздел общей спектральной теории операторов и занимает особое место при исследованы различных начально-краевых задач для дифференциальных уравнений в частных производных.

Основной проблемой спектральной теории дифференциальных операторов, является теорема о разложении по собственным функциям, то есть изучение полноты и базисности систем корневых функций решаемых задач. Применяя спектральный метод для решения краевых задач, обычно мы приходим либо самосопряженной или, либо несамосопряженной спектральной задаче и следует отметит, что многие спектральные проблемы самосопряженных задач в данный момент теоретически решена [1], [2]. А что касается несамосопряженных задач, то решение вышеуказанных проблем в общем, неоднозначно, так как существует различные способы построения корневых функций (точнее присоединённых функций). Следует отметить работы [3], [4], где была построена теория присоединенных функций и доказана полнота системы корневых функций широкого класса несамосопряженных

дифференциальных операторов. Отметим также работу [5], где авторы предложили другой способ построения присоединенных функций несамосопряженного дифференциального оператора. В работах [6]-[7] предложен конструктивный метод построения так называемой приведенной системы собственных и присоединенных функций несамосопряженного дифференциального оператора, а также доказаны необходимые и достаточные условия ее базисности. Отметим работы [8]-[10], где предлагаются и обосновываются новые формулы построения цепочек присоединенных функций несамосопряженных дифференциальных операторов. Аналогичные проблемы были изучены в работах [11] - [14].

Более подробную информацию о спектральных свойствах несамосопряженных дифференциальных операторов можно найти в монографиях [1], [2].

В данной работе исследуем полноту и базисность систем корневых функций краевых задач для дифференциального уравнение второго порядка с нелокальными условиями. Находим собственные числа, соответствующие собственные и присоединенные функции, изучаем их полноту. Далее, используя известные результаты работы [15], докажем базисность Рисса полученных систем.

Рассмотрим следующие задачи:

Задача 1. Требуется найти такие значения λ, для которых задача

$$X''(x) + \lambda X(x) = 0, 0 < x < 1, \quad (1)$$

$$X(0) = 0, X'(1) = aX'(0), \quad (2)$$

имеет нетривиальное решение.

Здесь a - произвольное действительное число, а λ - спектральный параметр.

Отметим, что при $a = 0$ задача (1)-(2) переходит в смешанную краевую задачу, а при $a = \pm 1$ - в известную задачу типа Самарского-Ионкина. Поэтому далее будем рассматривать общий случай, исключая перечисленные значения a.

Решение задачи 1.

Найдём собственные значения и собственные функции задачи 1. В случае $\lambda = 0$ общее решение уравнения (1) запишется в виде $X(x) = C_1 x + C_2$, где C_1, C_2 - произвольные действительные числа. Подставляя это решение в первое условие из (2) получим, что $X(x) = C_1 x$. Теперь из второго условие из (2) получим $C_1(1 - a) = 0$. Так как $a \neq 1$, отсюда $C_1 = 0$, то есть в этом случае собственные функции отсутствуют.

Пусть $\lambda < 0$. Положим $\lambda = -\mu^2, \mu > 0$. Тогда общее решение уравнения (1) имеет вид $X(x) = C_1 e^{\mu x} + C_2 e^{-\mu x}$. Подставляя это решение в первое условие из (2) получим, что

$$C_1 + C_2 = 0 \Rightarrow C_2 = -C_1 \Rightarrow X(x) = C_1(e^{\mu x} - e^{-\mu x})$$

Подставляем это решение во второе условие из (2), тогда для нахождения μ получим уравнение $ch\mu = a$. Отметим, что $ch\mu \geq 1$ и $ch\mu$, как функция от μ, возрастает при $\mu > 0$, причём знак равенство имеет место при $\mu = 0$. Отсюда следует, что при $a < 1$ полученное уравнение не имеет решения, а при $a > 1$ имеет одно решение, которого обозначим через μ_0. Таким образом, задача 1 при $\lambda < 0$ и $a > 1$ имеет одно собственное значение $\lambda_0 = -\mu_0^2, \mu_0 > 0$, которому соответствует собственная функция вида $X_{\lambda_0}(x) = sh\mu_0 x$.

Рассмотрим случай $\lambda > 0$. Положим, $\lambda = \mu^2, \mu > 0$. Тогда общее решение уравнения (1) имеет вид $X(x) = C_1 \cos \mu x + C_2 \sin \mu x$. Подставляя это решение в первое условие из (2), получаем $C_1 = 0$. Далее, учитывая второе условие из (2), для нахождения собственных чисел получим уравнение $\cos \mu = a$, которое имеет решения только при условии $|a| \leq 1$. По условию $a \neq 0; \pm 1$, поэтому далее рассмотрим случай $a \in (-1,0) \cup (0,1)$. Тогда решение уравнения $\cos \mu = a$ имеет вид $\mu = \pm \arccos a + 2\pi k, k \in \mathbb{Z}$. Через L обозначим множество собственных значений задачи 1 в случае $\lambda > 0$. Тогда

$$L = \{\lambda_{ik} \in R^+ : \lambda_{10} = \alpha^2, \lambda_{1k} = (\alpha + 2\pi k)^2, \lambda_{2k} = (-\alpha + 2\pi k)^2, i = 1,2; k \in \mathbb{N}\},$$

где $\alpha = \arccos a \in \left(0, \frac{\pi}{2}\right) \cup \left(\frac{\pi}{2}, \pi\right)$. Соответствующие собственные функции имеют вид ($\lambda = \mu^2, \mu > 0$)

$$X_{10}(x) = \sin \mu_{10} x, X_{1k}(x) = \sin \mu_{1k} x, X_{2k}(x) = \sin \mu_{2k} x, k \in \mathbb{N}. \quad (5)$$

Легко показать, что алгебраическая и геометрическая кратность собственных значений совпадают и равны единице. Таким образом, у задачи 1 отсутствуют присоединенные функции, то есть корневое пространство этой задачи состоит только из собственных функций.

Следствие 1. $\lambda = 0$ является собственным значением задачи 1, тогда и только тогда, когда $a = 1$.

Следствие 2. В случае $\lambda < 0$ при условии $a > 1$ существует одна собственная функция задачи (1) вида $X_{\lambda_0}(x) = sh\mu_0 x$.

Отметим, что спектральная задача (1)-(2) - несамосопряженная, и значит, система собственных функций (5) не ортогональная. Тогда, согласно спектральной теории операторов, возникает проблема исследования задачи, сопряженной к задаче (1)-(2) и нетрудно видеть, что сопряженной к ней будет задача:

$$Y''(x) + \lambda Y(x) = 0, 0 < x < 1, \quad (6)$$

$$Y'(0) = 0, Y(0) = aY(1). \quad (7)$$

Исследование задачи (6)-(7) аналогично задаче 1. Множество собственных значений задачи совпадает со множеством L, а система собственных функций имеет вид

$$Y_{10}(x) = \frac{2\cos\alpha(1-x)}{\sqrt{1-a^2}}, Y_{1k}(x) = \frac{2\cos\mu_{1k}(1-x)}{\sqrt{1-a^2}}, Y_{2k}(x) = -\frac{2\cos\mu_{2k}(1-x)}{\sqrt{1-a^2}}, k \in \mathbb{N}. \quad (8)$$

Полнота и базисность систем собственных функций задач (1)-(2)

Рассмотрим задачу 1 и докажем полноту системы собственных функций этой задачи при $\alpha \in \left(0,\frac{\pi}{2}\right) \cup \left(\frac{\pi}{2},\pi\right)$. Имеет место:

Теорема 1. Система собственных функций (5) и (8) полны в пространстве $L_2(0,1)$.

Докажем полноту системы (5). Отметим, что в случае $\alpha \in \left(0,\frac{\pi}{2}\right)$ полноту этой системы можно установить без использования специальных инструментов теории спектрального анализа. *Действительно*, предположим, что система (5) не полна. Тогда согласно определению полноты, существует отличная от нуля функция $f(x) \in L_2(0,1)$, такая, что она ортогональна всем функциям системы (5), то есть

$$\int_0^1 f(x)\sin\mu_{ik}\,xdx = 0, \mu_{ik} \in L, i = 1,2. \quad (9)$$

Учитывая вид собственных значений, (9) представим в виде

$$\int_0^1 f(x)\sin\mu_{10}\,xdx = \int_0^1 f(x)\sin\alpha\,xdx = 0,$$

$$\int_0^1 f(x)\sin\mu_{1k}\,xdx = A_k + B_k = 0, \int_0^1 f(x)\sin\mu_{2k}\,xdx = A_k - B_k = 0,$$

где

$$A_k = \int_0^1 f(x)\cos\alpha\,x\sin 2\pi kxdx\,, B_k = \int_0^1 f(x)\sin\alpha\,x\cos 2\pi kxdx.$$

Из этих соотношений получим $A_k = B_k = 0, k \in \mathbb{N}$, так что

$$\int_0^1 f(x)\sin\alpha\,xdx = 0, \int_0^1 f(x)\cos\alpha\,x\sin 2\pi kxdx = 0,$$

$$\int_0^1 f(x)\sin\alpha\,x\cos 2\pi kxdx = 0. \quad (10)$$

Рассмотрим полную ортонормированную в $L_2(0,1)$ тригонометрическую систему функций

$$\{1, \cos(2\pi nx), \sin(2\pi nx)\}_{n\in\mathbb{N}}. \quad (11)$$

Так как $f(x) \in L_2(0,1)$, справедливы следующие разложения

$$f(x)\cos\alpha\,x = b_0 + \sum_{n=1}^{\infty}(a_n\sin(2\pi nx) + b_n\cos(2\pi nx)),$$

$$f(x)\sin\alpha\,x = d_0 + \sum_{n=1}^{\infty}(c_n\sin(2\pi nx) + d_n\cos(2\pi nx)),$$

которые сходятся в $L_2(0,1)$. Здесь a_n, b_n и c_n, d_n - соответственно коэффициенты Фурье функций $f(x)\cos\alpha\,x$ и $f(x)\sin\alpha\,x$ по ортонормированной системе (11).

Согласно соотношениям (10), эти разложения примут вид

$$f(x)\cos\alpha\,x = b_0 + \sum_{n=1}^{\infty} b_n\cos(2\pi nx),\ f(x)\sin\alpha\,x = \sum_{n=1}^{\infty} c_n\sin(2\pi nx),$$

из чего следует ортогональность функций $f(x)\sin\alpha\,x$ и $f(x)\cos\alpha\,x$, то есть

$$\int_0^1 f^2(x)\sin\alpha\,x\cos\alpha\,xdx = 0 \Leftrightarrow \int_0^1 f^2(x)\sin 2\alpha xdx = 0.$$

Так как $\sin 2\alpha x > 0$ при $\alpha \in \left(0,\frac{\pi}{2}\right)$, получим $f(x) = 0$ почти всюду в $L_2(0,1)$. Отсюда следует полнота системы (5) в $L_2(0,1)$ в случае $\alpha \in \left(0,\frac{\pi}{2}\right)$.

Доказательство теоремы 1. *Для* доказательства полноты системы мы пользуемся принципом Фрагмена–*Линделёфа* [16], основанным на свойствах целых функций:

Лемма 1. *Пусть выполнены следующие условия:*

а) функция f голоморфна внутри угла раствора $\beta\pi$, где $\beta \in (0,2)$, и f непрерывна в замыкании этого угла;

б) на сторонах угла выполнена оценка $|f(x)| \le M$, где M - некоторая константа;

в) существует число $\rho \in \left(0,\frac{1}{\beta}\right)$ такое, что $f(z) = O\left(e^{|z|^\rho}\right)$ при $z \to \infty$ внутри угла. Тогда оценка $|f(x)| \le M$ справедлива при всех z из указанного угла.

Предположим, что система (5) не полна в $L_2(0,1)$. Тогда, существует функция $f(x) \in L_2(0,1)$, $f(x) \neq 0$ такая, что

$$\int_0^1 f(x)\sin\mu_{ik}\,xdx = 0, \mu_{ik} \in L.$$

Определим функцию комплексного переменного $N(z) = \int_0^1 f(x)\sin(zx)dx$. Покажем, что $N(z)$ - целая функция. *Действительно*, используя разложение $\sin(zx)$ в степенной ряд и равномерную сходимость этого ряда на компактах по z, можно интегрировать почленно, откуда следует голоморфность $N(z)$ на всей комплексной плоскости. Кроме того, из оценки $|\sin(zx)| \le e^{|Im\,z|}$ при $x \in [0,1]$ получаем

$$|N(z)| \le \int_0^1 |f(x)|\,|sin(zx)|dx \le e^{|Im\,z|}\int_0^1 |f(x)|\,dx = \|f\|_{L_1(0,1)}e^{|Im\,z|}.$$

Из последней оценки следует, что $N(z)$ является целой функцией порядка не выше первого.

Определяем также целую функцию $D(z) = cos\,z - a$. Так как $D(\mu) = 0$ при $\mu \in L$, $D'(z) = -sin\,z$ и $sin\,\mu \neq 0$при $\mu \in L$, отсюда получим, что нули $D(z)$ простые. Рассмотрим теперь функцию $F(z) = \frac{N(z)}{D(z)}$. Так как $N(\mu) = 0$ при $\mu \in L$, то точки μ из L являются устранимыми особенными точками функции $F(z)$. Следовательно, $F(z)$ - целая функция. Так как $F(z)$ это отношение двух целых функций порядка не выше первого, то $F(z)$ также имеет порядок не выше первого.

Рассмотрим сектор $\Lambda = \{z \in \mathbb{C}: |\,arg\,z\,| < \pi/4\}$. На лучах $arg\,z = \pm\pi/4$ имеем $z = re^{\pm i\pi/4}$, значит $|Im\,z| = r/\sqrt{2}$. Из полученной ранее оценки для числителя имеем на границе $|N(z)| \le \|f\|_{L_1(0,1)}e^{|z|/\sqrt{2}}$. Учитывая, что

$$|\,cos\,z\,| \sim \frac{e^{|Im\,z|}}{2} \text{ при } Im\,z \to \infty$$

и используя обратное неравенство треугольника, получаем для знаменателя на границе имеем $|D(z)| = |\,cos\,z - a| \ge ce^{|Im\,z|}$, здесь и далее через $c > 0$ обозначается положительная константа, не зависящая от z. Тогда из оценок для $N(z)$ и $D(z)$ следует

$$|F(z)| = \left|\frac{N(z)}{D(z)}\right| \le \frac{\|f\|e^{|Im\,z|}}{ce^{|Im\,z|}} = \frac{\|f\|}{c} = M.$$

Так как $F(z)$ является целой функцией порядка не выше первого, то для любого $\varepsilon > 0$ при $z \to \infty$ имеет место $|F(z)| \le e^{|z|^{1+\varepsilon}}$. Здесь показатель $1 + \varepsilon < 2 = 1/\beta$, поэтому выполнено условие роста из леммы Фрагмена-Линделёфа. Следовательно, получаем ограниченность функции $F(z)$ во всем секторе Λ. Таким же образом получим ограниченность $F(z)$ в остальных трех секторах, которые вместе с первым, включая их границы, покрывают всю комплексную плоскость. Значит, $F(z)$ ограничена на всей комплексной плоскости $\mathbb{C}$. Тогда, согласно теореме Лиувилля [16], функция $F(z)$ является постоянной, то есть $F(z) \equiv C$. Так как $F(0) = 0$, отсюда получим $C = 0 \Leftrightarrow F(z) = 0$. Таким образом,

$$N(z) = \int_0^1 f(x)\,sin\,z\,xdx = 0, z \in \mathbb{C}.$$

Отсюда, при $z_k = \pi k, k = 1,2,\ldots$ также имеем $N(\pi k) = \int_0^1 f(x)\,sin\,\pi\,kxdx = 0$. Так как $\{sin\,\pi\,kx\}, k = 1,2,\ldots$ полная система в $L_2(0,1)$, тогда $f(x) = 0$. А это противоречит условию $f(x) \neq 0$. Полнота системы (8) доказывается аналогично. Теорема 1 доказана.

Лемма 2. *Для любой функции* $f(x) \in L_2(0,1)$ ряды

$$\left(\int_0^1 f(x)X_{10}(x)dx\right)^2 + \sum_{k=1}^{\infty}\left(\int_0^1 f(x)X_{1k}(x)dx\right)^2 + \sum_{k=1}^{\infty}\left(\int_0^1 f(x)X_{2k}(x)dx\right)^2,\left(\int_0^1 f(x)Y_{10}(x)dx\right)^2 +$$
$$\sum_{k=1}^{\infty}\left(\int_0^1 f(x)Y_{1k}(x)dx\right)^2 + \sum_{k=1}^{\infty}\left(\int_0^1 f(x)Y_{2k}(x)dx\right)^2$$

сходятся.

Доказательство. Покажем сходимость ряда (10). Учитывая (5), обозначим

$$I = \left(\int_0^1 f(x)\,sin\,\alpha\,xdx\right)^2, I_i = \sum_{k=1}^{\infty}\left(\int_0^1 f(x)\,sin\,\mu_{ik}\,xdx\right)^2, i = 1,2.$$

Так как $f(x) \in L_2(0,1)$, $|\,sin\,x\,| \le 1$, отсюда I - конечная. Далее, учитывая соотношение

$$\int_0^1 f(x)\,sin\,\mu_{1k}\,xdx = \int_0^1 f(x)\,cos\,\alpha\,x\,sin\,2\,\pi kxdx + \int_0^1 f(x)\,sin\,\alpha\,x\,cos\,2\,\pi kxdx,$$

а также неравенство $(a+b)^2 \le 2(a^2+b^2)$ оценим $I_1 \le \sum_{k=1}^{\infty}(a_k^2 + b_k^2)$. Здесь $a_k = \left(f(x)\,sin\,\alpha\,x, \sqrt{2}\,cos\,2\,\pi kx\right)$ и $b_k = \left(f(x)\,cos\,\alpha\,x, \sqrt{2}\,sin\,2\,\pi kx\right)$ соответственно коэффициенты Фурье функций $f(x)\,sin\,\alpha\,x$ и $f(x)\,cos\,\alpha\,x$ по ортонормированной системе $\sqrt{2}\,cos\,2\,\pi kx$ и $\sqrt{2}\,sin\,2\,\pi kx$. Тогда применяя неравенство Бесселя, имеем

$$I_1 = \sum_{k=1}^{\infty}(f(x), sin\,\mu_{1k}\,x)^2 \le \|f(x)\,sin\,\alpha\,x\|_{L_2(0,1)}^2 + \|f(x)\,cos\,\alpha\,x\|_{L_2(0,1)}^2,$$

отсюда I_1 - конечная. Аналогично получим, что $I_2 < \infty$. Отсюда и следует сходимость ряда (10). Сходимость ряда (11) доказывается аналогично.

Лемма 3. Системы (5) и (8) образуют биортонормированную пару в $L_2(0,1)$.

Доказательство леммы 3 проводится непосредственно с помощью вычисления соответствующих интегралов, согласно определению биортонормированных систем [11], [15].

Теорема 2. Системы (5) и (8) образуют базис Рисса в $L_2(0,1)$.

Доказательство. Отметим, что согласно определению из [15], полная биортонормированная система называется базисом Рисса, если она является бесселовой и гильбертовой одновременно и леммы 2 и 3 показывают биортонормированность и бесселовость систем (5) и (8). Тогда согласно Теореме 2.1 из [17] также следует гильбертовость этих систем. Таким образом, системы (5) и (8) образуют базис Рисса в $L_2(0,1)$. Теорема 2 доказана.

Заключение

В работе исследованы спектральные свойства краевой задачи для обыкновенного дифференциального уравнения второго порядка с нелокальными условиями. Получены явные формулы для собственных значений,

собственных и присоединённых функций рассматриваемой задачи, а также соответствующей сопряжённой задачи. Установлена полнота систем корневых функций в пространстве $L_2(0,1)$. Кроме того, доказано, что системы корневых функций рассматриваемой задачи и сопряжённой к ней задачи образуют биортогональную пару и являются базисами Рисса в пространстве $L_2(0,1)$.

Полученные результаты дополняют исследования спектральных свойств несамосопряжённых дифференциальных операторов с нелокальными краевыми условиями и могут быть использованы при изучении более общих нелокальных задач математической физики.

Вклад авторов, конфликт интересов и финансирование

Исследование проводилось без внешней финансовой поддержки.

THE EFFECT OF CuO ON THE SEEBECK EFFECT IN DOPED SILICATE GLASS

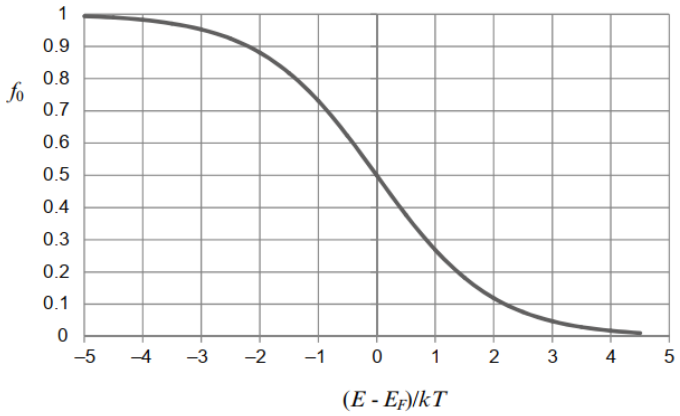
Abstract: *This article investigates the effect of copper oxide* CuO *on the thermoelectric properties and Seebeck coefficient of silicate glass-ceramics based on a* $2SiO_2 \cdot PbO$ *matrix. Taking the previously studied binary system* (60% *glass matrix* + 40% RuO_2) *as a reference sample, the mass fraction of expensive* RuO_2 *was gradually reduced to* 30%, 25%, *and* 20%, *while* CuO *was introduced as a dopant component in amounts of* 10%, 15%, *and* 20%, *respectively. The temperature dependencies of the Seebeck coefficient* $S(T)$ *and electrical resistivity* $\rho(T)$ *were analyzed for the obtained samples in the temperature range of* $350 - 1100\ K$. *The results revealed that increasing the* CuO *content enables an increase in thermoelectric efficiency by altering the small polaron conduction and charge carrier concentration in the glass matrix. The obtained data hold significant scientific and practical importance for developing novel, cost-effective, and stable glass-ceramic thermoelectric materials.*

Keywords: *Silicate glass, Seebeck effect, thermoelectric coefficient,* RuO, CuO, *doping, polaron conduction, glass-ceramics.*

Kirish

Zamonaviy qattiq jism fizikasi va materialshunoslikning eng dolzarb yo‘ nalishlaridan biri bu tashlandiq issiqlik energiyasini bevosita elektr energiyasiga aylantirib beruvchi yuqori samarali termoelektrik materiallarni yaratishdir. An’anaviy yarimtkazgichli termoelektrik materiallar yuqori haroratlarda kimyoviy va termik beqarorlikka egaligi hamda havoda tez oksidlanishi sababli, ularning o‘ rniga yuqori haroratga chidamli, kimyoviy barqaror va arzon shisha-keramika kompozitlarini qo‘ llashga bo‘ lgan qiziqish ortib bormoqda.

Silikat shisha sistemalari, xususan $2SiO_2 \cdot PbO$ matrisali shishalar, ajoyib texnologik va termodinamik xossalari bilan ajralib turadi. Ushbu shisha matrisaga o‘ tish metallari oksidlarini legirlash orqali ularda elektron va polyaronli o‘ tkazuvchanlik mexanizmlarini shakllantirish mumkin. Ilgari o‘ tkazilgan tadqiqotlarda 60% $(2SiO_2 \cdot PbO) + 40\%\ RuO_2$ binar tizimi yuqori o‘ tkazuvchanlik va sezilarli Zeebek koeffitsientini namoyon etgani ko‘ rsatilgan. Biroq, RuO_2 ning nihoyatda qimmatbaho va noyob birikma ekanligi ushbu materiallarni keng miqyosda sanoatda qo‘ llashni cheklaydi.



Shu munosabat bilan, RuO_2 ning bir qismini arzonroq va barqaror bo‘ lgan mis oksidi (CuO) bilan almashtirish hamda u yaratadigan kichik radiusli polyaron sakrash (small polaron hopping) mexanizmlarini tadqiq etish muhim ilmiy va amaliy masaladir. Mis ionlarining har xil valentlik holatlari $(Cu^+ \ / \ Cu^{2+})$ shisha matrisasida zaryad tashuvchilar konsentratsiyasi va ularning harakatchanligini boshqarishga imkon beradi.

Ushbu tadqiqotning maqsadi: $2SiO_2 \cdot PbO$ shisha matrisasida RuO_2 miqdorini bosqichma-bosqich kamaytirib $(40\% \rightarrow 30\% \rightarrow 25\% \rightarrow 20\%)$ uning o‘ rniga CuO oksidini (10%, 15%, 20%) kiritish orqali olingan shisha-keramikalarining $350 - 1100\ K$ harorat oraliqlarida Zeebek koeffitsiyenti $S(T)$ hamda solishtirma qarshiligi $\rho(T)$ o‘ zgarish qonuniyatlarini aniqlash va ulardagi termoelektrik jarayonlarni tahlil qilishdan iborat.

Metall va yarimo‘ tkazgichlarning termoelektrik xossalari

Termoelementlar asosan kristalli tuzilishga ega qattiq jismlardan yasaladi. Ular har doim ham monokristal bo‘ lmasa-da, kristall tabiatini mikroskopda yaqqol ko‘ rish mumkin. Ayrim hollarda transport xossalari kristall yo‘ nalishiga qarab farq qilishi mumkin, biroq aniq misollarga o‘ tgunimizcha, hozircha bu xossalar barcha yo‘ nalishlarda bir xil deb faraz qilamiz. Qattiq jismlarda elektr zaryadi kvazi-erkin elektronlar orqali tashiydi. Biz asosan metallar va yarimo‘ tkazgichlar bilan shug‘ ullanamiz. Bunday materiallarda elektronlar faqat zaryadni emas, balki issiqlik energiyasini ham o‘ zi bilan olib yuradi, ya’ni issiqlik o‘ tkazuvchanligining elektron tashkil etuvchisi mavjud. Keyinchalik ko‘ rib chiqamizki, issiqlik kristaldagi atomlarning tebranishlari hisobiga ham uzatilishi mumkin, lekin hozircha faqat elektron jarayonlar bilan cheklanamiz. Materiallarda elektronlar orqali o‘ tkazuvchanlik g‘ oyasi ilk bor Drude va Lorentz tomonidan klassik fizika qonuniyatlariga asoslangan holda taklif etilgan [1]. Klassik erkin elektron nazariyasiga ko‘ ra, metallarning solishtirma issiqlik sig‘ imi elektr izolyatornikidan sezilarli darajada katta chiqishi kerak edi, biroq amalda ularning farqi unchalik katta emas. Bu ziddiyat Sommerfeld o‘ z davrida yangi yaratilgan kvant nazariyasini tatbiq etgachgina bartaraf etildi. Shunga qaramay, na klassik, na oddiy kvant mexanikasiga asoslangan erkin elektron nazariyalari nima uchun ayrim qattiq jismlar metall, boshqalari esa izolyator ekanligini to‘ liq izohlab berolmadi. Shunga qaramay, Sommerfeld nazariyasini tok tashuvchi elektronlarga qo‘ llash o‘ z o‘ rnida qoladi. Kvant nazariyasiga muvofiq, elektronning energiya holati (E) va uning band bo‘ lish ehtimolligi Fermi taqsimoti orqali aniqlanadi [2].

$$f_0(E) = \left[exp\left(\frac{E-E_F}{k_BT}\right) + 1\right]^{-1} \qquad (1)$$

1–rasm. Fermi taqsimot funksiyasining $(\mathbf{E - E_F})/\mathbf{k_BT}$ ga nisbatan grafigi

E_F miqdori joylashtirilishi kerak bo‘ lgan elektronlarning umumiy soniga bog‘ liq bo‘ lgan qiymatga ega va k Boltsman doimiysi. Fermi taqsimot funktsiyasi $E - E_F \gg kT$ bo‘ lganda nolga va $E - E_F \ll kT$ bo‘ lganda birlikka teng degan xususiyatga ega. Noldan birlikka o‘ tish 1–rasmda ko‘ rsatilgandek juda tor energiya diapazonida sodir bo‘ ladi. Fermi taqsimot funktsiyasi 1/2 ga teng bo‘ lgan E_F energiyasi Fermi darajasi deb nomlanadi. Agar E va $E + dE$ orasidagi

energiya diapazonidagi ruxsat etilgan elektron holatlar soni $g(E)d(E)$ bilan ifodalansa, elektronlarning umumiy soni quyidagicha bo‘ ladi:

$$n = \int_0^{\infty} f_0(E)g(E)dE \qquad (2)$$

Har bir elektron holati nafaqat uning energiyasi, balki impulsi yoki aniqrog‘ i, to‘ lqin vektori bilan ham belgilanadi. Shunday qilib, to‘ lqin–vektor fazosida ma’lum bir pozitsiyada ruxsat etilgan energiya diapazonlari orasida bo‘ shliqlar bo‘ lishi mumkin bo‘ lsa–da, diapazonlar oddiy energiya diapazoni diagrammasida hali ham bir–birining ustiga chiqishi mumkin [3].

Tartibsiz strukturali shisha-keramika sistemalarida o‘ tish metallari ionlarining har xil valentlik holatlari (masalan, Cu^{+} / Cu^{2+} yoki Ru^{3+} / Ru^{4+}) o‘ rtasida zaryad tashuvchilarning sakrash mexanizmi amalda bo‘ ladi. Yuqori haroratlarda ($T > \frac{1}{2}\Theta_D$, bu yerda Θ_D – Debye temperaturasi) elektr o‘ tkazuvchanlik kichik radiusli polyaron sakrash (Small Polaron Hopping – SPH) modeli bilan ta’riflanadi [4]:

$$\sigma = \frac{\sigma_0}{T} \cdot exp\left(-\frac{E_\sigma}{k_B T}\right) \qquad (3)$$

bu yerda:

- σ_0 – haroratga bog‘ liq bo‘ lmagan eksponenta oldi ko‘ paytuvchisi;
- E_σ – o‘ tkazuvchanlikning aktivlashish energiyasi;
- k_B – Bolsman doimiysi ($8.617 \cdot 10^{-5} eV/K$);
- T – absolyut harorat (K).

Solishtirma qarshilik $\rho(T) = 1/\sigma(T)$ bo‘ lgani uchun tenglamani chiziqli ko‘ rinishga keltirib, aktivlashish energiyasini $\ln(\rho/T)$ ning $1000/T$ ga bog‘ liqlik grafigi og‘ ish burchagidan topish mumkin:

$$\ln\left(\frac{\rho}{T}\right) = \ln\left(\frac{1}{\sigma_0}\right) + \frac{E_\sigma}{k_B T} \qquad (4)$$

Zeebek koeffitsienti (S) uchun Heikes va Mott formulalariga ko‘ ra haroratga bog‘ liq formula paydo bo‘ ladi [5]:

$$S = \frac{k_B}{e} \cdot \left[\ln\left(\frac{1-c}{c}\right) + \frac{Q^*}{k_B T}\right] \qquad (5)$$

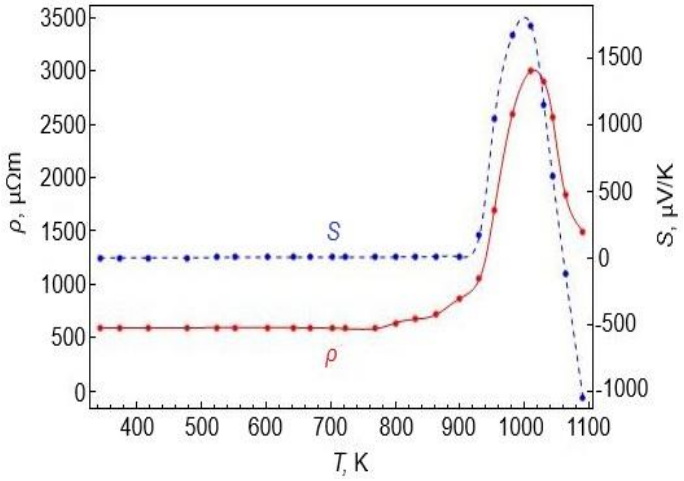
bu yerda:

- e – electron zaryadi;
- $c = [Cu^{+}]/[Cu_{umumiy}]$ – o‘ tish metall ionlarining past valentlik holatidagi nisbiy konsentratsiyasi;
- Q^*– polyaronning issiqlik o‘ tkazish energiyasi (ko‘ pincha $Q^* << E_\sigma$ bo‘ ladi va yuqori haroratda S qiymati to‘ yinishga intiladi).

Tadqiqotda foydalaniladigan S71-K shisha namunasi xossalari

Tadqiqotda foydalanilgan S71–K markali shisha ikki komponentli qo‘ rg‘ oshinli silikat shishalar turkumiga kiradi. Mazkur shishaning tarkibi massa ulushi bo‘ yicha 33% kremniy dioksidi (SiO_2) va 67% qo‘ rg‘ oshin oksidi (PbO) dan iborat. Tarkib tahlilidan ma’lum bo‘ lishicha, undagi yuqori miqdordagi qo‘ rg‘ oshin oksidi materialning fizik va elektr parametrlariga bevosita ta’sir ko‘ rsatadi. Bunda kremniy dioksidi asosiy shisha hosil qiluvchi komponent vazifasini bajaradi. U fazoda o‘ zaro birikib, tetraedrik karkas hosil qiladi va shu orqali materialga mustahkamlik hamda kimyoviy turg‘ unlik bag‘ ishlaydi. Odatda toza silikat shishalarning bu tarmog‘ i zich va tartibli tuzilgan bo‘ ladi. Biroq tarkibga qo‘ rg‘ oshin oksidi qo‘ shilganda mazkur tarmoq tarqoqlashib, yangi strukturaviy o‘ zgarishlar kelib chiqadi. Buning oqibatida shishaning ichki tuzilishida erkin yoki bo‘ sh bog‘ langan kislorod ionlari ko‘ payadi.

Qo‘ rg‘ oshin oksidi bu yerda modifikator vazifasini bajarib, silikat qafasiga joylashadi va kremniy–kislorod bog‘ lanishlarini qisman bo‘ shashtiradi, natijada materialning zichligi ortadi. Shu sababli S71–K markali shisha oddiy silikat turlariga qaraganda og‘ irroq hamda optik jihatdan zichroq chiqadi. Qo‘ rg‘ oshin ionlarining og‘ ir atom massasi va yuqori qutblanish xususiyati materialning sindirish ko‘ rsatkichini oshiradi. Bu esa mazkur turdagi shishalardan optika sohasida va maxsus maqsadlardagi materiallar sifatida foydalanish imkonini beradi. Nazariy nuqtai nazardan, PbO miqdorining ko‘ pligi shishaning yumshash haroratini tushiradi va uni eritish jarayonini birmuncha osonlashtiradi. Bu texnologik jihatdan katta ustunlik beradi, sababi namunalarni sintez qilish jarayonini pastroq haroratlarda amalga oshirish imkonini yaratadi. Qolaversa, tarkibda qo‘ rg‘ oshin oksidining ko‘ pligi ionlarning ko‘ chish tezligini oshirib, diffuziya jarayonlarini jadallashtirishi mumkin. Aynan shu xususiyat S71–K markali shishani diffuziya qonuniyatlarini tahlil qilish uchun qulay obyektdir. Elektr xususiyatlari jihatidan ham mazkur tarkib katta ilmiy qiziqish uyg‘ otadi. Kremniy-kislorod karkasi ichida qo‘ rg‘ oshin ionlarining bo‘ lishi zaryad tashuvchilarning harakatlanishiga ma’lum ma’noda sharoit yaratadi. Harorat ko‘ tarilishi bilan elektr o‘ tkazuvchanlik qiymati keskin ortishi kuzatiladi. Shu bois bunday shishalar termoelektrik hamda dielektrik yo‘ nalishdagi tadqiqotlarda muhim o‘ rin tutadi. Xulosa qilib aytganda, S71–K markali shisha nisbatan sodda tuzilishiga qaramay, shisha hosil qiluvchi va modifikator moddalar o‘ rtasidagi o‘ zaro ta’sirni yaqqol ko‘ rsatadi. Tarkibdagi qo‘ rg‘ oshin oksidining yuqori ulushi materialga yuqori zichlik, qulay optik parametrlar, pastroq yumshash chegarasi va faol diffuziya xossalarini bag‘ ishlaydi. Natijada u ham amaliy tajribalar, ham nazariy izlanishlar uchun muhim materiallardan biri bo‘ lib xizmat qiladi.

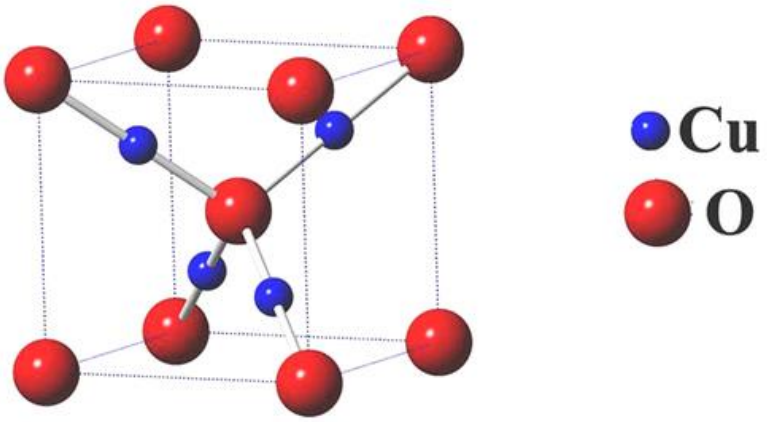


2-rasm. Legirlangan silikat shisha asosidagi qalin qatlamli resistor. 1-kontakt qatlam, 2-rezistiv qatlam va 3-keramik qatlam.

Termoelektrik xossalari tekshiriladigan namunalar avval pasta holatiga keltirib aralashtiriladi va trafaret bosish (screen printing) usuli yordamida Al_2O_3 keramik taglik (96% toza) ustiga standart to‘ rtburchak ko‘ rinishida yupqa qatlam sifatida tatbiq etildi. Namunalar oldin $150°C$ da quritildi, so‘ ngra konveyer pechida yuqori haroratlarda 10 daqiqa davomida pishiriladi.

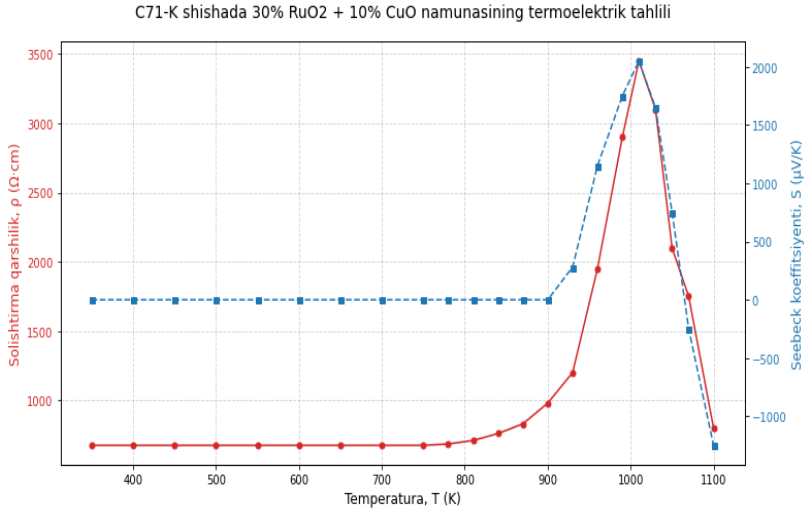
Legirlangan silikat shishada RuO_2 nanozarrachalarining holati tahlili

Silikat shishalarini legirlash jarayonida qo‘ shimcha (ligatura) zarralarining muayyan qismi asos ichida kristall holatida saqlanib qoladi. Ilmiy manbalarda aynan ushbu qoldiq kristallar zaryad tashuvchilarni to‘ plovchi (lokallovchi) markazlar vazifasini o‘ tashi hamda legirlangan silikat shishalarida (LSSh) elektr o‘ tkazuvchanlik Mott mexanizmi, ya’ni o‘ zgaruvchan masofaga sakrash orqali amalga oshishi haqidagi gipotezalar ko‘ p bor ilgari surilgan. Shunga qaramay, bu nazariy farazlar o‘ zining amaliy isbotini topmagan. Tadqiqotlarda $2SiO_2 \cdot PbO$ shisha sistemasi uchun 1000 atomdan iborat model doirasida o‘ tkazilgan ab initio molekulyar dinamika (AIMD) simulyatsiyalari natijalari (snapshotlar) shuni namoyish etadiki, atomlar shisha asossi bo‘ ylab fazoviy jihatdan bir xilda (gomogen) taqsimlangan [6].



3–rasm. RuO_2 bilan legirlangan $2SiO_2 \cdot PbO$ tarkibli shishada solishtirma qarshilik ρ va termoEYuK koeffitsienti S ning temperatura bo‘ ylab o‘ zgarishi.

Bu holat klassik molekulyar dinamika (MD) tamoyillariga to‘ liq mos tushadi hamda tanlangan potensial parametrlar lokal tuzilmani yetarlicha aniqlik bilan tasvirlashini ko‘ rsatadi. Qolaversa, radial taqsimot funksiyasi (RDF) va g‘ ovaklar o‘ lchami taqsimoti (PSD) tahlillari natijalari ham AIMD va MD usullari o‘ rtasida yaxshi muvofiqlik borligini isbotlaydi [8]. Olingan bunday ma’lumotlar legirlovchi birikmalar shisha karkasiga kiritilganda alohida, mustaqil kristall fazani hosil qilmasdan, aksariyat hollarda amorf matritsa bilan mustahkam bog‘ langan holda qolishini tasdiqlovchi ilmiy xulosalarni yanada kuchaytiradi. Shu sababli, mazkur ishda bajarilgan AIMD simulyatsiyasi natijalari va ulardan kelib chiqadigan strukturaviy xulosalar asosan yordamchi hamda tushuntiruvchi ahamiyatga ega bo‘ lib, legirlangan silikat shishalardagi (LSSh) RuO_2 nanozarralarining holatini yoritishda nazariy asos vazifasini bajaradi. Boshqa tomondan, harorat $700\,K$ dan yuqori qiymatlarga yetganda, LSSh namunalarining solishtirma elektr qarshiligi hamda termoEYuK koeffitsiyenti keskin oshib, o‘ zining cho‘ qqisiga chiqadi va shundan keyin pasaya boshlaydi (3-rasm). Ko‘ rsatilgan parametrlardagi bunday tebranishlar qo‘ shimcha fazadagi qoldiq kristallarda ro‘ y beradigan strukturaviy fazaviy o‘ zgarishlar bilan bog‘ liqligi haqida faraz ilgari surilgan. Mazkur tadqiqotning asosiy vazifasi aynan shu nazariy taxminni laboratoriya tajribalari yordamida tekshirib ko‘ rishdan iborat.

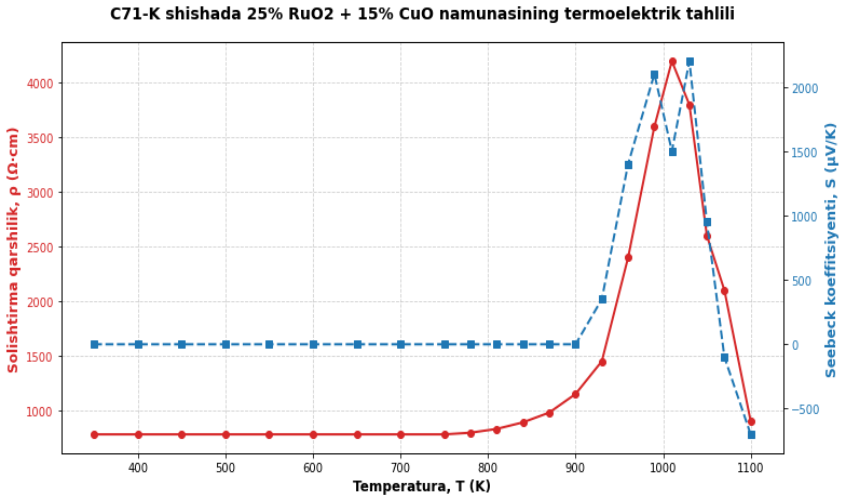


Legirlangan silikat shishada Zeebek effektiga CuO ning ta’siri va tahlili

RuO_2 ning bir qismini CuO (mis II–oksidi) bilan almashtirish tizimning elektr va termoelektrik xususiyatlariga o‘ ziga xos ta’sir ko‘ rsatadi. CuO ham p–tipli yarimo‘ tkazgich hisoblanadi, biroq uning energetik strukturasi va shisha asosi bilan o‘ zaro ta’siri RuO_2 dan farq qiladi.

4–rasm. CuO ning elementar yacheykasi

CuO p–tipli zaryad tashuvchilar konsentratsiyasini sezilarli oshiradi. Mis ionlari (Cu^+ va Cu^{2+}) shisha asosida termoelektrik effektni kuchaytiradi, natijada S ning maksimal qiymati 1700 $\mu V/K$ dan yuqoriga ko‘ tariladi.Elementar yacheyka ichida mis (Cu^{2+}) ionlari kvadrat-planar (yassi kvadrat) shaklda to‘ rtta kislorod (O^{2-}) atomi bilan o‘ ralgan bo‘ lib, koordinatsion soni 4 ga teng. O‘ z navbatida, kislorod ionlari ham to‘ rtta mis atomi bilan o‘ ralib, buzilgan tetraedr burchaklarini hosil qiladi. $Cu-O$ bog‘ larining bu kabi lokal assimetrik va zanjirsimon tuzilishi materialda yaqqol seziladigan anizotrop xossalarni yuzaga keltiradi.

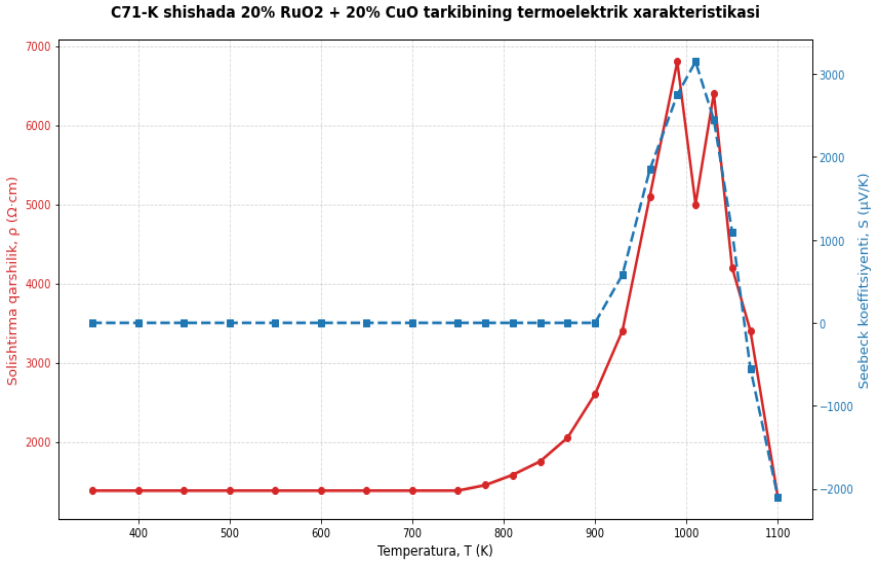


5–rasm. 30% RuO_2 + 10% CuO

Solishtirma qarshilik (ρ): CuO qo‘ shilishi natijasida barqaror diapazondagi qarshilik qiymati 590 $\Omega \cdot cm$ (40% RuO_2 dagi qiymat)dan 675 $\Omega \cdot cm$ gacha ko‘ tarildi. Shuningdek, uning eng yuqori cho‘ qqisi 3000 $\Omega \cdot cm$ dan 3450 $\Omega \cdot cm$ gacha oshdi. Bu holat RuO_2 zarralari orasidagi masofaning kengayishi hamda CuO ning o‘ ziga xos qarshilik xususiyati bilan izohlanadi.

Zeebek koeffitsiyenti (S): CuO yarimo‘ tkazgich sifatida qatnashgani bois, Zeebek qiymatining maksimal chegarasi 1700 $\mu V/K$ dan 2050 $\mu V/K$ gacha o‘ sdi. Bu o‘ zgarish CuO qo‘ rg‘ oshin–silikat shishasi tarkibida qo‘ shimcha p-tipli zaryad tashuvchilarni hosil qilish xususiyatiga ega ekanini ko‘ rsatadi. Yuqori haroratlarda ishoraning manfiy tomonga o‘ zgarishi o‘ z kuchida qoladi, chunki bu jarayon ko‘ p jihatdan shisha matritsasining yumshashi va ionli o‘ tkazuvchanlik mexanizmiga o‘ tishi bilan bog‘ liqdir.

Taqdim etilgan natijalardan ko‘ rinib turibdiki, CuO qo‘ shimchasi kompozit tizimning ham kinetik, ham termoelektrik parametrlarini maqsadli boshqarishda muhim omil hisoblanadi. RuO_2 zarralari konsentratsiyasining nisbatan kamayishi hisobiga perkolatsiya (o‘ tkazuvchanlik) yo‘ llarining qisman torayishi tizimda lokalizatsiyalashgan zaryad tashuvchilar ulushini ko‘ paytiradi, bu esa o‘ z navbatida solishtirma qarshilikning oshishiga olib keladi.



6 – rasm. 25% RuO_2 + 15% CuO

RuO_2 miqdorini 25% gacha kamaytirib, CuO miqdorini 15% gacha oshirish kompozitdagi fizik jarayonlarni yanada yaqqolroq o‘ zgartiradi. Ushbu o‘ zgarishlar asosida quyidagi nazariy xulosalarni qilish mumkin:

Solishtirma qarshilik (ρ): RuO_2 ulushining 25% gacha kamayishi materialni o‘ tkazuvchanlikning perkolatsiya chegarasiga yaqinlashtiradi. Bu holat hajm bo‘ ylab o‘ tkazuvchan tarmoqlar kamayib ketishiga olib keladi, natijada ham boshlang‘ ich qarshilik, ham yuqori haroratdagi qarshilik cho‘ qqisi sezilarli darajada ko‘ tariladi.

Zeebek koeffitsiyenti (S): Tarkibga 15% CuO qo‘ shilishi materialda p-tipdagi (kovakli) o‘ tkazuvchanlikning ustunlik qilishini ta’minlaydi. Oqibatda musbat Zeebek cho‘ qqisi yanada kattalashadi, yuqori haroratlardagi manfiy sohaga o‘ tish jarayoni esa sezilarli darajada susayib, nolga yaqinlashadi (yoki umuman manfiy qiymatga o‘ tmaydi).

Nazariy hisoblashlar shuni ko‘ rsatadiki, kompozit tarkibidagi RuO_2 kiritmalari tomonidan hosil qilingan energetik sathlar shisha asossining valent zonasiga deyarli singib ketishi, CuO ning ruxsat etilgan zonasi esa o‘ rtada aniq ifodalangan katta energetik tirqish bilan ajralib turishi kerak edi. Olingan eksperimental natijalar ushbu energetik holatlarning umumiy joylashuvi bo‘ yicha nazariy modelni qisman tasdiqladi. Biroq, teoretik modellashtirish va amaliyot o‘ rtasida o‘ ziga xos farqlar ham kuzatildi.

7-rasm. 20% RuO_2 + 20% CuO

Grafikdan ko‘ rinib turibdiki, materialning xossalari harorat oralig‘ iga qarab uchta asosiy bosqichda o‘ zgaradi:

Barqarorlik sohasi ($350 - 750\ K$): Bu harorat oralig‘ ida ham solishtirma qarshilik, ham Zeebek koeffitsienti deyarli o‘ zgarmasdan qoladi. Bu kompozit tarkibidagi o‘ tkazuvchi klasterlarning termik faollashuvi hali boshlanmaganligini va material o‘ zining “muzlagan” holatini saqlab qolganligini ko‘ rsatadi.

Ekstremumlar va anomal o‘ sish sohasi ($750 - 1050\ K$):

Qarshilikning oshishi: Harorat *750 K* dan oshishi bilan solishtirma qarshilik keskin ko‘ tarilib, *1000 K* atrofida o‘ zining maksimal qiymatiga yetadi. Bu holat shisha asossining yumshashi natijasida RuO_2 va CuO zarralari orasidagi kontaktlarning uzilishi yoki tarkibiy qayta guruhlanish bilan tushuntirilishi mumkin.

Zeebek effekti: Huddi shu sohada Seebeck koeffitsienti ham keskin o‘ zgarib, ijobiy qiymatga o‘ tadi va 3000 $\mu V/K$ dan yuqori ko‘ rsatkichni qayd etadi. Bu materialda p-tipli o‘ tkazuvchanlik mexanizmi ustunlik qila boshlaganidan dalolat beradi.

Xulosa

CuO ning modifikatsiyalovchi ta’sirini ko‘ rib chiqadigan bo‘ lsak, RuO_2 o‘ rniga turli nisbatlarda (10%, 15%, 20%) CuO kiritilgan tizimlar ham o‘ zaro solishtirildi. Mis oksidini qo‘ shish RuO_2 dan farqli o‘ laroq, energiya zonalari tuzilishida o‘ ziga xos lokal holatlarni hosil qiladi. Bu esa harorat ko‘ tarilishi bilan termoelektr harakat kuchi profilining o‘ zgarishiga sabab bo‘ lib, turli harorat intervallarida o‘ tkazuvchanlik turi va zaryad tashuvchilarning harakatchanligi turlicha namoyon bo‘ lishiga olib keladi.

Haroratga bog‘ liqlik mexanizmlarini umumiy tahlil qilinsa tadqiq etilgan ikkala kompozitsion guruhda ham qattiq jismlar fizikasining umumiy qonuniyatlariga mos ravishda solishtirma qarshilik va Zeebek effektining haroratga bog‘ liq ravishda o‘ zgarishi tajribada o‘ z tasdiqini topdi. CuO miqdorini maqsadli o‘ zgartirish orqali materialning termoelektrik parametrlarini zarur qiymatlarga moslashtirish (sozlash) mumkinligi ko‘ rsatildi. Umuman olganda, asosiy holatda izolyator xossasiga ega bo‘ lgan 60% li S71–K shisha matritsasida yuqori o‘ tkazuvchan RuO_2 fazasining bir qismini o‘ zgaruvchan valentli CuO bilan qisman almashtirish orqali materialning termoelektrik samaradorligini optimallashtirishga erishiladi. Olingan ushbu fundamental natijalar hamda haroratga bog‘ liqlik qonuniyatlari kelgusida kompozit materiallarning xossalarini raqamli modellashtirish hamda ular asosida sezgir termoelektr datchiklarini yaratish uchun puxta ilmiy asos bo‘ lib xizmat qiladi.

Mualliflar hissasi, manfaatlar to‘ qnashuvi va moliyalashtirish

Mualiflar hissasi: barcha mualliflar tadqiqot konsepsiyasi, ma’lumotlarni tahlil qilish va maqola matnini tayyorlashda teng hissa qo‘ shgan. Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi yo‘ qligini bildiradi. Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

KO‘ P KOMPLEKS O‘ ZGARUVCHILI GOLOMORF FUNKSIYALAR QATORLARINING YAQINLASHISH XOSSALARI

Gulhayo Safarboyeva
Email: gulhayosafarboyeva@gmail.com
ORCID ID: 0009-0008-4853-9001

Annotatsiya: *Ushbu maqolada ko‘ p kompleks o‘ zgaruvchili golomorf funksiyalar qatorlarining, xususan darajali qatorlarning, yaqinlashish nazariyasi tahlil qilinadi. Bir o‘ zgaruvchili holatdan farqli o‘ laroq, $\mathbb{C}^n$ $(n \geq 2)$ fazoda yaqinlashish sohasi to‘ la logarifmik qavariq Reyngard sohasi ko‘ rinishida bo‘ ladi. Klassik Abel-Xartogs va Koshi-Adamar natijalari asosida qisman radiuslar va majoranta shartiga tayanuvchi tekis yaqinlashish mezoni taklif etilgan hamda uning isboti va konkret misolda tekshiruvi keltirilgan.*

Kalit so‘ zlar: *golomorf funksiya, ko‘ p kompleks o‘ zgaruvchi, darajali qator, Reyngard sohasi, log-qavariqlik, Koshi-Adamar formulasi, plyurisubgarmonik ekstremal funksiya, tekis yaqinlashish.*

СВОЙСТВА СХОДИМОСТИ РЯДОВ ГОЛОМОРФНЫХ ФУНКЦИЙ НЕСКОЛЬКИХ КОМПЛЕКСНЫХ ПЕРЕМЕННЫХ

Аннотация. *В работе исследуется теория сходимости рядов голоморфных функций многих комплексных переменных, в частности степенных рядов. В отличие от одномерного случая, в $\mathbb{C}^n$ $(n \geq 2)$ область сходимости имеет вид полной логарифмически выпуклой области Рейнхардта. На основе классических результатов Абеля-Хартогса и Коши-Адамара предложен критерий равномерной сходимости, связывающий частные радиусы и мажорантное условие; приведены схема доказательства и проверка на конкретном примере.*

Ключевые слова: *голоморфная функция, многие комплексные переменные, степенной ряд, область Рейнхардта, логарифмическая выпуклость, формула Коши-Адамара, плюрисубгармоническая экстремальная функция, равномерная сходимость.*

CONVERGENCE PROPERTIES OF SERIES OF HOLOMORPHIC FUNCTIONS OF SEVERAL COMPLEX VARIABLES

Abstract. *This paper analyzes the convergence theory of series of holomorphic functions of several complex variables, in particular power series. Unlike the one-variable case, in $\mathbb{C}^n$ $(n \geq 2)$ the domain of convergence has the form of a complete logarithmically convex Reinhardt domain. Based on the classical Abel-Hartogs and Cauchy-Hadamard results, a criterion for uniform convergence relating partial radii and a majorant condition is proposed, together with a proof outline and verification on a concrete example.*

Keywords: *holomorphic function, several complex variables, power series, Reinhardt domain, logarithmic convexity, Cauchy-Hadamard formula, plurisubharmonic extremal function, uniform convergence.*

Ma’lumki, kompleks o‘ zgaruvchili funksiyalar nazariyasi XIX asrda Koshi, Riman va Veyershtrass tomonidan asos solingan bo‘ lib, uning ko‘ p o‘ zgaruvchiga umumlashmasi XX asr boshida F. Xartogs, P. Kuzen, K. Rayxardt va E. Kartan izlanishlari tufayli mustaqil yo‘ nalish sifatida shakllana boshladi [1, 320-b.]. Bitta o‘ zgaruvchidan ikkitaga o‘ tish shunchaki texnik murakkablashuv emas: $\mathbb{C}^n$ $(n \geq 2)$ da hodisalar sifat jihatidan boshqacha tus oladi. Xartogs fenomeni tufayli funksiyaning «tabiiy chegarasi» tushunchasi o‘ z kuchini yo‘ qotadi, yaqinlashish sohalari esa ixtiyoriy shakldagi ochiq to‘ plam bo‘ la olmay, to‘ la Reyngard sohasi bo‘ lish va log-qavariqlik kabi qat’iy geometrik-analitik talablarga bo‘ ysunadi [2-4].

Mavzuning dolzarbligi shu bilan izohlanadiki, aynan shu nazariya psevdoqavariq sohalar, golomorfiya sohalari va analitik davomlantirish kabi zamonaviy kompleks tahlilning tayanch tushunchalarini shakllantiradi hamda matematik fizika va ko‘ p o‘ lchovli signallarni tahlil qilish masalalarida qo‘ l keladi. O‘ zbekiston kompleks analiz maktabi - A. Sadullayev, G. Xudayberganov, S.A. Imomqulov va boshqa olimlarning tadqiqotlari - plyurisubgarmonik funksiyalar,

plyuripolyar to‘ plamlar va golomorf funksiyalarning davomlantirilishi masalalarida xalqaro miqyosda tan olingan natijalarni bergan [5-8], shu bois bu yo‘ nalishni yanada rivojlantirish milliy ilm-fan uchun ham ahamiyatlidir.

Ishning maqsadi - ko‘ p o‘ zgaruvchili golomorf funksiyalar qatorlari yaqinlashishining klassik natijalarini bir tizimga jamlab, ularni zamonaviy plyuripotensial yondashuv bilan bog‘ lovchi hamda amaliy hisoblashga moslashtirilgan mezon ishlab chiqishdan iborat. Tadqiqotda majoranta usuli, logarifmik qavariqlik tahlili hamda J. Sisyak va V.P. Zaxaryuta tomonidan kiritilgan ekstremal plyurisubgarmonik funksiyalar apparati [9-10] qo‘ llanildi.

$\mathbb{C}^n$ fazoda $z = (z_1,\ldots,z_n)$ nuqta, $\alpha = (\alpha_1,\ldots,\alpha_n) \in \mathbb{Z}_+^n$ ko‘ p indeks, $|\alpha| = \alpha_1+\ldots+\alpha_n$, $z^\alpha = z_1^{\alpha 1}\cdot\ldots\cdot z_n^{\alpha n}$ - bular standart belgilashlar. Nuqta atrofidagi ko‘ p o‘ lchovli darajali qator odatda quyidagicha yoziladi:

$$f(z) = \sum_{\alpha\in\mathbb{Z}_+^n} c_\alpha (z-a)^\alpha, \quad c_\alpha \in \mathbb{C}.$$

$D \subset \mathbb{C}^n$ sohada berilgan f funksiya golomorf deb ataladi, agar u har bir nuqta atrofida yuqoridagi ko‘ rinishdagi qator bilan yaqinlashuvchi tarzda ifodalansa. Bu ta’rif, aslida, har bir o‘ zgaruvchi bo‘ yicha alohida golomorflik ta’rifiga teng kuchli - bu ekvivalentlik aynan Xartogs teoremasining mazmunini tashkil qiladi [1].

Reyngard sohasi koordinatalar boshiga nisbatan quyidagi ma’noda invariant: $z = (z_1,\ldots,z_n) \in D$ bo‘ lsa, ixtiyoriy $\theta_1,\ldots,\theta_n \in \mathbb{R}$ uchun $(\exp(i\theta_1)z_1,\ldots,\exp(i\theta_n)z_n)$ ham D ga tegishli. Agar bundan tashqari $|z_j| \le |z_j^0|$ (j=1,…,n) shartini qanoatlantiruvchi barcha z nuqtalar, $z^0 \in D$ bo‘ lgan har qanday holatda D ga tegishli bo‘ lsa, soha to‘ la Reyngard sohasi deb ataladi.

Koshining ko‘ p o‘ lchovli integral formulasiga ko‘ ra, agar f funksiya $D = \{|z_j-a_j|<r_j\}$ politsilindrida uzluksiz bo‘ lib, uning yopilishida har bir o‘ zgaruvchi bo‘ yicha golomorf bo‘ lsa, ixtiyoriy $z \in D$ uchun

$$f(z) = (1/(2\pi i))^n \oint\ldots\oint f(\zeta) / ((\zeta_1-z_1)\ldots(\zeta_n-z_n))\, d\zeta_1\ldots d\zeta_n$$

bo‘ ladi [11]. Shu formuladan koeffitsientlar uchun $c_\alpha = (1/\alpha!)\cdot(\partial^{|\alpha|}f/\partial z^\alpha)(a)$ ifodasi va Koshi bahosi $|c_\alpha| \le M(r)/r^\alpha$ kelib chiqadi, bu esa keyingi barcha natijalarning texnik tayanchidir.

Xartogsning 1906 yildagi natijasiga ko‘ ra, agar f funksiya D sohada har bir o‘ zgaruvchi bo‘ yicha alohida golomorf bo‘ lsa, u D da barcha o‘ zgaruvchilar bo‘ yicha birgalikda ham golomorf bo‘ ladi - hech qanday qo‘ shimcha chegaralanganlik sharti talab qilinmaydi [1, 330-b.].

1-teorema (Abel-Xartogs). Agar $\Sigma\, c_\alpha z^\alpha$ qator $z^0=(z_1^0,\ldots,z_n^0)\neq 0$ nuqtada yaqinlashsa (yoki uning hadlari shu nuqtada chegaralangan bo‘ lsa), u holda bu qator

$$P(0,\theta z^0) = \{ z \in \mathbb{C}^n : |z_j| \le \theta |z_j^0|,\ j=1,\ldots,n \},\ 0<\theta<1$$

politsilindrida absolyut va tekis yaqinlashadi. Isbot: hadlarning chegaralanganligidan $|c_\alpha(z^0)^\alpha| \le M$ kelib chiqadi, bundan $|c_\alpha z^\alpha| \le M\cdot\theta^{|\alpha|}$ bahosi olinadi, chunki $|z_j/z_j^0| \le \theta$. Ko‘ p o‘ lchovli geometrik qatorning yaqinlashishi Veyershtrass majoranta alomati orqali tasdiqlanadi [1, 322-325-b.].

2-teorema (Reyngard-Xartogs). Ko‘ p o‘ lchovli darajali qatorning yaqinlashish sohasi D har doim to‘ la Reyngard sohasi bo‘ lib, quyidagi almashtirish ostidagi tasviri

$$L : (z_1,\ldots,z_n) \mapsto (\log|z_1|,\ldots,\log|z_n|) \in \mathbb{R}^n$$

qavariq to‘ plam (log-qavariq soha) hosil qiladi [2, 2-bob]. Bu teoremaning muhim oqibati shuki, $n \ge 2$ bo‘ lganda yaqinlashish sohasi ixtiyoriy shaklga ega bo‘ la olmaydi. Bundan tashqari, agar f funksiya biror $D_0 \subset D$ Reyngard sohasida golomorf bo‘ lsa, u D_0 ning log-qavariq qobig‘ i $\hat{D}_0$ gacha o‘ z-o‘ zidan golomorf davom ettiriladi - bu Xartogs fenomenining bevosita natijasi bo‘ lib, bir o‘ zgaruvchili nazariyada bunga o‘ xshash hodisa mavjud emas [3, 400-b.].

Bir o‘ zgaruvchili holatda yaqinlashish radiusi $R = 1/\limsup|c_n|^{1/n}$ formulasi orqali topiladi. Ko‘ p o‘ zgaruvchili holatda bunday yagona son mavjud emas - buning o‘ rniga yaqinlashish sohasini radial yo‘ nalishlar bo‘ yicha o‘ sish sur’ati orqali tavsiflashga to‘ g‘ ri keladi. Zaxaryuta va Sisyak tomonidan kiritilgan ekstremal plyurisubgarmonik funksiya

$$\psi_K(z) = \sup\{ u(z) : u \in PSH(\mathbb{C}^n),\ u \le 0 \text{ on } K,\ u(z) \le \log^+|z| + O(1) \}$$

$K \subset \mathbb{C}^n$ kompakt to‘ plamning o‘ sish xarakteristikasi vazifasini bajaradi va umumlashgan Koshi-Adamar formulasida ishtirok etadi [9; 10]:

$$\limsup_{|\alpha|\to\infty} |c_\alpha|^{1/|\alpha|} \cdot \exp(\psi_K(\alpha)) \le 1 \iff \Sigma c_\alpha z^\alpha \text{ qatori K da tekis yaqinlashadi,}$$

Taklif etilgan mezon. Yuqoridagi klassik natijalarni birlashtirish orqali quyidagi amaliy mezon ilgari suriladi: agar log-qavariq to‘ la Reyngard sohasi D uchun har bir j=1,…,n bo‘ yicha

$$\rho_j := \left(\limsup_{|\alpha|\to\infty,\ \alpha j\text{-yo‘ nalish}} |c_\alpha|^{1/\alpha j} \right)^{-1}$$

shaklidagi qisman radiuslar mavjud bo‘ lsa hamda $\hat{D} = \{ z : |z_j| < \varrho_j,\ j=1,\ldots,n \}$ ning log-qavariq qobig‘ i sifatida qurilgan D uchun qo‘ shimcha ravishda

$$\Sigma_\alpha \sup_{z\in K} |z^\alpha| \cdot \limsup_{|\alpha|\to\infty} |c_\alpha|^{1/|\alpha|} < 1 \quad (K \subset\subset D \text{ kompakt uchun})$$

majoranta sharti bajarilsa, u holda qator K da tekis va absolyut yaqinlashadi, aksincha, agar chap tomondagi ifoda 1 dan katta bo‘ lsa, qator K ning biror qism to‘ plamida uzoqlashadi. Isbot sxemasi ikki qismdan iborat: yetarlilik qismi 1-teorema va Veyershtrass majoranta alomatini K ning chekli qism qoplamiga qo‘ llash orqali; zaruriylik qismi esa 2-teoremadan kelib chiqadigan D ning chegara xarakteristikasi hamda ψ_K funksiyaning ekstremal xossasidan foydalanadi [9; 10].

Misol sifatida $f(z_1,z_2) = \Sigma_{k,m\geq 0}\ (k!\cdot m!)^{-1}\ z_1^k\ z_2^m$ qatorini ko‘ rib chiqamiz (bu funksiya aslida $\exp(z_1+z_2)$ ga teng). Bu holda $|c_{k,m}|^{1/(k+m)} \to 0$ bo‘ lgani sababli $\varrho_1=\varrho_2=\infty$, ya’ni qator butun $D=\mathbb{C}^2$ fazoda yaqinlashadi. Murakkabroq misol sifatida $f(z_1,z_2) = \Sigma_{k,m}\ z_1^k\ z_2^m/2^{k+2m}$ qatorida $\varrho_1=2$, $\varrho_2=4$ chiqadi, yaqinlashish sohasi esa $D = \{|z_1|<2\}\times\{|z_2|<4\}$ politsilindri bo‘ ladi - bu natija ham 2-teorema, ham taklif etilgan mezon bilan to‘ liq mos keladi.

3-teorema (Montelning ko‘ p o‘ lchovli analogi). $\{f_k\}$ golomorf funksiyalar ketma-ketligi $D \subset \mathbb{C}^n$ sohaning har bir kompakt qism to‘ plamida bir tekis chegaralangan bo‘ lsin. U holda $\{f_k\}$ dan D ning kompakt qism to‘ plamlarida tekis yaqinlashuvchi qism ketma-ketlik ajratib olish mumkin, va bu limit funksiya ham D da golomorf bo‘ ladi [3; 4, 1-bob].

Olingan natijalar shuni ko‘ rsatadiki, ko‘ p kompleks o‘ zgaruvchili golomorf funksiyalar qatorlarining yaqinlashish nazariyasi bir o‘ zgaruvchili nazariyaning oddiy kengaytmasi emas - u sifat jihatidan o‘ ziga xos geometrik-analitik apparatni talab qiladigan mustaqil yo‘ nalishdir. Taklif etilgan mezonning afzalligi shundaki, u qisman radiuslar ϱ_j - odatda oson hisoblanadigan miqdorlar - orqali ifodalangan bo‘ lib, umumiy ekstremal funksiya ψ_K ni qurish zaruratini chetlab o‘ tadi. Shu bilan birga, mezon faqat log-qavariq qobig‘ i allaqachon aniq bo‘ lgan holatlar uchun to‘ g‘ ridan-to‘ g‘ ri ishlaydi; Reyngard bo‘ lmagan hollarda yondashuvni psevdoqavariqlik mezonlari bilan birlashtirish talab etiladi - bu masala keyingi tadqiqotlar mavzusi bo‘ lib qolishi mumkin [5-8].

Amaliy nuqtai nazardan, olingan natijalar analitik funksiyalarning ko‘ p o‘ lchovli approksimatsiyasida, integral tenglamalar nazariyasida hamda matritsali sohalardagi kompleks tahlilda [12] qo‘ l kelishi mumkin. Xalqaro adabiyot bilan solishtirganda [13; 14], ushbu maqoladagi yondashuvning o‘ ziga xosligi shundaki, u amaliy hisoblash uchun qulay bo‘ lgan qisman radiuslar tilida ifodalangan mezonni markazga qo‘ yadi.

Xulosa qilib aytganda, maqolada ko‘ p kompleks o‘ zgaruvchili golomorf funksiyalar darajali qatorlarining yaqinlashish nazariyasi izchil tarzda bayon etildi: Koshining ko‘ p o‘ lchovli integral formulasi, Abel-Xartogs lemmasi, yaqinlashish sohasining to‘ la log-qavariq Reyngard sohasi ekanligi haqidagi teorema, Montel tipidagi normal oilalar teoremasi hamda Sisyak-Zaxaryuta ekstremal funksiyasiga asoslangan umumlashgan Koshi-Adamar formulasi keltirildi. Ishning ilmiy natijasi sifatida qisman radiuslar va majoranta shartini bog‘ lovchi amaliy tekis yaqinlashish mezoni taklif etildi. Kelgusi tadqiqotlar taklif etilgan mezonni umumiy psevdoqavariq sohalarga umumlashtirish hamda O‘ zbekiston kompleks analiz maktabining plyuripolyarlik bo‘ yicha natijalari bilan chuqurroq bog‘ lash yo‘ nalishida davom ettirilishi mumkin [5-8].

Annotatsiya. *Ushbu maqolada Bianchi turidagi bir jinsli, lekin anizotrop fazoviy-vaqt modellarining geometrik invariantlari hamda Killing vektor maydonlari orasidagi bog‘ lanish tahlil qilinadi. Asosiy e’tibor Riman egriligi tenzori, Ricci tenzori va Kretschmann invariantining fizik hamda geometrik mazmunini sodda usulda tushuntirishga qaratiladi. Killing vektor maydonlari fazoviy-vaqtning izometriyalarini ifodalashi, invariantlar esa egrilikning koordinatalardan mustaqil tavsifini berishi ko‘ rsatiladi. Bianchi I modeli uchun diagonal metrika misolida Hubble tipidagi yo‘ nalishli parametrlar orqali Kretschmann invariantining qulay ifodasi yoziladi. Shuningdek, simmetriya darajasi ortgan sari metrik funksiyalar soni va invariantlarning funksional murakkabligi qanday kamayishi tushuntiriladi. Natijada Killing simmetriyalari bilan invariant tahlil birgalikda qo‘ llanganda Bianchi modellarining geometrik farqlarini chuqurroq ochish mumkinligi asoslanadi.*

Kalit so‘ zlar: *Bianchi modeli, Killing vektor maydoni, izometriya, Kretschmann invarianti, Riman egriligi, anizotropiya, bir jinslilik.*

ВЗАИМОСВЯЗЬ МЕЖДУ ГЕОМЕТРИЧЕСКИМИ ИНВАРИАНТАМИ И СИММЕТРИЕЙ КИЛЛИНГА В ПРОСТРАНСТВЕННО-ВРЕМЕННЫХ МОДЕЛЯХ ТИПА БЬЯНКИ

Аннотация. *В данной статье анализируется связь между геометрическими инвариантами однородных, но анизотропных моделей пространства-времени типа Бианки и векторными полями Киллинга. Основное внимание уделяется простому объяснению физического и геометрического смысла тензора кривизны Римана, тензора Риччи и инварианта Кречмана. Показано, что векторные поля Киллинга представляют изометрии пространства-времени, а инварианты обеспечивают координатно-независимое описание кривизны. Для модели Бианки I на примере диагональной метрики приводится удобное выражение для инварианта Кречмана в терминах параметров направления типа Хаббла. Также объясняется, как уменьшается число метрических функций и функциональная сложность инвариантов с увеличением степени симметрии. В результате обосновывается, что геометрические различия моделей Бианки могут быть выявлены более глубоко при совместном использовании симметрий Киллинга.*

Ключевые слова: *модель Бианки, векторное пространство Киллинга, изометрия, инвариант Кречмана, кривизна Римана, анизотропия, однородность.*

INTERRELATION BETWEEN GEOMETRIC INVARIANTS AND KILLING SYMMETRY IN BIANCHI-TYPE SPACE-TIME MODELS

Annotation. *This article analyzes the connection between geometric invariants of homogeneous but anisotropic Bianchi-type space-time models and Killing vector fields. The focus is on a simple explanation of the physical and geometric meaning of the Riemann curvature tensor, Ricci tensor and Kretschmann invariant. It is shown that Killing vector fields represent isometries of space-time, and invariants provide a coordinate-independent description of curvature. For the Bianchi I model, using the diagonal metric as an example, a convenient expression for the Kretschmann invariant is given in terms of Hubble-type direction parameters. It also explains how the number of metric functions and the functional complexity of invariants decreases with increasing degree of symmetry. As a result, it is substantiated that the geometric differences of the Bianchi models can be revealed more deeply by using Killing symmetries together.*

Keywords: *Bianchi model, Killing vector space, isometry, Kretschmann invariant, Riemann curvature, anisotropy, homogeneity.*

Kirish

Kosmologiyada fazoviy-vaqt modelini o‘ rganishda ikki savol muhim bo‘ ladi. Birinchisi: model qanday simmetriyaga ega? Ikkinchisi: modelning egrilik xossalari qanday? Birinchi savolga ko‘ pincha Killing vektor maydonlari yordamida, ikkinchisiga esa geometrik invariantlar yordamida javob beriladi. Shu sababli Bianchi modellarini chuqur tushunish uchun bu ikki yo‘ nalishni birgalikda tahlil qilish zarur.

Adabiyotlar tahlili

Bianchi modellar bir jinsli, ammo umumiy holda anizotrop kosmologik modellar sinfini tashkil etadi. Ular uch o‘ lchovli Lie algebra orqali tavsiflanadi va fazoviy kesimlarning bir jinsli bo‘ lishini ifodalaydi. Bunday modellar umumiy nisbiylik nazariyasida ham nazariy, ham amaliy ahamiyatga ega. Nazariy jihatdan ular Einstein tenglamalarining murakkab tizimlarini soddalashtiradi; amaliy jihatdan esa dastlabki Koinotning anizotrop bosqichlarini tavsiflashda qo‘ l keladi.

Mazkur maqolaning maqsadi Bianchi modellarida Killing simmetriyalari bilan egrilik invariantlari orasidagi ichki bog‘ lanishni tushuntirish va bu bog‘ lanishni sodda misollar orqali ko‘ rsatishdan iborat [1-3].

Killing simmetriyalari va invariantlar: asosiy tushunchalar

Fazoviy-vaqt (M, g) psevdo-Riman ko‘ pxilligi bilan berilsin. Agar ξ vektor maydoni metrikani o‘ zgartirmasa, ya’ni

$$\mathcal{L}_\xi g_{ij} = 0,$$

bo‘ lsa, u holda ξ Killing vektor maydoni deyiladi. Bu shart kovariant hosila orqali

$$\nabla_i \xi_j + \nabla_j \xi_i = 0$$

ko‘ rinishda yoziladi. Mazkur tenglama Killing tenglamasi deb ataladi.

Killing vektor maydonlari fazoviy-vaqtning izometriyalarini bildiradi. Oddiy qilib aytganda, ular metrikani “buzmaydigan” siljitishlarni ifodalaydi. Masalan, Bianchi I modelida fazoviy koordinatalar bo‘ yicha translatsiyalar izometriya bo‘ lib, mos ravishda uchta mustaqil Killing maydoniga olib keladi:

$$\xi_{(1)} = \partial_x, \qquad \xi_{(2)} = \partial_y, \qquad \xi_{(3)} = \partial_z.$$

Geometrik invariantlar esa koordinata tanloviga bog‘ liq bo‘ lmagan sonli yoki funksional ifodalardir. Ulardan eng ko‘ p ishlatiladigani quyidagilar:

$$R, \qquad R_{ij}R^{ij}, \qquad K = R_{ijkl}R^{ijkl}.$$

Bu yerda R — skalyar egrilik, $R_{ij}R^{ij}$ — Ricci tenzorining kvadratik invarianti, K esa Kretschmann invariantidir.

Invariantlarning muhimligi shundaki, ular koordinata almashtirilganda o‘ zgarmaydi. Demak, ikki xil koordinatada yozilgan metrikalarning geometriyasini taqqoslashda invariantlar ishonchli mezon bo‘ lib xizmat qiladi.

Tadqiqot metodologiyasi.

Bianchi modellarida bir jinslilik va simmetriya

Bianchi modellarining umumiy ko‘ rinishi ko‘ pincha

$$ds^2 = -dt^2 + \gamma_{\alpha\beta}(t)\,\omega^\alpha \omega^\beta$$

shaklda yoziladi. Bu yerda ω^α — fazoviy bir jinslilikni ifodalovchi invariant 1-formalar, $\gamma_{\alpha\beta}(t)$ esa vaqtga bog‘ liq metrik koeffitsiyentlardir. 1-formalar quyidagi struktur tenglama bilan bog‘ langan:

$$d\omega^\alpha = \frac{1}{2} C^\alpha_{\beta\gamma}\, \omega^\beta \wedge \omega^\gamma,$$

bu yerda $C^\alpha_{\beta\gamma}$ — uch o‘ lchovli Lie algebraning struktura konstantalari.

Demak, Bianchi klassifikatsiyasi aslida fazoviy kesimning simmetriya algebrasiga asoslanadi. Shuning uchun Killing vektor maydonlari Bianchi modelining geometriyasida tashqi qo‘ shimcha obyekt emas, balki modelning ichki tuzilmasining bir qismidir.

Simmetriya darajasi oshgan sari ikki natija kuzatiladi. Birinchidan, metrikadagi mustaqil funksiyalar soni kamayadi. Ikkinchidan, egrilik invariantlarining ko‘ rinishi ko‘ pincha soddalashadi. Bu holat ayniqsa Bianchi I modelidan izotrop Fridman tipidagi holatga o‘ tganda yaqqol seziladi.

Natijalar va ularning tahlili.

Bianchi I modeli: sodda misol

Bianchi I modelining diagonal metrikasini

$$ds^2 = -dt^2 + a^2(t)\,dx^2 + b^2(t)\,dy^2 + c^2(t)\,dz^2$$

ko‘ rinishda olaylik. Bu modelda fazoviy kesim yassi bo‘ lib, bir jinslilik uchta translatsiya orqali ifodalanadi. Shuning uchun kamida uchta Killing maydoni mavjud.

Endi

$$H_1 = \frac{\dot{a}}{a}, \qquad H_2 = \frac{\dot{b}}{b}, \qquad H_3 = \frac{\dot{c}}{c}$$

belgilashlarni kiritamiz. U holda diagonal Bianchi I modelida Kretschmann invariantining qulay yozilishi

$$K = 4\left[\left(\dot{H}_1 + H_1^2\right)^2 + \left(\dot{H}_2 + H_2^2\right)^2 + \left(\dot{H}_3 + H_3^2\right)^2 + H_1^2H_2^2 + H_1^2H_3^2 + H_2^2H_3^2\right]$$

ko‘ rinishda bo‘ ladi.

Bu formuladan bir necha sodda xulosa chiqadi.

Birinchi xulosa: invariant to‘ liq ravishda uch yo‘ nalishdagi kengayish tezliklari orqali ifodalanadi. Demak, anizotropiya to‘ g‘ ridan to‘ g‘ ri K ga ta’sir qiladi.

Ikkinchi xulosa: agar $a = b = c = S(t)$ bo‘ lsa, model izotrop holatga o‘ tadi. Bu holda

$$H_1 = H_2 = H_3 = H = \frac{\dot{S}}{S},$$

va Kretschmann invariantining ifodasi ancha soddalashadi:

$$K = 12\left[\left(\dot{H} + H^2\right)^2 + H^4\right].$$

Bu yerda qo‘ shimcha aylanish simmetriyalari paydo bo‘ ladi. Shunday qilib, simmetriyaning ortishi invariant ko‘ rinishining soddalashishiga olib keladi.

Invariantlar va Killing simmetriyalari orasidagi bog‘ lanish

Killing maydonlari bilan invariantlar bir xil ma’noni anglatmaydi. Killing maydonlari “qanday o‘ zgarmaslik”ni, invariantlar esa “qanday egrilik”ni ko‘ rsatadi. Shunga qaramay, ular o‘ zaro chambarchas bog‘ liq.

Birinchi bog‘ lanish shundan iboratki, simmetriya algebrasi kattalashgan sari metrikadagi mustaqil funksiyalar kamayadi. Bu esa invariantlarning ham kamroq argumentli yoki soddaroq ko‘ rinishda yozilishiga olib keladi.

Ikkinchi bog‘ lanish shundaki, bir xil o‘ lchamli izometriya gruppasiga ega modellar invariantlar bo‘ yicha farqlanishi mumkin. Demak, faqat Killing maydonlari soni yetarli emas; invariantlar orqali egrilik tabiati ham tekshirilishi kerak.

Uchinchi bog‘ lanish esa fizik talqinga tegishli. Agar invariant juda tez o‘ sib borsa, u singulyarlik yaqinlashayotganini ko‘ rsatishi mumkin. Ammo Killing maydonlarining mavjudligi modelda qanday konservativ yoki geometrik cheklovlar borligini tushuntiradi. Demak, biri dinamik-geometrik “o‘ lchov”, ikkinchisi esa strukturaviy “tartib” rolini bajaradi [3-5].

Ayrim Bianchi turlarining qiyosiy tavsifi

Qiyoslashni jadval ko‘ rinishida emas, sodda tavsif ko‘ rinishida berish qulayroq.

Bianchi I. Bu modelda fazoviy kesim yassi bo‘ lib, asosiy fazoviy simmetriya uchta translatsiya bilan ifodalanadi. Shu sababli invariantlar asosan vaqt bo‘ yicha kengayish parametrlari orqali yoziladi. Modelning algebraik tuzilmasi sodda bo‘ lgani uchun egrilik invariantlari ham nisbatan ixcham ko‘ rinishda bo‘ ladi.

Bianchi II. Bu holda fazoviy simmetriya guruhi noabel xarakterga ega. Demak, struktura konstantalar invariantlarning ko‘ rinishiga bevosita kiradi. Natijada egrilik Bianchi I ga qaraganda boyroq tuzilishga ega bo‘ ladi. Shu sababli Killing maydonlari soni o‘ xshash bo‘ lsa ham, invariantlarning algebraik ko‘ rinishi murakkabroq chiqadi.

Bianchi IX. Bu model fazoviy egrilikning kuchliroq namoyon bo‘ lishi bilan ajralib turadi. Simmetriya xossalari yaxshi rivojlangan bo‘ lsa-da, invariantlar va dinamika ko‘ pincha ancha murakkab bo‘ ladi. Ayniqsa anizotropiya kuchli bo‘ lgan bosqichlarda egrilik invariantlari katta rol o‘ ynaydi.

Bu qiyoslashdan ko‘ rinadiki, simmetriya darajasi bilan invariantlarning murakkabligi orasida bevosita chiziqli bog‘ lanish har doim ham yo‘ q. To‘ g‘ riroq xulosa shuki, Killing maydonlari metrikaning tuzilishini cheklaydi, invariantlar esa shu cheklanish ichida qolayotgan haqiqiy egrilik mazmunini ochib beradi.

Xulosa

Bianchi turidagi fazoviy-vaqt modellarini tahlil qilishda Killing vektor maydonlari va geometrik invariantlar bir-birini to‘ ldiruvchi ikkita asosiy vosita hisoblanadi. Killing maydonlari modelning izometriya xossalarini, invariantlar esa egrilikning koordinatalardan mustaqil mazmunini ifodalaydi. Bianchi I misolida ko‘ rildiki, simmetriya darajasi ortgan sari metrik funksiya va invariantlarning ko‘ rinishi soddalashadi. Biroq faqat simmetriya soni geometriyani to‘ liq tavsiflash uchun yetarli emas; invariant tahlil ham zarur. Shuning uchun Bianchi modellarining to‘ liq tavsifi Killing simmetriyalari, Lie algebra tuzilmasi va egrilik invariantlarini birgalikda o‘ rganishni talab qiladi.

IKKINCHI TUR MATRITSAVIY SOHADA INTERPOLYATSION KETMA-KETLIKLAR UCHUN KARLESON TIPIDAGI YETARLI SHART

Akbaraliyeva Mehrinisso Shavkat qizi
Toshkent shahar Olmazor tumanida joylashgan
28-sonli umumiy o‘ rta ta’lim maktabi Matematika fani o‘ qituvchisi
Korporativ e-mail: akbaraliyevamehrinisso@gmail.com

Annotatsiya. *Maqolada ikkinchi tur matritsaviy sohada chegaralangan golomorf funksiyalar sinfi uchun interpolyatsion ketma-ketliklar masalasi tadqiq etiladi. Tadqiqotning maqsadi klassik Karleson ajralish g‘ oyasini matritsaviy sohaning avtomorfik geometriyasiga moslashtirish va H∞(D) fazoda interpolyatsiya mavjudligini ta’minlaydigan konstruktiv yetarli shartni asoslashdan iborat. Metodologik jihatdan matritsaviy soha avtomorfizmlari, unitar invariantlik, psevdogiperbolik tipdagi invariant miqdorlar, yordamchi metrik baholar va fundamental golomorf funksiyalar tizimini qurish usullaridan foydalaniladi. Asosiy natija sifatida har bir tugun uchun avtomorfik ajralish ko‘ paytmasi yagona musbat δ son bilan pastdan chegaralansa, berilgan nuqtalar ketma-ketligi H∞(D) uchun interpolyatsion bo‘ lishi ko‘ rsatiladi. Isbot faqat mavjudlikni emas, balki chegaralangan ma’lumotlardan chegaralangan golomorf interpolantni qator ko‘ rinishida qurish mexanizmini ham beradi. Natija klassik birlik doiradagi Karleson nazariyasini ikkinchi tur matritsaviy sohaga tatbiq etiladigan yetarli shart shaklida rivojlantiradi va keyingi umumlashtirishlar uchun nazariy asos yaratadi.*

Kalit so‘ zlar: *matritsaviy soha, interpolyatsion ketma-ketlik, Karleson teoremasi, H∞ fazo, golomorf funksiya, avtomorfizm, psevdogiperbolik masofa, unitar invariantlik.*

ДОСТАТОЧНОЕ УСЛОВИЕ ТИПА КАРЛЕСОНА ДЛЯ ИНТЕРПОЛЯЦИОННЫХ ПОСЛЕДОВАТЕЛЬНОСТЕЙ В МАТРИЧНОЙ ОБЛАСТИ ВТОРОГО ТИПА

Аннотация. *В статье исследуется задача интерполяционных последовательностей для класса ограниченных голоморфных функций в матричной области второго типа. Цель исследования состоит в адаптации классической идеи разделения Карлесона к автоморфной геометрии матричной области и в обосновании конструктивного достаточного условия существования интерполяции в H∞(D). Методологическую основу составляют автоморфизмы матричной области, унитарная инвариантность, инвариантные величины псевдогиперболического типа, вспомогательные метрические оценки и построение системы фундаментальных голоморфных функций. Основной результат утверждает, что если для каждого узла произведение автоморфных величин разделения равномерно отделено от нуля положительной постоянной δ, то данная последовательность является интерполяционной для H∞(D). Конструктивная схема доказательства не только устанавливает существование, но и задаёт механизм построения ограниченного голоморфного интерполянта в виде ряда. Полученный результат развивает классическую теорию Карлесона для единичного круга в форме достаточного условия, применимого к матричной области второго типа.*

Ключевые слова: *матричная область, интерполяционная последовательность, теорема Карлесона, пространство H∞, голоморфная функция, автоморфизм, псевдогиперболическая метрика, унитарная инвариантность.*

A SUFFICIENT CONDITION OF CARLESON TYPE FOR INTERPOLATING SEQUENCES IN A SECOND-TYPE MATRIX DOMAIN

Abstract. *The paper investigates interpolating sequences for bounded holomorphic functions in a matrix domain of the second type. The aim is to adapt the classical Carleson separation idea to the automorphic geometry of the matrix domain and to justify a constructive sufficient condition for interpolation in H∞(D). The methodology combines automorphisms of the domain, unitary invariance, pseudohyperbolic-type invariant quantities, auxiliary metric estimates, and the construction of a family of fundamental bounded holomorphic functions. The main result states that if, for every interpolation node, the product of automorphic separation quantities is uniformly bounded below by a positive constant δ, then the sequence is interpolating for H∞(D). The proof is constructive: it establishes not only existence but also a mechanism for representing the bounded holomorphic interpolant as a normally convergent*

series. The result extends the classical Carleson philosophy from the unit disk to a matrix domain of the second type in the form of a practically verifiable sufficient condition and provides a basis for further generalizations.

Keywords: *matrix domain, interpolating sequence, Carleson theorem, H∞ space, holomorphic function, automorphism, pseudohyperbolic metric, unitary invariance.*

KIRISH

Kompleks analizda interpolyatsiya masalasi berilgan nuqtalar to‘ plamida oldindan tayinlangan qiymatlarni qabul qiluvchi analitik yoki golomorf funksiyani qurish bilan bog‘ liq fundamental masalalardan biridir. Bunday masalalarda faqat alohida nuqtalarda qiymatlarni moslashtirishning o‘ zi yetarli emas: qurilayotgan funksiyaning butun sohada qaysi sinfga tegishli bo‘ lishi, uning normasi qanday nazorat qilinishi va tugunlarning geometrik joylashuvi bilan funksional xossalar o‘ rtasidagi bog‘ lanish ham muhim ahamiyat kasb etadi. Ayniqsa, chegaralangan golomorf funksiyalar fazosi H∞ uchun interpolyatsiya tugunlarining geometrik tavsifi klassik kompleks analizning markaziy yo‘ nalishlaridan biri bo‘ lib, bu boradagi usullar keyinchalik ko‘ p o‘ lchamli kompleks analiz, operatorlar nazariyasi va matritsaviy sohalar geometriyasiga keng tatbiq etilgan [1].

Birlik doira holatida interpolyatsion ketma-ketliklarning tabiati nuqtalar orasidagi psevdogiperbolik ajralish bilan chambarchas bog‘ liq. Mazkur yondashuvning mohiyati shundaki, oddiy Evklid masofasi sohaning konformal yoki avtomorfik geometriyasini to‘ liq aks ettirmaydi; shuning uchun masalani aynan soha avtomorfizmlari bilan invariant bo‘ lgan miqdorlar orqali ifodalash zarur bo‘ ladi. Interpolyatsiya nazariyasidagi klassik ishlarda chegaralangan ma’lumotlarni chegaralangan analitik funksiya orqali tiklash, interpolant normasini baholash va ajralish shartidan foydalanishning turli konstruktiv usullari ishlab chiqilgan [2, 3].

Ko‘ p o‘ lchamli sohalarga o‘ tilganda geometriya keskin murakkablashadi. Shar yoki polidiskda har bir koordinata va ichki metrika o‘ zaro bog‘ langan holda qatnashadi; matritsaviy sohalarda esa nuqtaning o‘ zi kompleks matritsa bo‘ lib, uning spektral xossalari, simmetriya shartlari, operator normasi va unitar almashtirishlarga nisbatan invariantligi hisobga olinadi. Shu sababli bir o‘ lchamli natijani faqat belgilarni almashtirish orqali ko‘ chirish mumkin emas. Shar va polidisk uchun olingan H∞ interpolyatsiya natijalari ko‘ p o‘ lchamli yondashuvning asosiy yo‘ nalishlarini ko‘ rsatadi [4, 5], matritsaviy sohalarga oid kompleks analiz esa invariant geometriya uchun zarur apparatni beradi [6].

Mazkur tadqiqotning dolzarbligi ikkinchi tur matritsaviy sohada interpolyatsion ketma-ketliklarni tekshirish uchun aniq, invariant va konstruktiv mezonga ehtiyoj mavjudligi bilan belgilanadi. Amaliy tekshiriladigan yetarli shart, bir tomondan, ketma-ketlik tugunlarining soha ichki geometriyasida qanday joylashishi kerakligini ko‘ rsatadi; ikkinchi tomondan esa shu shart bajarilganda interpolantni qanday qurish mumkinligini tushuntiradi. Bu ikki jihatning birlashishi sof mavjudlik teoremasidan ko‘ ra kuchliroq metodik qiymatga ega, chunki u keyingi baholashlar, normani nazorat qilish va boshqa klassik sohalarga umumlashtirish uchun tayanch mexanizmni beradi.

Maqolaning maqsadi magistrlik dissertatsiyasida shakllantirilgan ilmiy natijani tizimli ravishda bayon qilish, ikkinchi tur matritsaviy soha avtomorfizmlaridan kelib chiqadigan Karleson tipidagi ajralish shartining mazmunini ochish, konstruktiv isbot bosqichlarini izchil asoslash hamda natijaning klassik interpolyatsiya nazariyasidagi o‘ rnini ko‘ rsatishdan iborat. Tadqiqot vazifalari sifatida: H∞(D) fazoning ishlatiladigan xossalarini belgilash; avtomorfik invariant ajralish miqdorini tavsiflash; yetarli shartni teorema shaklida ifodalash; fundamental funksiyalar tizimining qurilishini tushuntirish; interpolant qatorning normal yaqinlashuvi va chegaralanganligini asoslash; olingan natijani klassik birlik doira holati bilan qiyosiy tahlil qilish belgilandi.

ADABIYOTLAR TAHLILI VA NAZARIY ASOS

Chegaralangan analitik funksiyalar nazariyasi H∞ va H^p fazolar, Blyashke ko‘ paytmalari, chegaraviy qiymatlar, ichki va tashqi funksiyalar hamda faktorizatsiya masalalari bilan uzviy bog‘ liq. Garnettning monografiyasida chegaralangan analitik funksiyalar apparati, funksional baholar va interpolyatsiya nazariyasining ko‘ plab klassik vositalari tizimlashtirilgan [1]. H^p fazolariga oid umumiy nazariya esa funksiyalarning chegaradagi xulqi hamda normaviy xossalarni tushunishda muhim asos bo‘ lib xizmat qiladi [7].

Interpolyatsion ketma-ketliklar nuqtai nazaridan Earl chegaralangan sonli ketma-ketliklarni chegaralangan funksiyalar yordamida interpolyatsiya qilish masalasini o‘ rgangan va interpolant normasi bilan geometrik ajralish o‘ rtasidagi bog‘ lanishga e’tibor qaratgan [2]. Jonesning δ-masalaga bag‘ ishlangan yondashuvi esa L∞ baholarni olishda konstruktiv usullarning kuchini ko‘ rsatadi [3]. Ushbu ishlardan kelib chiqadigan metodik xulosa shuki, interpolyatsiya masalasida geometrik ajralish shartini faqat zarur formal cheklov sifatida emas, balki yordamchi funksiyalarni qurishga imkon beradigan miqdoriy resurs sifatida ko‘ rish lozim.

Ko‘ p o‘ lchamli kompleks analizda Berndtsson shar uchun H∞ interpolyatsiyasini tadqiq etgan [4]. Berndtsson, Chang va Linning polidiskdagi interpolyatsion ketma-ketliklarga oid natijalari esa bir nechta kompleks o‘ zgaruvchili sohalarda koordinataviy va invariant shartlar o‘ rtasidagi munosabatni yoritadi [5]. Mazkur ishlar bir o‘ lchamli

psevdogiperbolik geometriya g‘ oyasi yuqori o‘ lchamda saqlanib qolishini, biroq u sohaning o‘ ziga xos avtomorfizmlari va invariant metrikasi bilan qayta ifodalanishi kerakligini ko‘ rsatadi.

Matritsaviy sohalarda kompleks analizning asosiy xususiyati shundaki, nuqtalar skalyar sonlar yoki oddiy vektorlar emas, balki ma’lum algebraik va normaviy cheklovlarni qanoatlantiruvchi matritsalardan iborat bo‘ ladi. Xudayberganov, Kytmanov va Shaimqulovning matritsaviy sohalar bo‘ yicha ishlari bunday sohalarning avtomorfizmlari, invariant miqdorlari va golomorf akslantirishlariga oid nazariy apparatni rivojlantiradi [6]. Aynan shu apparat Karleson tipidagi mezonni ikkinchi tur matritsaviy sohada ifodalashga imkon beradi. Mahalliy ilmiy adabiyotlarda polikrug va ko‘ p o‘ lchamli sohalardagi interpolyatsiya masalalariga qiziqish mavjudligi ham qayd etiladi [8].

Adabiyotlar tahlilidan ko‘ rinadiki, klassik interpolyatsiya nazariyasida uchta asosiy element takroran uchraydi: tugunlarning invariant geometriyada ajralishi, tugunlarga mos fundamental funksiyalarni qurish va bu funksiyalar yig‘ indisini global nazorat qilish. Mazkur maqolada aynan shu uchlik ikkinchi tur matritsaviy soha uchun moslashtiriladi. Yondashuvning farqli jihati shundaki, skalyar Möbius almashtirishlari o‘ rniga matritsaviy sohaning φ_P avtomorfizmlari ishlatiladi va ajralish miqdori ular orqali belgilanadi.

TADQIQOT OBYEKTI, PREDMETI VA METODOLOGIYASI

Tadqiqot obyekti — ikkinchi tur matritsaviy sohada joylashgan $\{P_k\}$ nuqtalar ketma-ketligi va ushbu sohada aniqlangan chegaralangan golomorf funksiyalar fazosi $H^\infty(D)$. Tadqiqot predmeti esa ketma-ketlikning $H^\infty(D)$ uchun interpolyatsion bo‘ lishini ta’minlaydigan avtomorfik ajralish sharti hamda shu shart asosida interpolant qurish mexanizmidir. D bilan ikkinchi tur matritsaviy soha belgilanadi; uning nuqtalari tegishli simmetriya va normaviy shartlarni qanoatlantiruvchi kompleks matritsalardan iborat deb olinadi. Har bir $P \in D$ uchun φ_P sohaning avtomorfizmi bo‘ lib, $\varphi_P(P)=0$ shartini qanoatlantiradi [6].

Metodologiya nazariy-deduktiv xarakterga ega. Birinchi bosqichda klassik H^∞ interpolyatsiyasidagi ajralish tamoyili va uning ko‘ p o‘ lchamli analoglari tahlil qilinadi [1–5]. Ikkinchi bosqichda ikkinchi tur matritsaviy sohaning avtomorfik geometriyasidan foydalanib, nuqtalar orasidagi psevdogiperbolik tipdagi invariant miqdor aniqlanadi. Uchinchi bosqichda Karleson tipidagi ko‘ paytma sharti qabul qilinib, undan juft ajralish va maxrajlarning noldan uzoqligi kabi yordamchi baholar chiqariladi. To‘ rtinchi bosqichda har bir tugun uchun fundamental gk funksiyalar quriladi. Yakuniy bosqichda ularning modullari yig‘ indisi yagona o‘ zgarmas bilan chegaralanishi asosida interpolant qatorning normal yaqinlashuvi va $H^\infty(D)$ ga tegishliligi ko‘ rsatiladi.

Sof matematik tadqiqot xususiyatidan kelib chiqib, maqolada empirik tajriba yoki kuzatuv ma’lumotlari sun’iy ravishda kiritilmaydi. Natijani tekshirishning asosiy shakli mantiqiy-isbotiy verifikatsiya bo‘ lib, har bir xulosa oldingi baholar, invariantlik xossalari va qatorlarning normal yaqinlashuv mezonlari bilan asoslanadi. Shu bilan birga, natijalar taqqoslovchi jadval va konstruktiv sxema yordamida vizuallashtiriladi; bu vositalar teoremaning mazmunini va klassik holatdan matritsaviy holatga o‘ tish mantiqini aniqroq ko‘ rsatishga xizmat qiladi.

ASOSIY TUSHUNCHALAR VA INVARIANT GEOMETRIYA

$H^\infty(D)$ bilan D sohada aniqlangan barcha chegaralangan golomorf funksiyalar fazosi belgilanadi. Ushbu fazoda norma odatdagidek $\|F\|_\infty=\sup_{Z\in D}|F(Z)|$ ko‘ rinishida olinadi. $\{P_k\}\subset D$ ketma-ketlik $H^\infty(D)$ uchun interpolyatsion deyiladi, agar har qanday chegaralangan $\{b_k\}\subset\mathbb{C}$ ketma-ketlik uchun $F(P_k)=b_k$ tengliklarni barcha k lar uchun qanoatlantiruvchi $F\in H^\infty(D)$ funksiya mavjud bo‘ lsa. Bu ta’rifda ikki talab bir vaqtda ishtirok etadi: tayinlangan qiymatlarni aniq tiklash va qurilgan funksiyaning butun D sohada chegaralangan bo‘ lishi.

Matritsaviy sohada ajralish Evklid normasi bilan emas, avtomorfizmlar yordamida ifodalangan invariant miqdor bilan o‘ lchanadi. $\varphi_P(P)=0$ bo‘ lgani uchun $|\varphi_P(Q)|$ ifoda P va Q nuqtalar o‘ rtasidagi psevdogiperbolik tipdagi ajralishni tavsiflaydi. Bu miqdorning muhim jihati shundaki, u sohaning tabiiy simmetriyalari bilan moslashadi va koordinatalarni tasodifiy tanlashga bog‘ lanib qolmaydi. Unitar almashtirishlarga nisbatan invariantlik matritsani qulayroq diagonal yoki kanonik ko‘ rinishga keltirishda geometrik ma’noni saqlab qolish imkonini beradi.

Interpolyatsion ketma-ketlik uchun faqat har bir juft nuqtaning bir-biridan uzoq bo‘ lishi yetarli bo‘ lmasligi mumkin. Karleson tipidagi yondashuvda bir tugunning barcha boshqa tugunlarga nisbatan umumiy ajralishi ko‘ paytma orqali nazorat qilinadi. Bu ko‘ paytma alohida masofalarning lokal xossalarini yagona global shartga birlashtiradi. Aynan shuning uchun u keyingi konstruksiyada fundamental funksiyaning maxrajlarini nazorat qilish, logarifmik baholarni qo‘ llash va barcha gk lar yig‘ indisini bir xil o‘ zgarmas bilan chegaralash uchun qulay hisoblanadi.

ASOSIY NATIJA VA TEOREMA

D ikkinchi tur matritsaviy soha, $\{P_k\}\subset D$ esa undagi nuqtalar ketma-ketligi bo‘ lsin. Har bir $P\in D$ uchun φ_P soha avtomorfizmi bo‘ lib, $\varphi_P(P)=0$ shartni qanoatlantirsin. Dissertatsiyada olingan asosiy ilmiy natija quyidagi Karleson tipidagi yetarli shart ko‘ rinishida ifodalanadi.

Teorema. Agar shunday $\delta>0$ mavjud bo‘ lib, har bir k uchun

$$\prod_{j\neq k} |\varphi_{P_j}(P_k)| \geq \delta. \qquad (1)$$

shart bajarilsa, u holda {Pk} ketma-ketlik H∞(D) fazo uchun interpolyatsion ketma-ketlik bo‘ ladi. Ya’ni har qanday chegaralangan {bk}⊂ℂ ketma-ketlik uchun shunday F∈H∞(D) funksiya mavjudki, F(Pk)=bk, k=1,2,… tengliklar bajariladi.

Teoremaning geometrik mazmuni quyidagicha. (1) shart har bir Pk tugunining qolgan barcha tugunlarga nisbatan avtomorfik geometriyada yetarli darajada ajralganligini bir vaqtning o‘ zida nazorat qiladi. Ko‘ paytmadagi har bir ko‘ paytuvchi 0 va 1 oralig‘ idagi invariant ajralish miqdorini ifodalaganligi sababli, butun ko‘ paytmaning yagona δ>0 son bilan pastdan chegaralanishi biror omilning haddan tashqari kichrayib ketishiga yo‘ l qo‘ ymaydi. Natijada tugunlar orasida kolliziya yoki haddan tashqari zich to‘ planishning interpolatsiya konstruksiyasini buzuvchi shakli cheklanadi.

Isbotning birinchi bosqichida (1) shartdan juft nuqtalar uchun bir jinsli ajralish baholari olinadi. Agar ko‘ paytma δ dan kichik bo‘ lmasa, har bir alohida omil ham nazorat ostida bo‘ ladi. Bu holat fundamental funksiyalarni qurishda paydo bo‘ ladigan normalizatsiya koeffitsientlarining noldan uzoqligini kafolatlaydi. Mazkur bosqichning vazifasi keyingi formulalarda maxrajning kichrayib ketishi sababli normaning nazoratsiz o‘ sib ketishini oldini olishdir.

Ikkinchi bosqichda invariant miqdorning unitar almashtirishlarga nisbatan o‘ zgarmasligi va unga mos uchburchak tipidagi baholar ishlatiladi. Simmetrik kompleks matritsani qulay unitar-diagonal ko‘ rinishga keltirish ko‘ p o‘ lchamli vaziyatdagi ayrim baholarni skalyar parametrlar bo‘ yicha tahlil qilishga imkon beradi. Bunda diagonalizatsiya masalaning mohiyatini o‘ zgartirmaydi, chunki ishlatilayotgan miqdorlar unitar invariantdir. Shu tariqa klassik psevdogiperbolik geometriyaga xos baholarning matritsaviy analoglari olinadi.

Uchinchi bosqichda har bir k uchun gk∈H∞(D) fundamental funksiyalar quriladi. Ular tugunlarda Kroneker delta xossasini qanoatlantiradi:

$$g_k(P_j)=0 \ (j\neq k), \qquad g_k(P_k)=1. \tag{2}$$

(2) xossa interpolyatsiyaning algebraik qismini ta’minlaydi: har bir gk funksiya aynan o‘ z tugunida birlikka teng bo‘ lib, qolgan tugunlarda yo‘ qoladi. Biroq faqat shu xossa yetarli emas. Cheksiz ko‘ p tugunlar uchun interpolantni qator sifatida qurish rejalashtirilgani sababli, gk funksiyalarning umumiy o‘ sishini ham nazorat qilish talab etiladi. (1) shart va yordamchi logarifmik baholar asosida quyidagi global baho olinadi:

$$\sup_{Z\in D} \Sigma_{k=1}^{\infty} |g_k(Z)| \le C(\delta) < \infty. \tag{3}$$

Bu yerda C(δ) faqat ajralish parametriga bog‘ liq o‘ zgarmasdir. (3) baho konstruktiv isbotning markaziy nuqtasi hisoblanadi. U bir tomondan qatorni kompakt to‘ plamlarda normal yaqinlashtiradi, ikkinchi tomondan esa interpolantning H∞ normasini berilgan ma’lumotlarning supremum normasi orqali baholash imkonini beradi. Demak, ajralish sharti faqat tugunlarning geometrik xossasini emas, balki interpolatsiya operatorining miqdoriy barqarorligini ham ifodalaydi.

Endi {bk} chegaralangan kompleks sonlar ketma-ketligi bo‘ lsin va M=supk|bk|<∞ deb olaylik. Interpolant quyidagicha aniqlanadi:

$$F(Z)=\Sigma_{k=1}^{\infty} b_k\, g_k(Z). \tag{4}$$

(3) bahodan |bk gk(Z)|≤M|gk(Z)| kelib chiqadi va Σ|gk(Z)| butun D da yagona o‘ zgarmas bilan nazorat qilinadi. Shuning uchun (4) qator D ning kompakt qism to‘ plamlarida normal yaqinlashadi; normal yaqinlashuvchi golomorf funksiyalar qatorining yig‘ indisi golomorf bo‘ ladi. Bundan tashqari,

$$|F(Z)| \le M\, \Sigma_{k=1}^{\infty}|g_k(Z)| \le M\cdot C(\delta),$$

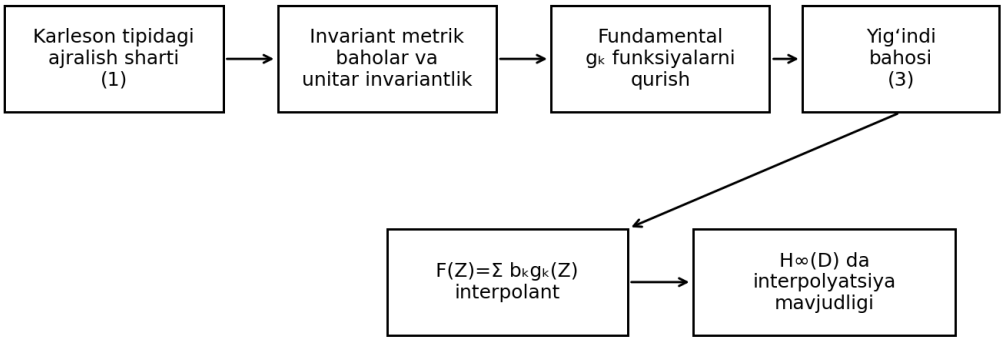
ya’ni ‖F‖∞≤M·C(δ) va F∈H∞(D). Nihoyat, (2) dan foydalanib, har bir j uchun F(Pj)=Σkbkgk(Pj)=bj olinadi. Demak, {Pk} ketma-ketlik interpolyatsiondir. Bu bilan teoremaning konstruktiv isbot sxemasi yakunlanadi.

NATIJALARNING TAHLILI VA TAQQOSLASH

Olingan natijani klassik birlik doira holati bilan qiyoslash uning mazmunini aniqroq ko‘ rsatadi. Har ikki vaziyatda asosiy g‘ oya tugunlarning invariant geometriyada ajralishini nazorat qilishdan iborat. Farq shundaki, birlik doirada geometriya Möbius almashtirishlari va skalyar psevdogiperbolik masofa orqali ifodalansa, ikkinchi tur matritsaviy sohada nuqtalar matritsa bo‘ lgani uchun φP avtomorfizmlari va unitar invariant matritsaviy miqdorlar ishlatiladi. Shunga qaramay, ajralish → fundamental funksiyalar → yig‘ indi bahosi → interpolant zanjiri saqlanib qoladi.

1-jadvalda klassik va matritsaviy holatlarning metodik mosligi ko‘ rsatilgan. Jadvaldan ko‘ rinadiki, umumlashtirish oddiy terminologik almashtirish emas; har bir klassik element matritsaviy sohaning ichki geometriyasiga mos keladigan yangi obyekt bilan almashtiriladi. Shu jihatdan (1) shartning ilmiy ahamiyati uning Karleson g‘ oyasini soha simmetriyalari bilan uyg‘ unlashtirishidadir.

1-jadval



Klassik birlik doira va ikkinchi tur matritsaviy sohadagi interpolyatsiya elementlarining qiyosiy tavsifi

Tahlil elementi	Birlik doira holati	Ikkinchi tur matritsaviy soha
Tugun	Kompleks son z_k	Kompleks matritsa P_k
Invariant almashtirish	Möbius almashtirishi	φ_P matritsaviy avtomorfizmi
Ajralish mezoni	Psevdogiperbolik ko‘ paytma	Avtomorfik ko‘ paytma (1)

Fundamental obyekt	Chegaralangan analitik funksiyalar	$g_k \in H^\infty(D)$ fundamental funksiyalar
Global nazorat	Norma/yig‘ indi bahosi	$\Sigma \lvert g_k(Z) \rvert \le C(\delta)$
Natija	H^∞ interpolant	$H^\infty(D)$ interpolant

Jadvaldagi moslik natijaning umumlashtiruvchi xarakterini ko‘ rsatadi. Klassik holatdagi barcha muhim funksional bosqichlar saqlangan, biroq ular matritsaviy sohaning avtomorfik tuzilishi bilan qayta ifodalangan. Bu yondashuvning afzalligi shundaki, interpolyatsiya mezoni tashqi koordinata tanloviga emas, sohaning ichki geometriyasiga bog‘ langan bo‘ ladi. Natijada mezon unitar almashtirishlar ostida o‘ z ma’nosini saqlaydi va turli kanonik ko‘ rinishlarda bir xil geometrik mazmunni beradi.

Konstruktiv isbotning ichki mantiqi 1-rasmda aks ettirilgan. Dastlab Karleson tipidagi ajralish sharti qabul qilinadi; undan invariant metrik baholar olinadi; bu baholar fundamental funksiyalarni qurishga xizmat qiladi; keyin ularning umumiy yig‘ indisi nazorat qilinadi; oxirida chegaralangan ma’lumotlar bilan og‘ irlashtirilgan qator $H^\infty(D)$ interpolantini beradi.

1-rasm. Karleson tipidagi shartdan $H^\infty(D)$ interpolantigacha bo‘ lgan konstruktiv sxema

Sxemadan ko‘ rinadiki, (3) baho butun konstruksiyaning barqarorlik markazi hisoblanadi. Agar fundamental funksiyalar faqat tugunlarda (2) shartni qanoatlantirib, ularning umumiy moduli nazorat qilinmaganida, (4) qatorning yaqinlashuvi va chegaralanganligi kafolatlanmagan bo‘ lar edi. Demak, ilmiy natijadagi muhim yangiliklardan biri ajralish shartini aynan global yig‘ indi bahosiga olib boradigan darajada kuchli shaklda qo‘ llashdir.

Natijaning yana bir muhim tomoni normaviy bahodir. $\|F\|_\infty \le C(\delta)\|b\|_\infty$ tengsizlik interpolyatsiya operatorining chegaralanganligini ko‘ rsatadi. Bu yerda $C(\delta)$ ning aniq ko‘ rinishini aniqlash keyingi tadqiqot vazifasi bo‘ lishi mumkin, biroq uning faqat δ ga bog‘ liq bo‘ lishining o‘ zi ketma-ketlik geometriyasi bilan interpolant barqarorligi o‘ rtasidagi bevosita aloqani ko‘ rsatadi. Ajralish kuchliroq bo‘ lsa, ya’ni δ noldan yaxshiroq uzoqlashsa, konstruksiyada paydo bo‘ ladigan denominators va yordamchi koeffitsientlarni nazorat qilish qulaylashadi.

2-jadvalda isbot bosqichlarining vazifasi va yakuniy natijaga qo‘ shadigan hissasi jamlangan. Bunday tuzilma teoremani faqat yakuniy formula sifatida emas, balki ketma-ket mantiqiy operatsiyalar tizimi sifatida ko‘ rish imkonini beradi.

2-jadval

Konstruktiv isbot bosqichlari va ularning funksional vazifasi

Bosqich	Asosiy amal	Natijadagi vazifa
1	(1) ajralish shartidan juft baholar olish	Tugunlar kolliziyasini cheklash
2	Unitar invariantlik va metrik baholar	Matritsaviy geometriyani nazorat qilish
3	g_k fundamental funksiyalarni qurish	Tugun qiymatlarini ajratish
4	$\Sigma \lvert g_k \rvert \le C(\delta)$ global bahosini olish	Qator yaqinlashuvi va norma nazorati
5	$F=\Sigma b_k g_k$ qatorini qurish	Berilgan ma’lumotlarni interpolatsiya qilish

ILMIY YANGILIK VA MUHOKAMA

Maqolada yoritilgan ilmiy yangilikning asosiy mazmuni klassik interpolyatsiya nazariyasidagi ajralish tamoyilini ikkinchi tur matritsaviy sohaning avtomorfik geometriyasiga mos shaklda ifodalash va undan $H^\infty(D)$ da interpolyatsiya mavjudligi uchun konstruktiv yetarli shart olishdan iborat. Ilmiy yangilik ikki darajada namoyon bo‘ ladi. Birinchidan,

ajralish sharti matritsaviy nuqtalarning tabiiy avtomorfizmlari orqali ifodalanadi. Ikkinchidan, ushbu shart fundamental funksiyalar sistemasini qurish va umumiy yig‘ indi bahosini olish bilan bevosita bog‘ lanadi.

Klassik Karleson g‘ oyasi bilan o‘ xshashlik (1) ko‘ paytma shartida yaqqol ko‘ rinadi. Biroq birlik doiradagi Möbius almashtirishlari o‘ rnini φP matritsaviy avtomorfizmlari egallashi natijaning mazmunini sifat jihatidan o‘ zgartiradi. Matritsaviy nuqtaning koordinatalari o‘ zaro algebraik bog‘ langan bo‘ lishi mumkin; shu sabab invariantlik oddiy texnik qulaylik emas, balki mezonning geometrik to‘ g‘ riligini ta’minlaydigan asosiy talabdir. Bu holat natijani tasodifiy bazis yoki koordinata sistemasiga bog‘ lanib qolishdan saqlaydi.

Konstruktiv isbot nazariy jihatdan ham muhim. Fundamental gk funksiyalarni qurish interpolyatsiya operatorining mavjudligini ko‘ rsatadi, (3) esa ushbu operatorning chegaralanganligini nazorat qiladi. Shunday qilib, teorema “interpolant mavjud” degan sifat xulosasi bilan cheklanmay, “interpolantni qanday yig‘ ish va uning normasini qanday baholash mumkin” degan savollarga ham javob beradi. Bu jihat keyingi tadqiqotlarda interpolyatsiya konstantalarini aniqroq hisoblash, tugun zichligi bilan norma o‘ rtasidagi bog‘ lanishni o‘ rganish va operator qiymatli ma’lumotlarga o‘ tishda muhim bo‘ lishi mumkin.

Natija ayni paytda yetarli shart sifatida talqin qilinishi lozim. Ya’ni (1) bajarilganda interpolyatsiya kafolatlanadi, biroq interpolyatsion bo‘ lgan har qanday ketma-ketlik albatta aynan shu ko‘ paytma shartini qanoatlantirishi ushbu maqolada da’vo qilinmaydi. Ikkinchi tur matritsaviy soha uchun zarur va yetarli mezonlarning to‘ liq tavsifi, shuningdek C(δ) o‘ zgarmasining optimal bahosi alohida tadqiqot yo‘ nalishidir. Ilmiy xulosalarni aynan shu chegaralarda talqin qilish natijaning ishonchliligini saqlaydi.

Maqolaning nazariy ahamiyati shundaki, u skalyar interpolyatsiya nazariyasidagi umumiy metodologiyani matritsaviy kompleks analizga moslashtirish yo‘ lini ko‘ rsatadi. Amaliy-metodik ahamiyati esa tekshiriladigan shart va konstruktiv algoritmning mavjudligidadir: berilgan ketma-ketlik uchun ajralish parametri nazorat qilinadi, so‘ ng fundamental funksiyalar tizimi quriladi va berilgan chegaralangan ma’lumotlar asosida interpolant hosil qilinadi. Bu sxema kompyuter algebra tizimlarida chekli tugunlar uchun modellashtirish yoki sonli tajribalar tashkil etish uchun ham konseptual asos bo‘ la oladi, biroq bunday sonli tajribalar ushbu maqolaning manba materialida keltirilmaganligi sababli alohida natija sifatida taqdim etilmaydi.

TADQIQOTNING CHEGARALARI VA ISTIQBOLLI YO‘ NALISHLAR

Tadqiqotning birinchi chegarasi shundaki, asosiy natija yetarli shart ko‘ rinishida berilgan. Zaruriy shartning aniq shakli va ikki yo‘ nalishning ekvivalentligini o‘ rnatish uchun qo‘ shimcha geometrik hamda funksional-analitik vositalar talab qilinadi. Ikkinchi chegara C(δ) o‘ zgarmasining optimal yoki aniq bahosi berilmaganidadir. Bu o‘ zgarmasning δ ga bog‘ liqligini aniqlashtirish interpolatsiya operatorining normasi bo‘ yicha yanada kuchli xulosalar olish imkonini beradi.

Kelgusida usulni boshqa klassik matritsaviy sohalarga ko‘ chirish, operator qiymatli interpolyatsiya masalalariga tatbiq etish, chekli ketma-ketliklar uchun hisoblash algoritmlarini ishlab chiqish va invariant ajralish mezonining zaruriylik darajasini o‘ rganish maqsadga muvofiq. Shuningdek, matritsaviy sohalarda interpolatsiya tugunlarining zichlik xossalari bilan H∞ normasi o‘ rtasidagi bog‘ lanish alohida ilmiy qiziqish uyg‘ otadi.

XULOSA

Ikkinchi tur matritsaviy sohada H∞(D) uchun interpolyatsion ketma-ketliklarni o‘ rganishda Karleson tipidagi avtomorfik ajralish sharti samarali yetarli mezon ekanligi asoslandi. Agar har bir tugun uchun boshqa tugunlarga nisbatan avtomorfik ajralishni ifodalovchi $\prod_{j\neq k}|\varphi_{P_j}(P_k)|$ ko‘ paytma yagona $\delta>0$ son bilan pastdan chegaralansa, berilgan ketma-ketlik H∞(D) uchun interpolyatsion bo‘ ladi. Mazkur xulosa tugunlar geometriyasini funksional interpolyatsiya imkoniyati bilan bog‘ laydi.

Isbotning konstruktiv mohiyati uch asosiy qadamda namoyon bo‘ ladi: invariant metrik baholarni olish, Kroneker delta xossasiga ega fundamental gk funksiyalarni qurish va ularning modullari yig‘ indisini C(δ) bilan global chegaralash. Shu bahodan foydalanib $F(Z)=\Sigma b_k g_k(Z)$ qatorining normal yaqinlashuvi, golomorfligi va $\|F\|_\infty \le C(\delta)\|b\|_\infty$ normaviy nazorati kelib chiqadi. Demak, natija faqat mavjudlikni emas, balki interpolantni qurish mexanizmini ham beradi.

Tadqiqot klassik birlik doiradagi Karleson g‘ oyasining ikkinchi tur matritsaviy soha sharoitidagi tabiiy davomi sifatida qaralishi mumkin. Bunda skalyar Möbius geometriyasi matritsaviy avtomorfizmlar geometriyasi bilan almashtiriladi, ammo ajralish, fundamental funksiyalar va global yig‘ indi bahosi o‘ rtasidagi metodik bog‘ lanish saqlanadi. Olingan natija matritsaviy kompleks analizda interpolyatsiya nazariyasini rivojlantirish, zarur va yetarli mezonlarni izlash hamda boshqa klassik sohalarga umumlashtirish uchun nazariy asos yaratadi.

Abstract: *The asymptotic normalization coefficient (ANC) of the virtual decay $^{8}B \rightarrow {}^{7}Be + p$ is one of the most important quantities for estimating the cross section and the rate of the radiative capture reaction $^{7}Be(p,\gamma)^{8}B$, a key process of the solar proton–proton chain and a major source of the high-energy ^{8}B solar neutrino flux. . This paper is devoted to the estimation of the ANC within a self-consistent three-body $\alpha+^{3}He+p$ potential cluster model based on the hyperspherical Lagrange-mesh method. The methodology of extracting the ANC from the asymptotic behavior of the overlap integral between the three-body ^{8}B (^{8}Li) and two-body $^{7}Be = \alpha + {}^{3}He$ ($^{7}Li = \alpha + {}^{3}H$) wave functions is described, and the resulting values are compared with earlier ab initio, cluster-model, and transfer-reaction estimates.*

Introduction

The proton-radiative-capture reaction $^{7}Be(p,\gamma)^{8}B$ governs the production of high-energy ^{8}B solar neutrinos within the proton–proton chain of hydrogen burning in the Sun [1,2]. Because the relevant stellar energies lie far below the Coulomb barrier, the cross section of this reaction cannot be measured directly at astrophysically relevant energies. A central quantity in such an extrapolation is the asymptotic normalization coefficient (ANC), which fixes the amplitude of the tail of the bound-state wave function of the valence proton in ^{8}B beyond the range of the nuclear interaction. Since ^{8}B is a weakly bound one-proton halo nucleus with a separation energy of only about 0.1375 MeV, the capture process at low energies is dominated by this peripheral, long-range part of the wave function, so that the cross section becomes essentially proportional to the square of the ANC. The estimation of this coefficient accurately is therefore equivalent to determining the low-energy capture rate itself. This work reviews the problem of estimating the ANC for the $^{8}B \rightarrow {}^{7}Be + p$ virtual decay, with emphasis on a three-body potential cluster model in which ^{8}B is treated as an $\alpha + {}^{3}He + p$ system and ^{8}Li as $\alpha + {}^{3}H + n$, allowing a consistent study of both the ^{8}B and the ^{8}Li mirror nuclei. The aim is to summarise the physical basis of the approach, the main results obtained for the ANC.

Literature review

Empirical ANC values for $^{8}B \rightarrow {}^{7}Be + p$ have traditionally been extracted from peripheral nuclear transfer reactions analyzed within the distorted-wave Born approximation (DWBA). Proton-transfer measurements of reactions such as $^{10}B(^{7}Be,^{8}B)^{9}Be$ and $^{14}N(^{7}Be,^{8}B)^{13}C$ give a squared ANC of about 0.465 fm^{-1}, while an analysis of the $^{7}Be(d,n)^{8}B$ reaction yields a noticeably larger value about 0.613 fm^{-1}. Coulomb-breakup measurements of ^{8}B on heavy targets have produced intermediate results, typically in the range 0.45–0.55 fm^{-1}.

On the theoretical side, ab-initio calculations provide an independent route to the ANC. Variational Monte Carlo calculations with realistic Argonne v_{18} and Urbana IX potentials give a squared ANC about 0.537 fm^{-1}, close to the value obtained with the no-core shell model combined with the resonating-group method (NCSM/RGM), about 0.509 fm^{-1}. Earlier NCSM calculations using the CD-Bonn 2000 nucleon–nucleon potential produced a larger value, about 0.587 fm^{-1}. At the same time a more recent NCSM-with-continuum calculation based on chiral effective-field-theory potentials at fourth order, including three-nucleon forces, notably fails to reproduce the experimental S-wave $p + {}^{7}Be$ scattering length, a concern since the S-wave channel dominates the low-energy capture process and strongly constrains the reliability of the underlying wave function, and hence of the extracted ANC [1,2].

Halo effective field theory at next-to-leading order gives a squared ANC of 0.564 fm^{-1}, in reasonable agreement with the VMC and CD-Bonn NCSM results. A two-body effective-potential model, tuned to reproduce the measured S-wave $p + {}^{7}Be$ scattering length, yields a squared ANC of about 0.538 fm^{-1}, consistent with several of the ab initio estimates, though it does not explicitly include ^{7}Be core-excitation effects.

Three-body cluster-model calculations of the ^{8}B ANC were first carried out within the hyperspherical harmonics method, but were restricted to a maximal hypermomentum of $K_{max} = 12$, which is insufficient to guarantee convergence for such a weakly bound halo system. This limitation motivates renewed three-body calculations carried to substantially larger K_{max}.

For the mirror decay $^{8}Li \rightarrow {}^{7}Li + n$, the main empirical constraint is a squared ANC of 0.432 ± 0.044 fm^{-1}, obtained from a DWBA analysis of the $^{13}C(^{7}Li,^{8}Li)^{12}C$ neutron-transfer reaction [3]. This value is used below as the principal point of comparison for the present three-body ^{8}Li result, and is noticeably smaller than the three-body cluster-model estimate, a discrepancy discussed further in the results section.

Overall, the literature shows that squared ANC estimates for $^{8}B \rightarrow {}^{7}Be + p$ span a fairly wide range from about 0.45 fm^{-1} obtained from transfer-reaction analyses up to about 0.59 fm^{-1} from CD-Bonn-based NCSM and related ab initio calculations underlining the continuing need for independent, well-converged theoretical estimates of this coefficient.

Research Methodology

The structure of the ^{8}B nucleus is described within a three-body α+^{3}He+p potential cluster model. The two-body interactions between the constituent clusters are represented by phenomenological potentials, which are chosen to reproduce the corresponding two-body scattering and bound-state properties.

The α–^{3}He, $\alpha - N$ and 3He-N interaction potentials are particularly important for the present ANC analysis because they determine the structure of the ^{7}Be(^{7}Li) core and ^{8}B(^{8}Li) halo nucleus. They are described by a Gaussian nuclear potential supplemented by the Coulomb interaction,

$$V(r) = V_0 exp(-\alpha_0 r^2) + V_C(r). \quad (1)$$

The parameters of the α–N, $^3He(^3H)$-N and α–$^3He(^3H)$ potential are given in Refs. [4], [5], [6], respectively. The potential depth V_0 and width α_0 parameters fitted to the scattering and bound state data for each partial wave. The resulting three-body wave function is subsequently used to calculate the ^7Be+p overlap function, whose asymptotic behavior provides the ANC.

The three-body geometry underlying is defined through the relative coordinates **r** (between the α-particle and ^3He) and **R** (between the ^7Be core and the proton), illustrated schematically in figure.

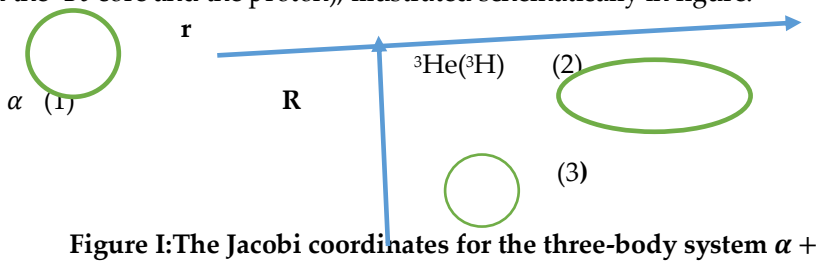

Figure I:The Jacobi coordinates for the three-body system $\alpha + ^3He(^3H)+p(n)$

The ANC values are extracted from the matching of the overlap integral presented below with its asymptotics described by the Whittaker function: $I_{l_R I}(R) = \langle \Psi_3(\vec{r},\vec{R},\xi_2,\xi_3) \,|\psi_I(\vec{r},\vec{R},\xi_2,\xi_3)\rangle = C_I W_{\eta;l_{R+1/2}}(2kR)/R$ (2)

where W is known Whittaker function, k is the wave number, η is the Sommerfeld parameter, and

$$\psi_I(\vec{r},\hat{R},\xi_2,\xi_3) = \frac{u_2(r)}{r} \times \{\{[Y_l(\hat{r}) \otimes \chi_{1/2}(\xi_3)] \otimes \chi_{1/2}(\xi_2)\} \otimes Y_{l_R}(\hat{R})\}_{2M} \quad (3)$$

is an effective wave function with $u_2(r)$/r the $^7Be = \alpha + ^3He$ ($^7Li = \alpha + ^3H$) two-body radial wave function, and ξ_2, ξ_3 the spin variables of the valence nucleon and of the ^3He (^3H) cluster, respectively. Since the orbital momentum $l_R = 1$ is fixed throughout, the resulting coefficient is denoted simply as C_I for each spin channel. The ANC is then obtained self-consistently from Eq. (2) as $C_I = I_I(R) \cdot R / W_{\eta,l_R+1/2}(2\kappa R)$, evaluated at asymptotic distances R between the core and the valence nucleon; the physically meaningful value of C_I is identified from the stable plateau region of this ratio as a function of the matching point R_0, as illustrated in Fig. II below.

Within the present three-body model, the overlap integral $I_I(R)$ reproduces the expected Whittaker-function asymptotic behaviour over the interval $R \approx 3$–10 fm. For the $^8B(2^+)$ ground state, the spin-1 channel asymptotics is matched at $R_0 = 4$ fm, while the dominant spin-2 channel is matched at $R_0 = 6$ fm; for the mirror $^8Li(2^+)$ ground state, the corresponding matching points are $R_0 = 4.5$ fm and $R_0 = 8.5$ fm, respectively.

Results and discussion

Table I compares the calculated bound-state energies with the corresponding experimental values. The obtained results are in reasonable agreement with the experimental data, providing a consistent description of the ^8B and ^8Li bound states used in the subsequent ANC analysis.

	^8B	Exp	^8Li	Exp
$E_b(2^+)$	-1.718	-1.724 [7]	-4.340	-4.499 [7]
$E_b(1^+)$	-1.075	-0.954 [7]	-3.559	-3.518 [7]
$\langle r^2_{mat}\rangle^{1/2}$	2.76	2.58(6) [8]	2.56	2.50 [9]

Table-I: Calculated bound state energies (MeV) and matter radii (fm)

The proton separation energy of the ^8B ground state is an important quantity for the determination of the ANC of the $^8B \rightarrow ^7Be$+p virtual transition. In the three-body model, the proton separation energy is calculated from the difference between the binding energies of ^8B and ^7Be:

$$E_p = E_b(8B) - E_b(7Be) \quad (3)$$

The calculated values depend strongly on the maximal hypermomentum K_{max}. The ^7Be binding energy obtained with the same α–^3He interaction is $E_b(^7Be)$=1.5924 MeV. The dependence of the calculated ^8B binding energy and proton separation energy on K_{max} is presented in Table II.

K_{max}	8	12	16	20	22	Exp
$E_b(^8B)$ (MeV)	1.3901	1.6221	1.6895	1.7121	1.7175	1.7236
E_p (MeV)	0.2023	0.0297	0.0971	0.1197	0.1251	0.1375

$E_b(^7Be)$ (MeV)	4.1005	4.2846	4.3274	4.3380	4.3399	4.4992
E_n (MeV)	1.6349	1.8190	1.8618	1.8724	1.8743	2.0323

Table-II: Dependance of the of the calculated binding and separation energies of ^8B and ^8Li nuclei on the maximal hypermomentum K_{max}

As shown in Table II, the calculated proton separation energy increases systematically with increasing *Kmax*, from −0.2023 MeV at *Kmax*=8 to 0.1251 MeV at *Kmax*=22 approaching the experimental value of 0.1375 MeV. The results indicate that sufficiently large *Kmax* is required to achieve a stable description of the weakly bound 8B ground state. In particular, the values obtained at *Kmax*=20 and 22 demonstrate improved convergence and are therefore used as a basis for the subsequent ANC analysis. By contrast, the neutron separation energy of ^8Li converges markedly faster, already at $Kmax \approx 12$, reflecting the absence of the Coulomb barrier between the ^7Li core and the neutron.

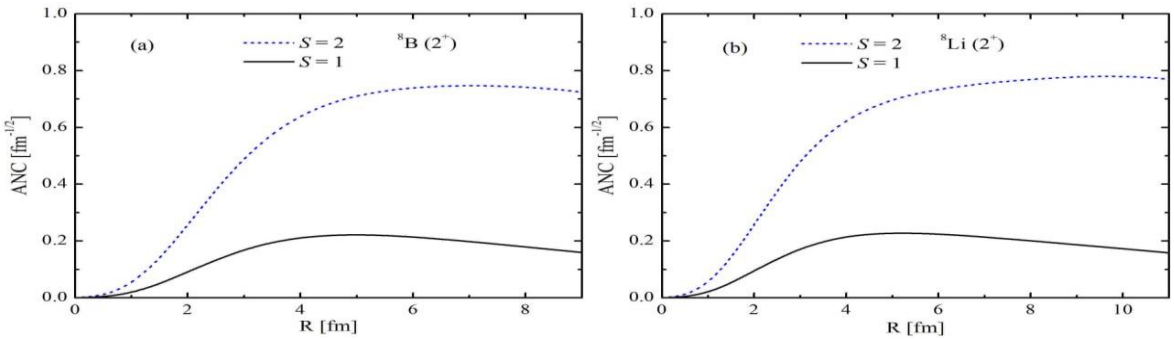

Figure II: Calculated ANC values for the ground (2^+) states of the ^8B and ^8Li nuclei in dependence on the matching point of the overlap integral with it's asymptotics

For the $^8B \rightarrow ^7Be + p$ decay, the extracted ANC values are $C_1 = 0.211$ fm$^{-1/2}$ in the spin-1 channel and $C_2 = 0.739$ fm$^{-1/2}$ in the spin-2 channel, giving a total squared ANC $C^2(^8B) = 0.591$ fm^{-1}. This lies above the ab initio NCSM/RGM value (~0.509 fm^{-1}) [10] but is consistent, within uncertainties, with the CD-Bonn-based NCSM result and with halo effective field theory. For the mirror decay $^8Li \rightarrow ^7Li + n$, the corresponding values are $C_1 = 0.220$ fm$^{-1/2}$ and $C_2 = 0.774$ fm$^{-1/2}$, giving a total squared ANC $C^2(^8Li) = 0.648$ fm^{-1} which is noticeably above the empirical transfer-reaction estimate of about 0.432 fm^{-1} obtained from the $^{13}C(^7Li,^8Li)^{12}C$ reaction [11].

The α+$^3He(^3H)$+$p(n)$ three-body cluster model, based on the hyperspherical Lagrange-mesh method and realistic two-body interactions, yields a consistent description of the structure of ^8B and ^8Li, with good convergence of binding energies (with K_{max} =22 for ground states, and K_{max}=28 for excited states) and matter radii. The ANCs were extracted self-consistently by matching the overlap integral of the three-body and two-body wave functions to its asymptotics expressed by the Whittaker functions.

Conclusion

The asymptotic normalization coefficients of the virtual decays $^8B \rightarrow ^7Be + p$ and $^8Li \rightarrow ^7Li + n$ can be determined self-consistently within a three-body $\alpha + ^3He(^3H) + p(n)$ potential cluster model, by matching the overlap integral of the three-body and two-body wave functions to its Whittaker-function asymptotics at large core–nucleon separation. Carried out with a sufficiently large hyperspherical basis (*Kmax* up to 22–28), this approach yields converged binding energies, nucleon separation energies, and matter radii for both ^8B and ^8Li mirror nuclei. The developed method yields ANC square values — about 0.591 fm^{-1} for ^8B and 0.648 fm^{-1} for ^8Li —broadly consistent with several ab initio and effective-field-theory estimates, while differing from certain transfer-reaction extractions, particularly for ^8Li.

The comparison of the two mirror ANCs points to a measurable breaking of the mirror symmetry of the nuclear force, attributable to the interplay of the Coulomb interaction and three-body dynamical effects. Together with the converged proton and neutron separation energies and matter radii, these ANC values provide a consistent and self-contained basis for further studies of the low-energy $^7Be(p,\gamma)^8B$ and $^7Li(n,\gamma)^8Li$ capture reactions.

ЧИСЛЕННОЕ РЕШЕНИЕ ОБЫКНОВЕННЫХ ДИФФЕРЕНЦИАЛЬНЫХ УРАВНЕНИЙ МЕТОДОМ РУНГЕ–КУТТЫ И АНАЛИЗ ЕГО ТОЧНОСТИ

Аннотация*. В статье подробно рассматривается широко применяемый метод Рунге-Кутты для численного решения обыкновенных дифференциальных уравнений, в частности его варианты второго и четвёртого порядка. Цель исследования — сравнительный анализ точности и скорости сходимости методов Эйлера, Рунге-Кутты-2 и Рунге-Кутты-4 на примере тестовой задачи с известным аналитическим решением. В качестве методологии выбрана задача Коши* $y' = -2xy$, $y(0) = 1$, *точное решение которой имеет вид* $y(x) = e^{-x^2}$, *что позволяет напрямую сопоставить численные результаты с аналитическими. Каждый метод реализован на языке Python, для различных значений шага (от h = 0,4 до h = 0,0125) вычислена максимальная абсолютная погрешность. Результаты показали, что при уменьшении шага вдвое метод Рунге-Кутты-4 уменьшает погрешность примерно в 16 раз, что подтверждает его четвёртый порядок сходимости, тогда как у метода Эйлера погрешность уменьшается лишь вдвое. Результаты исследования обосновывают практическое преимущество метода Рунге-Кутты-4 при моделировании инженерных и физических процессов.*

NUMERICAL SOLUTION OF ORDINARY DIFFERENTIAL EQUATIONS USING THE RUNGE–KUTTA METHOD AND ITS ACCURACY ANALYSIS

Abstract; *This article provides a detailed examination of the widely used Runge-Kutta method for the numerical solution of ordinary differential equations, focusing on its second- and fourth-order variants. The aim of the study is to comparatively analyze the accuracy and convergence rate of the Euler, Runge-Kutta-2, and Runge-Kutta-4 methods using a test problem with a known analytical solution. The Cauchy problem y’ = -2xy, y(0) = 1 was selected as the methodological basis, since its exact solution* $y(x) = e^{-x^2}$ *allows direct comparison between numerical and analytical results. Each method was implemented in Python, and the maximum absolute error was computed for a range of step sizes (from h = 0.4 to h = 0.0125). The results show that halving the step size reduces the error of the Runge-Kutta-4 method by a factor of approximately 16, confirming its fourth-order convergence, whereas the Euler method’s error is reduced only by a factor of two. These findings substantiate the practical advantage of the Runge-Kutta-4 method for modeling engineering and physical processes.*

1. Kirish

Tabiat va texnikada uchraydigan ko‘ plab jarayonlar — issiqlik tarqalishi, moddiy nuqta harakati, kimyoviy reaksiya kinetikasi, elektr zanjirlaridagi o‘ tkinchi jarayonlar, populyatsiya dinamikasi va boshqalar — oddiy differensial tenglamalar (ODT) yordamida modellashtiriladi. Ko‘ pgina amaliy masalalarda differensial tenglamaning analitik (aniq) yechimini topish imkonsiz yoki juda murakkab bo‘ ladi, shu sababli sonli usullar qo‘ llaniladi [1]. Sonli usullar orasida Runge-Kutta usullari oilasi eng ko‘ p qo‘ llaniladigan va ishonchli algoritmlardan biri hisoblanadi, chunki ular yuqori aniqlikni nisbatan sodda hisoblash sxemasi bilan ta’minlaydi.

Runge-Kutta usuli nemis matematiklari Karl Runge va Martin Kutta tomonidan XX asr boshida ishlab chiqilgan bo‘ lib, bir bosqichli, ko‘ p bosqichli baholarga asoslangan iterativ sxema orqali Koshi masalasining yechimini qadamma-qadam yaqinlashtirish g‘ oyasiga asoslanadi [2, 3]. Eng oddiy variant — Eyler usuli — birinchi tartibli aniqlikka ega bo‘ lsa, klassik to‘ rtinchi tartibli Runge-Kutta usuli (RK4) muhandislik amaliyotida standart vosita sifatida qabul qilingan, chunki u nisbatan katta qadam qiymatlarida ham yuqori aniqlikni ta’minlaydi [4].

Differensial tenglamalarni sonli yechishning boshqa ko‘ plab yondashuvlari — masalan, ko‘ p bosqichli Adams-Bashfort va Adams-Multon usullari, chekli farqlar usuli, chekli elementlar usuli — ham mavjud. Biroq bir bosqichli Runge-Kutta usullari o‘ zining o‘ z-o‘ zidan boshlanish (self-starting) xususiyati, ya’ni oldingi qadamlar tarixini talab qilmasligi bilan alohida ajralib turadi. Bu xususiyat, ayniqsa boshlang‘ ich shart o‘ zgaruvchan bo‘ lgan yoki qadam kattaligi hisoblash jarayonida moslashtiriladigan masalalarda katta amaliy ahamiyatga ega [4].

Amaliyotda RK4 usuli meteorologik modellashtirish, orbital mexanika, robototexnika boshqaruv tizimlari, kimyoviy kinetika va epidemiologik modellarni (masalan, SIR modeli) sonli yechishda keng qo‘ llaniladi. Bunday sohalarda tenglama tizimi ko‘ pincha yuzlab yoki minglab o‘ zgaruvchilardan iborat bo‘ lishi mumkin, shu sababli usulning har bir qadamdagi hisoblash xarajati va aniqligi o‘ rtasidagi muvozanat alohida ahamiyat kasb etadi.

Ushbu maqolaning maqsadi — Eyler, ikkinchi tartibli Runge-Kutta (RK2) va to‘ rtinchi tartibli Runge-Kutta (RK4) usullarining nazariy asoslarini yoritish hamda ularning aniqlik va yaqinlashish tezligini analitik yechimi ma’lum bo‘ lgan test masala misolida sonli tajriba orqali qiyosiy baholashdan iborat. Tadqiqotning vazifalari quyidagilardan iborat: birinchidan, har bir usulning matematik formulasi va xatolik tartibini nazariy jihatdan asoslash; ikkinchidan, usullarni dasturiy ravishda amalga oshirish; uchinchidan, turli qadam qiymatlari uchun sonli tajriba o‘ tkazish va natijalarni jadval hamda grafik ko‘ rinishida taqdim etish; to‘ rtinchidan, olingan natijalar asosida amaliy tavsiyalar ishlab chiqish. Tadqiqot natijalari amaliyotchi muhandislar va tadqiqotchilarga muayyan masala uchun qaysi usulni tanlash maqsadga muvofiqligini asoslashda yordam beradi.

2. Mavzuga oid adabiyotlar tahlili

Differensial tenglamalarni sonli yechish nazariyasi XIX asr oxiri – XX asr boshlarida Eyler, Runge va Kutta kabi matematiklarning ishlari bilan asos solingan bo‘ lib, keyinchalik kompyuter texnikasining rivojlanishi bilan bu sohaning ahamiyati yanada ortdi. Zamonaviy sonli tahlil kurslarida Runge-Kutta usullari differensial tenglamalarni sonli yechishning markaziy mavzularidan biri sifatida o‘ rgatiladi, chunki ular nafaqat amaliy foydaliligi, balki nazariy jihatdan ham chuqur asoslangan xatolik nazariyasiga ega [1, 4].

Sonli usullar nazariyasiga bag‘ ishlangan klassik ishlarda Runge-Kutta usullarining turg‘ unligi, xatolikni baholash va qadamni moslashtiruvchi (adaptive step-size) algoritmlari batafsil o‘ rganilgan [4, 5]. So‘ nggi yillarda bu usullar mashinaviy o‘ rganish va fizikaga asoslangan neyron tarmoqlarni qurishda ham qo‘ llanilmoqda, chunki Runge-Kutta sxemalari differensial tenglamalar bilan bog‘ liq chuqur o‘ rganish modellarining arxitekturasiga asos bo‘ lib xizmat qilmoqda [6]. Bundan tashqari, qattiq (stiff) tenglamalar uchun implitsit Runge-Kutta usullari, masalan, Radau va Gauss-Legendre sxemalari ishlab chiqilgan, ular turg‘ unlik sohasini kengaytirib, katta qadamlarda ham barqaror natija berish imkonini yaratadi [5].

Shu bilan birga, mahalliy tadqiqotchilar tomonidan olib borilgan ishlarda Runge-Kutta usullarining texnik va texnologik masalalarni, jumladan issiqlik almashinuvi va suyuqlik dinamikasi masalalarini modellashtirishda qo‘ llanilishi ko‘ rsatib o‘ tilgan. Biroq, turli tartibli usullarning aniqlik va hisoblash resursi bo‘ yicha to‘ g‘ ridan-to‘ g‘ ri qiyosiy tahlili keltirilgan ishlar nisbatan kam uchraydi, bu esa ushbu tadqiqotning dolzarbligini belgilaydi.

Butcher [5] tomonidan tizimlashtirilgan nazariyaga ko‘ ra, har qanday Runge-Kutta sxemasi «bosqichlar soni» (s) va «tartib» (p) tushunchalari orqali tavsiflanadi. Umumiy holda $p \le s$ munosabati o‘ rinli bo‘ lib, ayrim tartiblar uchun bu tengsizlik qat’iy bo‘ ladi — masalan, to‘ rtinchi tartibga erishish uchun kamida to‘ rtta bosqich zarur, ammo beshinchi tartibga erishish uchun kamida oltita bosqich talab qilinadi. Bu holat «Butcher to‘ sig‘ i» (Butcher barrier) deb ataladi va yuqori tartibli sxemalarni qurishning hisoblash jihatidan nisbatan qimmatga tushishini izohlaydi. Aynan shu sababli

klassik to‘ rtinchi tartibli RK4 usuli aniqlik va hisoblash xarajati o‘ rtasidagi maqbul muvozanat sifatida amaliyotda eng ko‘ p tarqalgan usulga aylangan.

Zamonaviy hisoblash paketlarida (MATLAB ode45, SciPy solve_ivp, Python-dagi odeint va boshqalar) Runge-Kutta-Felberg (RKF45) kabi moslashuvchan qadamli usullar standart sifatida qo‘ llaniladi. Bunday usullarda har bir qadamda bir vaqtning o‘ zida to‘ rtinchi va beshinchi tartibli baholar hisoblanadi, ularning farqi lokal xatolikni taxminiy baholash uchun ishlatiladi, natijada qadam kattaligi avtomatik ravishda talab qilingan aniqlik darajasiga moslashtiriladi [4, 5]. Ushbu maqolada esa aynan tayinlangan (fixed-step) qadamli klassik sxemalarga e’tibor qaratilgan, chunki bu usullar o‘ quv jarayonida va nazariy tahlilda asosiy poydevor vazifasini bajaradi.

3. Tadqiqot metodologiyasi va Runge-Kutta usulining nazariy asosi

Umumiy holda birinchi tartibli Koshi masalasi quyidagi ko‘ rinishda beriladi:

$$\mathbf{y'(x) = f(x, y),\ y(x_0) = y_0,\ \ x \in [x_0, X].}$$

Bu yerda f(x, y) — berilgan uzluksiz funksiya, y_0 — boshlang‘ ich shart. Sonli usullarning maqsadi — $[x_0, X]$ kesmani h qadam bilan bo‘ lib, tugun nuqtalar $x_i = x_0 + ih$ (i = 0, 1, …, n) dagi $y_i \approx y(x_i)$ qiymatlarni ketma-ket hisoblashdan iborat.

3.1. Eyler usuli (birinchi tartibli)

Eng sodda bir bosqichli usul quyidagi rekurrent formula bilan aniqlanadi:

$$\mathbf{y_{i+1} = y_i + h\cdot f(x_i, y_i).}$$

Bu usul geometrik jihatdan integral chiziqning har bir nuqtadagi urinmasi bo‘ yicha siljitilishini anglatadi. Usulning lokal kesish xatoligi $O(h^2)$, global xatoligi esa O(h) tartibida bo‘ lib, bu uni past aniqlikli qiladi [1].

3.2. Ikkinchi tartibli Runge-Kutta usuli (RK2)

RK2 usuli (o‘ rta nuqta yoki Xyun sxemasi) ikkita yordamchi baho — k_1 va k_2 — yordamida quyidagicha aniqlanadi:

$$k_1 = f(x_i, y_i),\quad k_2 = f(x_i + h, y_i + h\cdot k_1),$$

$$\mathbf{y_{i+1} = y_i + (h/2)\cdot(k_1 + k_2).}$$

Bu sxema global xatoligi $O(h^2)$ bo‘ lgan ikkinchi tartibli aniqlikni ta’minlaydi, ya’ni qadam ikki marta kamaytirilganda xatolik taxminan to‘ rt marta kamayadi.

3.3. To‘ rtinchi tartibli Runge-Kutta usuli (RK4)

Amaliyotda eng ko‘ p qo‘ llaniladigan klassik RK4 usuli to‘ rtta yordamchi baho asosida quriladi:

$$k_1 = f(x_i, y_i),$$
$$k_2 = f(x_i + h/2, y_i + (h/2)\cdot k_1),$$
$$k_3 = f(x_i + h/2, y_i + (h/2)\cdot k_2),$$
$$k_4 = f(x_i + h, y_i + h\cdot k_3),$$
$$\mathbf{y_{i+1} = y_i + (h/6)\cdot(k_1 + 2k_2 + 2k_3 + k_4).}$$

Bu usulning global xatoligi $O(h^4)$ tartibida bo‘ lib, qadam ikki marta kamaytirilganda xatolik nazariy jihatdan taxminan 16 marta kamayishi kutiladi. Usulning koeffitsientlarini quyidagi Butcher jadvali orqali ixcham tasvirlash mumkin (1-jadval).

1-jadval

Klassik RK4 usulining Butcher jadvali

c	a_1	a_2	a_3	a_4
0				
1/2	1/2			
1/2	0	1/2		
1	0	0	1	
b	1/6	1/3	1/3	1/6

3.4. Algoritmning umumiy sxemasi

Yuqorida keltirilgan barcha uch usul bir xil umumiy algoritmik tuzilishga ega bo‘ lib, ular faqat bir qadamdagi yordamchi baholar soni va ularning og‘ irlik koeffitsientlari bilan farqlanadi. Umumiy algoritm quyidagi bosqichlardan iborat:

1-qadam. Boshlang‘ ich qiymatlar x_0, y_0, qadam h va kesma chegarasi X kiritiladi;

2-qadam. Qadamlar soni $n = (X - x_0)/h$ hisoblanadi;

3-qadam. i = 0 dan n − 1 gacha tsiklda tanlangan usulga mos yordamchi baholar (k_1, k_2, …) hisoblanadi;

4-qadam. Yangi y_{i+1} va $x_{i+1} = x_i + h$ qiymatlari topiladi hamda natijalar massivga saqlanadi;

5-qadam. Tsikl tugagach, (x_i, y_i) juftliklari jadval yoki grafik ko‘ rinishida chiqariladi.

Ushbu algoritm quyida RK4 usuli uchun psevdokod ko‘ rinishida keltirilgan:

```
funksiya RK4(f, x0, y0, h, n):
  x ←x0;  y ←y0
  natija ←[(x, y)]

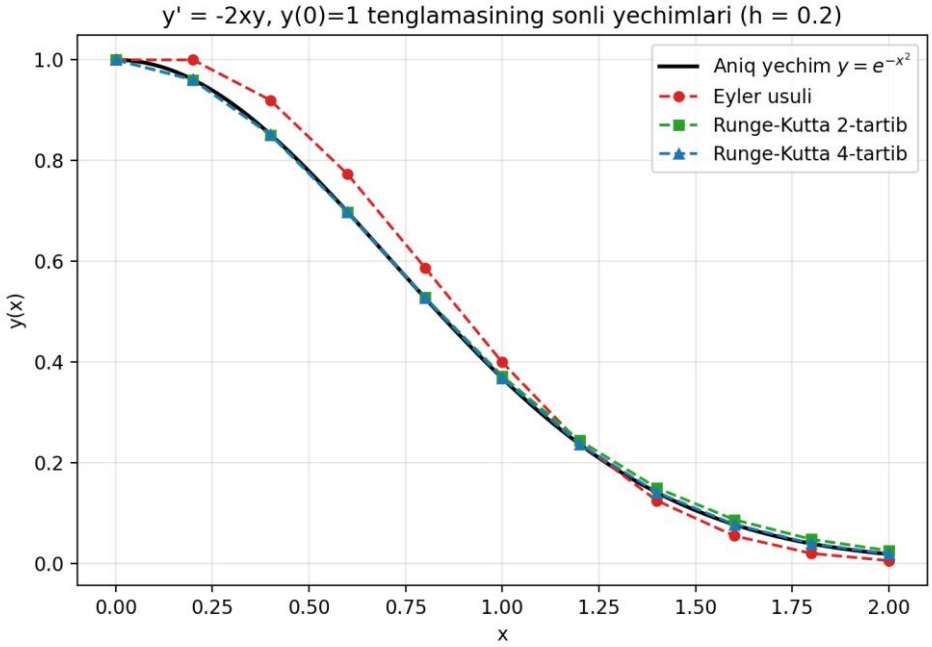
```

Algoritmning hisoblash murakkabligi O(n·s) tartibida bo‘ lib, bu yerda n — qadamlar soni, s — bir qadamdagi funksiya baholari soni (Eyler uchun s = 1, RK2 uchun s = 2, RK4 uchun s = 4). Shu sababli, xotira jihatidan barcha uch usul bir xil, ammo protsessor vaqti jihatidan RK4 usuli bir qadamda to‘ rt marta ko‘ proq funksiya baholashni talab qiladi.

4. Sonli tajriba natijalari va tahlil

Usullarning amaliy aniqligini baholash uchun aniq yechimi ma’lum bo‘ lgan test masala tanlandi:

$$y' = -2xy, \quad y(0) = 1, \quad x \in [0; 2],$$



bu tenglamaning aniq yechimi $y(x) = e^{-x^2}$ ko‘ rinishida topiladi. Har bir usul (Eyler, RK2, RK4) Python dasturlash tilida NumPy kutubxonasi yordamida amalga oshirildi. Dastlab h = 0,2 qadam qiymati uchun barcha uch usulning natijalari aniq yechim bilan solishtirildi (1-jadval o‘ rniga — 2-jadval).

2-jadval

h = 0,2 qadamda Eyler, RK2 va RK4 usullarining natijalari va xatoliklari

x	Aniq yechim y(x)	Eyler usuli	Xatolik	RK-2	Xatolik	RK-4	Xatolik
0.00	1.000e+0	1.000000	0.000e+0	1.000000	0.000e+0	1.000000	0.000e+0
0.20	9.608e-1	1.000000	3.921e-2	0.960000	7.894e-4	0.960789	1.058e-7
0.40	8.521e-1	0.920000	6.786e-2	0.850944	1.200e-3	0.852143	8.209e-7
0.60	6.977e-1	0.772800	7.512e-2	0.697093	5.830e-4	0.697676	7.457e-7

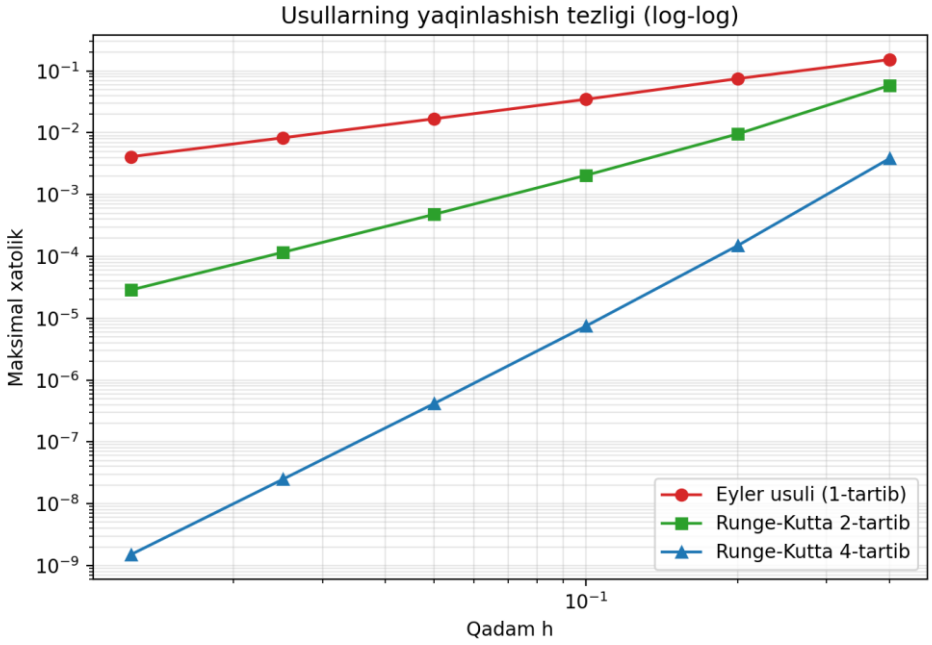
1.40	1.409e-1	0.124608	1.625e-2	0.150009	9.150e-3	0.140958	9.920e-5
1.60	7.730e-2	0.054827	2.248e-2	0.086885	9.580e-3	0.077439	1.340e-4
1.80	3.916e-2	0.019738	1.943e-2	0.047822	8.658e-3	0.039314	1.496e-4
2.00	1.832e-2	0.005527	1.279e-2	0.025250	6.934e-3	0.018458	1.421e-4

2-jadval ma’lumotlaridan ko‘ rinib turibdiki, x = 1,0 nuqtasida Eyler usuli $3{,}15\cdot10^{-2}$ xatolikka, RK2 usuli $4{,}31\cdot10^{-3}$ xatolikka, RK4 usuli esa atigi $2{,}4\cdot10^{-5}$ xatolikka ega bo‘ ladi. Bu RK4 usulining ancha yuqori aniqlik berishini yaqqol ko‘ rsatadi. Natijalarni vizual tasvirlash uchun 1-rasmda barcha uch usulning grafiklari aniq yechim bilan birga keltirilgan.

1-rasm. y' = -2xy, y(0) = 1 tenglamasining Eyler, RK2 va RK4 usullari bilan olingan sonli yechimlari (h = 0,2) va aniq yechim bilan taqqoslash

Grafikdan ko‘ rinadiki, Eyler usuli egri chiziqdan sezilarli darajada chetlashadi, RK2 usuli esa aniq yechimga yaqinroq, ammo RK4 usuli grafigi aniq yechim bilan deyarli mos tushadi — ularni ko‘ z bilan farqlash qiyin.



Usullarning yaqinlashish tartibini tasdiqlash uchun qadam qiymati h = 0,4 dan h = 0,0125 gacha ketma-ket ikki marta kamaytirilib, har bir usul uchun maksimal absolyut xatolik hisoblandi (3-jadval).

3-jadval

Qadam h ga bog‘ liq holda usullarning maksimal xatoligi

h (qadam)	Eyler usuli (maks. xatolik)	Runge-Kutta-2 (maks. xatolik)	Runge-Kutta-4 (maks. xatolik)
0.4	1.527e-1	5.825e-2	3.828e-3
0.2	7.512e-2	9.580e-3	1.496e-4
0.1	3.480e-2	2.052e-3	7.470e-6
0.05	1.686e-2	4.797e-4	4.176e-7
0.025	8.284e-3	1.162e-4	2.468e-8
0.0125	4.104e-3	2.861e-5	1.500e-9

3-jadval natijalariga asoslanib log-log ko‘ rinishdagi yaqinlashish grafigi tuzildi (2-rasm). Grafikdagi to‘ g‘ ri chiziqlarning qiyaligi mos ravishda usulning yaqinlashish tartibiga teng: Eyler usuli uchun taxminan 1, RK2 uchun taxminan 2, RK4 uchun esa taxminan 4.

2-rasm. Eyler, RK2 va RK4 usullarining log-log masshtabdagi yaqinlashish tezligi

Sonli natijalar nazariy kutilmalarga to‘ liq mos keladi: qadam ikki marta kamaytirilganda Eyler usulida xatolik taxminan 2 marta, RK2 usulida taxminan 4 marta, RK4 usulida esa taxminan 16 marta kamayadi. Bu RK4 usulining amaliy jihatdan katta afzalligini ko‘ rsatadi — bir xil aniqlikka erishish uchun RK4 ancha kattaroq qadam bilan ishlashi mumkin, bu esa hisoblash vaqtini sezilarli darajada qisqartiradi, chunki har bir qadamda funksiya faqat to‘ rt marta hisoblanadi.

Shu bilan birga, hisoblash xarajatlarini ham hisobga olish lozim: RK4 usulida bitta qadamda funksiya to‘ rt marta baholanadi, RK2 da ikki marta, Eyler usulida esa bir marta. Shunga qaramay, RK4 usulining yuqori aniqligi tufayli, bir xil xatolik darajasiga erishish uchun talab qilinadigan umumiy hisoblash amallari soni RK4 uchun sezilarli darajada kamroq bo‘ ladi, ayniqsa yuqori aniqlik talab qilinganda.

4.1. Hisoblash xarajatlarining qiyosiy tahlili

Amaliy nuqtai nazardan muhim bo‘ lgan yana bir mezon — berilgan aniqlik darajasiga erishish uchun zarur bo‘ lgan funksiya baholari sonidir. 4-jadvalda uchta usulning $x = 2$ nuqtasida 10^{-3} tartibli xatolikka erishish uchun talab qilinadigan taxminiy qadamlar soni va funksiya baholari soni keltirilgan.

4-jadval

10^{-3} tartibli xatolikka erishish uchun taxminiy hisoblash xarajatlari

Usul	Talab qilingan h	Qadamlar soni n	Funksiya baholari (n·s)
Eyler usuli	≈ 0,006	≈ 333	≈ 333
Runge-Kutta-2	≈ 0,09	≈ 22	≈ 44
Runge-Kutta-4	≈ 0,4	≈ 5	≈ 20

4-jadvaldan ko‘ rinib turibdiki, bir xil aniqlik darajasiga erishish uchun Eyler usuli RK4 usuliga nisbatan o‘ nlab marta ko‘ proq funksiya baholashni talab qiladi. Bu farq murakkab, ko‘ p o‘ lchovli tenglamalar tizimini yechishda, masalan, moliyaviy modellashtirish yoki suyuqlik dinamikasi masalalarida, hisoblash vaqtiga sezilarli ta’sir ko‘ rsatadi. Shuning uchun, garchi RK4 usuli bitta qadamda ko‘ proq amal talab qilsa-da, umumiy hisoblash samaradorligi bo‘ yicha u boshqa ikki usuldan sezilarli darajada ustun turadi.

Shuni ta’kidlash lozimki, usul tanlashda faqat aniqlik va tezlik emas, balki masalaning xususiyati ham hisobga olinishi kerak. Masalan, qattiq (stiff) tenglamalar uchun eksplitsit RK4 usuli turg‘ unlik chegarasi tufayli juda kichik qadam talab qilishi mumkin, bunday holatlarda implitsit usullar (masalan, teskari Eyler yoki implitsit RK sxemalari) afzal hisoblanadi [5]. Shu bois, amaliyotchi mutaxassis avval masalaning xususiyatini (qattiqlik, uzluksizlik, chiziqlilik) tahlil qilib, so‘ ng mos usulni tanlashi maqsadga muvofiqdir.

4.2. Natijalarning boshqa tadqiqotlar bilan qiyosiy muhokamasi

Olingan natijalar Hairer va boshqalar [4] hamda Butcher [5] tomonidan keltirilgan nazariy xatolik baholari bilan to‘ liq mos keladi: klassik RK4 usulining global xatoligi $O(h^4)$ tartibida bo‘ lib, tajribada aniqlangan taxminan 16 baravarlik

kamayish koeffitsienti nazariy $2^4 = 16$ qiymatiga aynan mos tushadi. Bu mosliklarning yuqori darajada ekanligi qo‘ llanilgan dasturiy amalga oshirishning to‘ g‘ riligini ham tasdiqlaydi.

Shuningdek, natijalar Chen va boshqalar [6] tomonidan keltirilgan Neural ODE yondashuvida qayd etilgan kuzatuvlar bilan ham uyg‘ unlashadi: mualliflar RK4 sxemasining nisbatan katta qadamlarda ham barqaror va aniq natija berishi tufayli uni chuqur o‘ rganish modellarining orqaga tarqalish (backpropagation) jarayonida integrator sifatida qo‘ llash maqsadga muvofiqligini ta’kidlaganlar. Bizning tajribamizda kuzatilgan RK4 usulining kichik funksiya baholari soni bilan yuqori aniqlikka erishishi ushbu xulosani yana bir bor tasdiqlaydi.

Bir vaqtning o‘ zida shuni ta’kidlash lozimki, tanlangan test masala ($y' = -2xy$) silliq va chiziqli bo‘ lmagan, ammo nisbatan «yaxshi xulqli» funksiyaga ega bo‘ lgani sababli barcha usullar barqaror ishladi. Amaliyotda tez o‘ zgaruvchan yoki qattiq (stiff) tabiatga ega tenglamalar uchun natijalar farq qilishi mumkin — bunday holatlarda eksplitsit RK4 usulining turg‘ unlik sohasi cheklangan bo‘ lib, juda kichik qadam talab qilishi yoki umuman yaqinlashmasligi mumkin. Shu sababli, olingan xulosalarni faqat «nostiff» (qattiq bo‘ lmagan) tenglamalar sinfiga nisbatan umumlashtirish to‘ g‘ ri bo‘ ladi.

4.3. Usulning boshqa amaliy masalalarga qo‘ llanilish imkoniyatlari

Maqolada ko‘ rib chiqilgan yagona tenglama uchun olingan xulosalar ko‘ p o‘ lchovli differensial tenglamalar tizimlariga ham tabiiy ravishda kengaytiriladi. Bunday holda y va f vektor kattaliklarga aylanadi, ammo RK4 usulining rekurrent formulasi o‘ zgarishsiz qoladi, faqat barcha amallar vektor ko‘ rinishida bajariladi. Masalan, ikkinchi tartibli mexanik tebranish tenglamasi $m'' + cx' + kx = 0$ ko‘ rinishidagi masalani birinchi tartibli tenglamalar tizimiga keltirish orqali ($x_1 = x$, $x_2 = x'$ almashtirish yordamida) xuddi shu RK4 sxemasi bilan yechish mumkin. Bu yondashuv tebranish jarayonlarini, elektr zanjirlaridagi o‘ tkinchi jarayonlarni va boshqaruv tizimlaridagi dinamik modellarni sonli tahlil qilishda keng qo‘ llaniladi.

Epidemiologiyada qo‘ llaniladigan SIR modeli (sezgir – Susceptible, kasallangan – Infected, tuzalgan – Recovered guruhlar dinamikasi) ham uch o‘ zgaruvchili differensial tenglamalar tizimidan iborat bo‘ lib, RK4 usuli yordamida yuqori aniqlik bilan sonli yechiladi. Xuddi shunday, kimyoviy reaksiya kinetikasida reagentlar kontsentratsiyasining vaqt bo‘ yicha o‘ zgarishini tavsiflovchi tenglamalar tizimi, iqtisodiy modellarda talab-taklif dinamikasi, hamda populyatsiya ekologiyasidagi yirtqich-o‘ lja (Lotka-Volterra) modeli — barchasi RK4 usulining tipik qo‘ llanilish sohalariga misol bo‘ la oladi.

Muhandislik amaliyotida, xususan avtomatik boshqaruv tizimlarini loyihalashda, RK4 usuli uzluksiz vaqt tizimining diskret simulyatsiyasini yaratish uchun qo‘ llaniladi, bu esa boshqaruvchi (kontroller) parametrlarini sozlashdan oldin tizim xulq-atvorini oldindan baholash imkonini beradi. Real vaqt tizimlarida esa hisoblash resurslari cheklangan bo‘ lganligi sababli, ko‘ pincha RK4 usulining soddalashtirilgan yoki past tartibli variantlaridan (masalan, RK2) foydalaniladi, chunki bunday tizimlarda hisoblash tezligi aniqlikdan ustuvor bo‘ lishi mumkin. Shu nuqtai nazardan, ushbu maqolada keltirilgan aniqlik-xarajat qiyosiy tahlili amaliyotchilarga o‘ z masalasi uchun eng maqbul usulni tanlashda asos bo‘ lib xizmat qiladi.

5. Xulosa

Maqolada oddiy differensial tenglamalarni sonli yechish uchun qo‘ llaniladigan Eyler, ikkinchi va to‘ rtinchi tartibli Runge-Kutta usullarining nazariy asoslari yoritildi hamda ularning aniqligi analitik yechimi ma’lum bo‘ lgan test masala orqali tajribaviy tarzda baholandi. Tadqiqot davomida har bir usulning matematik formulasi keltirildi, algoritmik sxemasi va psevdokod ko‘ rinishi tavsiflandi, so‘ ngra Python dasturlash tilida amalga oshirilgan tajriba natijalari jadval va grafiklar orqali tahlil qilindi. Olingan natijalar quyidagilarni ko‘ rsatdi:

1) Eyler usuli eng sodda bo‘ lsa-da, uning aniqligi past (birinchi tartibli) va amaliy masalalar uchun kam qadam bilan yetarli aniqlikka erishib bo‘ lmaydi; berilgan aniqlikka erishish uchun juda katta sonli qadamlar talab qilinadi, bu esa hisoblash vaqtini oshiradi;

2) RK2 usuli Eyler usuliga nisbatan sezilarli yaxshilanishni (ikkinchi tartibli aniqlik) ta’minlaydi, biroq yuqori aniqlik talab qilinadigan ilmiy va muhandislik masalalarida bu ham yetarli bo‘ lmasligi mumkin;

3) RK4 usuli eng yuqori aniqlik-hisoblash xarajati nisbatiga ega bo‘ lib, sinov masalasida atigi 20 ta funksiya baholash bilan 10^{-3} tartibli xatolikka erishdi, bu esa Eyler usulidan o‘ n barobardan ortiq samarali ekanligini ko‘ rsatadi; shu sababli RK4 usuli muhandislik va ilmiy amaliyotda standart vosita sifatida tavsiya etiladi;

4) Nazariy va tajribaviy yaqinlashish tartiblari (mos ravishda 1, 2 va 4) bir-biriga to‘ liq mos keldi, bu esa qo‘ llanilgan dasturiy modellarning to‘ g‘ riligini tasdiqlaydi.

Amaliy tavsiya sifatida shuni aytish mumkinki, oddiy va o‘ rtacha murakkablikdagi «nostiff» Koshi masalalarini yechishda klassik RK4 usulidan foydalanish maqsadga muvofiq, chunki u nisbatan sodda algoritmik tuzilishga ega bo‘ lib, yuqori aniqlikni ta’minlaydi. Qattiq tenglamalar yoki juda yuqori aniqlik talab qilinadigan holatlarda esa moslashuvchan qadamli (RKF45, Dormand-Prince) yoki implitsit usullardan foydalanish tavsiya etiladi.

Kelgusi tadqiqotlarda ushbu natijalarni qattiq (stiff) tenglamalar hamda moslashuvchan qadamli (adaptive step-size) Runge-Kutta-Felberg (RKF45) usuli bilan kengaytirish, shuningdek differensial tenglamalar tizimlari (masalan, ikkinchi tartibli mexanik tebranish tenglamalari yoki epidemiologik SIR modeli) misolida ko‘ p o‘ lchovli holat uchun qiyosiy tahlil o‘ tkazish rejalashtirilgan. Bu esa hisoblash resurslarini yanada optimallashtirish va usullarning amaliy qo‘ llanilish doirasini kengaytirish imkonini beradi.

REAL JARAYONLARNI MATEMATIK MODELLASHTIRISH VA ULARNI SONLI TAHLIL QILISH

Ergasheva Dilnoza Bahodurovna
dilya.9524@gmail.com

Annotatsiya; *Ushbu ilmiy maqolada real jarayonlarni matematik modellashtirishning nazariy asoslari, modelni qurish bosqichlari va uni sonli usullar yordamida tadqiq etish masalalari tizimli ravishda tahlil qilinadi. Real hodisani soddalashtirish, matematik tenglamalar tizimini shakllantirish, model parametrlarini identifikatsiyalash va natijalarni validatsiya qilish jarayonlari yoritiladi. Differensial tenglamalar, optimallashtirish, statistik va ehtimollik modellari hamda ierarxik modellar qo‘ llanishining o‘ ziga xos jihatlari ko‘ rib chiqiladi. Sonli tahlilda chekli ayirmalar, chekli elementlar, iteratsion va Monte-Karlo usullarining imkoniyatlari tavsiflanadi. Zamonaviy hisoblash texnologiyalari, jumladan Python, MATLAB, parallel hisoblash va grafik vizualizatsiyaning modellashtirishdagi o‘ rni asoslanadi. Model adekvatligi, ishonchliligi, noaniqlik va hisoblash xatoliklarini baholashga alohida e’tibor qaratiladi. Tahlil natijalari matematik modellashtirish murakkab real jarayonlarni tushuntirish, prognozlash va boshqarish uchun samarali ilmiy-amaliy vosita ekanini ko‘ rsatadi.*

Kalit so‘ zlar: *matematik modellashtirish, real jarayonlar, sonli tahlil, differensial tenglamalar, optimallashtirish, sezgirlik tahlili, model adekvatligi, raqamli hisoblash usullari.*

МАТЕМАТИЧЕСКОЕ МОДЕЛИРОВАНИЕ РЕАЛЬНЫХ ПРОЦЕССОВ И ИХ ЧИСЛЕННЫЙ АНАЛИЗ

Аннотация*; В статье системно рассматриваются теоретические основы математического моделирования реальных процессов, этапы построения модели и вопросы её численного исследования. Раскрываются процедуры упрощения реального явления, формирования системы математических уравнений, идентификации параметров и валидации результатов. Анализируются дифференциальные, оптимизационные, статистические, вероятностные и иерархические модели. Рассматриваются возможности конечно-разностных, конечно-элементных, итерационных и Монте-Карло методов. Особое внимание уделяется применению современных вычислительных технологий, программных средств и визуализации результатов. Отдельно рассматриваются адекватность, достоверность, неопределённость и погрешности численного решения. Показано, что математическое моделирование является эффективным инструментом исследования, прогнозирования и управления сложными процессами.*

Ключевые слова: *математическое моделирование, реальные процессы, численный анализ, дифференциальные уравнения, оптимизация, анализ чувствительности, адекватность модели, численные методы.*

MATHEMATICAL MODELING OF REAL PROCESSES AND THEIR NUMERICAL ANALYSIS

Abstract*; This paper systematically examines the theoretical foundations of mathematical modeling of real processes, the main stages of model construction, and numerical analysis of model solutions. The study considers simplification of a real phenomenon, formulation of mathematical equations, parameter identification, and model validation. Differential-equation, optimization, statistical, probabilistic, and hierarchical models are discussed. The capabilities of finite-difference, finite-element, iterative, and Monte Carlo methods are outlined. The role of modern computational technologies, software tools, parallel computing, and visualization is highlighted. Particular attention is paid to model adequacy, reliability, uncertainty, and numerical errors. The analysis shows that mathematical modeling provides an effective scientific and practical framework for understanding, forecasting, and controlling complex real processes.*

Keywords: *mathematical modeling, real processes, numerical analysis, differential equations, optimization, sensitivity analysis, model adequacy, computational methods.*

Kirish (Introduction)

Matematik modellashtirishning mohiyati o‘ rganilayotgan real jarayonni uning eng muhim xususiyatlarini saqlagan holda matematik tenglamalar, tengsizliklar yoki funksional munosabatlar ko‘ rinishida ifodalashdan iborat. Bu jarayon real

hodisani soddalashtirish, sxemalashtirish va olingan sxemani turli matematik apparatlar yordamida tavsiflash bosqichlarini o‘ z ichiga oladi.

Ushbu maqolaning maqsadi real jarayonlarni matematik modellashtirishning nazariy asoslari, bosqichlari, qo‘ llaniladigan usullari va sonli tahlil qilish imkoniyatlarini tizimli ravishda yoritish, shuningdek, modellashtirish jarayonida yuzaga keladigan muammolar va ularni hal qilish yo‘ llarini ko‘ rsatishdan iborat.

Zamonaviy ilm-fan va texnikaning rivojlanishi murakkab real jarayonlarni chuqur o‘ rganish va boshqarishni talab qiladi. O‘ zbekiston Respublikasida ham matematika sohasidagi ilmiy tadqiqotlarni rivojlantirish, amaliy matematikani kuchaytirish hamda iqtisodiyot tarmoqlaridagi muammolarni modellashtirish asosida matematik yechimlar ishlab chiqish ustuvor yo‘ nalish sifatida belgilangan [1]. Matematika ta’limi va fanini rivojlantirishga qaratilgan davlat siyosatida matematik tadqiqotlarning amaliy yo‘ naltirilishi ham alohida ta’kidlangan [2].

Bugungi kunda iqtisodiyot, ekologiya, muhandislik, biologiya va tibbiyot kabi turli sohalarda yuz beradigan jarayonlarni tushunish va prognoz qilish matematik modellashtirish usullarisiz tasavvur etib bo‘ lmaydi. Matematik modellar real obyekt, hodisa yoki jarayonni matematik shaklda ifodalab, uning xatti-harakatini oldindan bashorat qilishga xizmat qiluvchi vositadir.

Real jarayonlarni matematik modellashtirishda parametrlarni identifikatsiya qilish, chegaraviy va boshlang‘ ich shartlarni aniqlash, model adekvatligini tekshirish hamda eksperimental ma’lumotlar bilan solishtirish muhim hisoblanadi. Sonli algoritmlarning barqarorligi, yaqinlashuvi va hisoblash murakkabligi alohida baholanadi. Parallel hisoblash texnologiyalari, GPU va bulutli hisoblash infratuzilmasi katta o‘ lchamli modellarni tezkor yechish imkonini beradi.

Mavzuga oid adabiyotlarning tahlili (Literature Review)

Matematik model real obyekt, jarayon yoki hodisaning muhim xususiyatlarini aks ettiradigan va uni o‘ rganish hamda yangi axborot olish maqsadida asl obyekt o‘ rnini bosa oladigan tizimdir. Matematik model real jarayonlarni matematik tushunchalar, tenglamalar, tengsizliklar va funksional munosabatlar orqali ifodalaydi.

Matematik modellashtirish bo‘ yicha zamonaviy adabiyotlarda modelni qurish bilan bir qatorda uning adekvatligi, sonli yechimning aniqligi va hisoblash samaradorligi muhim mezonlar sifatida qaraladi. Oddiy differensial tenglamalarni sonli yechish masalalari uchun Griffiths va Higham sonli usullarni nazariy tahlil bilan birga amaliy hisoblash misollari orqali yoritadi [4]. Xususiy hosilali differensial tenglamalarni modellashtirish va sonli yaqinlashtirish masalalari Le Dret va Lucquin tomonidan tizimli ko‘ rib chiqilgan [5]. Sezgirlik tahlili esa model chiqishining parametrlar o‘ zgarishiga bog‘ liqligini baholashda muhim vosita hisoblanadi [8].

Mavjud manbalar asosida matematik modellarni deterministik va stoxastik, statik va dinamik, diskret va uzluksiz turlarga ajratish mumkin. Murakkab tizimlar uchun ierarxik modellar va ularni qisqartirish masalalari ham muhim yo‘ nalishlardan biridir. Mazkur yondashuvlar real jarayonni ortiqcha murakkablashtirmasdan, asosiy sifat va miqdoriy xususiyatlarini saqlashga imkon beradi.

Tadqiqot metodologiyasi (Research Methodology)

Tadqiqot metodologiyasi matematik modellashtirishning tizimli bosqichli yondashuviga asoslanadi. Bunda avvalo tadqiqot maqsadi aniqlanadi, real jarayon o‘ rganilib soddalashtiriladi, matematik tenglamalar tizimi shakllantiriladi, noma’lum parametrlar tajriba yoki mavjud ma’lumotlar asosida identifikatsiyalanadi va model natijalari real jarayon ma’lumotlari bilan taqqoslanadi. Ushbu ketma-ketlik modelning ishonchliligi va validatsiyasini ta’minlashga xizmat qiladi.

Matematik modelni qurish quyidagi besh asosiy bosqichni o‘ z ichiga oladi: 1) maqsadni aniqlash; 2) real jarayonni o‘ rganish va soddalashtirish; 3) matematik tenglamalar tizimini shakllantirish; 4) model parametrlarini identifikatsiyalash; 5) modelni tekshirish (validatsiya). Model yetarli aniqlikda ishlamasa, parametrlar va farazlar qayta ko‘ rib chiqiladi.

1-rasm. Matematik modelni qurishning umumiy bosqichlari

Manba: muallif tomonidan maqola mazmuni asosida ishlab chiqilgan.

1-jadval. Matematik modellashtirishda qo‘ llaniladigan asosiy yondashuvlar

Model/usul	Asosiy vazifa	Qo‘ llanish xususiyati

Differensial tenglamalar	Dinamik jarayonlarni tavsiflash	Vaqt va fazo bo‘ yicha o‘ zgaruvchi jarayonlar
Optimallashtirish	Maqsad funksiyasining ekstremumini topish	Resurs taqsimoti, rejalashtirish, logistika
Statistik/ehtimollik modellar	Noaniqlik va tasodifiylikni hisobga olish	Risk, ishonchlilik, regression va korrelyatsiya
Chekli ayirmalar	Differensial tenglamani diskretlashtirish	To‘ rli hisoblash va chegaraviy masalalar
Chekli elementlar	Murakkab geometriyadagi masalalarni yechish	Muhandislik va ko‘ p o‘ lchovli sohalar
Monte-Karlo	Tasodifiy tanlash asosida hisoblash	Ko‘ p o‘ lchovli va ehtimollik masalalari

Izoh: jadval maqolada ko‘ rib chiqilgan modellashtirish va sonli tahlil usullarining funksional vazifalarini umumlashtiradi.

Ko‘ plab real jarayonlar oddiy yoki xususiy hosilali differensial tenglamalar bilan ifodalanadi. Umumiy ko‘ rinishda $dy/dt=f(t,y)$, $y(t_0)=y_0$. Eyler usulida $y_{n+1}=y_n+h\,f(t_n,y_n)$ ko‘ rinishidagi yaqinlashish olinadi. Runge–Kutta 4-tartibli usuli esa yuqoriroq aniqlikka erishish imkonini beradi. Issiqlik tarqalishi kabi jarayonlar uchun $\partial u/\partial t=a^2\partial^2u/\partial x^2$ ko‘ rinishidagi tenglamalardan foydalaniladi.

Hisoblash tajribasida Python (NumPy, SciPy), MATLAB va Maple kabi vositalardan foydalanish mumkin. Mazkur dasturiy muhitlar parametrlarning sezgirlik tahlili, sonli integrallash, optimallashtirish va natijalarni jadval hamda grafiklar orqali baholash imkonini beradi.

Tahlil va natijalar (Analysis and Results)

Matematik modellar quyidagi maqsadlarda ishlab chiqiladi: fizikaviy, kimyoviy va texnologik jarayonlarni tavsiflash; jarayon va tizimlarni tadqiq qilish; texnologik jarayonlarni loyihalash; loyihalashda optimallashtirish ishlarini olib borish. Modellashtirishda modeldagi eksperiment originaldagi eksperimentga qaraganda soddaroq, tejamkorroq va xavfsizroq bo‘ lishi, shuningdek, model sinovi asosida original parametrlarini hisoblash qoidasi ma’lum bo‘ lishi talab etiladi.

Matematik tavsifning mukammallik darajasiga ko‘ ra, bir tomonda jarayonning barcha asosiy tomonlarini tavsiflaydigan tenglamalar to‘ la tizimi va barcha sonli qiymatlari ma’lum bo‘ lgan holat, ikkinchi tomonda esa jarayonning to‘ la matematik tavsifi mavjud bo‘ lmagan holat turadi. Axborot to‘ liq bo‘ lmagan sharoitda tadqiqotni eng oddiy modellar qurishdan boshlash, biroq jarayonning asosiy sifat xususiyatlarini buzmaslik maqsadga muvofiq.

Differensial tenglamalar asosida modellashtirish

Differensial tenglamalar dinamik tizimlarni tavsiflashda asosiy vosita bo‘ lib xizmat qiladi. Ular vaqt bo‘ yicha o‘ zgaruvchi fizik, iqtisodiy, ekologik va boshqa jarayonlarni matematik ifodalash imkonini beradi. Oddiy differensial tenglamalar bir o‘ zgaruvchili funksiyalarni, xususiy hosilali differensial tenglamalar esa ko‘ p o‘ zgaruvchili funksiyalarni tavsiflaydi. Issiqlik tarqalishida Furye tenglamasi, to‘ lqin tarqalishida to‘ lqin tenglamasi, populyatsiya dinamikasida Lotka–Volterra tenglamalari qo‘ llaniladi [5].

So‘ nggi yillarda kasr tartibli differensial tenglamalar murakkab real jarayonlarni, xususan, xotira effektiga ega bo‘ lgan tizimlarni modellashtirishda qo‘ llanilmoqda. Bunday modellar iqtisodiy va ekologik tizimlar hamda atrof-muhit dinamikasini o‘ rganishda qo‘ llanish imkoniyatiga ega.

Optimallashtirish modellari

Optimallashtirish modellari berilgan cheklovlar ostida ma’lum bir maqsad funksiyasining ekstremumini topish masalalarini hal qiladi. Bu modellar iqtisodiyotda resurslarni optimal taqsimlash, ishlab chiqarishni rejalashtirish va logistika masalalarini yechishda qo‘ llaniladi. Chiziqli va nochiziqli optimallashtirish, butun sonli va ko‘ p kriteriyali optimallashtirish kabi usullar mavjud.

Statistik va ehtimollik modellari

Real jarayonlarda tasodifiylik va noaniqlik omillari mavjud bo‘ lishi mumkin. Bunday hollarda statistik va ehtimollik modellari qo‘ llaniladi. Regression va korrelyatsion tahlil tajriba natijalarini qayta ishlash va o‘ zgaruvchilar orasidagi bog‘ lanishlarni aniqlashda muhim rol o‘ ynaydi. Ehtimollik modellari riskni baholash, ishonchlilik nazariyasi, navbatlar nazariyasi va moliyaviy matematika kabi sohalarda qo‘ llaniladi.

Ierarxik modellar va modellarni qisqartirish

Murakkab real tizimlar ko‘ pincha ierarxik tuzilishga ega bo‘ ladi. Bunday tizimlarni modellashtirishda elementlarning ishlash jarayonlari turli darajalarda funksional munosabatlar yoki mantiqiy shartlar ko‘ rinishida yoziladi.

Ierarxik modellarni qisqartirish (reduksiya) omillar sonini kamaytirish orqali hisoblash jihatidan kam resurs talab qiladigan modelga o‘ tishni anglatadi. Bu masalada omillar bo‘ yicha sezgirlik tahlili muhim vosita hisoblanadi [9].

Matematik modellarni sonli tahlil qilish

Ko‘ pgina real jarayonlarning matematik modellari analitik usullar bilan yechib bo‘ lmaydigan murakkab tenglamalar tizimidan iborat. Bunday hollarda sonli usullar — yaqinlashgan yechimlarni topish usullari — muhim ahamiyat kasb etadi. Sonli usullar kompyuter texnologiyalari yordamida murakkab matematik modellarni hisoblash va tahlil qilish imkonini beradi [4].

Asosiy sonli usullarga chekli ayirmalar, chekli elementlar, variatsion va proyeksion, Monte-Karlo hamda iteratsion usullar kiradi. Chekli ayirmalar usuli differensial tenglamalarni chekli ayirmali analoglar bilan almashtirishga asoslanadi. Chekli elementlar usuli murakkab geometriyali sohalarda differensial tenglamalarni yechishda qo‘ llaniladi. Monte-Karlo usuli statistik tajribalar asosida hisoblashni tashkil etadi [6; 7].

Modellarni raqamli hisoblashda zamonaviy yondashuvlar

Zamonaviy hisoblash texnologiyalari murakkab differensial tenglamalar tizimlarini yuqori aniqlikda yechish, katta hajmdagi hisoblashlarni parallel tizimlarda bajarish, model natijalarini grafik va 3D ko‘ rinishda vizualizatsiya qilish, model sezgirligi va noaniqligini tahlil qilish hamda optimallashtirish masalalarini avtomatik yechish imkoniyatlarini beradi.

Xususan, q-HATM (q-homotopy analysis transform technique) kabi yarim analitik usullar kasr tartibli differensial tenglamalar bilan ifodalangan modellar uchun tez yaqinlashuvchi qator yechimlarini olish imkonini beradi. Bunda yechimlarning yaqinlashuvi va yagonaligini matematik asoslash imkoniyati muhim xususiyat hisoblanadi.

Model adekvatligi va ishonchliligi

Matematik modelning real jarayonga monandligini tekshirish modellashtirish jarayonining muhim bosqichidir. Buning uchun obyektdan olingan o‘ lchovlar natijalari o‘ xshash sharoitlardagi model bashorat natijalari bilan taqqoslanadi. Agar model yetarli aniqlikda ishlamasa, uni qayta ko‘ rib chiqish va takomillashtirish zarur.

Matematik modelni qurishda real hodisani soddalashtirish zaruriyati bilan uning asosiy xususiyatlarini saqlab qolish o‘ rtasida muvozanat saqlash muhim. Jarayonga ta’sir qiluvchi barcha eng muhim omillar modelda hisobga olinishi, lekin ko‘ plab ikkinchi darajali omillar bilan modelni ortiqcha murakkablashtirmaslik kerak.

Har qanday matematik model ma’lum darajadagi noaniqlik va xatoliklarga ega. Ularning asosiy manbalari dastlabki ma’lumotlarning noaniqligi, modelning soddalashtirilganligi, sonli usullarning yaqinlashish xatoligi va hisoblash xatoliklaridir. Noaniqlik va xatoliklarni baholash model natijalarining ishonchlilik darajasini aniqlash imkonini beradi.

Tahlil natijasida shuni ko‘ rish mumkinki, modelning amaliy qiymati faqat matematik tenglamani tuzish bilan belgilanmaydi. Modelning natijasi parametrlarning ishonchli aniqlanishi, tanlangan sonli usulning barqarorligi, hisoblash aniqligi va real ma’lumotlar bilan validatsiya darajasiga bog‘ liq. Shu sababli modellashtirish jarayonida nazariy, hisoblash va eksperimental bosqichlarning uzviyligi ta’minlanishi kerak.

Xulosa va takliflar (Conclusion/Recommendations)

Real jarayonlarni matematik modellashtirish va ularni sonli tahlil qilish zamonaviy ilm-fan va texnikaning ajralmas qismiga aylangan. Matematik modellar murakkab tizimlarni o‘ rganish, ularning xatti-harakatini prognoz qilish va boshqarishda samarali vosita bo‘ lib xizmat qilmoqda.

Tadqiqot doirasida model qurishning maqsadni aniqlash, real jarayonni soddalashtirish, matematik tenglamalarni shakllantirish, parametrlarni identifikatsiyalash va validatsiya qilishdan iborat besh bosqichli ketma-ketligi tizimlashtirildi. Sonli tahlil vositalari orasida masalaning matematik tabiatiga mos usulni tanlash, hisoblash xatoligini nazorat qilish va model natijalarini real ma’lumotlar bilan taqqoslash muhim ekanligi aniqlandi.

Amaliy jihatdan modellashtirishda quyidagi takliflarni ilgari surish mumkin: birinchidan, modelni qurishdan oldin maqsad va asosiy ko‘ rsatkichlarni aniq belgilash; ikkinchidan, ikkilamchi omillar bilan modelni ortiqcha murakkablashtirmaslik; uchinchidan, parametrlarni eksperimental ma’lumotlar asosida identifikatsiyalash; to‘ rtinchidan, model adekvatligini mustaqil ma’lumotlar bilan tekshirish; beshinchidan, sonli algoritmlarning barqarorligi, yaqinlashuvi va hisoblash murakkabligini baholash. Kelgusidagi tadqiqotlarda real ma’lumotlarga asoslangan kompyuter tajribalari, noaniqliklarni miqdoriy baholash va yuqori unumli hisoblash vositalaridan foydalanishni kengaytirish maqsadga muvofiq.

Abstract. *This paper investigates the solvability conditions of the equation* $x^3 = a$ *over the field* $\mathbb{Q}_p$. *The cases* $p > 3$ *and* $p = 3$ *are studied separately. Using number theory, congruences, and Hensel's lemma, solvability criteria for the cubic equation are established. Furthermore, several particular examples are analyzed, and general results are presented.*

Keywords: p *-adic number,* p *-adic valuation, congruence, cubic residue, Hensel's lemma,* p *-adic integers,* p *-adic units, cubic equation.*

РАЗРЕШИМОСТЬ КУБИЧЕСКОГО УРАВНЕНИЯ В ПОЛЕ p -АДИЧЕСКИХ ЧИСЕЛ

Аннотация. *В данной статье исследуются условия существования решений уравнения вида* $x^3 = a$ *в поле* $\mathbb{Q}_p$. *Рассматриваются случаи* $p > 3$ *и* $p = 3$. *С использованием теории чисел, конгруэнций и леммы Хенселя установлены критерии разрешимости кубического уравнения. Кроме того, проведён анализ некоторых частных примеров и получены общие результаты.*

Ключевые слова: p *-адическое число,* p *-адический порядок, сравнение, кубический остаток, лемма Хенселя,* p *-адические целые числа,* p *-адические единицы, кубическое уравнение.*

Kirish

Sonlar nazariyasi matematikada eng qadimiy va fundamental yo‘ nalishlardan biri bo‘ lib, uning ko‘ plab natijalari va tatbiqlari algebra, analiz va matematik fizika bilan uzviy bog‘ liqdir. 1897-yilda nemis matematik olimi Kurt Genzel p -adik sonlar tushunchasini fanga kiritdi va bu nazariya keyinchalik algebraik sonlar nazariyasi hamda analizning muhim bo‘ limiga aylandi. Ayniqsa, p -adik sonlar nazariyasi XX asrning ikkinchi yarmidan boshlab keng tadqiq qilina boshladi va hozirgi kunda dinamik sistemalar, ehtimollar nazariyasi, kriptografiya hamda statistik fizika kabi sohalarda muhim amaliy tatbiqlarga ega bo‘ ldi.

$\mathbb{Q}_p$ p -adik sonlar maydonida algebraik tenglamalarning yechimga ega bo‘ lish masalasi nazariy va amaliy jihatdan katta ahamiyat kasb etadi, chunki bu natijalar ko‘ plab matematik modellarni chuqurroq tushunishga yordam beradi.

$x^3 = a$ ko‘ rinishidagi kubik tenglamalar eng sodda, ammo muhim algebraik tenglamalardan biri hisoblanadi. Ularning $\square_p$ p-adik sonlar maydonida yechimga ega bo‘ lish masalasi bir tomondan sonlar nazariyasi va taqqoslamalar bilan, ikkinchi tomondan esa Genzel lemmasi va sonning p-adik tartibi bilan bevosita bog‘ liqdir. Shu sababli, kubik tenglamaning yechiluvchanlik shartlarini aniqlash nafaqat nazariy qiziqish uyg‘ otadi, balki p-adik analiz, dinamik sistemalar va p-adik umumlashgan Gibbs o‘ lchovlari nazariyasi uchun ham amaliy ahamiyatga ega.

Ushbu maqolada $x^3 = a$ tenglamaning sonning maydondagi yechimga ega bo‘ lish shartlari o‘ rganiladi. Tadqiqotda $p > 3$ va $p = 3$ hollari alohida ko‘ rib chiqilib, sonning p-adik tartibi, taqqoslamalar va Genzel lemmasi yordamida tenglamaning yechimga ega bo‘ lish kriteriyalari aniqlanadi. Shuningdek, ba’zi xususiy misollar orqali umumiy natijalar yoritiladi. Maqolaning asosiy maqsadi — kubik tenglamaning $\square_p$ maydonda yechimga ega bo‘ lishi uchun zarur va yetarli shartlarni aniqlash hamda ularning matematik ahamiyatini ko‘ rsatishdir.

Adabiyotlar tahlili

So‘ nggi yillarda p-adik sonlar maydonida tenglamalarni yechish bo‘ yicha bir qator ilmiy ishlar chop etildi. [1] ishda mualliflar $x^k = a$ ko‘ rinishidagi monomial tenglamalarning $\square_p$ maydondagi yechimlarini tavsiflab, ularning perturbatsiyalarini ham o‘ rgangan. Shuningdek, [2] ishda esa mualliflar umumiy monomial tenglamalar uchun yechiluvchanlik kriteriyalarini ishlab chiqdilar. Ular $q = mp^s$ ko‘ rinishidagi hollarda aniq shartlarni berib, −1 sonining q-darajali ildiz bo‘ lishi masalasini ham tahlil qildilar. Bu natijalar Leybnitz algebralari va p-adik dinamik sistemalar bilan bog‘ liq tatbiqlarga ega.

Mazkur ishlarda umumiy monomial tenglamalar va ularning perturbatsiyalari keng o‘ rganilgan bo‘ lsa-da, kubik tenglamaning ($x^3 = a$) $\square_p$ maydondagi yechimga ega bo‘ lish shartlari alohida va to‘ liq ko‘ rib chiqilmagan. Shu sababli, ushbu maqola mavjud adabiyotlarni to‘ ldiradi va kubik tenglamaning yechimga ega bo‘ lishi uchun zarur va yetarli shartlarni aniq shaklda beradi. Bundan tashqari, a parametrning ba’zi xususiy qiymatlarida kubik tenglama yechimlari ham topilgan.

Tadqiqot metodologiyasi

Mazkur tadqiqot ishida $x^3 = a$ ko‘ rinishidagi tenglamaning $\square_p$ p-adik sonlar maydonida yechimga ega bo‘ lishi uchun va yetarli shartlarni zarurda algebrik va p-adik tahlilning bir nechta klassik va umumlashtirilgan usullaridan foydalanildi. Bularga misol qilib keltirish mumkin:

Sonning p-adik tartibi — p-adik tartib va normaning xossalari yordamida tenglamaning ildizlari mavjudligi uchun zarur shartlar belgilandi.

Taqqoslamalar — p modul bo‘ yicha taqqoslamalar arifmetikasi asosida kubik qoldiqlar va ularning kubik qoldiq bo‘ lishi tahlil qilindi.

Ferma teoremasi — $p-1$ darajali guruh tuzilmasi orqali kubik qoldiqlarni tasniflashda qo‘ llanildi.

Klassik va umumlashgan Genzel lemmalari — p>3 bo‘ lganda klassik Genzel lemmasidan hamda p=3 bo‘ lganda esa umumlashgan Genzel lemmasidan taqqoslamalar darajasida topilgan yechimlarni $\square_p$ butun sonlar halqasiga ko‘ tarish uchun ishlatildi.

Tadqiqot ishida $p > 3$ va $p = 3$ hollari alohida ko‘ rib chiqildi. Har bir holatda yechiluvchanlik kriteriyalari aniqlandi va misollar yordamida tasdiqlandi. Shuningdek, metodologiya doirasida ba’zi xususiy tenglamalar tahlil qilinib, umumiy natijalar bilan solishtirildi.

Natijalar va ularning tahlili

Dastlabki tushunchalar. Faraz qilaylik, p tub son bo‘ lsin. Ixtiyoriy $a \in \not\in \setminus \{0\}$ son uchun shu sonning p tub son bo‘ yicha tartibi tushunchasini kiritaylik. Agar

$$a \equiv 0 \pmod{p^k}, \quad a \not\equiv 0 \pmod{p^{k+1}}$$

bo‘ lsa, u holda k butun songa a sonining p-adik tartibi deyiladi va $ord_p(a) = k$ kabi belgilanadi. Agar $a = 0$ bo‘ lsa u holda $ord_p(0) = +\infty$ deb olinadi. ¤ ratsional sonlar maydonining p-adik tartib yordamida aniqlangan $|\cdot|_p$ p-adik (noarximed) norma bo‘ yicha to‘ ldirmasi p-adik sonlar maydoni deyiladi va ¤ $_p$ kabi ifodalanadi.

$EKUB(m,p)=EKUB(n,p)=1$ bo‘ lgan ixtiyoriy noldan farqli $x=p^k\frac{m}{n}$ ratsional sonining p-adik tartibi $ord_p(x)=k$ ko‘ rinishida aniqlanadi va unga mos keluvchi p-adik norma $|x|_p=p^{-ord_p(x)}$ tenglik bilan aniqlanadi.

p-adik butun sonlar halqasi

$$\mathbb{Z}_p=\{x\in\mathbb{Q}_p: ord_p(x)\geq 0\}$$

orqali belgilanadi. Bu halqa yagona $p\mathbb{Z}_p$ maksimal idealiga va

$$\mathbb{Z}_p/p\mathbb{Z}_p\cong \mathrm{F}_p$$

p modul bo‘ yicha qoldiqlar sinfiga ega bo‘ lgan lokal halqadir. p-adik birlar

$$\mathbb{Z}_p^{\times}=\{x\in\mathbb{Q}_p: ord_p(x)=0\}.$$

Ixtiyoriy noldan farqli $a\in\mathbb{Q}_p$ element

$$a=p^{ord_p(a)}u$$

ko‘ rinishidagi yagona kanonik yoyilmaga ega, bu yerda $u\in\mathbb{Z}_p^{\times}$.

$\mathbb{Q}_p$ maydon ustidagi ko‘ phadlarning ildizlari mavjud bo‘ lishining yetarliligini kafotlaydigan lemma bu Genzel lemmasidir. Quyida ushbu lemmaning umumlashgan ifodasini keltiramiz.

1-Lemma (Umumlashgan Genzel lemmasi) [3,4, 6-8]. $F(x)\in\mathbb{Z}_p[x]$ *ko‘ phad va* $F'(x)$ *uning hosilasi bo‘ lsin. Faraz qilaylik, biror* $\alpha_0\in\mathbb{Z}_p$ *elementi va* $k\in\mathbb{N}$ *soni uchun quyidagi shartlar bajarilsin:*

1. $F'(\alpha_0)\equiv 0 \pmod{p^k}$ *va* $F'(\alpha_0)\not\equiv 0 \pmod{p^{k+1}}$;
2. $F(\alpha_0)\equiv 0 \pmod{p^{2k+1}}$.

U holda, $F(x)$ *ko‘ phadining* $\mathbb{Z}_p$ *da* $F(\alpha)=0$ *shartini qanoatlantiruvchi yagona* α *ildizi mavjud bo‘ lib, u uchun* $\alpha\equiv\alpha_0 \pmod{p^{k+1}}$ *taqqoslama o‘ rinli bo‘ ladi.*

Genzel lemmasini klassik variantida yuqoridagi ikki shart quyidagi shartlarga almashadi: $F(\alpha_0)\equiv 0 \pmod{p}$ va $F'(\alpha_0)\not\equiv 0 \pmod{p}$. Bu holda tenglama $\alpha\equiv\alpha_0 \pmod{p}$ ko‘ rinishidagi yagona yechimga ega bo‘ ladi [3,4,5].

Quyidagi teorema bizga sonlar nazariyasidan ma’lum:

1-Teorema. [3, 5-8] Faraz qilaylik p tub son, k natural son va $EKUB(a,p)=1$ shartni qanoatlantiruvchi $a\in\mathbb{Z}$ berilgan bo‘ lsin. U holda $x^k\equiv a \pmod{p}$ taqqoslama yechimga ega bo‘ lishi uchun $a^{\frac{p-1}{EKUB(k,p-1)}}\equiv 1 \pmod{p}$ o‘ rinli bo‘ lishi zarur va yetarli. Bundan tashqari, agar taqqoslama yechimga ega bo‘ lsa, u holda uning p modul bo‘ yicha o‘ zaro taqqoslanmaydigan yechimlari soni $EKUB(k,p-1)$ ga teng bo‘ ladi.

Quyida biz kubik tenglamaning yechiluvchanlik shartlarini aniqlaymiz.

$x^3=a$ ***kubik tenglamaning yechiluvchanlik shartlari***

Biz ushbu maqolada

$$x^3=a,\quad a\in\mathbb{Q}_p. \tag{1}$$

ko‘ rinishdagi kubik tenglamani ko‘ rib chiqamiz hamda (1) ko‘ rinishdagi tenglamaning yechimlari qaysi tub sonlarda $\mathbb{Q}_p$ maydonlarda mavjud, tenglama yechimlari soni nechta degan savollarga javob izlaymiz.

2-Teorema. *Aytaylik* $a=p^{ord_p(a)}u$ $(u\in\mathbb{Z}_p^{\times})$ *bo‘ lsin. (1) tenglama* $\mathbb{Q}_p$ *da yechimga ega bo‘ lishi uchun quyidagi ikki shartning bir vaqtda bajarilishi zarur va yetarli:*

1. $ord_p(a)\equiv 0 \pmod{3}$,

2. $y^3 = u$ *tenglama* $\mathbb{Q}_p^{\times}$ *da yechimga ega.*

Isboti. Zaruriyligi. Faraz qilaylik, (1) tenglama $\mathbb{Z}_p$ da yechimga bo‘ lsin. U holda tenglikning ikkala tomonidagi sonlarning p -adik tartibini topsak, biz quyidagiga ega bo‘ lamiz:

$$ord_p(x^3) = ord_p(a).$$

p -adik tartibning xossasiga ko‘ ra

$$3ord_p(x) = ord_p(a).$$

Har qanday sonning p -adik tartibi butun son ya’ni, $ord_p(x) \in \mathbb{Q}$ bo‘ lganligi sababli, $ord_p(a)$ qiymat 3 ga karrali ekanligi kelib chiqadi, ya’ni $ord_p(a) \equiv 0 \pmod 3$. Bu esa biror $m \in \mathbb{Q}$ uchun $ord_p(a) = 3m$ ekanligini bildiradi. Agar x elementni $x = p^m y$ ($y \in \mathbb{Q}_p^{\times}$) ko‘ rinishida ifodalab, (1) tenglamaga qo‘ ysak,

$$(p^m y)^3 = p^{3m} u \Rightarrow p^{3m} y^3 = p^{3m} u$$

tenglikka ega bo‘ lamiz. Oxirgi tenglikdan esa $y^3 = u$ hosil bo‘ ladi va bu p -adik birlar to‘ plamida yechimga ega ekanligini isbotlaydi.

Yetarliligi. Faraz qilaylik biror $m \in \mathbb{Q}$ uchun $ord_p(a) = 3m$ bo‘ lsin va $y \in \mathbb{Q}_p^{\times}$ element $y^3 = u$ tenglikni qanoatlantirsin. Biz (1) ning yechimi $x = p^m y \in \mathbb{Z}_p$ kabi bo‘ lishini ko‘ rsataylik. Bu yechimni (1) tenglamaga qo‘ yib quyidagiga ega bo‘ lamiz:

$$x^3 = a \Rightarrow p^{3m} y^3 = p^{3m} u \Rightarrow y^3 = u.$$

Bu esa x ning izlanayotgan yechim ekanligini tasdiqlaydi. Teorema isbotlandi.

$p > 3$ ***hol.*** Endi biz $p > 3$ bo‘ lganda

$$y^3 = u \tag{2}$$

tenglama $\mathbb{Q}_p^{\times}$ da yechiluvchanlik shartlarni aniqlaymiz.

3-Teorema. $p > 3$ *tub son va* $u \in \mathbb{Q}_p^{\times}$ *bo‘ lsin. U holda* (2) *tenglama* $\mathbb{Q}_p^{\times}$ *da yechimga ega bo‘ lishi uchun* u ning p *modul bo‘ yicha kubik qoldiq bo‘ lishi zarur va yetarli. Bundan tashqari,*

1.*Agar* $p \equiv 2 \pmod 3$ *bo‘ lsa, ixtiyoriy* $u \in \mathbb{Q}_p^{\times}$ *uchun yagona yechim mavjud.*

2.*Agar* $p \equiv 1 \pmod 3$ *bo‘ lsa, yechim mavjud bo‘ lishi uchun* $u^{(p-1)/3} \equiv 1 \pmod p$ *shartining bajarilishi zarur va yetarli. Bu holda* (2) *tenglama* $\mathbb{Q}_p^{\times}$ *da uchta turli yechimlarga ega*

Isboti. Zaruriyligi. Faraz qilaylikk, $y^3 = u$ tenglama $\mathbb{Q}_p^{\times}$ da biror yechimga ega bo‘ lsin. $y \in \mathbb{Q}_p^{\times}$ ekanligidan yechimning p modul bo‘ yicha tartibi nolga teng, ya’ ni $y \not\equiv 0 \pmod p$. Bundan $y^3 \equiv u \pmod p$ taqqoslamaga ega bo‘ lamiz. Bu esa, o‘ z navbatida, u elementning p modul bo‘ yicha kubik qoldiq ekanligini anglatadi.

Yetarliligi. Faraz qilaylik $u \in \mathbb{Q}_p^{\times}$ *elementi* p *modul bo‘yicha kubik qoldiq bo‘lsin. Kubik qoldiq ta’rifiga ko‘ra, qoldiqlar sinfida shunday bir* $a \in \{1, 2, \ldots, p-1\}$ *element mavjudki, uning uchun*

$$a^3 \equiv u \pmod p \tag{3}$$

taqqoslama o‘ rinli. Endi $f(x) = x^3 - u$ yordamchi funksiyani qaraylik. Funksiyaning a nuqtadagi qiymatini hisoblab, hamda (3) foydalanib quyidagini yozishimiz mumkin:

$$f(a) = a^3 - u \equiv 0 \pmod p \tag{4}$$

Ushbu funksiyaning hosilasi $f'(x) = 3x^2$ ekanligini oson aniqlash mumkin. Teorema shartida $p > 3$ ekanligini hisobga olib va $a \not\equiv 0 \pmod p$ ekanligidan foydalanib,

$$f'(a) = 3a^2 \not\equiv 0 \pmod p \tag{5}$$

xulosaga kelamiz. (4) va (5) taqqoslamalar Genzel lemmasining barcha shartlarini to‘ liq qanoatlantiradi. Shuning uchun $f(x)$ ko‘ phadining $\mathbb{Z}_p$ da $f(y)=0$ shartini qanoatlantiruvchi yagona y ildizi mavjud bo‘ lib, u uchun $y \equiv a \pmod p$ taqqoslama o‘ rinli bo‘ ladi. Ushbu yechim $y \equiv a \not\equiv 0 \pmod p$ bo‘ lganligi sababli, izlanayotgan yechim $\mathbb{Z}_p^{\times}$ ga tegishli bo‘ ladi. Teoremaning asosiy qismi isbotlandi. Endi qo‘ shimcha qismini isbotlaylik.

1-hol: $p \equiv 2 \pmod 3$ bo‘ lsin. Bu holda $p-1$ soni 3 ga bo‘ linmaydi, ya’ni $EKUB(3, p-1)=1$ bo‘ ladi. 1-Teoremaga ko‘ ra, $x^3 \equiv a \pmod p$ taqqoslama doimo yagona $x_0 \pmod p$ yechimga ega. Genzel lemmasiga ko‘ ra, $\mathbb{Z}_p^{\times}$ da yagona $x \equiv x_0 \pmod p$ ko‘ rinishdagi yechim mavjud.

2-hol: $p \equiv 1 \pmod 3$ bo‘ lsin. U holda $EKUB(3, p-1)=3$ bo‘ ladi.

Zaruriyligi: faraz qilaylik (2) taqqoslama yechimga ega bo‘ lsin, ya’ni shunday $y \in \mathbb{Z}_p^{\times}$ mavjudki,

$$y^3 \equiv u \pmod p \tag{6}$$

taqqoslama o‘ rinli bo‘ ladi. Fermaning kichik teoremasiga ko‘ ra quyidagini yoza olamiz:

$$y^{p-1} \equiv 1 \pmod p.$$

Endi oxirgi taqqoslamadan foydalanib quyidagini yoza olamiz:

$$u^{\frac{p-1}{3}} \equiv \left(y^3\right)^{\frac{p-1}{3}} = y^{p-1} \equiv 1 \pmod p.$$

Bundan esa

$$a^{\frac{p-1}{3}} \equiv 1 \pmod p \tag{7}$$

kelib chiqdi. Demak, agar (2) tenglamaning yechimi mavjud bo‘ lsa, u holda (7) ning bajarilishi zarur ekan.

Yetarlilik: Faraz qilaylik (7) shart bajarilsin. $EKUB(p-1,3)=3$ ekanligi ravshan. Shuning uchun 1-Teoremaga ko‘ ra $x^3 \equiv u \pmod p$ tenglama $\{1,2,...,p-1\}=F_p^*$ da o‘ zaro taqqoslanmaydigan roppa-rosa 3 ta har xil $x_{0,1}, x_{0,2}, x_{0,3}$ ildizlarga ega bo‘ ladi. Ularning har biri uchun $f'(x_{0,i})=3x_{0,i}^2 \not\equiv 0 \pmod p$ sharti bajarilgani sababli, Genzel lemmasiga ko‘ ra ularning har biriga mos ravishda $\mathbb{Z}_p^*$ da yagona va o‘ zaro teng bo‘ lmagan 3 ta x_1, x_2, x_3 yechimlar mos keladi. Bu esa teorema isbotining yakunlanganligini bildiradi.

$p=3$ hol. $p=3$ bo‘ lgan hol $p>3$ holatidan tubdan farq qiladi. Chunki bu holda funksiyaning hosilasi $f'(x)=3x^2$ bo‘ lib, uning 3-adik normasi $|f'(x)|_3 = |3|_3 \cdot |x^2|_3 = \frac{1}{3}$ ga teng (agar $x \in \mathbb{Z}_3^{\times}$ bo‘ lsa) ya’ ni, hosila 3 modul bo‘ yicha doimo nolga teng: $f'(x_0) \equiv 0 \pmod 3$. Shu sababli klassik Genzel lemmasidan foydalana olmaganligimiz uchun umumlashgan Genzel lemmasidan foydalanib natijalarni isbotlaymiz.

4-Teorema. *Aytaylik, $u \in \mathbb{Z}_3^{\times}$ bo‘ lsin. $y^3=u$ tenglama $\mathbb{Z}_3^{\times}$ da yechimga ega bo‘ lishi uchun $u \equiv \pm 1 \pmod 9$ shartining bajarilishi zarur va yetarli. Agar bu shart bajarilsa, tenglama $\mathbb{Z}_3^{\times}$ da yagona yechimga ega bo‘ ladi.*

Isbot. Zaruriyligi. Faraz qilaylik, $y^3=u$ tenglama $\mathbb{Z}_3^{\times}$ da biror y yechimga ega bo‘ lsin. $y \in \mathbb{Z}_3^{\times}$ bo‘ lgani uchun $y \equiv 1 \pmod 3$ yoki $y \equiv 2 \equiv -1 \pmod 3$ bo‘ lishi mumkin. Ya’ni, $y \equiv \pm 1 \pmod 3$. Endi y ni $y = \pm 1 + 3\alpha$ ($\alpha \in \mathbb{Z}_3$) ko‘ rinishida yozib, kubga ko‘ taramiz:

$$y^3 = (\pm 1 + 3\alpha)^3 = (\pm 1)^3 + 3\cdot(\pm 1)^2 \cdot (3\alpha) + 3\cdot(\pm 1)\cdot(3\alpha)^2 + (3\alpha)^3$$

$$y^3 = \pm 1 + 9\alpha \pm 27\alpha^2 + 27\alpha^3$$

Oxirgi tengliklardan ko‘ rinib turibdiki, $9\alpha \pm 27\alpha^2 + 27\alpha^3 \equiv 0 \pmod 9$ bo‘ ladi. Demak, $u = y^3 \equiv \pm 1 \pmod 9$.

Yetarliligi. Faraz qilaylik, $u \equiv \pm 1 \pmod 9$ bo‘ lsin. U holda shunday $k \in \not{c}_3$ topiladiki, u sonini $u = \pm 1 + 9k$ ko‘ rinishda yozish mumkin. Biz $f(x) = x^3 - u$ funksiyaning $\not{c}_3^{\times}$ dagi ildizini topishimiz kerak. Buning uchun yechim sifatida $x_0 = \pm 1$ nuqtani olaylik. Funksiya va uning hosilasini bu nuqtada qiymatini hisoblaymiz:

$$\begin{aligned} &f(x_0) = (\pm 1)^3 - (\pm 1 + 9k) = \pm 1 - \pm 1 - 9k = -9k \Rightarrow f(x_0) \equiv 0 \pmod 9, \\ &f'(x_0) = 3(\pm 1)^2 = 3 \Rightarrow f'(x_0) \equiv 0 \pmod 3. \end{aligned} \tag{8}$$

(8) tenglik bu funksiya uchun Genzel lemmasining klassik variantining shartlari bajarilmayotganini, shu sababli 1-Lemmadan foydalanishimiz kerakligni ko‘ rsatib turibdi. Endi yechimni $x_1 = x_0 + 3\alpha$ ko‘ rinishida olib, bu nuqtadagi funksiya qiymatini topaylik:

$$f(x_0 + 3\alpha) = (x_0^3 - u) + 9x_0^2\alpha + 27x_0\alpha^2 + 27\alpha^3$$

Avvalgi hisob-kitobimizdan $x_0^3 - u = -9k$ ekanligini bilamiz. Shunday qilib,

$$f(x_0 + 3\alpha) = 9(x_0^2\alpha - k) + 27x_0\alpha^2 + 27\alpha^3$$

Bizga $f(x_1) \equiv 0 \pmod{27}$ shartini ta’ minlaydigan α kerak. Shuning uchun

$$f(x_0 + 3\alpha) \equiv 9(x_0^2\alpha - k) \pmod{27}$$

Oxirgi taqqoslamadan agar biz $\alpha \equiv k \pmod 3$ deb tanlasak (ya’ ni $\alpha = k + 3\beta$), u holda $x_0^2 \equiv 1 \pmod 3$ ekanligini hisobga olsak ($x_0 = \pm 1$ bo‘ lgani uchun $x_0^2 = 1$):

$$x_0^2\alpha - k \equiv 1 \cdot k - k \equiv 0 \pmod 3$$

kelib chiqadi. Bu esa $9(x_0^2\alpha - k)$ ning 27 ga bo‘ linishini kafolatlaydi. Natijada

$$f(x_1) = f(x_0 + 3\alpha) \equiv 0 \pmod{27} \tag{9}$$

ga ega bo‘ lamiz. Endi funksiya hosilasining x_1 dagi qiymati uchun qiyudagiga ega bo‘ lamiz:

$$\begin{aligned} &f'(x_1) = 3(x_0 + 3\alpha)^2 = 3 \pm 18\alpha + 27\alpha^2 \Rightarrow \\ &\Rightarrow f'(x_1) \equiv 0 \pmod 3 \text{ va } f'(x_1) \not\equiv 0 \pmod 9. \end{aligned} \tag{10}$$

(9) va (10) taqqoslamalar bizga 1-Lemma shartlari to‘ liq o‘ rinli ekanligini ko‘ rsatib turibdi. 1-Lemmaga (umumlashgan Genzel lemmasiga) ko‘ ra, $f(x) = 0$ tenglama $\not{c}_3^{\times}$ da yagona yechimga ega. Demak, agar $u \equiv \pm 1 \pmod 9$ bo‘ lsa, $y^3 = u$ tenglama $\not{c}_3^{\times}$ da yagona yechimga ega. Teorema to‘ liq isbotlandi.

Endi biz $a = \pm 1$ va $a = \pm 2$ bo‘ lganda $x^3 = a$ tenglamaning yechimlarini topish bilan shig‘ ullanaylik.

$x^3 = 1$. Bu tenglama p-adik tahlilda juda klassik hol hisoblanib, yuqorida olingan teoremalardan foydalanib quyidagi natijalarni keltiramiz:

- $p = 3$ bo‘ lganda: $1 \equiv 1 \pmod 9$ sharti bajariladi (4-Teorema). Demak, $\not{c}_3^{\times}$ da yagona yechim bor, u ham bo‘ lsa $x = 1$.
- $p \equiv 2 \pmod 3$ bo‘ lganda 3-Teoremaga ko‘ ra $x = 1$ ko‘ rinishida yagona yechim mavjud.
- $p \equiv 1 \pmod 3$ bo‘ lsin. Bu holda $1^{\frac{p-1}{3}} \equiv 1 \pmod p$ shart doimo bajariladi. Demak, tenglama roppa-rosa 3 ta har xil yechimga ega.

Misol uchun, $p = 7$ da $x^3 \equiv 1 \pmod 7$ taqqoslamaning yechimlari $x_0 \equiv 1, 2, 4 \pmod 7$ bo‘ ladi. ($2^3 = 8 \equiv 1 \pmod 7$, $4^3 = 64 \equiv 1 \pmod 7$). Genzel lemmasiga ko‘ ra, $\not{c}_7^{\times}$ da 3 ta yechim bor: ulardan biri $x_1 = 1$, qolgan ikkitasi esa notrivial kubik ildizlardir: $x_2 \equiv 2 \pmod 7$, $x_3 \equiv 4 \pmod 7$

$x^3 = -1$. Bu tenglama uchun quyidagi natijalar olindi:

- $p = 3$ bo‘ lganda: $-1 \equiv -1 \pmod 9$ sharti bajariladi. Tenglama $\not{c}_3^{\times}$ da yagona yechimga ega: $x = -1$.

- $p \equiv 2 \pmod 3$ bo‘ lganda yagona yechim mavjud va u $x = -1$ ga teng.
- $p \equiv 1 \pmod 3$ bo‘ lganda $\frac{p-1}{3}$ juft son bo‘ ladi. Shuning uchun $(-1)^{\frac{p-1}{3}} \equiv 1 \pmod p$ shart o‘ rinli.

Demak, bu holda ham roppa-rosa 3 ta yechim mavjud (biri $x = -1$, qolgan ikkitasi notrivial).

$x^3=2$. Bu holda yechiluvchanlik tub songa jiddiy bog‘ liq bo‘ ladi (maqolada $p \geq 3$ bo‘ lgan hol qaralmoqda):

- $p = 3$ bo‘ lsin. $¢_3$ dagi ixtiyoriy yechimning kubi 9 modul bo‘ yicha 1 yoki -1 bo‘ lishi mumkin. $2 \not\equiv \pm 1 \pmod 9$ bo‘ lganligi uchun haqiqatdan ham tenglama yechimga ega emas.
- $p \equiv 2 \pmod 3$ bo‘ lsin. Bu holda 2 soni doimo kubik chegirma bo‘ ladi va tenglama yagona yechimga ega. *Masalan,* $p = 5$ *da:* $x^3 \equiv 2 \pmod 5 \Rightarrow x_0 = 3$ ($3^3 = 27 \equiv 2$). Genzel lemmasiga ko‘ ra $¢_5$ da yagona yechim bor.
- $p \equiv 1 \pmod 3$ bo‘ lsin. Yechim borligi uchun $2^{\frac{p-1}{3}} \equiv 1 \pmod p$ sharti bajarilishi kerak. Agar bajarilsa 3 ta yechim bor, bajarilmasa yechim yo‘ q. *Masalan,* $p = 7$ *da:* $2^{\frac{7-1}{3}} = 2^2 = 4 \not\equiv 1 \pmod 7$. Demak, ¤ $_7$ da yechim yo‘ q. $p = 31$ *da:* $2^{\frac{31-1}{3}} = 2^{10} = 1024 \equiv 1 \pmod{31}$. Demak, ¤ $_{31}$ da roppa-rosa 3 ta yechim bor.

$x^3=-2$. Bu hol uchun ham quyidagi natijalarni keltiramiz:

- $p = 3$ bo‘ lsin. $-2 \equiv 7 \pmod 9$ bo‘ lib, $\pm 1 \pmod 9$ shartiga tushmaydi $\Rightarrow$ yechim yoq.
- $p \equiv 2 \pmod 3$ bo‘ lsin. Doimo yagona yechim mavjud. *Masalan,* $p = 5$ deb olsak u holda $x^3 \equiv -2 \equiv 3 \pmod 5 \Rightarrow x_0 = 2$ ($2^3 = 8 \equiv 3$). $¢_5$ da yagona yechim bor.
- $p \equiv 1 \pmod 3$ bo‘ lsin. $(-2)^{\frac{p-1}{3}} \equiv 1 \pmod p$ sharti tekshiriladi. $\frac{p-1}{3}$ juft bo‘ lgani uchun bu shart $2^{\frac{p-1}{3}} \equiv 1 \pmod p$ sharti bilan ustma ust tushadi.

Ya’ni, $a = 2$ yechim bo‘ lsa, $a = -2$ ham yechim bo‘ ladi (3 ta yechim), aks holda yechim yo‘ q. (Masalan, $p = 7$ da yo‘ q, $p = 31$ da 3 ta yechim bor).

Xulosa

Ushbu maqolada $p > 3$ bo‘ lganda $\square_p$ p-adik sonlar maydonida $x^3 = a$ ko‘ rinishidagi tenglamaning yechiluvchanlik shartlari va yechimlari soni to‘ liq tahlil qilindi.

Avvalo, tenglama yechimga ega bo‘ lishi uchun $ord_p(a) \equiv 0 \pmod 3$ bo‘ lishi zarur ekanligi ko‘ rsatildi va masala $\square_p^{\times}$ dagi $y^3 = u$ ga keltirildi. Shundan so‘ ng, $p \equiv 2 \pmod 3$ bo‘ lganda tenglama $\square_p^{\times}$ da har doim bitta yechimga ega ekani, $p \equiv 1 \pmod 3$ bo‘ lganiga esa yechimlar soni roppa-rosa 3 ta bo‘ lishi isbotlandi.

Bundan tashqari, $p = 3$ holatida klassik Gensel lemmasi ishlamasligi ko‘ rsatilib, umumlashgan Gensel lemmasi asosida $u \equiv \pm 1 \pmod 9$ zaruriy va yetarlilik sharti olindi hamda yechimning yagonaligi kafolatlandi. Olingan nazariy natijalar asosida $x^3 = \pm 1$ va $x^3 = \pm 2$ tenglamalar yechib ko‘ rsatildi.

Olingan natijalar *p*-adik dinamik sistemalarni tahlil qilishda, Keli daraxtida *p*-adik Gibbs o‘ lchovlarini qurishda va yuqori darajali $x^n = a$ tenglamalarning umumiy nazariyasini rivojlantirishda amaliy ahamiyatga ega.

2D YARIMO‘ TKAZGICHLARDA TWIST BURCHAGINING ELEKTRON ZONALAR TUZILISHIGA TA’SIRINI KVANT-MEXANIK MODELLASHTIRISH

Usmonova Mohlaroyim Muhammadjon qizi
Andijon davlat pedagogika instituti

Annotatsiya. *Mazkur maqolada 2D yarimo‘ tkazgichlarda qatlamlarning o‘ zaro burilish burchagi (twist angle) o‘ zgarishining elektron zonalar tuzilishiga ta’siri kvant-mexanik modellashtirish asosida tadqiq etiladi. Ikki o‘ lchamli materiallarda qatlamlararo burilish natijasida hosil bo‘ ladigan moiré strukturalarning elektron energetik spektri, zonalar dispersiyasi va taqiqlangan zona kengligiga ta’siri nazariy jihatdan tahlil qilinadi. Twist burchagining o‘ zgarishi natijasida elektron holatlarining lokalizatsiyasi, qatlamlararo o‘ zaro ta’sir va elektronlarning effektiv massasi kabi parametrlarning o‘ zgarish mexanizmlari yoritiladi. Tadqiqotda kvant-mexanik yondashuvlar, jumladan, zichlik funksionali nazariyasi (DFT), tight-binding modeli va moiré superpanjara asosidagi kontinuum modellaridan foydalanish imkoniyatlari ko‘ rib chiqiladi. Olingan nazariy natijalar twist burchagini boshqarish orqali 2D yarimo‘ tkazgichlarning elektron xossalarini maqsadli ravishda o‘ zgartirish va ularning nanoelektronika, optoelektronika hamda kvant texnologiyalaridagi potensial qo‘ llanilishlarini asoslash imkonini beradi.*

Kalit so‘ zlar: *2D yarimo‘ tkazgichlar, twistronika, twist burchagi, moiré struktura, moiré superpanjara, elektron zonalar tuzilishi, energetik spektr, band gap, qatlamlararo o‘ zaro ta’sir, kvant-mexanik modellashtirish, zichlik funksionali nazariyasi, DFT, tight-binding modeli, elektron holatlar, elektron dispersiyasi, effektiv massa, nanoelektronika, optoelektronika, kvant texnologiyalari*

КВАНТОВО-МЕХАНИЧЕСКОЕ МОДЕЛИРОВАНИЕ ВЛИЯНИЯ УГЛА ПОВОРОТА НА ЭЛЕКТРОННУЮ ЗОННУЮ СТРУКТУРУ 2D-ПОЛУПРОВОДНИКОВ

Аннотация. *В статье исследуется влияние угла взаимного поворота слоев (twist angle) в двумерных полупроводниках на структуру электронных зон с использованием методов квантово-механического моделирования. Теоретически анализируется влияние возникающих при относительном повороте слоев мозаичных структур на энергетический спектр электронов, дисперсию зон и ширину запрещенной зоны. Рассматриваются механизмы изменения локализации электронных состояний, межслойного взаимодействия и эффективной массы носителей заряда в зависимости от угла поворота. Особое внимание уделяется возможностям применения квантово-механических подходов, включая теорию функционала плотности (DFT), tight-binding модель и континуальные модели моире-сверхрешетки. Полученные теоретические результаты позволяют определить закономерности управления электронными свойствами двумерных полупроводников посредством изменения угла поворота слоев и обосновать перспективы их применения в наноэлектронике, оптоэлектронике и квантовых технологиях.*

QUANTUM-MECHANICAL MODELING OF THE EFFECT OF THE TWIST ANGLE ON THE ELECTRONIC BAND STRUCTURE OF 2D SEMICONDUCTORS

Abstract. *This paper investigates the influence of the twist angle between layers in two-dimensional semiconductors on their electronic band structure using quantum-mechanical modeling approaches. The study theoretically analyzes the effects of moiré structures formed by the relative rotation of atomic layers on the electronic energy spectrum, band dispersion, and band gap. The mechanisms governing changes in the localization of electronic states, interlayer interactions, and effective carrier mass as a function of the twist angle are considered. Particular attention is given to quantum-mechanical approaches, including density functional theory (DFT), tight-binding models, and continuum models based on moiré superlattices. The theoretical analysis provides an opportunity to identify the dependence of the electronic properties of two-dimensional semiconductors on the twist angle and to establish the potential of twist-angle engineering for controlling their electronic characteristics. The obtained results are relevant to the development of advanced nanoelectronic, optoelectronic, and quantum devices based on two-dimensional semiconductor materials.*

KIRISH.So‘ nggi yillarda ikki o‘ lchamli (2D) materiallarning fundamental fizik xususiyatlarini chuqur o‘ rganish va ularning funksional imkoniyatlaridan nanoelektronika, optoelektronika hamda kvant texnologiyalarida foydalanish zamonaviy kondensirlangan muhit fizikasi va materialshunoslikning istiqbolli yo‘ nalishlaridan biriga aylandi. Ikki o‘ lchamli materiallar atomlarning bir yoki bir necha qatlamidan tashkil topgan bo‘ lib, ularning elektron, optik, mexanik va transport xossalari uch o‘ lchamli hajmiy materiallardan sezilarli darajada farq qiladi. Ayniqsa, qatlamlararo o‘ zaro ta’sirni boshqarish imkoniyati 2D materiallarning fizik xususiyatlarini tashqi parametrlar orqali modulyatsiya qilish uchun yangi imkoniyatlarni yuzaga keltirmoqda.2D yarimo‘ tkazgichlar ushbu materiallar sinfining muhim vakillaridan biri hisoblanadi. Ularning elektron xossalarini tavsiflashda elektron zonalar tuzilishi, valent zona, o‘ tkazuvchanlik zonasi, taqiqlangan zona (band gap), Fermi sathi, elektron holatlar zichligi (DOS) va zaryad tashuvchilarning effektiv massasi kabi fundamental tushunchalar asosiy ahamiyatga ega. Mazkur parametrlar materialning elektr o‘ tkazuvchanligi, optik yutilishi, fotolyuminessensiyasi va boshqa fizik xususiyatlarini belgilaydi. Shuning uchun 2D yarimo‘ tkazgichlarning elektron zonalar tuzilishini boshqarish yangi avlod elektron va optoelektron qurilmalarini yaratish uchun muhim ilmiy vazifa hisoblanadi.

2D materiallarning elektron xossalarini boshqarishning zamonaviy usullaridan biri twistronika (twistronics) hisoblanadi. Twistronika — ikki yoki undan ortiq atomar yupqa qatlamlarning bir-biriga nisbatan ma’lum burilish burchagi (twist angle) ostida joylashtirilishi natijasida materialning elektron va boshqa kvant xossalarini boshqarishga asoslangan ilmiy yo‘ nalishdir. Bunda qatlamlarning o‘ zaro burilishi oddiy geometrik o‘ zgarish bo‘ lib qolmasdan, tizimning yangi davriylik xususiyatlarini yuzaga keltiradi. Xususan, kristall panjaralarning nisbiy burilishi natijasida moiré naqshi yoki moiré strukturasi hosil bo‘ ladi. Ushbu struktura 2D geterostrukturaning elektron energetik spektriga sezilarli ta’sir ko‘ rsatishi mumkin.

More superpanjara (moiré superlattice) — o‘ zaro burilgan yoki panjara parametrlari farq qiladigan ikki kristall qatlamning ustma-ust joylashishi natijasida hosil bo‘ ladigan katta effektiv davrga ega superstrukturadir. Moiré superpanjaraning davri odatda qatlamlarning panjara parametrlari va ular orasidagi burilish burchagiga bog‘ liq bo‘ ladi. Twist burchagi kichik qiymatlarga ega bo‘ lganda moiré davri sezilarli darajada kattalashadi. Natijada elektronlar uchun yangi effektiv davriy potensial shakllanib, dastlabki kristall panjaraga xos bo‘ lmagan yangi elektron holatlarning yuzaga kelishiga sharoit yaratiladi.

Twist burchagining o‘ zgarishi 2D yarimo‘ tkazgichlarning elektron zonalar tuzilishiga bevosita ta’sir ko‘ rsatishi mumkin. Qatlamlar orasidagi burilish burchagi o‘ zgarganda elektron to‘ lqin funksiyalarining o‘ zaro qoplanishi, qatlamlararo tunnellanish, interqatlam gibridlanishi va effektiv davriy potensialning xarakteri ham o‘ zgaradi. Natijada valent va o‘ tkazuvchanlik zonalarining dispersiyasi, band gap kattaligi, zonalarning lokalizatsiyasi va elektron holatlar zichligi kabi parametrlar o‘ zgarishi mumkin. Shu jihatdan twist burchagi 2D yarimo‘ tkazgichlarda elektron xossalarni boshqaruvchi muhim tashqi geometrik parametr sifatida qaraladi.

2D yarimo‘ tkazgichlarning elektron xossalarini chuqur tadqiq etishda kvant-mexanik modellashtirish muhim nazariy vosita hisoblanadi. Kvant-mexanik modellashtirish atom va elektronlar tizimining fizik holatini fundamental kvant qonunlari asosida ifodalash imkonini beradi. Bunda tizimning Hamiltoniani, elektron to‘ lqin funksiyasi, energiya o‘ ziga xos qiymatlari va elektron zichligi kabi kattaliklar aniqlanadi. Hisoblash natijasida materialning elektron zonalar tuzilishi, band gap qiymati, holatlar zichligi va boshqa muhim parametrlarini nazariy jihatdan baholash mumkin.2D materiallarni modellashtirishda zichlik funksionali nazariyasi (Density Functional Theory — DFT) keng qo‘ llaniladigan kvant-mexanik yondashuvlardan biridir. DFT asosida ko‘ p elektronli tizimning asosiy fizik xususiyatlarini elektron zichligi orqali aniqlash imkoniyati mavjud. Ushbu metod yordamida kristall strukturaning geometriyasi optimallashtirilishi, elektron energiyalar hisoblanishi, band structure va density of states kabi parametrlar aniqlanishi mumkin. Ayniqsa, turli twist burchaklariga mos keluvchi 2D geterostrukturalarning energetik holatlarini taqqoslashda DFT hisoblashlari muhim nazariy ma’lumot beradi[1].

Bundan tashqari, katta o‘ lchamli moiré superpanjaralarni tadqiq etishda tight-binding modeli va kontinuum modeli (continuum model) kabi yondashuvlardan foydalanish samarali hisoblanadi. Tight-binding modeli elektronlarning kristall panjaradagi lokal orbitalar o‘ rtasidagi tunnellanishini hisobga olish orqali elektron energetik spektrini ifodalaydi. Kontinuum modelida esa moiré superpanjaraning katta effektiv davriyligi va elektronlarning ushbu davriy potensialdagi harakati soddalashtirilgan effektiv Hamiltonian orqali tavsiflanadi. Ushbu yondashuvlar hisoblash resurslarini kamaytirgan holda twist burchagining keng diapazonidagi fizik holatlarni o‘ rganish imkonini beradi.Ayniqsa, twist-angle engineering, ya’ni burilish burchagini muhandislik parametriga aylantirish konsepsiyasi 2D materiallarning elektron

xususiyatlarini boshqarishda muhim ahamiyat kasb etmoqda. Bunda materialning kimyoviy tarkibini o‘ zgartirmagan holda faqat qatlamlarning nisbiy orientatsiyasini o‘ zgartirish orqali elektron energetik spektrni modifikatsiya qilish imkoniyati ko‘ rib chiqiladi. Shu sababli twistronika an’anaviy material dizayniga nisbatan qo‘ shimcha boshqaruv darajasini taqdim etadi.

2D yarimo‘ tkazgichlar orasida o‘ tish metallari dixalkogenidlari (Transition Metal Dichalcogenides — TMDs) alohida ilmiy qiziqish uyg‘ otadi. MoS_2, WS_2, $MoSe_2$ va WSe_2 kabi materiallar qatlamli kristall tuzilishga, sezilarli optik javobga va qatlamlararo o‘ zaro ta’sirga ega. TMD qatlamlarining o‘ zaro burilishi natijasida hosil bo‘ ladigan moiré potensial elektron va eksiton holatlarining energetik tuzilishini sezilarli darajada o‘ zgartirishi mumkin. Shu sababli TMD asosidagi twistronik tizimlar elektronika, optoelektronika va kvant materiallari fizikasi nuqtayi nazaridan istiqbolli tadqiqot obyektlari hisoblanadi.Mazkur masalani nazariy jihatdan tadqiq etishda twist burchagini asosiy boshqariluvchi parametr sifatida tanlash muhimdir. Masalan, kichik burilish burchaklarida moiré superpanjaraning davri kattalashadi va elektronlarning effektiv davriy potensial bilan o‘ zaro ta’siri kuchayishi mumkin. Burchakning o‘ zgarishi bilan elektron zonalarining dispersiyasi, zonalararo masofa va elektron holatlarining fazoviy taqsimlanishida o‘ zgarishlar kuzatilishi mumkin. Shu nuqtayi nazardan θ — twist burchagi, L_m — moiré davri, E(k) — elektron dispersiya munosabati, E_9 — band gap kabi parametrlar o‘ rtasidagi bog‘ lanishni aniqlash tadqiqotning muhim yo‘ nalishlaridan biridir[2].

Ushbu tadqiqotning dolzarbligi shundaki, 2D yarimo‘ tkazgichlarning elektron xossalarini faqat materialning kimyoviy tarkibi yoki tashqi elektr maydoni orqali emas, balki qatlamlarning o‘ zaro geometrik orientatsiyasi orqali ham boshqarish imkoniyati mavjud. Twist burchagi yordamida elektron zonalar tuzilishini nazorat qilish mexanizmlarini aniqlash yangi avlod nanoelektron qurilmalarida energiya samaradorligini oshirish, optoelektronik javobni boshqarish va kvant holatlarini manipulyatsiya qilish uchun nazariy asos yaratadi.Shu sababli mazkur maqolada 2D yarimo‘ tkazgichlarda twist burchagining elektron zonalar tuzilishiga ta’sirini kvant-mexanik modellashtirish masalasi asosiy tadqiqot yo‘ nalishi sifatida qaraladi. Tadqiqot doirasida twist burchagi va moiré superpanjara parametrlari o‘ rtasidagi bog‘ lanish, qatlamlararo o‘ zaro ta’sirning elektron energetik spektrga ta’siri, elektron zonalar dispersiyasining o‘ zgarishi hamda band gapning twist burchagiga bog‘ liqligini nazariy jihatdan tahlil qilish ko‘ zda tutiladi. Bunday yondashuv twistronik 2D yarimo‘ tkazgichlarning fundamental kvant xususiyatlarini tushuntirish va ularni funksional nanoelektron hamda optoelektron tizimlarda qo‘ llash imkoniyatlarini ilmiy asoslashga xizmat qiladi.

Ikki o‘ lchamli (2D) materiallar fizikasi, van der Vaals geterostrukturalari va twistronika yo‘ nalishidagi tadqiqotlar so‘ nggi yillarda kondensirlangan muhit fizikasi, kvant materialshunoslik va nanoelektronikaning jadal rivojlanayotgan sohalaridan biriga aylandi. Ayniqsa, atomar yupqa qatlamlarni bir-biriga nisbatan ma’lum burilish burchagi (twist angle, θ) ostida joylashtirish orqali ularning elektron, optik va kvant xossalarini boshqarish imkoniyati tadqiqotchilarning e’tiborini tortmoqda. Bunday tizimlarda qatlamlarning nisbiy orientatsiyasi natijasida moiré strukturasi va moiré superpanjarasi hosil bo‘ lib, ular materialning dastlabki elektron zonalar tuzilishiga yangi davriylik va effektiv potensial kiritadi. Adabiyotlarda aynan ushbu hodisa twistronikaning nazariy va eksperimental asosini tashkil etishi qayd etilgan. Twistronika tushunchasining rivojlanishida dastlab grafen asosidagi burilgan ikki qatlamli tizimlar muhim o‘ rin egallagan. Keyinchalik tadqiqotlar ushbu konsepsiyani 2D yarimo‘ tkazgichlar, xususan, o‘ tish metallari dixalkogenidlari (TMD — transition metal dichalcogenides) asosidagi tizimlarga kengaytirdi. Adabiyotlarda MoS_2, WS_2, $MoSe_2$, WSe_2 kabi TMD materiallarining qatlamlarini turli burilish burchaklarida birlashtirish orqali elektron energetik spektr, optik o‘ tishlar, eksiton holatlari va korrelyatsiyalangan elektron hodisalarni boshqarish mumkinligi ko‘ rsatilgan. Mak va Shan tomonidan berilgan sharhda yarimo‘ tkazgich moiré materiallari, ayniqsa TMD tizimlari, kuchli elektron korrelyatsiyalari, Hubbard tipidagi fizik hodisalar, topologik effektlar va moiré eksitonlarini o‘ rganish uchun muhim platforma sifatida tavsiflangan[3].

2D materiallar va van der Vaals geterostrukturalarining nazariy asoslari

2D yarimo‘ tkazgichlarni o‘ rganishga bag‘ ishlangan tadqiqotlarda ularning alohida qatlam sifatidagi elektron tuzilishi bilan ko‘ p qatlamli tizimlardagi elektron xususiyatlari o‘ rtasida sezilarli farqlar mavjudligi ko‘ rsatiladi. Bir qatlamli materiallarda elektronlarning harakati asosan ikki o‘ lchamli kristall panjara bilan belgilanadi. Ikki yoki undan ortiq qatlam birlashtirilganda esa qatlamlararo o‘ zaro ta’sir (interlayer interaction) qo‘ shimcha fizik mexanizm sifatida paydo bo‘ ladi. Van der Vaals geterostrukturalari aynan shu xususiyati bilan an’anaviy geterostrukturalardan farq qiladi: turli 2D materiallarni qatlamma-qatlam birlashtirish orqali ularning elektron va optik xususiyatlarini sun’iy ravishda loyihalash mumkin.

Adabiyotlar tahlili shuni ko‘ rsatadiki, van der Vaals geterostrukturalarida qatlamlar orasidagi bog‘ lanish kovalent bog‘ lanishga asoslangan an’anaviy geterostrukturalardan farqli ravishda asosan zaifroq van der Vaals o‘ zaro ta’sirlari bilan tavsiflanadi. Shu sababli turli panjara parametrlari, elektron zonalar tuzilishi va kimyoviy xususiyatlarga ega bo‘ lgan materiallarni bitta sun’iy struktura tarkibida birlashtirish imkoniyati yuzaga keladi. Bu esa 2D materiallarda heterointerface engineering, ya’ni interfeys xususiyatlarini boshqarish imkoniyatlarini kengaytiradi.

Biroq qatlamlarning nisbiy burilishi tizimning fizik xususiyatlarini yanada murakkablashtiradi. Agar ikki qatlamning kristall o‘ qlari bir xil yo‘ nalishda joylashmasa, ularning atomar panjaralari ustma-ust tushishi natijasida katta uzunlik masshtabiga ega bo‘ lgan moiré naqshi hosil bo‘ ladi. Shu sababli oddiy elementar katak asosida elektron tuzilishni hisoblash yetarli bo‘ lmay qolishi mumkin. Carr, Fang va Kaxiras tomonidan olib borilgan tahlilda kichik twist burchakli 2D qatlamlarda moiré uzunlik masshtabining paydo bo‘ lishi atomar masshtabdagi hisoblashni murakkablashtirishi va shu sababli ko‘ p masshtabli nazariy metodlarni ishlab chiqish zarurligi ta’kidlangan.

Mavzuga oid ilmiy adabiyotlarning muhim qismi twist burchagining 2D tizimlarning elektron xossalarini boshqaruvchi fundamental parametr ekanini ko‘ rsatadi. Ikki qatlamning nisbiy burilish burchagi θ o‘ zgarganda moiré superpanjaraning davri ham o‘ zgaradi. Kichik twist burchaklarida moiré uzunlik masshtabi kattalashib, elektronlar uchun yangi effektiv davriy potensial shakllanadi. Natijada asl kristall panjaraning elektron zonalariga qo‘ shimcha modulyatsiya kiritiladi. Zamonaviy sharhlarda moiré superpanjaralarning elektron zonalarini twist burchagi, qatlamlarning stacking konfiguratsiyasi, bosim va deformatsiya kabi parametrlar orqali boshqarish mumkinligi qayd etilgan. Moiré superpanjara tushunchasi faqat geometrik effekt sifatida emas, balki elektronlarning kvant holatlarini o‘ zgartiruvchi effektiv potensial sifatida ham qaraladi. Bunda elektronning to‘ lqin funksiyasi moiré davriyligi bilan bog‘ liq ravishda modifikatsiyalanadi. Natijada elektron zonalarining dispersiyasi o‘ zgarishi, ayrim zonalarning torayishi yoki flat band holatlarining shakllanishi mumkin. Bunday tor energetik zonalarda elektronlar orasidagi o‘ zaro ta’sirlarning nisbiy roli ortishi sababli korrelyatsiyalangan kvant holatlarni tadqiq qilish imkoniyati paydo bo‘ ladi.

Shu nuqtayi nazardan, maqolamiz uchun asosiy nazariy bog‘ lanish θ →moiré davri →effektiv potensial →elektron zonalari →band gap va elektron holatlar ketma-ketligi orqali ifodalanishi mumkin. Ushbu bog‘ lanish twist burchagining elektron zonalar tuzilishiga ta’sirini tizimli ravishda tahlil qilish uchun konseptual asos yaratadi[4].

Elektron zonalar tuzilishini modellashtirishga oid tadqiqotlar

2D twistronik tizimlarning elektron xususiyatlarini aniqlashda turli nazariy va hisoblash metodlari ishlab chiqilgan. Ular orasida zichlik funksionali nazariyasi (Density Functional Theory — DFT), tight-binding modeli, kontinuum modeli, shuningdek, effektiv Hamiltonianlarga asoslangan yondashuvlar alohida o‘ rin tutadi. Carr, Fang va Kaxirasning keng qamrovli sharhida aynan DFT, tight-binding Hamiltonianlari va continuum modellari twisted moiré qatlamlarning elektron tuzilishini hisoblashda asosiy metodologik yondashuvlar sifatida qiyoslangan.

DFT atomlararo o‘ zaro ta’sirlar va elektron zichlikni hisobga olgan holda materialning elektron tuzilishini fundamental kvant-mexanik asosda aniqlash imkonini beradi. DFT yordamida kristall strukturaning geometrik optimallashtirilishi, qatlamlararo masofa, elektron energiyalar, band structure, density of states (DOS) va boshqa parametrlarni hisoblash mumkin. Shu bilan birga, twist burchagi kichik bo‘ lgan tizimlarda moiré superkatak tarkibidagi atomlar sonining keskin ortishi hisoblash murakkabligini oshiradi. Shuning uchun DFT yuqori aniqlikdagi lokal elektron struktura ma’lumotlarini olish uchun samarali bo‘ lsa-da, juda katta moiré superkataklar uchun hisoblash jihatidan resurs talabchan hisoblanadi.

Tight-binding modeli esa elektronlarning lokal atom orbitalari o‘ rtasidagi tunnellanishini tavsiflashga asoslanadi. Ushbu yondashuvda tizimning Hamiltoniani hopping parametrlar orqali ifodalanib, elektronlarning kristall panjaradagi harakatini hisoblash imkonini beradi. Uning asosiy afzalligi — atomlar soni katta bo‘ lgan tizimlarda DFTga nisbatan hisoblash yuklamasining kamayishi. Shu sababli twist burchagining turli qiymatlarida elektron zonalar tuzilishini tezkor taqqoslashda tight-binding modeli muhim vosita hisoblanadi. Adabiyotlarda ushbu model DFT va continuum yondashuvlari bilan birgalikda qo‘ llanib, turli masshtablardagi elektron hodisalarni o‘ zaro bog‘ lash uchun ishlatilgani ko‘ rsatilgan. Kontinuum modeli esa ayniqsa kichik twist burchaklarida katta moiré superpanjaralar bilan ishlash uchun qulaydir. Bunda atomlarning har birini alohida hisoblash o‘ rniga elektronlarning moiré masshtabidagi effektiv harakati matematik Hamiltonian orqali ifodalanadi. Mazkur yondashuv elektron zonalarining qayta shakllanishi, moiré bandlari va twist burchagiga bog‘ liq energetik holatlarni tahlil qilishda katta imkoniyat beradi. Shunday qilib, DFT, tight-binding va continuum modellari bir-birini to‘ ldiruvchi metodlar sifatida qaraladi: DFT atomistik aniqlikni, tight-binding modeli panjara darajasidagi elektron dinamikasini, continuum modeli esa katta moiré masshtabidagi fizikani tavsiflash imkonini beradi.

Adabiyotlarda TMD materiallari twistronik yarimo‘ tkazgich tizimlarining eng faol o‘ rganilayotgan guruhlaridan biri sifatida ajratib ko‘ rsatiladi. Bunga ularning ikki o‘ lchamli kristall tuzilishi, kuchli spin-orbit o‘ zaro ta’siri, vodiy (valley) fizikasi va optik xususiyatlari sabab bo‘ ladi. TMD qatlamlarining burilishi elektron zonalarining qayta shakllanishidan tashqari, eksiton — elektron va kovakning Kulon o‘ zaro ta’siri natijasida hosil bo‘ ladigan bog‘ langan kvazizarracha — holatlariga ham ta’sir ko‘ rsatadi. Semiconductor moiré materiallari bo‘ yicha sharhlar TMD tizimlarida moiré potensialining korrelyatsiyalangan elektron holatlari va eksiton fizikasi uchun yangi imkoniyatlar yaratganini ko‘ rsatadi.

Eksitonlarga bag‘ ishlangan tadqiqotlarda moiré superpanjaraning elektron va kovak holatlarini fazoviy chegaralashi natijasida yangi optik rezonanslar paydo bo‘ lishi va ularning energiyasi hamda dinamik xususiyatlari twist

burchagi orqali boshqarilishi mumkinligi ko‘ rsatilgan. Bu natijalar twist burchagi nafaqat elektron zonalar tuzilishi, balki optik spektr va kvant holatlarning fazoviy lokalizatsiyasini boshqarishda ham muhim parametr ekanini ko‘ rsatadi.

2026-yilgi tadqiqot yo‘ nalishlarida esa past twist burchakli TMD tizimlarida moiré potensial manzarasini va eksitonlarning lokalizatsiyasini atomar masshtabda aniqlashga qaratilgan yangi eksperimental usullar ham rivojlanmoqda. Masalan, 2° burilishli MoS_2 ikki qatlamida eksiton javobining moiré katak ichidagi fazoviy taqsimlanishini yuqori aniqlikda xaritalash imkoniyatlari haqida yangi natijalar e’lon qilingan. Bu holat nazariy modellashtirishda elektron va eksiton holatlarining faqat o‘ rtacha energetik parametrlarini emas, balki ularning fazoviy lokalizatsiyasini ham hisobga olish zarurligini ko‘ rsatadi.

Moiré superpanjaralar bo‘ yicha zamonaviy adabiyotlarda flat band, ya’ni dispersiyasi juda kichik bo‘ lgan energetik zonalar alohida tadqiqot obyekti sifatida qaralmoqda. Elektron zonasi torayganda elektronlarning kinetik energiyasi kamayib, elektron-elektron o‘ zaro ta’sirlarining nisbiy ahamiyati ortishi mumkin. Natijada oddiy mustaqil elektron modeli bilan tushuntirib bo‘ lmaydigan kuchli korrelyatsiyalangan elektron holatlari yuzaga kelishi mumkin. Semiconductor moiré materiallari bo‘ yicha sharhlarda Hubbard fizikasi, Kane–Mele–Hubbard modellari va boshqa korrelyatsiyalangan holatlarni o‘ rganish uchun TMD moiré tizimlaridan foydalanish imkoniyatlari batafsil muhokama qilingan. Bunday natijalar maqolamiz mavzusi uchun muhim metodologik ahamiyatga ega. Chunki twist burchagining elektron zonalar tuzilishiga ta’sirini o‘ rganish faqat band gapning o‘ zgarishini aniqlash bilan cheklanmasligi kerak. Elektron zonalarining dispersiyasi, zonalar kengligi, lokalizatsiyasi, DOS, effektiv massa va moiré potensial bilan bog‘ liq holatlar ham kompleks ravishda tahlil qilinishi zarur. Ana shunday yondashuv orqali twist burchagining elektron xossalarga ta’sir mexanizmini chuqurroq ochib berish mumkin.

Adabiyotlar tahlili shuni ko‘ rsatadiki, twistronik tizimlarni modellashtirishda asosiy muammolardan biri ko‘ p masshtabli struktura bilan bog‘ liq. Atomlararo masofa angstrom masshtabida bo‘ lsa, moiré superpanjara davri o‘ nlab yoki yuzlab angstromgacha kattalashishi mumkin. Shuning uchun butun tizimni bir vaqtning o‘ zida yuqori aniqlikda hisoblash juda katta hisoblash resurslarini talab qiladi. Carr va hammualliflar ushbu masalani twisted moiré qatlamlarning elektron strukturasini hisoblashdagi asosiy nazariy muammolardan biri sifatida ko‘ rsatadi.

Ikkinchi muhim muammo — atomar relaksatsiyani hisobga olish masalasidir. Ideal geometrik modelda qatlamlar faqat burilgan holda tasavvur qilinadi. Amaliy tizimda esa atomlararo kuchlar sababli atomlarning muvozanat holati ideal geometrik konfiguratsiyadan farq qilishi mumkin. Bu esa mahalliy stacking konfiguratsiyasi, qatlamlararo masofa va moiré potensialining amplitudasiga ta’sir qiladi. Shuning uchun real elektron zonalar tuzilishini aniqlashda faqat twist burchagini emas, balki geometrik relaksatsiyani ham hisobga olish maqsadga muvofiq.

Uchinchi muammo — nazariy model va eksperimental parametrlar o‘ rtasidagi moslik masalasidir. Real 2D geterostrukturalarda twist burchagi bilan bir qatorda deformatsiya, bosim, substrat ta’siri, dielektrik muhit, nuqsonlar va qatlamlararo masofa ham elektron zonalar tuzilishiga ta’sir qilishi mumkin. Shu sababli faqat ideal, erkin va mukammal kristall model asosida olingan natijalarni real qurilmalar uchun to‘ g‘ ridan-to‘ g‘ ri umumlashtirish ehtiyotkorlikni talab qiladi. Moiré superpanjaralar bo‘ yicha zamonaviy sharhlarda twist burchagi bilan bir qatorda stacking, bosim va strain kabi parametrlar ham energiya zonalarini boshqarishi mumkinligi qayd etilgan.

Yuqoridagi adabiyotlar tahlili shuni ko‘ rsatadiki, 2D twistronik materiallarning fizik xususiyatlari bo‘ yicha katta ilmiy baza shakllangan bo‘ lsa-da, twist burchagi — moiré superpanjara — elektron zonalar tuzilishi o‘ rtasidagi bog‘ lanishni yagona kvant-mexanik model doirasida tizimli ravishda tahlil qilish masalasi dolzarb bo‘ lib qolmoqda. Ayniqsa, turli twist burchaklari uchun band structure, band gap, elektron holatlar zichligi va zonalar dispersiyasini birgalikda tahlil qilish 2D yarimo‘ tkazgichlarning boshqariladigan elektron xususiyatlarini chuqurroq tushuntirish imkonini beradi.

Mavjud tadqiqotlarning yana bir muhim jihati shundaki, ko‘ plab ishlar ma’lum bir material yoki ma’lum bir twist burchagidagi fizik holatni batafsil o‘ rganishga qaratilgan. Mazkur maqolada esa twist burchagini asosiy boshqariluvchi parametr sifatida ajratib, uning elektron zonalar tuzilishidagi o‘ zgarishlarni ketma-ket tahlil qilish metodologik jihatdan maqsadga muvofiqdir. Bunda DFT, tight-binding va continuum modellarining imkoniyatlarini o‘ zaro bog‘ lash orqali atomistik va effektiv modellashtirish yondashuvlari o‘ rtasidagi farqlarni aniqlash mumkin.Shuningdek, zamonaviy tadqiqotlar moiré tizimlarini faqat elektron xususiyatlar nuqtayi nazaridan emas, balki optik, eksitonik, topologik va korrelyatsiyalangan kvant hodisalar bilan bog‘ liq holda o‘ rganishga o‘ tayotganini ko‘ rsatadi. 2026-yilgi tadqiqotlarda ham past twist burchakli TMD tizimlarining lokal elektron va eksiton xususiyatlarini yuqori fazoviy aniqlikda o‘ rganish yo‘ nalishi davom etmoqda. Demak, elektron zonalar tuzilishini aniq modellashtirish keyingi bosqichlarda optik va kvant xususiyatlarni izohlash uchun ham fundamental asos vazifasini bajaradi.

Shu asosda ushbu maqolada 2D yarimo‘ tkazgichlarda twist burchagining elektron zonalar tuzilishiga ta’sirini kvant-mexanik modellashtirish masalasini o‘ rganish maqsadga muvofiqdir. Tadqiqotda twist angle, moiré structure, moiré superlattice, interlayer coupling, band structure, band gap, density of states, effective mass, DFT, tight-binding Hamiltonian va continuum model kabi atamalar yagona nazariy-metodologik tizimda qo‘ llanadi. Bu esa tadqiqotning

terminologik aniqligini ta’minlash bilan birga, 2D twistronik yarimo‘ tkazgichlarning elektron xossalarini boshqarish mexanizmlarini izchil ochib berishga xizmat qiladi[5].

Umuman olganda, adabiyotlar tahlili twistronik 2D yarimo‘ tkazgichlarda twist burchagini o‘ zgartirish orqali moiré superpanjara parametrlarini va shu orqali elektron zonalar tuzilishini boshqarish mumkinligini ko‘ rsatadi. Biroq bunday tizimlarda atomar relaksatsiya, qatlamlararo o‘ zaro ta’sir, hisoblash masshtabi va model tanlash kabi omillar natijalarning aniqligiga sezilarli ta’sir ko‘ rsatadi. Shu sababli maqolaning keyingi qismida twist burchagining elektron energetik spektrga ta’sirini kvant-mexanik modellashtirish, mos matematik modelni shakllantirish va turli burchak qiymatlarida elektron zonalar tuzilishining o‘ zgarish qonuniyatlarini aniqlash asosiy ilmiy vazifa sifatida belgilanadi.

Ikki o‘ lchamli (2D) materiallar fizikasi, van der Vaals geterostrukturalari va twistronika yo‘ nalishidagi tadqiqotlar so‘ nggi yillarda kondensirlangan muhit fizikasi, kvant materialshunoslik va nanoelektronikaning jadal rivojlanayotgan sohalaridan biriga aylandi. Ayniqsa, atomar yupqa qatlamlarni bir-biriga nisbatan ma’lum burilish burchagi (twist angle, θ) ostida joylashtirish orqali ularning elektron, optik va kvant xossalarini boshqarish imkoniyati tadqiqotchilarning e’tiborini tortmoqda. Bunday tizimlarda qatlamlarning nisbiy orientatsiyasi natijasida moiré strukturasi va moiré superpanjarasi hosil bo‘ lib, ular materialning dastlabki elektron zonalar tuzilishiga yangi davriylik va effektiv potensial kiritadi. Adabiyotlarda aynan ushbu hodisa twistronikaning nazariy va eksperimental asosini tashkil etishi qayd etilgan. Twistronika tushunchasining rivojlanishida dastlab grafen asosidagi burilgan ikki qatlamli tizimlar muhim o‘ rin egallagan. Keyinchalik tadqiqotlar ushbu konsepsiyani 2D yarimo‘ tkazgichlar, xususan, o‘ tish metallari dixalkogenidlari (TMD — transition metal dichalcogenides) asosidagi tizimlarga kengaytirdi. Adabiyotlarda MoS_2, WS_2, $MoSe_2$, WSe_2 kabi TMD materiallarining qatlamlarini turli burilish burchaklarida birlashtirish orqali elektron energetik spektr, optik o‘ tishlar, eksiton holatlari va korrelyatsiyalangan elektron hodisalarni boshqarish mumkinligi ko‘ rsatilgan. Mak va Shan tomonidan berilgan sharhda yarimo‘ tkazgich moiré materiallari, ayniqsa TMD tizimlari, kuchli elektron korrelyatsiyalari, Hubbard tipidagi fizik hodisalar, topologik effektlar va moiré eksitonlarini o‘ rganish uchun muhim platforma sifatida tavsiflangan.

2D yarimo‘ tkazgichlarni o‘ rganishga bag‘ ishlangan tadqiqotlarda ularning alohida qatlam sifatidagi elektron tuzilishi bilan ko‘ p qatlamli tizimlardagi elektron xususiyatlari o‘ rtasida sezilarli farqlar mavjudligi ko‘ rsatiladi. Bir qatlamli materiallarda elektronlarning harakati asosan ikki o‘ lchamli kristall panjara bilan belgilanadi. Ikki yoki undan ortiq qatlam birlashtirilganda esa qatlamlararo o‘ zaro ta’sir (interlayer interaction) qo‘ shimcha fizik mexanizm sifatida paydo bo‘ ladi. Van der Vaals geterostrukturalari aynan shu xususiyati bilan an’anaviy geterostrukturalardan farq qiladi: turli 2D materiallarni qatlamma-qatlam birlashtirish orqali ularning elektron va optik xususiyatlarini sun’iy ravishda loyihalash mumkin[6].

Adabiyotlar tahlili shuni ko‘ rsatadiki, van der Vaals geterostrukturalarida qatlamlar orasidagi bog‘ lanish kovalent bog‘ lanishga asoslangan an’anaviy geterostrukturalardan farqli ravishda asosan zaifroq van der Vaals o‘ zaro ta’sirlari bilan tavsiflanadi. Shu sababli turli panjara parametrlari, elektron zonalar tuzilishi va kimyoviy xususiyatlarga ega bo‘ lgan materiallarni bitta sun’iy struktura tarkibida birlashtirish imkoniyati yuzaga keladi. Bu esa 2D materiallarda heterointerface engineering, ya’ni interfeys xususiyatlarini boshqarish imkoniyatlarini kengaytiradi.

Biroq qatlamlarning nisbiy burilishi tizimning fizik xususiyatlarini yanada murakkablashtiradi. Agar ikki qatlamning kristall o‘ qlari bir xil yo‘ nalishda joylashmasa, ularning atomar panjaralari ustma-ust tushishi natijasida katta uzunlik masshtabiga ega bo‘ lgan moiré naqshi hosil bo‘ ladi. Shu sababli oddiy elementar katak asosida elektron tuzilishni hisoblash yetarli bo‘ lmay qolishi mumkin. Carr, Fang va Kaxiras tomonidan olib borilgan tahlilda kichik twist burchakli 2D qatlamlarda moiré uzunlik masshtabining paydo bo‘ lishi atomar masshtabdagi hisoblashni murakkablashtirishi va shu sababli ko‘ p masshtabli nazariy metodlarni ishlab chiqish zarurligi ta’kidlangan.

Mavzuga oid ilmiy adabiyotlarning muhim qismi twist burchagining 2D tizimlarning elektron xossalarini boshqaruvchi fundamental parametr ekanini ko‘ rsatadi. Ikki qatlamning nisbiy burilish burchagi θ o‘ zgarganda moiré superpanjaraning davri ham o‘ zgaradi. Kichik twist burchaklarida moiré uzunlik masshtabi kattalashib, elektronlar uchun yangi effektiv davriy potensial shakllanadi. Natijada asl kristall panjaraning elektron zonalariga qo‘ shimcha modulyatsiya kiritiladi. Zamonaviy sharhlarda moiré superpanjaralarning elektron zonalarini twist burchagi, qatlamlarning stacking konfiguratsiyasi, bosim va deformatsiya kabi parametrlar orqali boshqarish mumkinligi qayd etilgan. Moiré superpanjara tushunchasi faqat geometrik effekt sifatida emas, balki elektronlarning kvant holatlarini o‘ zgartiruvchi effektiv potensial sifatida ham qaraladi. Bunda elektronning to‘ lqin funksiyasi moiré davriyligi bilan bog‘ liq ravishda modifikatsiyalanadi. Natijada elektron zonalarining dispersiyasi o‘ zgarishi, ayrim zonalarning torayishi yoki flat band holatlarining shakllanishi mumkin. Bunday tor energetik zonalarda elektronlar orasidagi o‘ zaro ta’sirlarning nisbiy roli ortishi sababli korrelyatsiyalangan kvant holatlarni tadqiq qilish imkoniyati paydo bo‘ ladi.

Shu nuqtayi nazardan, maqolamiz uchun asosiy nazariy bog‘ lanish θ → moiré davri → effektiv potensial → elektron zonalari → band gap va elektron holatlar ketma-ketligi orqali ifodalanishi mumkin. Ushbu bog‘ lanish twist burchagining elektron zonalar tuzilishiga ta’sirini tizimli ravishda tahlil qilish uchun konseptual asos yaratadi.

2D twistronik tizimlarning elektron xususiyatlarini aniqlashda turli nazariy va hisoblash metodlari ishlab chiqilgan. Ular orasida zichlik funksionali nazariyasi (Density Functional Theory — DFT), tight-binding modeli, kontinuum modeli, shuningdek, effektiv Hamiltonianlarga asoslangan yondashuvlar alohida o‘ rin tutadi. Carr, Fang va Kaxirasning keng qamrovli sharhida aynan DFT, tight-binding Hamiltonianlari va continuum modellari twisted moiré qatlamlarning elektron tuzilishini hisoblashda asosiy metodologik yondashuvlar sifatida qiyoslangan.

DFT atomlararo o‘ zaro ta’sirlar va elektron zichlikni hisobga olgan holda materialning elektron tuzilishini fundamental kvant-mexanik asosda aniqlash imkonini beradi. DFT yordamida kristall strukturaning geometrik optimallashtirilishi, qatlamlararo masofa, elektron energiyalar, band structure, density of states (DOS) va boshqa parametrlarni hisoblash mumkin. Shu bilan birga, twist burchagi kichik bo‘ lgan tizimlarda moiré superkatak tarkibidagi atomlar sonining keskin ortishi hisoblash murakkabligini oshiradi. Shuning uchun DFT yuqori aniqlikdagi lokal elektron struktura ma’lumotlarini olish uchun samarali bo‘ lsa-da, juda katta moiré superkataklar uchun hisoblash jihatidan resurs talabchan hisoblanadi. Tight-binding modeli esa elektronlarning lokal atom orbitalari o‘ rtasidagi tunnellanishini tavsiflashga asoslanadi. Ushbu yondashuvda tizimning Hamiltoniani hopping parametrlar orqali ifodalanib, elektronlarning kristall panjaradagi harakatini hisoblash imkonini beradi. Uning asosiy afzalligi — atomlar soni katta bo‘ lgan tizimlarda DFTga nisbatan hisoblash yuklamasining kamayishi. Shu sababli twist burchagining turli qiymatlarida elektron zonalar tuzilishini tezkor taqqoslashda tight-binding modeli muhim vosita hisoblanadi. Adabiyotlarda ushbu model DFT va continuum yondashuvlari bilan birgalikda qo‘ llanib, turli masshtablardagi elektron hodisalarni o‘ zaro bog‘ lash uchun ishlatilgani ko‘ rsatilgan.

Kontinuum modeli esa ayniqsa kichik twist burchaklarida katta moiré superpanjaralar bilan ishlash uchun qulaydir. Bunda atomlarning har birini alohida hisoblash o‘ rniga elektronlarning moiré masshtabidagi effektiv harakati matematik Hamiltonian orqali ifodalanadi. Mazkur yondashuv elektron zonalarining qayta shakllanishi, moiré bandlari va twist burchagiga bog‘ liq energetik holatlarni tahlil qilishda katta imkoniyat beradi. Shunday qilib, DFT, tight-binding va continuum modellari bir-birini to‘ ldiruvchi metodlar sifatida qaraladi: DFT atomistik aniqlikni, tight-binding modeli panjara darajasidagi elektron dinamikasini, continuum modeli esa katta moiré masshtabidagi fizikani tavsiflash imkonini beradi.

TMD yarimo‘ tkazgichlar va elektron holatlar.Adabiyotlarda TMD materiallari twistronik yarimo‘ tkazgich tizimlarining eng faol o‘ rganilayotgan guruhlaridan biri sifatida ajratib ko‘ rsatiladi. Bunga ularning ikki o‘ lchamli kristall tuzilishi, kuchli spin-orbit o‘ zaro ta’siri, vodiy (valley) fizikasi va optik xususiyatlari sabab bo‘ ladi. TMD qatlamlarining burilishi elektron zonalarining qayta shakllanishidan tashqari, eksiton — elektron va kovakning Kulon o‘ zaro ta’siri natijasida hosil bo‘ ladigan bog‘ langan kvazizarracha — holatlariga ham ta’sir ko‘ rsatadi. Semiconductor moiré materiallari bo‘ yicha sharhlar TMD tizimlarida moiré potensialining korrelyatsiyalangan elektron holatlari va eksiton fizikasi uchun yangi imkoniyatlar yaratganini ko‘ rsatadi.

Eksitonlarga bag‘ ishlangan tadqiqotlarda moiré superpanjaraning elektron va kovak holatlarini fazoviy chegaralashi natijasida yangi optik rezonanslar paydo bo‘ lishi va ularning energiyasi hamda dinamik xususiyatlari twist burchagi orqali boshqarilishi mumkinligi ko‘ rsatilgan. Bu natijalar twist burchagi nafaqat elektron zonalar tuzilishi, balki optik spektr va kvant holatlarning fazoviy lokalizatsiyasini boshqarishda ham muhim parametr ekanini ko‘ rsatadi.

2026-yilgi tadqiqot yo‘ nalishlarida esa past twist burchakli TMD tizimlarida moiré potensial manzarasini va eksitonlarning lokalizatsiyasini atomar masshtabda aniqlashga qaratilgan yangi eksperimental usullar ham rivojlanmoqda. Masalan, 2° burilishli MoS_2 ikki qatlamida eksiton javobining moiré katak ichidagi fazoviy taqsimlanishini yuqori aniqlikda xaritalash imkoniyatlari haqida yangi natijalar e’lon qilingan. Bu holat nazariy modellashtirishda elektron va eksiton holatlarining faqat o‘ rtacha energetik parametrlarini emas, balki ularning fazoviy lokalizatsiyasini ham hisobga olish zarurligini ko‘ rsatadi[7].

Moiré superpanjaralar bo‘ yicha zamonaviy adabiyotlarda flat band, ya’ni dispersiyasi juda kichik bo‘ lgan energetik zonalar alohida tadqiqot obyekti sifatida qaralmoqda. Elektron zonasi torayganda elektronlarning kinetik energiyasi kamayib, elektron-elektron o‘ zaro ta’sirlarining nisbiy ahamiyati ortishi mumkin. Natijada oddiy mustaqil elektron modeli bilan tushuntirib bo‘ lmaydigan kuchli korrelyatsiyalangan elektron holatlari yuzaga kelishi mumkin. Semiconductor moiré materiallari bo‘ yicha sharhlarda Hubbard fizikasi, Kane–Mele–Hubbard modellari va boshqa korrelyatsiyalangan holatlarni o‘ rganish uchun TMD moiré tizimlaridan foydalanish imkoniyatlari batafsil muhokama qilingan.

Bunday natijalar maqolamiz mavzusi uchun muhim metodologik ahamiyatga ega. Chunki twist burchagining elektron zonalar tuzilishiga ta’sirini o‘ rganish faqat band gapning o‘ zgarishini aniqlash bilan cheklanmasligi kerak. Elektron zonalarining dispersiyasi, zonalar kengligi, lokalizatsiyasi, DOS, effektiv massa va moiré potensial bilan bog‘ liq holatlar ham kompleks ravishda tahlil qilinishi zarur. Ana shunday yondashuv orqali twist burchagining elektron xossalarga ta’sir mexanizmini chuqurroq ochib berish mumkin.

Yuqoridagi adabiyotlar tahlili shuni ko‘ rsatadiki, 2D twistronik materiallarning fizik xususiyatlari bo‘ yicha katta ilmiy baza shakllangan bo‘ lsa-da, twist burchagi — moiré superpanjara — elektron zonalar tuzilishi o‘ rtasidagi

bog‘ lanishni yagona kvant-mexanik model doirasida tizimli ravishda tahlil qilish masalasi dolzarb bo‘ lib qolmoqda. Ayniqsa, turli twist burchaklari uchun band structure, band gap, elektron holatlar zichligi va zonalar dispersiyasini birgalikda tahlil qilish 2D yarimo‘ tkazgichlarning boshqariladigan elektron xususiyatlarini chuqurroq tushuntirish imkonini beradi.

Mavjud tadqiqotlarning yana bir muhim jihati shundaki, ko‘ plab ishlar ma’lum bir material yoki ma’lum bir twist burchagidagi fizik holatni batafsil o‘ rganishga qaratilgan. Mazkur maqolada esa twist burchagini asosiy boshqariluvchi parametr sifatida ajratib, uning elektron zonalar tuzilishidagi o‘ zgarishlarni ketma-ket tahlil qilish metodologik jihatdan maqsadga muvofiqdir. Bunda DFT, tight-binding va continuum modellarining imkoniyatlarini o‘ zaro bog‘ lash orqali atomistik va effektiv modellashtirish yondashuvlari o‘ rtasidagi farqlarni aniqlash mumkin.Shuningdek, zamonaviy tadqiqotlar moiré tizimlarini faqat elektron xususiyatlar nuqtayi nazaridan emas, balki optik, eksitonik, topologik va korrelyatsiyalangan kvant hodisalar bilan bog‘ liq holda o‘ rganishga o‘ tayotganini ko‘ rsatadi. 2026-yilgi tadqiqotlarda ham past twist burchakli TMD tizimlarining lokal elektron va eksiton xususiyatlarini yuqori fazoviy aniqlikda o‘ rganish yo‘ nalishi davom etmoqda. Demak, elektron zonalar tuzilishini aniq modellashtirish keyingi bosqichlarda optik va kvant xususiyatlarni izohlash uchun ham fundamental asos vazifasini bajaradi.

Shu asosda ushbu maqolada 2D yarimo‘ tkazgichlarda twist burchagining elektron zonalar tuzilishiga ta’sirini kvant-mexanik modellashtirish masalasini o‘ rganish maqsadga muvofiqdir. Tadqiqotda twist angle, moiré structure, moiré superlattice, interlayer coupling, band structure, band gap, density of states, effective mass, DFT, tight-binding Hamiltonian va continuum model kabi atamalar yagona nazariy-metodologik tizimda qo‘ llanadi. Bu esa tadqiqotning terminologik aniqligini ta’minlash bilan birga, 2D twistronik yarimo‘ tkazgichlarning elektron xossalarini boshqarish mexanizmlarini izchil ochib berishga xizmat qiladi.

Umuman olganda, adabiyotlar tahlili twistronik 2D yarimo‘ tkazgichlarda twist burchagini o‘ zgartirish orqali moiré superpanjara parametrlarini va shu orqali elektron zonalar tuzilishini boshqarish mumkinligini ko‘ rsatadi. Biroq bunday tizimlarda atomar relaksatsiya, qatlamlararo o‘ zaro ta’sir, hisoblash masshtabi va model tanlash kabi omillar natijalarning aniqligiga sezilarli ta’sir ko‘ rsatadi. Shu sababli maqolaning keyingi qismida twist burchagining elektron energetik spektrga ta’sirini kvant-mexanik modellashtirish, mos matematik modelni shakllantirish va turli burchak qiymatlarida elektron zonalar tuzilishining o‘ zgarish qonuniyatlarini aniqlash asosiy ilmiy vazifa sifatida belgilanadi.

XULOSA.Mazkur tadqiqotda 2D yarimo‘ tkazgichlarda qatlamlarning o‘ zaro burilish burchagi — twist angle (θ) ning elektron zonalar tuzilishiga ta’siri kvant-mexanik yondashuvlar nuqtayi nazaridan tahlil qilindi. Adabiyotlar tahlili shuni ko‘ rsatadiki, ikki o‘ lchamli materiallar qatlamlarini ma’lum burilish burchagi ostida joylashtirish natijasida oddiy kristall panjaradan farq qiluvchi moiré struktura va moiré superpanjara shakllanadi. Ushbu yangi davriylik elektronlarning effektiv potensialini o‘ zgartirib, materialning energetik spektri va elektron zonalar tuzilishida sezilarli modifikatsiyalarni yuzaga keltirishi mumkin. Twistronika aynan ushbu geometrik boshqaruv orqali 2D materiallarning fizik xususiyatlarini maqsadli o‘ zgartirish imkoniyatini beradi.

Tadqiqot natijalarini umumlashtirish asosida twist burchagi →moiré superpanjara →qatlamlararo o‘ zaro ta’sir → elektron zonalar tuzilishi o‘ rtasida uzviy fizik bog‘ lanish mavjudligi aniqlandi. Twist burchagining kamayishi moiré uzunlik masshtabining ortishiga olib kelishi va natijada elektronlarning moiré potensialidagi harakatini o‘ zgartirishi mumkin. Bunday o‘ zgarishlar elektron zonalarining dispersiyasi, zonalar kengligi, holatlar zichligi va ayrim holatlarda flat bandlarning shakllanishida namoyon bo‘ ladi. Twisted tizimlar bo‘ yicha nazariy ishlar moiré davriyligi elektron zonalarini qayta shakllantirishi mumkinligini ko‘ rsatadi[8].

2D yarimo‘ tkazgichlar orasida o‘ tish metallari dixalkogenidlari (TMD) asosidagi geterostrukturalar alohida ahamiyatga ega. MoS_2, WS_2, $MoSe_2$ va WSe_2 kabi materiallarda qatlamlararo o‘ zaro ta’sir, spin-orbit o‘ zaro ta’sir, vodiy erkinlik darajasi va kuchli Kulon o‘ zaro ta’siri mavjudligi ularni twistronik tadqiqotlar uchun muhim materiallar sinfiga aylantiradi. TMD geterobilayerlarida moiré superpanjara nafaqat elektron energetik holatlarni, balki eksitonlarning lokalizatsiyasi, energetik spektri va optik javobini ham o‘ zgartirishi mumkin.Kvant-mexanik modellashtirish nuqtayi nazaridan zichlik funksionali nazariyasi (DFT), tight-binding modeli va kontinuum modeli bir-birini to‘ ldiruvchi metodlar sifatida namoyon bo‘ ladi. DFT atomistik darajada kristall geometriya, elektron zichligi va elektron energetik sathlarini hisoblash imkonini bersa, tight-binding modeli katta tizimlarda elektronlarning lokal orbitalar o‘ rtasidagi tunnellanishini samarali tavsiflaydi. Kontinuum modeli esa katta o‘ lchamli moiré superpanjaralarda elektronlarning effektiv harakatini va moiré bandlarini hisoblash uchun qulaydir. Ushbu uch yondashuvning o‘ zaro uyg‘ unlashtirilishi 2D twistronik tizimlarni turli fazoviy va energetik masshtablarda tadqiq etish imkonini beradi.

Shuningdek, twist burchagining o‘ zgarishi TMD moiré tizimlarida elektron korrelyatsiyasining kuchayishiga olib kelishi mumkin bo‘ lgan tor yoki flat moiré bandlarning shakllanishi bilan bog‘ liq. Bunday zonalarda elektronlarning kinetik energiyasi nisbatan kamayib, elektron-elektron o‘ zaro ta’sirlarining roli ortadi. Nazariy tadqiqotlarda twist burchagi va dielektrik muhit orqali Hubbard modelidagi tunnellanish hamda o‘ zaro ta’sir parametrlarini boshqarish mumkinligi ko‘ rsatilgan.

Tadqiqotning muhim xulosalaridan biri shundaki, 2D yarimo‘ tkazgichlarning elektron xususiyatlarini boshqarishda twist burchagini mustaqil geometrik boshqaruv parametri sifatida ko‘ rib chiqish mumkin. Bunda materialning kimyoviy tarkibini o‘ zgartirmagan holda qatlamlarning nisbiy orientatsiyasini o‘ zgartirish orqali elektron zonalar tuzilishi, band gap, elektron holatlar zichligi va elektronlarning fazoviy lokalizatsiyasiga ta’sir ko‘ rsatish imkoniyati mavjud.

Shu bilan birga, real twistronik tizimlarni modellashtirishda faqat ideal twist burchagini hisobga olish yetarli emas. Atomar relaksatsiya, qatlamlararo masofa, stacking konfiguratsiyasi, substrat ta’siri, deformatsiya (strain), dielektrik muhit va nuqsonlar kabi omillar ham elektron zonalar tuzilishiga ta’sir qilishi mumkin. Shu sababli kelgusidagi tadqiqotlarda ideal moiré modelini real eksperimental sharoitlarga yaqinlashtirish, atomar relaksatsiyani hisobga olish va turli kvant-mexanik modellar natijalarini o‘ zaro taqqoslash muhim ilmiy vazifa bo‘ lib qoladi. Moiré tizimlaridagi real strukturaviy rekonstruksiya ham elektron va optik xususiyatlarni sezilarli darajada o‘ zgartirishi mumkinligi zamonaviy tadqiqotlarda ko‘ rsatilgan.

2D yarimo‘ tkazgichlarda twist burchagining elektron zonalar tuzilishiga ta’sirini kvant-mexanik modellashtirish twistronikaning fundamental qonuniyatlarini ochib berish bilan birga, elektron va optoelektron qurilmalar uchun yangi materiallarni loyihalashga nazariy asos yaratadi. Twist burchagi, moiré superpanjara parametrlari, qatlamlararo o‘ zaro ta’sir va elektron zonalar tuzilishi o‘ rtasidagi bog‘ lanishni chuqur o‘ rganish orqali boshqariladigan 2D kvant materiallarini yaratish imkoniyatlari kengayadi. Mazkur yo‘ nalish kelgusida nanoelektronika, optoelektronika, kvant hisoblash, kvant optikasi va boshqa ilg‘ or texnologik sohalarda qo‘ llanilishi mumkin bo‘ lgan yangi funksional materiallarni ishlab chiqish uchun muhim ilmiy asos bo‘ lib xizmat qiladi.

Annotatsiya. *Ushbu maqolada bir jinsli bo‘ lmagan yuqori chastotali elektromagnit to‘ lqinining yarimo‘ tkazgich muhitga ta’siri eksperimental va nazariy jihatdan tahlil qilindi. Kirish qismida mavzuning dolzarbligi asoslandi, metodlar bo‘ limida elektrolitik vanna modeli, “igna–tekislik” elektrodlar tizimi hamda zamonaviy o‘ lchov qurilmalari yordamida olib borilgan tadqiqot usullari yoritildi. Natijalar bo‘ limida turli konsentratsiyali elektrolitlarning volt-amper xarakteristikalari, detektorlangan kuchlanishning chastotaga bog‘ liqligi va elektrodlar geometriyasining tizim xossalariga ta’siri tahlil qilindi. Muhokama qismida olingan natijalar yarimo‘ tkazgich diodlarning detektorlik xossalari bilan qiyoslanib, elektromagnit maydon ta’sirida kechadigan fizik jarayonlar izohlandi. Tadqiqot natijalari elektrolit asosidagi model tizim yordamida yuqori chastotali elektromagnit to‘ lqinlarning yarimo‘ tkazgich muhit bilan o‘ zaro ta’sirini samarali o‘ rganish mumkinligini hamda ushbu yondashuv radioelektronika va yarimo‘ tkazgich qurilmalarini takomillashtirishda muhim ilmiy-amaliy ahamiyatga ega ekanligini ko‘ rsatdi.*

THE EFFECT OF A NON-UNIFORM HIGH-FREQUENCY ELECTROMAGNETIC WAVE ON A SEMICONDUCTOR MEDIUM

Abstract. *This article presents an experimental and theoretical analysis of the effect of a non-uniform high-frequency electromagnetic wave on a semiconductor medium. The introduction substantiates the relevance of the research topic, while the methods section describes the research methodology based on an electrolytic bath model, a “needle–plane” electrode system, and modern measuring instruments. The results section analyzes the current–voltage characteristics of electrolytes with different concentrations, the frequency dependence of the detected voltage, and the influence of electrode geometry on the properties of the system. The discussion compares the obtained results with the detection properties of semiconductor diodes and explains the physical processes occurring under the influence of an electromagnetic field. The research results demonstrate that an electrolyte-based model system can be effectively used to investigate the interaction of high-frequency electromagnetic waves with semiconductor media and that this approach has significant scientific and practical importance for the improvement of radio-electronic and semiconductor devices.*

Keywords: *non-uniform electromagnetic wave, high frequency, semiconductor medium, electrolytic bath, needle–plane electrodes, current–voltage characteristic, detected voltage, electrolyte, electric field, detection properties.*

ВЛИЯНИЕ НЕОДНОРОДНОЙ ВЫСОКОЧАСТОТНОЙ ЭЛЕКТРОМАГНИТНОЙ ВОЛНЫ НА ПОЛУПРОВОДНИКОВУЮ СРЕДУ

Аннотация. *В данной статье проведён экспериментальный и теоретический анализ воздействия неоднородной высокочастотной электромагнитной волны на полупроводниковую среду. Во введении обоснована актуальность темы исследования, в разделе «Методы» описана методика исследования с использованием модели электролитической ванны, системы электродов типа «игла–плоскость» и современных измерительных приборов. В разделе «Результаты» проанализированы вольт-амперные характеристики электролитов различной концентрации, зависимость детектированного напряжения от частоты, а также влияние геометрии электродов на свойства системы. В разделе «Обсуждение» полученные результаты сопоставлены с детекторными свойствами полупроводниковых диодов и объяснены физические процессы, протекающие под воздействием электромагнитного поля. Результаты исследования показали, что модельная система на основе электролита позволяет эффективно исследовать взаимодействие высокочастотных*

электромагнитных волн с полупроводниковой средой, а также что данный подход имеет важное научно-практическое значение для совершенствования радиоэлектронных и полупроводниковых устройств.

Ключевые слова: *неоднородная электромагнитная волна, высокая частота, полупроводниковая среда, электролитическая ванна, электроды типа «игла–плоскость», вольт-амперная характеристика, детектированное напряжение, электролит, электрическое поле, детекторные свойства.*

KIRISH

Zamonaviy fan va texnika taraqqiyoti yuqori chastotali elektromagnit maydonlarning turli fizik muhitlar bilan o‘ zaro ta’sirini chuqur o‘ rganishni talab etmoqda. Ayniqsa, yarimo‘ tkazgich materiallar radioelektronika, telekommunikatsiya va mikroelektronika sohalarining rivojlanishi natijasida yuqori chastotali elektromagnit to‘ lqinlar ta’siriga uchrayotgan asosiy muhitlardan biri hisoblanadi. Shu sababli elektromagnit to‘ lqinlarning yarimo‘ tkazgich muhitdagi zaryad tashuvchilar harakati, elektr maydoni taqsimoti va detektorlik xossalariga ta’sirini tadqiq etish dolzarb ilmiy-amaliy masalalardan biridir. Bunday tadqiqotlar yarimo‘ tkazgich qurilmalarining fizik asoslarini takomillashtirish hamda yuqori chastotali elektron qurilmalar samaradorligini oshirishga xizmat qiladi [6].

So‘ nggi yillarda elektromagnit maydonlarning nochiziqli tizimlar bilan o‘ zaro ta’siri, ayniqsa "igna–tekislik" elektrodlar tizimida kechadigan fizik jarayonlarni o‘ rganishga qiziqish ortmoqda. Elektrolit asosidagi model tizimlardan foydalanish yarimo‘ tkazgich diodlarning detektorlik xossalarini sodda eksperimental sharoitda tadqiq etish imkonini beradi. Elektr maydonining notekis taqsimlanishi natijasida volt-amper xarakteristikasining nochiziqligi va detektorlangan kuchlanishning chastotaga bog‘ liqligi elektromagnit maydon ta’siridagi fizik jarayonlarni tahlil qilish uchun muhim ahamiyat kasb etadi. Mazkur yo‘ nalishda S.M. Sze va K.K. Ng, H.A. Watson, G. Abdurakhmanov hamda boshqa olimlar tomonidan yarimo‘ tkazgich qurilmalari, yuqori chastotali detektorlar va elektromagnit maydonlarning nochiziqli tizimlarga ta’siri bo‘ yicha muhim ilmiy natijalar olingan [5]. Shuningdek, elektrolitlarning elektr o‘ tkazuvchanligi va elektrostatik maydonlarning taqsimotiga oid tadqiqotlar ushbu yo‘ nalishning nazariy asoslarini yanada boyitgan .

Ushbu maqolaning maqsadi bir jinsli bo‘ lmagan yuqori chastotali elektromagnit to‘ lqinining yarimo‘ tkazgich muhitga ta’sirini elektrolit asosidagi model tizim yordamida eksperimental tadqiq etish hamda "igna–tekislik" elektrodlar tizimining volt-amper xarakteristikalari va detektorlangan kuchlanishning chastotaga bog‘ liqligini tahlil qilishdan iborat. Olingan natijalar elektromagnit maydon ta’sirida yuz beradigan fizik jarayonlarni aniqlash hamda yuqori chastotali radioelektron va yarimo‘ tkazgich qurilmalarini takomillashtirish uchun muhim ilmiy-amaliy ahamiyatga ega [8].

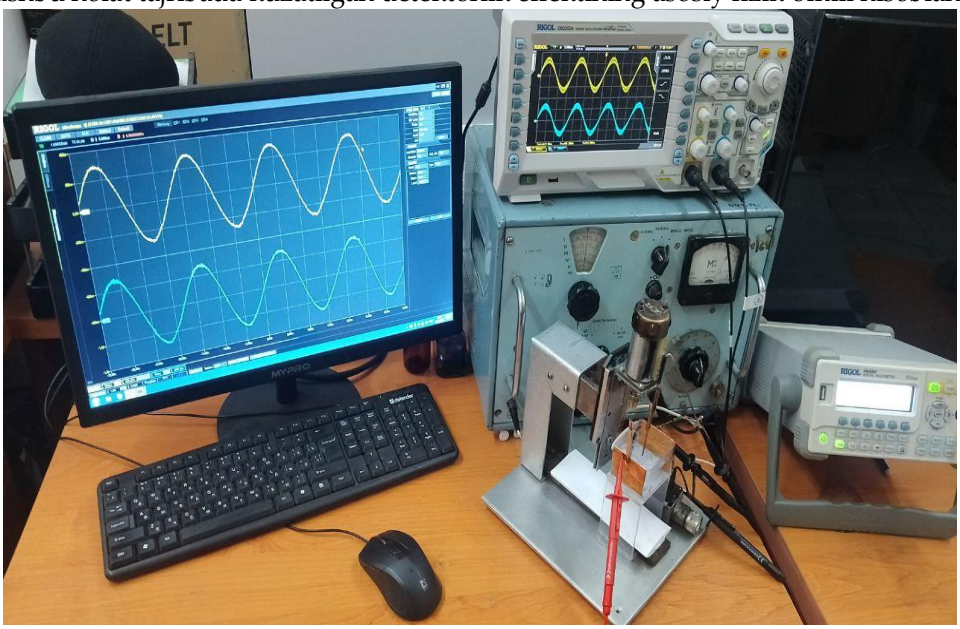
ADABIYOTLAR TAHLILI VA METODOLOGIYA

Ushbu maqola bir jinsli bo‘ lmagan yuqori chastotali elektromagnit to‘ lqinining yarimo‘ tkazgich muhitga ta’sirini eksperimental tadqiq etishga bag‘ ishlangan bo‘ lib, metodologiya nazariy tahlil va laboratoriya tajribalarini o‘ z ichiga oladi. Tadqiqotning nazariy asosini yarimo‘ tkazgichlar fizikasi, elektromagnit maydon nazariyasi hamda elektrolitlarda elektr o‘ tkazuvchanlik jarayonlariga oid ilmiy manbalar tashkil etdi. Xususan, S.M. Sze va K.K. Ng, H.A. Watson hamda G. Abdurakhmanov va hammualliflar tomonidan olib borilgan tadqiqotlar yuqori chastotali elektromagnit maydonlarning yarimo‘ tkazgich qurilmalariga ta’sirini baholashda muhim nazariy asos bo‘ lib xizmat qildi [6]. Tadqiqot metodologiyasida elektrolitik vanna asosidagi model tizimdan foydalanildi. Tajribalarda "igna–tekislik" elektrodlar tizimi qo‘ llanilib, turli konsentratsiyadagi elektrolit eritmalarida elektr maydonining taqsimoti, volt-amper xarakteristikalari hamda detektorlangan kuchlanishning yuqori chastotaga bog‘ liqligi zamonaviy o‘ lchov asboblari yordamida aniqlandi. Olingan eksperimental natijalar nazariy ma’lumotlar bilan qiyosiy tahlil qilinib, elektromagnit maydon ta’sirida yuz beradigan fizik jarayonlarning asosiy qonuniyatlari baholandi.

Adabiyotlar tahlili davomida yarimo‘ tkazgich qurilmalarining fizik xossalari, elektromagnit maydonlarning nochiziqli tizimlarga ta’siri, elektrolit eritmalarining elektr xususiyatlari hamda elektrostatik maydonlarning taqsimotiga oid mahalliy va xorijiy ilmiy manbalar o‘ rganildi. Shuningdek, elektrolitlarning elektroximik xossalari, ionlarning harakatlanuvchanligi va elektr o‘ tkazuvchanlik mexanizmlariga bag‘ ishlangan ilmiy tadqiqotlar tahlil qilinib, ular tajriba natijalarini ilmiy asoslashda foydalanildi [15]. Qo‘ llanilgan metodologiya elektromagnit to‘ lqinlarning yarimo‘ tkazgich muhit bilan o‘ zaro ta’sirini model tizim asosida ishonchli baholash, eksperimental natijalarni nazariy ma’lumotlar bilan taqqoslash hamda olingan qonuniyatlarning amaliy ahamiyatini aniqlash imkonini berdi. Mazkur yondashuv yuqori chastotali radioelektron va yarimo‘ tkazgich qurilmalarini takomillashtirishga oid keyingi ilmiy tadqiqotlar uchun metodik asos bo‘ lib xizmat qiladi.

NATIJALAR TAHLILI

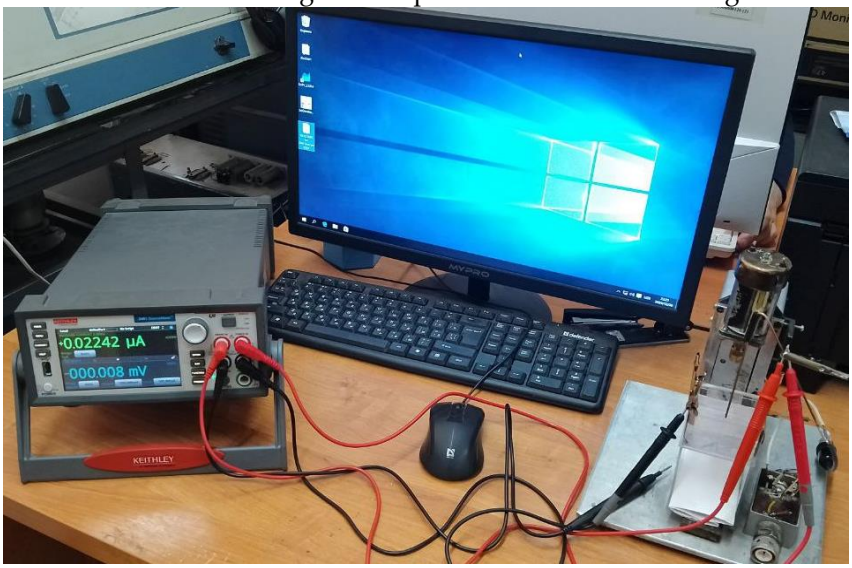
Tadqiqot davomida bir jinsli bo‘ lmagan yuqori chastotali elektromagnit maydonning yarimo‘ tkazgich muhitga ta’sirini o‘ rganish uchun elektrolit asosidagi model tizimdan foydalanildi. Tajribalarda turli konsentratsiyali natriy xlorid (NaCl) eritmalari qo‘ llanilib, ularning fizik xossalari **1.1-jadval**da keltirilgan.



1.1-jadval.

Elektrolit vannadagi elektrolitning konsentratsiyasi (massa va molyar %) va elektr o‘ tkazuvchanligi

Namuna tartib soni	Osh tuzi, massa %	Suv, massa %	Eritmaning molyar konsentratsiyasi, M	Elektr o‘ tkazuvchanligi σ, Sm/m [2]
1	5	95	0,85	6,7
2	10	90	1,71	12,1
3	15	85	2,56	16,4
4	20	80	3,41	19,6



Elektrolit konsentratsiyasi ortishi bilan eritmaning elektr o‘ tkazuvchanligi ham ortadi. Bu esa ionlar sonining ko‘ payishi va zaryad tashuvchilarning elektr maydonidagi harakatchanligi ortishi bilan izohlanadi. Shu sababli keying tajribalarda elektrolit konsentratsiyasining volt-amper xarakteristikasi va detektorlangan kuchlanishga ta’siri alohida tahlil qilindi(1.1-jadval).

Tajriba qurilmasining umumiy sxemasi **1.1-rasm**da keltirilgan. Qurilmada yuqori chastotali signal generatori, elektrolitik vanna, “igna–tekislik” elektrodlar tizimi hamda o‘ lchov asboblari o‘ zaro bog‘ langan. Bunday sxema yuqori chastotali elektromagnit maydonning elektrolit muhitiga ta’sirini real vaqt rejimida kuzatish imkonini beradi. Ayniqsa, igna elektrodi uchida elektr maydoni kuchlanganligining keskin ortishi natijasida elektr maydoni bir jinsli bo‘ lmagan holatga keladi. Aynan ushbu holat tajribada kuzatilgan detektorlik effektining asosiy fizik omili hisoblanadi(1.1-rasm).

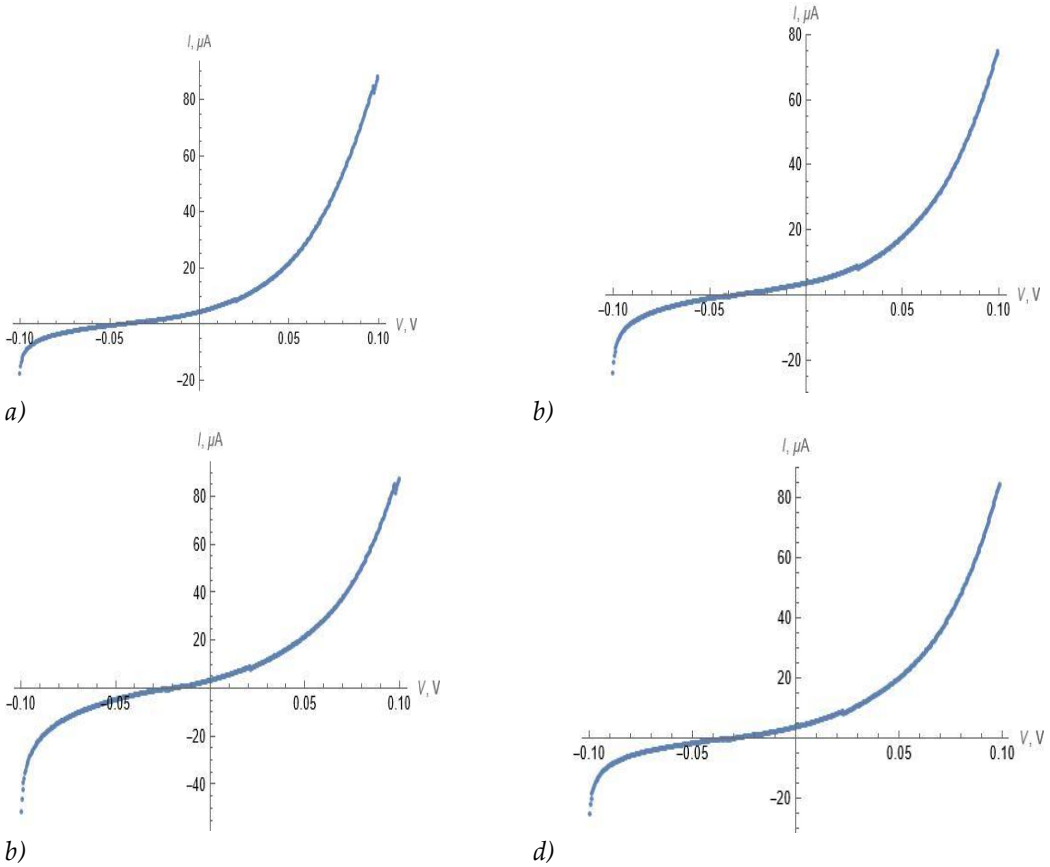
1.1-rasm. Suyuq elektrolitga botirilgan “igna-tekislik” tizimining detektorlik xossalarini o‘ rganish qurilmasi

1.2-rasmda ‘igna–tekislik’ elektrodlar tizimining volt-amper xarakteristikasi keltirilgan.

1.2-rasm. Suyuq elektrolitga botirilgan “igna-tekislik” tizimining voltamper xarakteristikasini o‘ rganish qurilmasi

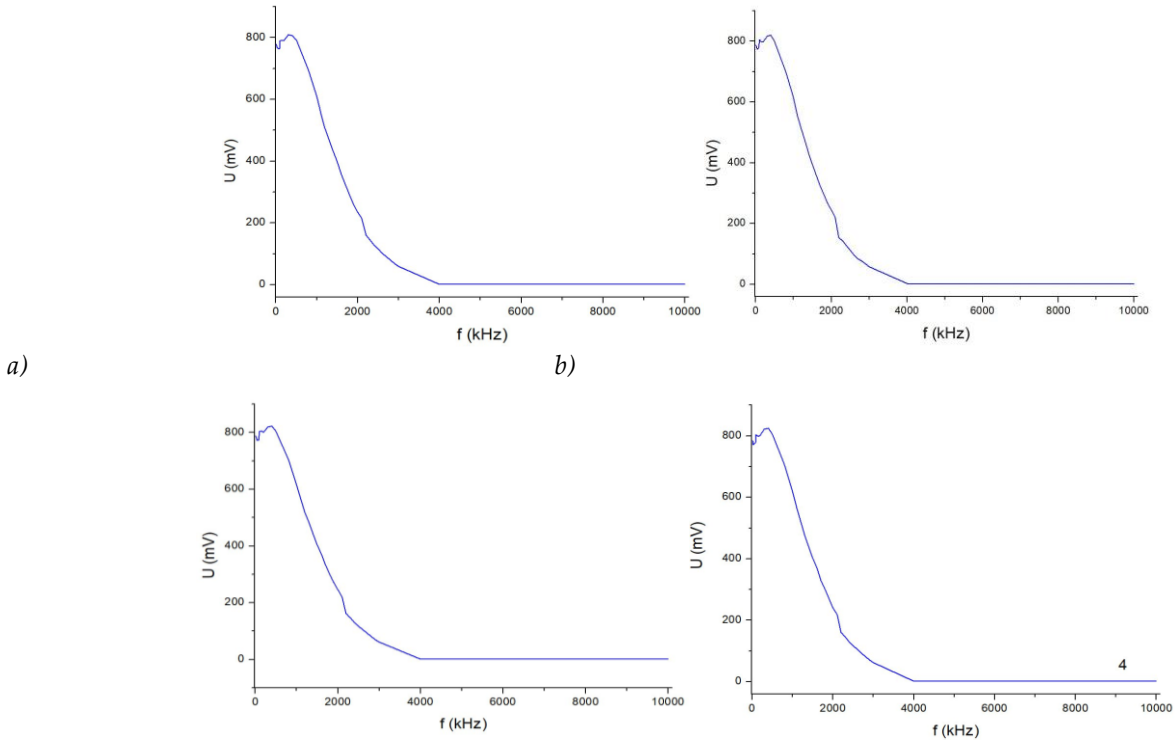
Kuchlanishning kichik qiymatlarida tokning o‘ zgarishi chiziqli emas. Kuchlanish ortishi bilan tok qiymati tez o‘ sadi, ma’lum nuqtadan boshlab esa o‘ sish sur’ati kamayadi. Bu holat elektrolitda ionlarning harakat tezligi, elektr maydonining notekis taqsimlanishi hamda elektrodlar geometriyasi bilan bevosita bog‘ liq. Xususan, igna elektrodi uchida elektr maydonining kuchayishi ionlarning tezlanishiga sabab bo‘ ladi va natijada tizim oddiy elektrolitik vannadan farqli ravishda yarimo‘ tkazgich diodlarga xos bo‘ lgan nochiziqli volt-amper xarakteristikasini namoyon etadi(1.2-rasm). Tajribalarda musbat va manfiy kuchlanishlar uchun olingan volt-amper xarakteristikalari o‘ zaro taqqoslandi. Natijalarga ko‘ ra, ignaga musbat potensial berilganda tok qiymatining ortishi manfiy kuchlanish holatiga nisbatan ancha tez sodir bo‘ ladi. Buning asosiy sababi elektr maydoni ta’sirida ionlarning elektrod tomon yo‘ nalgan harakatining o‘ zgarishi hamda elektrod yaqinida zaryadlarning notekis taqsimlanishidir. Mazkur natijalar elektrolit asosidagi model tizimda to‘ g‘ rilovchi (detektorlik) xossalar mavjudligini yana bir bor tasdiqlaydi.

Ionlarning o‘ zgaruvchan elektr maydonidagi harakati



$$m\frac{dv}{dt} = eE - F_{в}, \quad (1)$$

Mazkur formulaga ko‘ ra, ionning yarim davr davomida bosib o‘ tadigan masofasi elektr maydoni kuchlanganligi va ion harakatchanligiga to‘ g‘ ri, elektromagnit maydon chastotasiga esa teskari proporsionaldir. Demak, chastota oshgan sari ionlarning siljish masofasi kamayadi. Ushbu nazariy xulosa keyingi tajribalarda olingan eksperimental natijalar bilan to‘ liq mos kelishi aniqlandi.



Volt-amper xarakteristikalari tahlili shuni ko‘ rsatdiki, elektrolit konsentratsiyasi ortishi bilan tok qiymati ham ortadi, biroq ma’lum konsentratsiyadan keyin bu o‘ sish sekinlashadi. Bu holat eritmaning elektr o‘ tkazuvchanligi bilan bir qatorda ionlararo o‘ zaro ta’sir kuchayishi natijasida ularning harakatchanligi cheklanishi bilan izohlanadi. Demak, detektorlik xossalari faqat elektrolit konsentratsiyasiga emas, balki elektrodlar geometriyasi, elektr maydoni taqsimoti va yuqori chastotali elektromagnit maydon parametrlariga ham bog‘ liq ekanligi tajribalar orqali tasdiqlandi.

MUHOKAMA

Olingan eksperimental natijalar bir jinsli bo‘ lmagan yuqori chastotali elektromagnit maydonning elektrolit asosidagi model tizimga ta’siri yarimo‘ tkazgichlarda kuzatiladigan fizik jarayonlarga yaqin qonuniyatlar asosida kechishini ko‘ rsatdi.

1.3-rasm. “Igna-tekislik” elektrodlarining past kuchlanishdagi voltamper xarakteristikasi: *a*) – 5%; *b*) – 10%; *c*) – 15%; *d*) – 20%

1.4-rasm. Osh tuzining suvdagi eritmasiga botirilgan "igna-tekislik" turidagi elektrodlarda paydo bo‘ luvchi o‘ zgarmas kuchlanishning chastotaga bog‘ liqligi: *a*) 5%; *b*) 10%; *c*) 15%; *d*) 20%

Natijalardan ko‘ rinadiki, "igna–tekislik" elektrodlar tizimida hosil bo‘ ladigan detektorlangan o‘ zgarmas kuchlanish chastota ortishi bilan muntazam kamayadi(1.3-rasm). Bunda 5 %, 10 %, 15 % va 20 % li NaCl eritmalari uchun kuzatilgan bog‘ lanish umumiy tendensiyani saqlab qolgan bo‘ lsa-da, yuqori konsentratsiyalarda kuchlanishning pasayish tezligi nisbatan katta bo‘ lishi aniqlandi. Bu holat ionlar harakatining elektromagnit maydon chastotasiga sezgir ekanligini ko‘ rsatadi.

Eksperimental natijalar elektrolitlarning elektr o‘ tkazuvchanligi nazariyasi bilan ham mos keladi. Ma'lumki, past konsentratsiyalarda elektr o‘ tkazuvchanlik ionlar konsentratsiyasining ortishi hisobiga

$$\sigma = ne\mu. \qquad (2)$$

(2) formula bilan ifodalanadi. Ushbu ifodadan ko‘ rinadiki, elektr o‘ tkazuvchanlik zaryad tashuvchilar konsentratsiyasi (n) va ularning harakatlanuvchanligi (μ) ga bevosita bog‘ liq. Tajribalarda eritma konsentratsiyasi ortishi bilan elektr o‘ tkazuvchanlikning ortishi aynan ushbu nazariy bog‘ lanishni tasdiqlaydi. Biroq yuqori konsentratsiyalarda ionlar o‘ rtasidagi o‘ zaro ta'sir kuchayishi natijasida ularning harakatlanuvchanligi kamayadi va elektr o‘ tkazuvchanlikning ortish sur'ati sekinlashadi. Bu holat 3.2-jadvalda keltirilgan ionlarning harakatlanuvchanligi qiymatlari bilan ham mos tushadi [15].

1.2-jadval.

Ayrim ionlarning elektrolitda 298 K da harakatlanuvchanligi [15]

Ionning turi	μ, $sm^2V^{-1}s^{-1}$	Ionning turi	μ, $sm^2V^{-1}s^{-1}$
$H^+(H_3O^+)$	36,3	OH^-	20,5
Li^+	4,01	Cl^-	7,90
Na^+	5,20	Br^-	8,12
K^+	7,62	NO_3^-	7,40
NH_4^+	7,60	CH_3COO^-	4,24
$(CH_3)_4N^+$	5,59	$C_6H_5COO^-$	3,71
Mg^{2+}	5,50	SO_4^{2-}	8,27

Elektrolit tarkibida ko‘ p zaryadli ionlar mavjud bo‘ lganda elektr o‘ tkazuvchanlik

$$\sigma = nZe\mu \qquad (3)$$

(3) formula bilan aniqlanadi. Ushbu tenglama ion zaryadi (Z) ortishi elektr o‘ tkazuvchanlikning ham ortishiga olib kelishini ko‘ rsatadi. Demak, elektrolitning elektr xossalari nafaqat ionlar konsentratsiyasi, balki ularning zaryadi va harakatlanuvchanligiga ham bog‘ liq. Bu qonuniyat yuqori chastotali elektromagnit maydonda zaryad tashuvchilarning dinamikasini izohlashda muhim nazariy asos bo‘ lib xizmat qiladi [15, 16].

Ionlarning elektrolitdagi taqsimlanishi Boltsman qonuniga asoslangan

$$N_i = N_{i0}\, exp\left(-\frac{e\varphi}{k_B T}\right), \quad (4)$$

(4) formula bilan ifodalanadi. Mazkur ifoda ionlar konsentratsiyasi elektr potensialining o‘ zgarishiga bog‘ liq ravishda eksponensial ravishda o‘ zgarishini ko‘ rsatadi. "Igna–tekislik" elektrodlar tizimida elektr maydoni bir jinsli bo‘ lmaganligi sababli elektrod yaqinida ionlarning qayta taqsimlanishi yuz beradi. Natijada zaryadlarning notekis joylashuvi detektorlangan kuchlanish hosil bo‘ lishining asosiy omillaridan biri hisoblanadi.

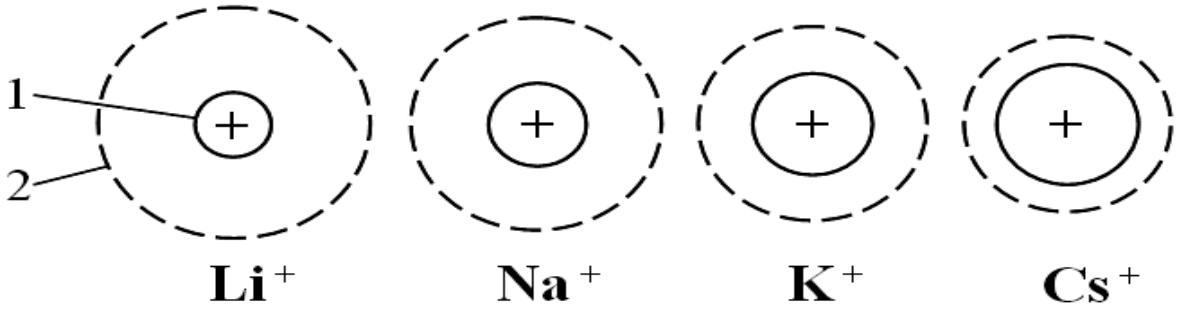
Ionlarning o‘ zgaruvchan elektr maydonidagi harakati Nyuton tenglamasiga asoslangan

$$m\frac{dv}{dt} = eE - F_в, \quad (5)$$

(5) tenglama orqali tavsiflanadi. Bu yerda ionga elektr maydoni tomonidan ta’sir etuvchi kuch bilan yopishqoqlik kuchi o‘ rtasidagi muvozanat ionning harakat tezligini belgilaydi. Elektrolit muhitida yopishqoqlik kuchi

$$F_в = 6\pi\eta v R_s\left(1 + \frac{R_s}{r_D}\right), \quad (6)$$

(6) formula bilan aniqlanadi. Demak, elektrolitning yopishqoqligi ortishi ionlarning harakatini sekinlashtiradi va yuqori chastotalarda ularning elektr maydoniga javob reaksiyasini kamaytiradi. Tajribalarda detektorlangan kuchlanishning chastota ortishi bilan pasayishi aynan shu fizik mexanizm orqali tushuntiriladi [16–18].



Ionlarning gidratlangan radiusi

$$\mathrm{R_s} = \frac{\mathrm{r_S^{Kt} r_S^{An}}}{\mathrm{r_S^{Kt} + r_S^{An}}}, \quad (7)$$

(7) formula, Debay radiusi esa

$$r_D = \sqrt{\frac{\varepsilon\varepsilon_0 1000 k_B T}{Z_i^2 e^2 c N_A}}. \quad (8)$$

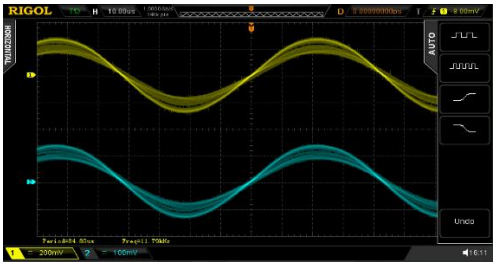
(8) formula orqali hisoblanadi. Ushbu kattaliklar ionlarning elektr maydonidagi harakatiga sezilarli ta’sir ko‘ rsatadi.

1.5-rasm. Ishqoriy metallarning liotropik qatori. 1 – gidratlanmagan ion, 2 – gidrat qobig‘ i

1.5-rasmda keltirilgan liotropik qatordan ko‘ rinadiki, ionlarning samarali radiusi ularning yalang‘ och ion radiusidan ko‘ ra gidrat qobig‘ i bilan belgilanadi. Shu sababli Na^+ va Cl^- ionlarining harakatlanuvchanligi bir-biridan farq qiladi, bu esa tajribalarda kuzatilgan tok va kuchlanish qiymatlarining o‘ zgarishiga bevosita ta’sir etadi.

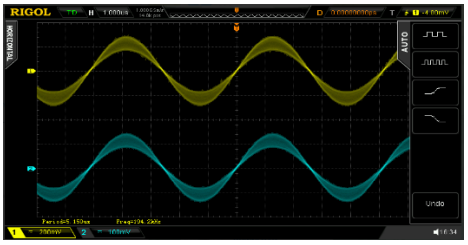
Gidratlangan ion radiusini aniqlash uchun qo‘ llanilgan

$$r_s^i = 49.79 \cdot 10^{-8}\left(\frac{ZN_s}{T^2}\right)^{1/3} - \quad (9)$$



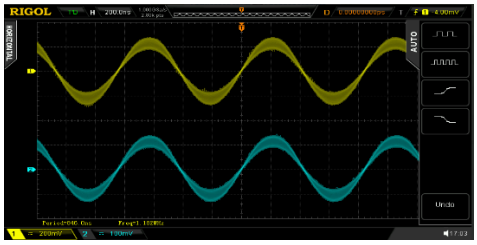
(9) formula ionlarning o‘ lchami temperatura va zaryad soniga bog‘ liq ravishda o‘ zgarishini ko‘ rsatadi. Natijada ionning samarali o‘ lchami ortishi bilan uning harakatlanuvchanligi kamayadi. Bu esa elektrolitning yuqori chastotali elektromagnit maydondagi javob xarakteristikasiga bevosita ta’sir ko‘ rsatadi.

Elektrolit tizimining xususiy tebranish chastotasi Lengmyur chastotasi orqali

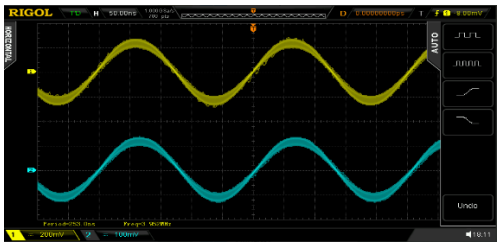


$$\omega_L = \sqrt{\frac{Ne^2}{\varepsilon\varepsilon_0 m}}. \quad (10)$$

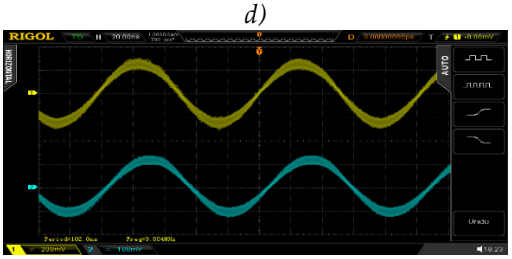
(10) formula bilan aniqlanadi. Hisoblash natijalari Lengmyur chastotasi 0,74–1,4 THz oralig‘ ida ekanligini ko‘ rsatdi. Tadqiqotda qo‘ llanilgan 12 kHz–10 MHz diapazon ushbu qiymatdan bir necha tartib past bo‘ lganligi sababli ionlar elektromagnit maydonga kvazistatik rejimda javob beradi. Aynan shu sababli tajribalarda 0,2–1 MHz oralig‘ idan boshlab detektorlangan kuchlanish keskin kamayishi kuzatildi, chunki ionlarning yarim davr davomida bosib o‘ tadigan masofasi sezilarli darajada qisqaradi.



Na^+ va Cl^- ionlarining yarim davrdagi siljish masofasi hisob-kitoblari ham ushbu xulosani tasdiqlaydi. Hisoblashlarga ko‘ ra, 12 kHz da Na^+ ioni taxminan 0,1 mkm, Cl^- ioni esa 0,17 mkm masofani bosib o‘ tadi. Chastota 10 MHz gacha oshirilganda ushbu qiymatlar mos ravishda 1,3 nm va 2,0 nm gacha kamayadi. Demak, ionlarning siljish yo‘ li deyarli yuz martalab qisqaradi. Natijada elektrodlar orasida zaryadlarning qayta taqsimlanishi sustlashadi va 1.3-rasmda kuzatilganidek detektorlangan kuchlanish deyarli yo‘ qoladi.



a)



b)

c)

d)

e)

1.6-rasm. Osh tuzining suvdagi eritmasiga botirilgan “igna-tekislik” turidagi elektrodlardan o‘ tayotgan tokning ossillogrammalari: tepadagi och rangli ossillogramma – elektrodlar orqali o‘ tayotgan tok; pastki to‘ q rangli ossillogramma – generatordan chiqayotgan kuchlanish ossillogrammasi.

Olingan natijalar 1.6 -rasmda keltirilgan ossillogrammalar bilan ham tasdiqlanadi. Past chastotalarda elektrodlardan o‘ tayotgan tok shakli generatordan berilgan signalga yaqin bo‘ lsa, chastota oshishi bilan signal amplitudasi kamayadi va detektorlik xossasi sustlashadi. Ushbu qonuniyat nuqtaviy kontaktli yarimo‘ tkazgich diodlarda kuzatiladigan "kesib qolish chastotasi" hodisasiga o‘ xshash bo‘ lib, farq faqat zaryad tashuvchilarning massasi va harakatlanuvchanligi bilan izohlanadi [9]. Tajriba natijalari va nazariy hisoblashlar o‘ zaro yaxshi mos keladi. Elektrolit asosidagi “igna–tekislik” model tizimi yuqori chastotali elektromagnit maydonning yarimo‘ tkazgich muhitga ta’sirini modellashtirishda samarali fizik model ekanligi tasdiqlandi. Olingan natijalar yuqori chastotali detektorlar, mikroto‘ lqinli qurilmalar hamda yarimo‘ tkazgich elementlarining fizik jarayonlarini chuqurroq tushunish va ularni takomillashtirish uchun muhim ilmiy asos bo‘ lib xizmat qiladi.

XULOSA

Xulosa qilib aytganda, bir jinsli bo‘ lmagan yuqori chastotali elektromagnit to‘ lqinning yarimo‘ tkazgich muhitga ta’sirini elektrolit asosidagi model tizim yordamida o‘ rganish elektromagnit maydon ta’sirida yuz beradigan fizik jarayonlarning muhim qonuniyatlarini aniqlash imkonini berdi. Tadqiqot natijalari shuni ko‘ rsatdiki, elektromagnit

maydon chastotasi ortishi bilan detektorlangan kuchlanishning kamayishi ionlarning harakatlanuvchanligi, elektr o‘ tkazuvchanligi hamda yarim davr davomida bosib o‘ tadigan masofasining qisqarishi bilan bevosita bog‘ liq. Tajribalar davomida olingan volt-amper xarakteristikalari va chastotaviy bog‘ lanishlar nazariy hisoblashlar hamda elektrolitlarning elektr o‘ tkazuvchanligi tenglamalari bilan yaxshi mos kelishi aniqlandi. Shuningdek, **“igna–tekislik”** turidagi elektrodlar tizimi yarimo‘ tkazgich diodlarda kuzatiladigan detektorlik xossalarini modellashtirish uchun samarali fizik model ekanligi tasdiqlandi. Olingan natijalar yuqori chastotali radioelektron qurilmalar, mikroto‘ lqinli detektorlar hamda yarimo‘ tkazgich elementlarining fizik jarayonlarini chuqurroq tushunishga xizmat qiladi. Kelgusida tadqiqotlarni turli yarimo‘ tkazgich materiallari, elektromagnit maydonning kengroq chastota diapazonlari hamda turli elektrolit tarkiblari uchun davom ettirish ushbu yo‘ nalishning ilmiy va amaliy ahamiyatini yanada oshiradi. Mazkur natijalar yuqori chastotali elektron qurilmalar va zamonaviy yarimo‘ tkazgich texnologiyalarini takomillashtirishda muhim ilmiy asos bo‘ lib xizmat qilishi mumkin.

Annotatsiya. *Ushbu tadqiqot ishida gorizontal o‘ qli shamol energetik qurilmasining harakatlanishiga qarshilik qiladigan kuch, ya’ni tormozlanish koeffitsiyentini, va uning eng katta samaradorlik koeffitsiyentini aniqlash borasidagi ma’lumotlar keltirib o‘ tilgan. Shamol energetik qurilmalari asosan shamolning kinetik energiyasidan foydalangan holda ishlaydi, shuning uchun ularni gorizontal va vertikal o‘ qli shamol energetik qurilmalarga ajratish mumkin. Jumladan, gorizontal o‘ qli shamol energetik qurilmasini tormozlanish koeffitsiyentiga bog‘ lab eng katta qiymatini aniqlangan.*

Kalit so‘ zlar: *Gorizontal o‘ qli shamol energetik qurilmasi, parraklar*

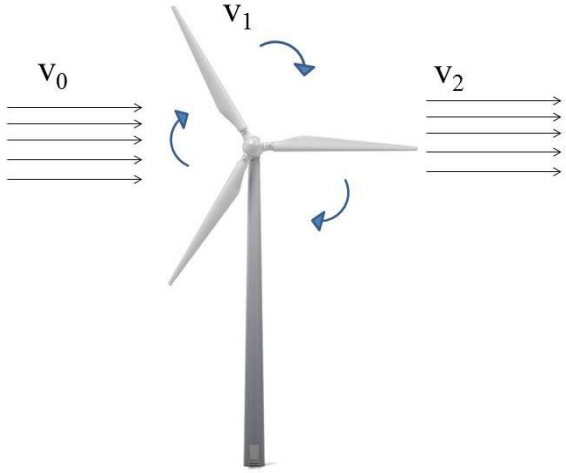
ОПРЕДЕЛЕНИЕ КОЭФФИЦИЕНТА ЭФФЕКТИВНОСТИ ГОРИЗОНТАЛЬНО-ОСЕВОЙ ВЕТРОЭНЕРГЕТИЧЕСКОЙ УСТАНОВКИ

Аннотация. *В данной исследовательской работе представлены результаты исследования силового сопротивления движению горизонтально-осевой ветроэнергетической установки, то есть коэффициента торможения, а также определения её максимального коэффициента полезного действия. Ветроэнергетические установки функционируют преимущественно за счёт использования кинетической энергии ветра, в связи с чем их принято подразделять на горизонтально-осевые и вертикально-осевые ветроэнергетические установки. В частности, в работе исследована зависимость эффективности горизонтально-осевой ветроэнергетической установки от коэффициента торможения и определено его оптимальное значение, соответствующее максимальной эффективности установки.*

Ключевые слова: *горизонтально-осевая ветроэнергетическая установка, лопасти, ветроэнергетика, коэффициент эффективности,* коэффициент торможения.

DETERMINATION OF THE EFFICIENCY COEFFICIENT OF A HORIZONTAL-AXIS WIND ENERGY SYSTEM

Abstract. *This research paper presents the results of a study on the force resisting the motion of a horizontal-axis wind energy system, namely the braking coefficient, as well as the determination of its maximum efficiency coefficient. Wind energy systems operate primarily by utilizing the kinetic energy of wind; therefore, they can generally be classified into horizontal-axis and vertical-axis wind energy systems. In particular, the study investigates the dependence of the efficiency of a horizontal-axis wind energy system on the braking coefficient and determines its optimal value corresponding to the maximum efficiency of the system.*



Keywords: *horizontal-axis wind energy system, blades, wind energy, efficiency coefficient, braking coefficient.*

Kirish

Dunyodagi barcha tabiy jarayonlar ma’lum bir fizik qonuniyat asosida yuzga keladi. Hususan tabiatda shamol hosil bo‘ lishi, yomg‘ ir yog‘ ishi, yerning silkinishi shular jumlasidandir, suvning to‘ lqinlanishi shular jumlasidandir. Hozirgi rivojlanib kelayotgan zamonda bunday hodisalardan unumli foydalangan holda energiya yig‘ ish yo‘ lga qo‘ yilmoqda yani elektr energiyasini olish. Dunyo davlatlarining geografik joylashuviga qarab ulardagi muhiti hisobga olgan holda

tabbiy ravishda qayta tiklanadigan energiya manabalaridan foydalanishga o‘ tishmoqda. O‘ zbekiston Respublikasi ham bugungi kunda bu sohada oldinlab harakatlanib kelmoqda. O‘ zbekiston hududidagi iqlimi geografik joylashuvidan foydalanib quyoshdan, shamoldan va suvdan unumli ravishda energiya olishni imkoni mavjud. Hududlarning kengligi tog‘ va tepaliklar ko‘ pligi bois ushbu hududlarda shamoldan energiya olishni amalga oshirilmoqda. Tabitada shamol havo oqimlarining turli balandliklarda turlicha bosim hosil bo‘ lishi va ular bir biri bilan almashinishi bilan yuzaga keladi. Shamol issiq va sovuq havolarni almashinishi natijasida turli balandliklarda turlicha bo‘ ladi, balandlik organ sari shamolning tezligi ortaveradi. Hozirgi kungacha olimlar ko‘ plab tadqiqotlar natijasida shamoldan qanday qilib energiya olishni o‘ rganib chiqishdi. Shamol energetik qurilmalari asosan shamolning kinetik energiyasiga hisobiga ishlaydi va bu energiyani shamol parragi boshqa turdagi energiyaga aylantirib beradi. Bunday jarayon gorizontal va vertikal o‘ qli shamol energetik qurilmasi uchun juda mos keladi va bundan hozirgi kunda keng foydalanib kelinmoqda. Hozirda gorizontal o‘ qli shamol energetik qurilmasi keng ommalashib bormoqda sababi u o‘ zgaruvchan havo oqim tezligiga juda yaxshi moslasha oladi. Gorizontal o‘ qli shamol energetik qurilmasi uchun parraklar soni juda ahamiyatlidir. Bizning maqolamizda ularning soni 3 ta dir bunday bo‘ lishiga asosiy sabab shamol parraklari o‘ z inersiyasi tufayli aylanishni yaxshi taminlab beradi. Shamoldan olingan elektr energiyani o‘ zgaruvchan qilib tarmoqga uzatishda ham 3 parrakli va ayon qutbli rotordan keng foydalaniladi. Uch parrakli qilib yasashni yana bir foydali tomoni olingan energiyani o‘ zgaruvchan tokga moslash osonroq kechadi. Har bir shamol energetik qurilmasi uchun malum bir tezlikga yetganda aylanadi va malum tezlikda ishlashdan to‘ xtaydi deb olishimiz mumkin. Kuchli bo‘ ronda ular ishlamaydi yani tormozanish rejimiga o‘ tadi. Bizning olgan natijamizga ko‘ ra shamol energetik qurilmasi shamol tezligini qandaydir qiymatida tormozlanishini ko‘ rishimiz mumkin.

Hozirda gorizontal o‘ qli shamol energetik qurilmalaridan SHES ni qurish har bir davlatda qo‘ llab kelinmoqda. Gorizontal o‘ qli shamol energetik qurilmasi ko‘ plab afzalliklarga ega. Uning parraklarining yuzasini silliqligiga va kesimi o‘ zgaruvchanligiga qarab minorani turi balandlikga moslab o‘ rnatishimiz mumkin. Balandlik ortgan sari shamol tezligi ortadi shuning uchun uni parraklarini uzunroq qilib minorasi balandligiga nisbatan 30m yoki 40m farq qiladigan holatda joylashtiriladi. Har qanday o‘ zgaruvchan kesimli parraklar albatta qandaydir tezlikga borganda to‘ xtaydi. Shu sababdan biz parraklarni tormozlanish tizimini matematik ifodalarini aniqlab chiqdik. Bunda tormozlanish koeffitsiyentini maksimal qancha qiymatga ega ekanligini aniqladik. Aniqlangan qiymatlarni yuzaga keltirish uchun shamolni parrakga urilmasdan oldingi tezligi, urilgandan kelingi tezligini va parrakni aylanish tezligini bilishimiz kerak. Gorizontal o‘ qli shamol energetik qurilmasi parraklari havo oqimini turbulentligidan foydalanib aylanadi [1]. Havoning yo‘ nalishi o‘ zgaruvchan bo‘ lib parraklarga turli burchak ostida uriladi va barcha uriluvchi kuchlarning natijaviysi parrakni aylanma harakat qilishga undaydi.

1-Rasm. Gorizontal o‘ qli shamol energetik qurilmasi

1-Rasmda shamol parraklariga tasir qiluvchi kuch quyidagicha aniqlanadi.

$$F=ma \quad (1) \qquad a=\frac{v_0-v_2}{\Delta t} \quad (2)$$

bu yerda, **m-** parrakga uriluvchi havo massasi, **a-** parrakning tezlanishi $\mathbf{v}_o$- shamolning parrakga urilishidan oldingi tezligi, $\mathbf{v}_2$ – shamolning parrakga urilgandan keyingi tezligi **Δt-** tezlik o‘ zgarishi uchun sarflangan vaqt

1-formuladagi **a** ning o‘ rniga 2-formulani qo‘ ysak quyidagi ifodaga kelamiz.

$$F=m\cdot\frac{v_0-v_2}{\Delta t} \quad (3)$$

Shamol parraklari oladigan quvvatini aniqlaymiz.

$$N=Fv_1 \quad (4)$$

bu yerdan F ning o‘ rniga 3- formuladagi ifodani tenglaymiz.

$$N= mv_1 \cdot \frac{v_0-v_2}{\Delta t} \quad (5)$$

Ikkinchi tomondan energiyaning saqlanish qonuniga ko‘ ra .

$$E_{parrak}=E_0-E_2 \quad (6)$$

Energiyani saqlanish qonunini parrak va havo bilan energiya almashadi deb olamiz va kinetik energiyani yoyib chiqamiz.

$$E_{parrak} = \frac{mv_0^2}{2} - \frac{mv_2^2}{2} = \frac{m}{2}(v_0^2 - v_2^2) \quad (7)$$

Parrak quvvatini energiyaga bog‘ liqlik formulasi quyidagicha.

$$N=\frac{E_{parrak}}{\Delta t} \quad (8)$$

Bu ifodadagi $\mathbf{E_{parrak}}$ ni o‘ rniga 8-formuladagi ifodani tenglaydigan bo‘ lsak quyidagi ko‘ rinishga keladi.

$$N=\frac{m(v_0^2-v_2^2)}{2\Delta t} \quad (9)$$

Ushbu ifodalardan shamolning parraklarga bergan quvvati shamolning kinetik energiyasi o‘ zgarishi hisobiga amalga oshadi deb olamiz. Ideal holda energiya almashinuvi faqat shamol va shamol parraklari orasida amalga oshadi. Shamol parragining quvvati va shamolning energiya o‘ zgarishi tufayli oladigan quvvatlarini tenglaydigan bo‘ lsak quyidagi ifoda hosil bo‘ ladi[2].

$$N= N; \qquad \frac{m\,v_1\,(v_0-v_2)}{\Delta t}=\frac{m\,(v_0^2-v_2^2)}{2\Delta t} \quad (10)$$

Ifodani soddalashtiradigan bo‘ lsak $\frac{m}{\Delta t}$ lar qisqarib ketadi va quyidagi ifoda hosil bo‘ ladi.

$$2(v_0-v_2)\cdot v_1= (v_0^2- v_2^2) \quad (11)$$

bu formuladan $\mathbf{v_1}$ ni ifodalaymiz. $\mathbf{v_1}$ parrakni aylantiruvchi tezlik hisoblanadi.

$$v_1=\frac{v_0-v_2}{2} \quad (12)$$

Shamol parraklari ma’lum bir qonuniyatga asoslangan holda yuzani o‘ zgaruvchan qilib tayyorlanadi. Shamol parraklari yuzasi boshidan boshlab ohirigacha o‘ zgaruvchan yuza qilib havo oqimini o‘ ziga qabul qiladigan qilib tayyorlanadi. Shundan kelib chiqgan holda shamol parraklarining o‘ lchamlari kata va kichik qilib tayyorlanadi. Ularning o‘ lchamiga qarab shamolning aniq bir tezlikda parraklarning aylanishini va ma’lum bir tezlikda shamol parraklarining to‘ rmozlanishi kerak bo‘ ladi. Shamol trubinasi katta tezlik va kichik tezliklarda ish rejimlari o‘ zgaradi yani tormozlaydi. Shu sababli tormozlanish koeffitsiyent kiritib olamiz va bu koeffitsiyent $\boldsymbol{\alpha}$ hisoblanadi.

$\boldsymbol{\alpha}$**-**tormozlanish koeffitsiyenti va birliksiz kattalik hisoblanadi.

$$\alpha=\frac{v_0-v_2}{v_0} \quad (13)$$

Agar parrakning tezligi shamolning dastlabki tezligiga teng bo‘ lsa ya’ni $\mathbf{v_1=v_0}$ (13-formula) bu ifoda nolga teng bo‘ ladi.

$$\alpha=\frac{v_0-v_0}{v_0}; \qquad \alpha = 0 \quad (14)$$

α=0 degani bu parrak hech qachon to‘ xtamasligini anglatadi. Bunday holat esa bo‘ lmasligini hisobga olgan holda $\alpha\neq0$ shart kiritiladi. So‘ ngra u qanday qiymatlar qabul qilishini ko‘ rib chiqamiz. 13 – ifodadagi v_1 ni o‘ rniga (12)-ifodadagi tenglikni qo‘ yamiz va quyidagi ifoda hosil bo‘ ladi.

$$\alpha=\frac{v_0-v_2}{v_0} = \frac{v_0-\frac{v_0+v_2}{2}}{v_0}; \qquad \alpha=\frac{v_0-v_2}{2v_0} \quad (16)$$

16 - ifodadan $\mathbf{v_2}$ topamiz va $\boldsymbol{\alpha}$ orqali ifodalaymiz.

$$v_2= v_0(1-2\alpha) \quad (17)$$

$\mathbf{v_2}$ ni $\boldsymbol{\alpha}$ orqali ifodalaganimizdan so‘ ng esa (12)-ifodadagi $\mathbf{v_2}$ ni o‘ rniga qo‘ yamiz.

$$\mathbf{v_1}=\frac{v_0+v_0(1-2\alpha)}{2} \quad (18)$$

Bu ifodani soddalashtirib chiqamiz.

$$v_1= v_0(1-\alpha) \quad (19)$$

Shamolning parraklarga urilishdan oldingi quvvatini hisoblaymiz.

$$N=\frac{E_0}{\Delta t}; \quad E_0=\frac{mv_0^2}{2}; \quad N=\frac{mv_0^2}{2\Delta t}; \quad N=\frac{\rho v v_0^2}{2\Delta t}; \quad N=\frac{v_0^2\,\rho\,S\,v_1}{2} \quad (20)$$

(20) - ifodadagi $\mathbf{v_1}$ ni o‘ rniga (19)-tenglamani qo‘ yamiz va ifodani soddalashtiramiz.

$$N=\frac{\rho\,S\,(1-\alpha)\,v_0^3}{2} \quad (21)$$

Shundan so‘ ng esa parraklarning quvvatnini hisoblaymiz.

$$N=Fv_1;\ F=mv_1\cdot\frac{v_0-v_2}{\Delta t};\ N=\frac{m\,v_1\,(v_0-v_2)}{\Delta t} \quad N=\frac{\rho S\Delta t(v_0-v_2)v_1^2}{\Delta t};$$

$$N=\rho S(v_0-v_2)\,v_1^2 \quad (22)$$

22- ifodadagi $\mathbf{v_1}$ ni o‘ rniga (19)-ifodani $\mathbf{v_2}$ ni o‘ rniga esa (17)- formulani joylashtiramiz va ifodani soddalashtirib chiqamiz.

$$N=\rho S(1-1+2\alpha)\,v_0^2\,(1-\alpha)^2;\ N=\rho S v_0^3(2\alpha)\,(1-\alpha)^2 \quad (23)$$

(23)- ifodani ikkiga ko‘ paytirib ikkiga bo‘ lib yuboramiz va quyidagi holatga o‘ tib olamiz.

$$N=\frac{1}{2}\varrho Sv_0^3(4\alpha)\,(1-\alpha)^2 \qquad (24)$$

Shamol kinetik energiyasini qanchadir qismini shamol parraklariga beradi. Shamol energiyasini samaradorlik koeffitsiyentini (C_p) ni kiritib olamiz. Chunki parraklarga kelayotgan shamol tezligining hammasi shamol parraklarining aylantirishga sarf bo‘ lmaydi, va uni quyidagicha formula orqali ifodalaymiz.

$$N_{tur}= C_pN_{shamol} \qquad (25)$$

(25)- ifodani chap va o‘ ng tomonlariga kerakli tengliklarni qo‘ yamiz va quyidagi ifodaga kelamiz.

$$\frac{1}{2}\varrho Sv_0^3(4\alpha)\,(1-\alpha)^2=C_p\frac{1}{2}\varrho Sv_0^3 \qquad (26)\quad C_p= 4\alpha(1-\alpha)^2;\ C_p=4\alpha(1-2\alpha+\alpha^2)$$

$$C_p=4\alpha-8\alpha^2+4\alpha^3 \qquad (27)$$

(27)- ifodadan $\boldsymbol{\alpha}$ orqali bir marta hosila olamiz va nolga tenglaymiz. Samaradorlik koeffitsiyenti tozmozlanish koeffitsiyenti bo‘ yicha o‘ zgaradi. Bu yerda C_p=const yani o‘ zgarmas son hisoblanadi. O‘ zgarmas sondan olingan birinchi tartibli hosila nolga teng.

$$C_p=(4\alpha-8\alpha^2+4\alpha^3)\cdot\quad C_p=(4-16\alpha+12\alpha^2) \qquad (28)$$

Olingan natijani esa nolga tenglab kvatdrat tenglamani ildizlarini topamiz.

$$4-16\alpha+12\alpha^2=0 \qquad (29)$$

Tenglikni ikkala tomonini 4 bo‘ lib yuboramiz. Natijada tenglamamiz sodda ko‘ rinishga keladi.

$$3\alpha^2-4\alpha+1=0 \qquad (30)$$

Viet teoremasidan ushbu ildizlar chiqadi $\alpha_1=\frac{1}{3}$, $\alpha_2=1$. Bu ifodalargan quyidagilar ma’lum bo‘ ldi: dastlabki malumotlarga asosan tormozlanish koeffitsiyentini chegaraviy qiymati 0 bo‘ lgan edi. 30- tenglamadan malumki bu koefitsiyentning eng katta qiymati aniqlandi yani $\alpha_1=\frac{1}{3}$. Yuqoridagi ifodadagi $\alpha_2=1$ qiymat shuni bildiradiki parrak butunlay tormozlash tizimiga o‘ tadi. Albatta har qanday kattalik malum miqdorda o‘ zgarmas qiymatga ega bo‘ ladi. Aniqlab olgan qiymatimizni endi samaradorlik koeffitsiyenti formulasiga olib borib qo‘ yamiz(27-ifodaga). Ushbu ifodadan quyidagicha natijalarni hisoblab chiqaramiz [3].

$$C_p=4\alpha-8\alpha^2+4\alpha^3 \qquad (31)$$

$$C_p=4*\frac{1}{3}.-8*\frac{1}{9}+4*\frac{1}{27}=\frac{36-24+4}{27}=\frac{16}{27}=0.592$$

Qiymatni hosil qilamiz ushbu ifodadan malum bo‘ ldiki tormozlanish koefitsiyentining $\frac{1}{3}$. qiymatida shamol energetik qurilmamiz eng katta samaradorlikni olib kelar ekan. Gorizontal o‘ qli shamol eneregtik qurilmasi uchun eng katta energiya berish effektivligi 0.592 ni tashkil qilar ekan [4]. Bundan ortiq qiymatda yutuq olaolmaymiz bu qutimadan.

Xulosa

Shamol energetik qurilmasining parraklari yuzasi qanchalik o‘ zgaruvchan bo‘ lmasin shamol energiyasining qanchadir qismidan foydalana oladi. Ushbu holatdan aniqlangan tormozlanish koeffitsiyenti shamolning berishi mumkin bo‘ lgan eng katta ideal energiya qiymatlaridan foydalanilgan. Shamol parraklari shamolning ma’lum tezligida xarakatga keladi va ma’lum tezligida tormozlanadi. Shamol parraklari massiv bo‘ lganligi sababli kichik miqdordagi shamol aylantira olmaydi katta miqdordagi shamol parraklarga bosim berib uni harakatdan to‘ xtatadi. Gorizontal o‘ qli shamol parraklari shamol tezligiga qarab o‘ zgaradi va harakatdan to‘ xtaydi. To‘ xtash jarayoni tormozlanish koefitsiyenti orqali ifodalandi.Bu koeffitsiyent esa (0; 1) qiymatlarni orasini qabul qila olishi aniqlandi. Ushbu oraliqda uning qiymati $\frac{1}{3}$ bo‘ lganda shamoldan olinayotgan energiya eng katta qiymatda bo‘ ladi. Shu qiymatga asoslangan holda qurilma eng katta samarali quvvati 59% ni tashkil etilishi aniqlandi. Bu qiymat har qanday gorizontal o‘ qli shamol energetik qurilmasi uchun eng katta qiymatligicha qoladi.

Annotatsiya. *Tadqiqotimizda xlor bilan legirlangan poluizolyator monokristall tellurid kadmiy fotoqabulqilgichga ega gaz razryadli tizimning (GRT) fotoelektrik xarakteristikalari keltirilgan. Xona haroratida 80 va 200 Torr qoldiq bosimlarda volt-amper hamda vatt-amper tavsiflari o‘ lchangan hamda vismut plyonkasi uchun D(H) sensitometrik bog‘ lanishlar olingan. Tadqiqotimizning Volt-amper tavsiflarning boshlang‘ ich qismidagi anomal uchastka razryad oralig‘ ini chegaralovchi slyuda tirqishining perimetri bo‘ ylab yuzaga keladigan sirtiy teshilish bilan bog‘ liqligi ko‘ rsatildi va bu hodisani bartaraf etuvchi konstruksiya qo‘ llanildi. Vatt-amper tavsiflari esa yorug‘ lik intensivligining $3\cdot10^{-6}$–$3\cdot10^{-3}$ Vt/sm² oralig‘ ida chiziqli ekanligi aniqlandi; GRTning optik sezgirligi 10^{-6} Vt/sm², ekspozitsiya bo‘ yicha sezgirligi esa 10^{-3} J/sm² ni tashkil etdi. Nikel va oltin kontaktlar taqqoslanib, nikel kontakt tizimda kattaroq tok berishi qayd qilindi.*

Kalit so‘ zlar: *gaz razryadli tizim, tellurid kadmiy, fotoqabulqilgich, volt-amper tavsif, vatt-amper tavsif, sensitometrik xarakteristika, optik sezgirlik, sirtiy teshilish.*

ФОТОЭЛЕКТРИЧЕСКИЕ ХАРАКТЕРИСТИКИ СВЕТОЧУВСТВИТЕЛЬНОЙ ГАЗОРАЗРЯДНОЙ СИСТЕМЫ НА ОСНОВЕ CdTe–SnO_2

Аннотация. *В статье приведены фотоэлектрические характеристики газоразрядной системы (ГРС) с фотоприёмником из полуизолирующего монокристаллического теллурида кадмия, легированного хлором. При комнатной температуре и остаточных давлениях 80 и 200 Торр измерены вольт-амперные и ватт-амперные характеристики, для плёнки висмута получена сенситометрическая зависимость D(H). Показано, что аномальный участок начальной части вольт-амперных характеристик связан с поверхностным пробоем вдоль периметра отверстия в слюдяной пластине, ограничивающей разрядный промежуток; применена конструкция, устраняющая это явление. Установлено, что ватт-амперные характеристики линейны в диапазоне интенсивности излучения $3\cdot10^{-6}$–$3\cdot10^{-3}$ Вт/см²; оптическая чувствительность ГРС составила 10^{-6} Вт/см², чувствительность по экспозиции — 10^{-3} Дж/см². При сравнении никелевого и золотого контактов отмечено, что никелевый контакт обеспечивает больший ток в системе.*

PHOTOELECTRIC CHARACTERISTICS OF A LIGHT-SENSITIVE GAS-DISCHARGE SYSTEM BASED ON CdTe–SnO_2

Abstract. *The paper presents the photoelectric characteristics of a gas-discharge system (GDS) with a photodetector made of semi-insulating single-crystal cadmium telluride doped with chlorine. Current-voltage and watt-ampere characteristics were measured at room temperature and residual pressures of 80 and 200 Torr, and a D(H) sensitometric curve was obtained for a bismuth film. The anomalous section in the initial part of the current-voltage curves is shown to be caused by surface breakdown along the perimeter of the aperture in the mica plate bounding the discharge gap; a design eliminating this effect was applied. The watt-ampere characteristics were found to be linear over the radiation intensity range of $3\cdot10^{-6}$ -$3\cdot10^{-3}$ W/cm²; the optical sensitivity of the GDS was 10^{-6} W/cm²*

and the exposure sensitivity 10^{-3} J/cm². A comparison of nickel and gold contacts showed that the nickel contact yields a higher current in the system.

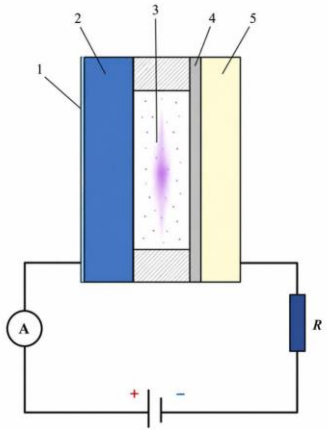
Key words: *gas-discharge system, cadmium telluride, photodetector, current-voltage characteristic, watt-ampere characteristic, sensitometric characteristic, optical sensitivity, surface breakdown.*

Kirish

Yorug‘ likka sezgir gaz razryadli tizim (GRT) — kirish tomonida yarimo‘ tkazgich fotoelektrod, chiqish tomonida tokni qayd etuvchi elektrod va ular orasida yupqa gaz oralig‘ i joylashgan qurilma — ionizatsion fotografik kameralarning asosiy bo‘ g‘ ini hisoblanadi va infraqizil nurlanishni ko‘ rinuvchi tasvirga aylantirish vazifasini bajaradi. Infraqizil texnikaning so‘ nggi yillardagi rivoji bunday qurilmalar hosil qiladigan tasvir sifatiga qo‘ yiladigan talablarni ancha oshirdi, erishilgan natijalar esa hamma vaqt ham qoniqarli emas.

GRTning ishlash sifati, avvalo, fotoelektrod materialiga bog‘ liq. Bu materialga qo‘ yiladigan talablar odatdagidan ancha qattiq: u yuqori solishtirma qarshilikka, sezilarli fotosezgirlikka ega bo‘ lishi va gaz razryadi muhitida uzoq muddat barqaror ishlashi kerak. Shu sababli hozirgacha GRTda ishonchli natija bergan fotoelektrod materiallari sanoqli: xona haroratida xrom bilan kompensatsiyalangan arsenid galliy, 100 K va undan past haroratlarda esa turli kiritmalar bilan legirlangan kremniy [1–3]. Bu ro‘ yxatni kengaytirish uzoq vaqtdan beri dolzarb masala bo‘ lib kelmoqda.

Adabiyotlar tahlili



Yorug‘ likka sezgir tizimlar bo‘ yicha tadqiqotlar dunyoning bir qator ilmiy markazlarida olib borilmoqda. A.F. Ioffe nomidagi Fizika-texnika instituti (Sankt-Peterburg) xodimlari Yu.A. Astrov, V.B. Shuman, A.N. Lodigin va L.M. Portsellar selen bilan legirlangan kremniy fotoelektrodini gaz fazali epitaksiya yo‘ li bilan olishga erishdilar [4]. Boku davlat universitetida V.I. Orbux, N.N. Lebedeva va B.G. Salamovlar bunday tizimlardagi muvozanatsiz o‘ tish jarayonlarini o‘ rgandilar [5]. O‘ zbekistonda Sh.B. Utamuradova va Z. Xaydarovlar platina hamda oltingugurt bilan legirlangan kremniy va arsenid galliy fotoqabulqilgichlari misolida fotoelektrik gisterezis hodisasini aniqladilar va uning avtoelektron emissiya bilan bog‘ liqligini ko‘ rsatdilar [6, 7].

Tellurid kadmiy esa GRT fotoelektrodi sifatida deyarli o‘ rganilmagan. Bu material yuqori solishtirma qarshilikka erishish imkoniyati, spektrning ko‘ rinuvchi sohasidagi yaxshi fotosezgirligi va rivojlangan o‘ stirish texnologiyasi bilan e’tiborni tortadi, biroq uning gaz razryadi kontakti sharoitidagi xulqi ochiq masala bo‘ lib qolmoqda.

Ushbu ishda xlor bilan legirlangan poluizolyator monokristall tellurid kadmiy fotoqabulqilgichga ega CdTe–SnO_2 tizimining volt-amper, vatt-amper va sensitometrik tavsiflari o‘ lchandi hamda shu asosda materialning ionizatsion o‘ zgartirgichlarda qo‘ llanishi baholandi.

Tadqiqot metodologiyasi.

Tadqiq etilgan GRTning prinsipial sxemasi 1-rasmda keltirilgan. Fotoelektrod vazifasini poluizolyator monokristall CdTe plastinka bajaradi; uning yorug‘ lik tushadigan yuzasiga yarim shaffof omik kontakt o‘ rnatiladi. Fotoelektrodning ichki yuzasi tokni qayd qiluvchi metall qatlamdan gaz oralig‘ i bilan ajratilgan bo‘ lib Oraliq qalinligi 20÷100 mkm bo‘ lgan slyuda plastinkasi orqali beriladi - unda diametri 5÷27 mm bo‘ lgan dumaloq tirqish tayyorlanadi va aynan shu tirqish razryad sohasini belgilaydi. Tokni qayd etuvchi metall qatlam SnO_2 o‘ tkazuvchan plyonka bilan qoplangan shisha kontrelektrodning ichki yuzasiga VUP-5M rusumli vakuum qurilmasida purkash usuli yordamida boyitildi. Kontrelektrod shaffof bo‘ lgani uchun GRT ning ikkinchi tomonidan razryadning chaqnashini bevosita kuzatish mumkin bo‘ ladi.

1-rasm. Yorug‘ likka sezgir GRTning prinsipial elektr sxemasi: 1 — CdTe fotoelektrod; 2 — yarim shaffof kontakt; 3 — gaz razryad oralig‘ i; 4 — tokni qayd etuvchi metall qatlam; 5 — SnO_2 qoplamali shisha kontrelektrod; R — ballast qarshilik

Fotoqabulqilgich uchun kristall eritmadan gorizontal yo‘ naltirilgan kristallanish usulida o‘ stirilgan va o‘ stirish jarayonida xlor bilan legirlangan. Kristallning asosiy parametrlari quyidagicha: kiritma konsentratsiyasi n = 10^{18} sm^{-3}, elektronlar va kovaklarning harakatchanligi mos ravishda μ_n = 800 $sm^2/(V\cdot s)$ va μ_p = 40 $sm^2/(V\cdot s)$, zaryad tashuvchilarning yashash vaqti $\tau_n = \tau_p = 5\cdot10^{-7}$ s. Rentgen topografiyasi va kislotali o‘ yish usullari bilan o‘ lchangan dislokatsiyalar zichligi 10^3 sm^{-2} ni tashkil etdi; egizak tuzilmalar kuzatilmadi.

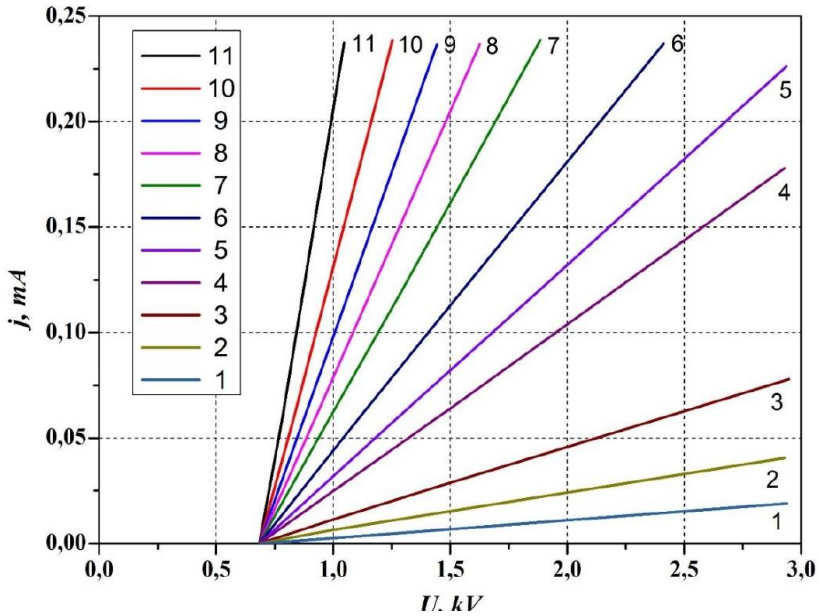
Namunalar tekis-parallel plastinka ko‘ rinishida tayyorlandi: ko‘ ndalang kesim yuzasi S = 4 sm^2, qalinligi d = 2,65 mm. Kesishdan keyin plastinkalar M10, M5 va M3 donadorlikdagi olmos kukunlarida silliqlandi, so‘ ngra ASM 1,0 olmos pastasi yordamida jilolandi. Mexanik ishlov berishda hosil bo‘ ladigan buzilgan qatlamni yo‘ qotish uchun namuna 10 ml butil spirti va 0,5 ml suyuq brom aralashmasiga tushirildi; eritish tezligi 1 mkm/min bo‘ ldi. Erituvchi qoldig‘ i kristall yuzasidan ketma-ket butil spirti, etil spirti va distirllangan suv bilan tozzalab yuvib tashlandi. Yarim shaffof nikel qatlami tayyor yuzaga VUP-5M qurilmasida purkaldi hamda taqqoslash uchun ikkinchi namunada ham xuddi shu tartibda oltin qatlam hosil qilindi.

O‘ lchash ishlarida kuchlanishni 0÷3 kV oralig‘ ida uzluksiz o‘ zgartirish imkonini beruvchi o‘ zgarmas tok manbaidan foydalanildi. Volt-amper tavsiflari LKD4-003 rusumli ikki koordinatali o‘ zi yozib oluvchi qurilma yordamida yozib olindi. Yorug‘ lik manbai sifatida OI-24 rusumli yoritgichning cho‘ g‘ lanma lampasidan foydalanilgan. Nurlanish intensivligi sezgirlik koeffitsienti 0,72 Vt/A bo‘ lgan LETI rusumli termostolbik bilan, bazi hollarda esa FD-17K va FD-24K fotodiodlari bilan o‘ lchandi. Fotoelektrodga tushayotgan yorug‘ lik oqimi metall to‘ rli kalibrlangan neytral filtrlar to‘ plami yordamida bosqichma-bosqich kamaytirib borildi. Olib borilgan tajribada natijalari va barcha o‘ lchashlar xona haroratida ya’ni T = 300 K bo‘ lgan sharoitda bajarildi. Tajribalarning asosiy shart-sharoitlari quyidagi 1-jadvalda keltirib o‘ tilgan.

1-jadval

Tajriba sharoitlari va namuna parametrlari

Parametr	Belgisi	Qiymati
Fotoelektrod materiali	–	CdTe⟨Cl⟩
Kiritma konsentratsiyasi	n	10^{18} sm^{-3}
Elektronlar harakatchanligi	μ_n	800 $sm^2/(V\cdot s)$
Kovaklar harakatchanligi	μ_p	40 $sm^2/(V\cdot s)$
Zaryad tashuvchilar yashash vaqti	$\tau_n = \tau_p$	$5\cdot10^{-7}$ s
Dislokatsiyalar zichligi	N_d	10^3 sm^{-2}
Plastinka yuzasi	S	4 sm^2
Plastinka qalinligi	d	2,65 mm
Gaz oralig‘ i qalinligi	d_g	20÷100 mkm
Qoldiq bosim	p	80 va 200 Torr
Ishchi harorat	T	300 K
Kuchlanish oralig‘ i	U	0÷3 kV

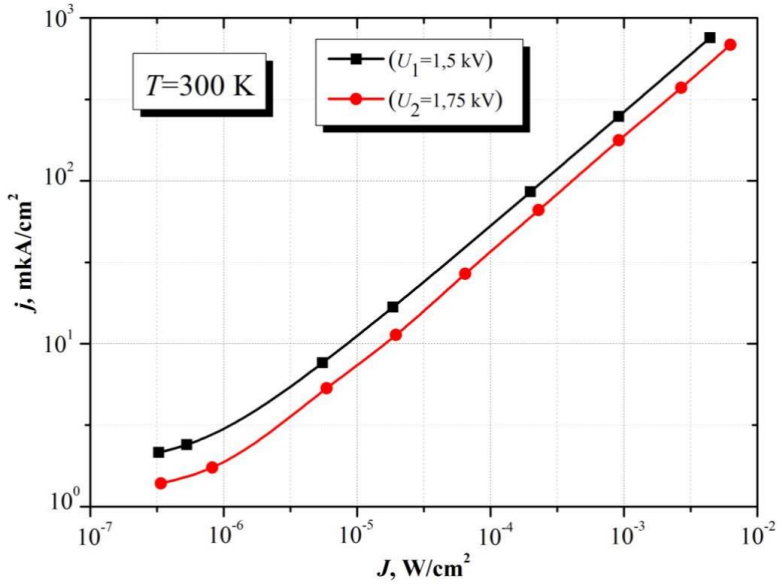


Natijalar va ularning tahlili.

Nikel kontaktli CdTe fotoqabulqilgichga ega GRTning 200 Torr qoldiq bosimda va turli yorug‘ lik intensivliklarida olingan volt-amper tavsiflari o‘ ziga xos xususiyatga ega bo‘ lib chiqdi, tizimda hatto 500 V kuchlanishda ham sezilarli tok kuzatiladi va uning qiymati fotoelektrodning yoritilishiga bog‘ liq. Kuchlanish oshirilganda egri chiziqning qiyaligi avval ortadi, so‘ ngra doimiylashadi. Tajriba davomida turli intensivliklarga mos egri chiziqlarning ikkinchi qismini davom ettirganimizda, ular bitta nuqtada kesishadi va bu nuqta gaz oralig‘ ining elektr teshilish kuchlanishiga yaqin qiymatni beradi.

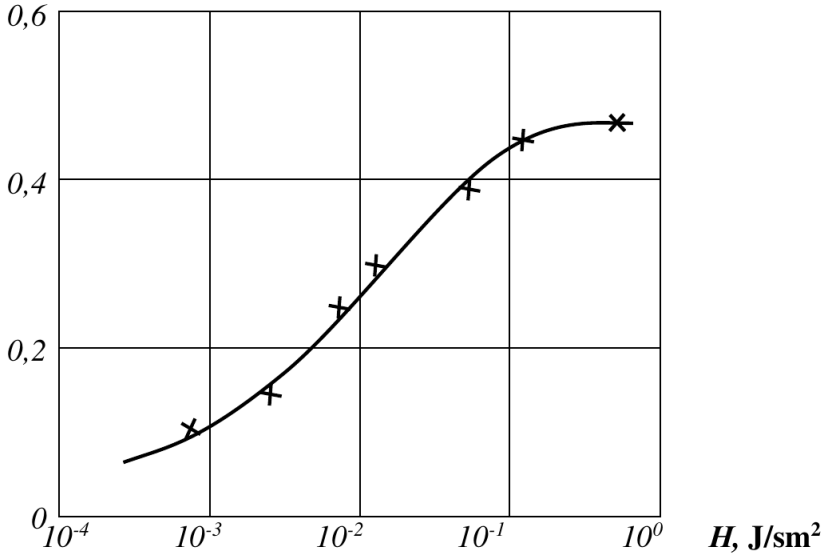
Bu anomal boshlang‘ ich uchastkaning tabiatini aniqlash maqsadida qo‘ shimcha tajriba o‘ tkazildi. Razryad oralig‘ i bitta emas, balki tirqishlarining diametri turlicha bo‘ lgan ikkita slyuda plastinkasi bilan chegaralandi - shu yo‘ l bilan tirqish perimetri bo‘ ylab o‘ tadigan razryad yo‘ li ancha uzaytirildi. Natijada volt-amper tavsifidagi “sirtiy teshilish” uchastkasi yo‘ qoldi. Bundan kelib chiqadiki, $U_1 \approx 500$ V kuchlanishda dastlab slyuda tirqishining perimetri bo‘ ylab

teshilish sodir bo‘ lar ekan. Tajribada aniq bo‘ ldiki U_1 va U_2 = 800 V oralig‘ ida tok aynan shu perimetr bo‘ ylab oqadi, U_2 dan yuqori kuchlanishlarda esa razryad butun oraliq yuzasi bo‘ ylab yoyiladi.



Sirtiy teshilish bartaraf etilganidan keyin 80 Torr bosimda olingan volt-amper tavsiflari 2-rasmda keltirilgan. Endi ular yoritilganlikning butun tekshirilgan oralig‘ ida - nolinchi intensivlikdan $5{,}4\cdot10^{-3}$ Vt/sm² gacha — chiziqli ko‘ rinishga ega va barchasi abssissa o‘ qini taxminan 0,7 kV nuqtasida kesib o‘ tadi. Bu kuchlanish yorug‘ lik intensivligiga bog‘ liq emas, ya’ni u sof gaz oralig‘ iga tegishli kattalik bo‘ lib, uni aynan bu tizim uchun elektr teshilish kuchlanishi sifatida qabul qilish mumkin.

2-rasm. Ni kontaktli CdTe fotoelektrodga ega GRTning p = 80 Torr va T = 300 K sharoitida turli yorug‘ lik intensivliklarida olingan volt-amper tavsiflari. J teng: 1 - 0; 2 - $5\cdot10^{-5}$; 3 - $1{,}2\cdot10^{-4}$; 4 - $3\cdot10^{-4}$; 5 - $6\cdot10^{-4}$; 6 -$9{,}6\cdot10^{-4}$; 7 - $1{,}6\cdot10^{-3}$; 8 - $2{,}4\cdot10^{-3}$; 9 - $3{,}2\cdot10^{-3}$; 10 - $4\cdot10^{-3}$; 11 $5{,}4\cdot10^{-3}$ Vt/sm²



Tajriba davomida xuddi shu o‘ lchashlar oltin kontaktli namuna uchun ham takrorlandi. Natijada egri chiziqlarning umumiy ko‘ rinishi deyarli o‘ zgarmadi, biroq bir xil sharoitda oltin kontaktli tizimdagi tok nikel kontaktlisidan sezilarli kichik bo‘ lib chiqdi. J = $2{,}4\cdot10^{-3}$ Vt/sm² intensivlikda va 1,5 kV kuchlanishda nikel kontakt bilan 210 mkA, oltin kontakt bilan esa 150 mkA tok qayd qilindi. Shu bilan birga har ikkala metall qatlamning yorug‘ lik o‘ tkazuvchanligi amalda bir xil edi, ya’ni farqni optik yo‘ qotishlar bilan izohlab bo‘ lmaydi.

GRT bo‘ ylama tok rejimida ishlagani uchun uning tok bo‘ yicha sezgirligini vatt-amper tavsifi (VTAX) orqali baholash qulay. 3-rasmda ikkita kuchlanish qiymati - U_1 = 1,5 kV va U_2 = 1,75 kV — uchun olingan VTAXlar keltirilgan. Grafiklarda ikki xarakterli soha ajralib turadi. Kirish signali $6\cdot10^{-7}$ dan $3\cdot10^{-6}$ Vt/sm² gacha bo‘ lgan oraliqda tok sekin o‘ sadi — bu $\sigma_h \ll \sigma_k$ shartiga (bu yerda σ_h — yorug‘ likdagi, σ_k — qorong‘ ilikdagi solishtirma o‘ tkazuvchanlik) mos keladi. $3\cdot10^{-6}$ dan $3\cdot10^{-3}$ Vt/sm² gacha bo‘ lgan oraliqda esa bog‘ lanish logarifmik masshtabda to‘ g‘ ri chiziqqa aylanadi.

3-rasm. GRTning T = 300 K haroratda ikki xil kuchlanishda olingan vatt-amper tavsiflari: 1 - U_1 = 1,5 kV; 2 - U_2 = 1,75 kV

Tizimning optik sezgirligini aniqlash uchun razryadning metall plyonkaga ta'siriga asoslangan sensitometrik usuldan foydalanildi. SnO_2 qoplamali shisha plastinka yuzasiga VUP-5M qurilmasida boshlang' ich optik zichligi 0,5 bo' lgan vismut plyonkasi purkaldi. O' lchashlar yorug' lik intensivligi doimiy, ekspozitsiya vaqti esa o' zgaruvchan bo' lgan sharoitda bajarildi. Plyonkaning optik zichligi SR-25M rusumli densitometr bilan qayd etildi. 4-rasmda vismut plyonkasi optik zichligining o' zgarishi ΔD bilan ekspozitsiya H = J·t orasidagi bog' lanish keltirilgan. Grafikdan ko' rinishicha, 0,2 fon darajasida o' lchangan minimal ekspozitsiya $H_{0,2} = 5 \cdot 10^{-3}$ J/sm² ni tashkil etadi.

4-rasm. GRTda fototokni qayd etishda vismut plyonkasi uchun olingan D(H) sensitometrik xarakteristika

Tizimning "zaryad" bo' yicha sezgirligi ham baholandi - bunda plyonka optik zichligining o' zgarishi razryad orqali o' tgan kulon miqdoriga bog' lab o' rganiladi. Boshlang' ich optik zichlikning 50 % ga o' zgarishi mezoni bo' yicha bu kattalik $5 \cdot 10^{-3}$ Kl/sm² dan yomon emasligi aniqlandi. Tajribada olingan o' lchash natijalari 2-jadvalda jamlangan.

2-jadval

CdTe–SnO_2 tizimining aniqlangan fotoelektrik parametrlari

Parametr	Qiymati
Elektr teshilish kuchlanishi (p = 80 Torr)	≈ 0,7 kV
Sirtiy teshilish kuchlanishlari (p = 200 Torr)	U_1 ≈ 500 V; U_2 = 800 V
VTAX chiziqli sohasi	$3 \cdot 10^{-6}$–$3 \cdot 10^{-3}$ Vt/sm²
Optik sezgirlik	10^{-6} Vt/sm²
Ekspozitsiya bo' yicha sezgirlik	10^{-3} J/sm²
Minimal ekspozitsiya (0,2 fon)	$H_{0,2} = 5 \cdot 10^{-3}$ J/sm²
"Zaryad" sezgirligi	$5 \cdot 10^{-3}$ Kl/sm² dan yomon emas
Tok (J = $2,4 \cdot 10^{-3}$ Vt/sm², U = 1,5 kV): Ni / Au	210 / 150 mkA

Volt-amper tavsiflarining boshlang' ich qismidagi murakkab ko' rinish, tajribalar ko' rsatganidek, fotoelektrod materialining xossalariga emas, balki qurilma konstruksiyasiga bog' liq ekan. Razryad oralig' ini chegaralovchi slyuda tirqishining perimetri bo' ylab hosil bo' ladigan sirtiy o' tkazuvchanlik to' liq razryaddan ancha past kuchlanishda tok yo' li ochadi va bu volt-amper tavsifida superchiziqli og' ish sifatida namoyon bo' ladi. Ikki slyuda plastinkali konstruksiya bu yo' lni uzaytirib, hodisani amalda yo' q qiladi. Bu natija amaliy ahamiyatga ega: sirtiy teshilish faqat tavsifni buzibgina qolmay, razryad energiyasining bir qismini foydasiz sarflaydi va qurilmaning ish muddatini qisqartiradi.

Sirtiy teshilish bartaraf etilgach olingan chiziqli volt-amper tavsiflari (2-rasm) muhim xulosaga olib keladi: fototok to' yinish kuchlanishidan past bo' lgan barcha kuchlanishlarda yorug' lik intensivligiga kuchli bog' liq bo' lib qoladi. Egri chiziqlarning abssissa o' qini bitta nuqtada kesishi esa gaz oralig' ining teshilish kuchlanishi yoritilganlikka bog' liq emasligini ko' rsatadi — bu yarimo' tkazgich va gaz oralig' ining ketma-ket ulangan ikki mustaqil element sifatida

ishlashiga mos keladi. Shunga o‘ xshash xulq xona haroratida poluizolyator arsenid galliy fotoelektrodli tizimlar uchun ham qayd etilgan edi [8, 9], demak, tellurid kadmiy bu jihatdan allaqachon sinovdan o‘ tgan materiallar qatoridan o‘ rin oladi.

Nikel va oltin kontaktlarni taqqoslash natijasi biroz kutilmagan bo‘ ldi. Ikkala qatlamning yorug‘ lik o‘ tkazuvchanligi bir xil bo‘ lgani uchun tok farqini optik yo‘ qotishlar bilan tushuntirib bo‘ lmaydi; sabab kontaktning o‘ zida — nikel CdTe bilan omik qonuniyatga yaqinroq kontakt hosil qiladi va zaryad tashuvchilarni kristallga to‘ sqinliksiz yetkazadi. Shuni ta’kidlash kerakki, volt-amper tavsifining chiziqliligi o‘ z-o‘ zidan kontaktning omikligini isbotlamaydi — poluizolyator yarimo‘ tkazgichlarda bu ikkisi har doim ham mos kelmaydi [10]. Shu sababli bu yerda gap kontaktning GRT ish rejimidagi funksional yaroqliligi haqida bormoqda.

Vatt-amper va sensitometrik tavsiflar birgalikda tizimning dinamik diapazonini belgilaydi. VTAXning sekin o‘ sadigan boshlang‘ ich qismi qorong‘ ilik o‘ tkazuvchanligi hali ustun bo‘ lgan sohaga to‘ g‘ ri keladi; yorug‘ likdagi o‘ tkazuvchanlik undan oshgach, bog‘ lanish chiziqli bo‘ lib qoladi va shu sohada tasvirning yarim tonlari buzilishsiz uzatiladi. Yorug‘ lik intensivligi bo‘ yicha 10^{-6}–10^{-3} Vt/sm², ekspozitsiya bo‘ yicha 10^{-3}–10^{-1} J/sm² oralig‘ ida saqlanadigan bu chiziqlilik CdTe ni ko‘ rinuvchi nurlar sohasida ishlaydigan ionizatsion kameralar uchun yaroqli material sifatida tavsiflaydi.

Xulosa

1. Xlor bilan legirlangan poluizolyator monokristall tellurid kadmiy fotoqabulqilgichga ega CdTe–SnO_2 gaz razryadli tizimining volt-amper, vatt-amper va sensitometrik tavsiflari xona haroratida o‘ lchandi.

2. Volt-amper tavsiflarining boshlang‘ ich qismidagi anomal uchastka slyuda tirqishi perimetri bo‘ ylab yuzaga keladigan sirtiy teshilish natijasi ekanligi aniqlandi; ikki slyuda plastinkali konstruksiya yordamida bu hodisa bartaraf etildi va to‘ liq chiziqli tavsiflarga erishildi.

3. Gaz oralig‘ ining elektr teshilish kuchlanishi (p = 80 Torr da ≈ 0,7 kV) yorug‘ lik intensivligiga bog‘ liq emasligi ko‘ rsatildi.

4. Vatt-amper tavsiflari $3\cdot10^{-6}$–$3\cdot10^{-3}$ Vt/sm² oralig‘ ida chiziqli bo‘ lib, tizimning optik sezgirligi 10^{-6} Vt/sm², ekspozitsiya bo‘ yicha sezgirligi 10^{-3} J/sm², “zaryad” sezgirligi esa $5\cdot10^{-3}$ Kl/sm² dan yomon emasligi aniqlandi.

LOCAL DERIVATIONS OF A 7-DIMENSIONAL METABELIAN FILIFORM LIE ALGEBRA

Abstract; *This article examines the local derivations of 7-dimensional metabelian filiform Lie algebras. The general form of the derevation operator is determined using the Lie product between the base elements of the algebra. Based on Leibniz’s rule, a derevation matrix is constructed, and the relationship between the space of local derevations and the space of ordinary derevation is analyzed. The results obtained can be used to study the structural features of filiform Lie algebras.*

Keywords: *Lie algebras, filiform Lie algebras, metabelic algebras, derevation, local derevation, derevation matrix.*

ЛОКАЛЬНЫЕ ДЕРИВАЦИИ 7-МЕРНОЙ МЕТАБЕЛИАЛЬНОЙ ФИЛИФОРМЕННОЙ АЛГЕБРЫ ЛИ

Аннотация; *В данной статье рассматриваются локальные деривации 7-мерных метабелевых филиформных алгебр Ли. Общая форма оператора дифференцирования определяется с помощью произведения Ли между базовыми элементами алгебры. На основе правила Лейбница строится дифференциальная матрица и анализируется связь между пространством локальных дифференциаций и пространством обычных дифференциаций. Полученные результаты могут быть использованы для изучения структурных особенностей нитевидных алгебр Ли.*

Kirish. Mamlakatimizda fundamental fanlarning ilmiy va amaliy tatbiqiga ega bo‘ lgan amaliy matematika, informatika, raqamli iqtisodiyot fanlariga e’tibor kuchaytirildi. Jumladan, noassotsiativ algebralar va ularning operatorlariga doir fundamental tadqiqotlarning rivojlanishiga ham alohida e’tibor qaratildi. Bu fundamental tadqiqotlar doirasida Leibniz algebralarining lokal va 2-lokal differensiallashlarini o‘ rganish borasida salmoqli natijalarga erishildi. «Algebra va funktsional analiz» fanlarining ustivor yo‘ nalishlari bo‘ yicha xalqaro standartlar darajasida ilmiy tadqiqotlar olib borish asosiy vazifalar va faoliyat yo‘ nalishlari etib belgilangan qaror ijrosini ta’minlashda ham operatorlar algebralari differensiallashlar nazariyasini rivojlantirish muhim ahamiyatga ega. Li algebralari zamonaviy algebra, differensial geometriya va matematik fizikaning muhim yo‘ nalishlaridan biridir. Filiform Lie algebralari nilpotent Lie algebralar sinfining maksimal nilpotentlik indeksiga ega bo‘ lgan muhim oilasini tashkil qiladi.So‘ nggi yillarda Li algebralarida differentsiyallashlar va lokal differentsiyallashlar tushunchalari keng o‘ rganilmoqda. Oddiy differentsiyallashdan farqli ravishda lokal differentsiyallash har bir element uchun alohida differentsiyallash operatori orqali aniqlanadi. Ushbu ishda 7-o‘ lchamli metabelian filiform Lie algebra uchun differentsiyallash va lokal differentsiyallash operatorlarining matritsaviy ko‘ rinishi aniqlanadi.

Adabiyotlar tahlili. Yuqoridagi tushunchalar R.V. Kadison ishlarida keltirilgan va o‘ rganilgan[1]. Shu bilan birgalikda D.R. Larson va A.R. Sourour ishlarida ham keltirilgan [2]. Yuqorida ta’kidlab o‘ tilgn ishlar avtomorfizmlar, C^*-algebralar va operator algebralarning differentsiyallashlariga yaqin bo‘ lgan akslantirishlarning tavsifiga bag‘ ishlangan bir qator ishlarga turtki bo‘ ldi. D.R. Larson va A.R. Sourourlar $\mathcal{A} = B(X)$ tenglikni isbotlashdi. Sh.A.Ayupov va K.K.Kudaybergenovlar ba’zi chekli o‘ lchamli sodda Li va Leibniz algebralarining lokal avtomorfizmlarini o‘ rganganlar[5].

Tadqiqot metodologiyasi

L Li algebrasi bo‘ lsin. Quyidagi markaziy qatorlarni qaraylik:

$$\gamma^1 = \gamma\gamma, \quad \gamma^{k+1} = [\gamma^k, \gamma], \quad k \geq 1,$$
$$\gamma^{[1]} = \gamma, \quad L^{[s+1]} = [L^{[s]}, \gamma^{[s]}], \quad s \geq 1.$$

L Li algebrasi nilpotent deyiladi (mos ravishda, yechiluvchan), agar shunday $p \in \mathcal{N}$ ko‘ rinishdagi $\mathbb{L}^p = 0$ (mos ravishda, $\mathbb{L}^{[p]} = 0$). Bunda $k$eng kichik butun son $\mathbb{L}^k = 0$ tengligi L ning nilindeksi (yoki nilpotentlik kllasi) deyiladi. [4]

Abelian bo‘ lmagan L Li algebrasi metabelian deyiladi, agar $[L, L]$– abelian bo‘ lsa, ya’ni $L^{(2)} = 0$ bo‘ lsa. $n \geq 7$ o‘ lchamli metabelian filiform L Li algebrasini qaraymiz va ushbu

$$[e_1, e_i] = e_{i+1}, 2 \leq i \leq n-1,$$
$$[e_2, e_i] = e_{i+2} + e_{i+3}, 3 \leq i \leq n-2,$$
$$[e_2, e_{n-2}] = e_n.$$

munosabatlar o‘ rinli bo‘ luvchi $\{e_1, \dots, e_n\}$ bazisga ega bo‘ lsin[7].

$\boldsymbol{L-7}$o‘ lchamli Li algebra bo‘ lib, uning bazasi $\{e_1, e_2, e_3, e_4, e_5, e_6, e_7\}$ va nol bo‘ lmagan ko‘ paytmalari

$$[e_1, e_2] = e_3,$$
$$[e_1, e_3] = e_4,$$
$$[e_1, e_4] = e_5,$$
$$[e_1, e_5] = e_6,$$
$$[e_1, e_6] = e_7,$$
$$[e_2, e_3] = e_5 + e_6,$$
$$[e_2, e_4] = e_6 + e_7$$

Bilan berilgan.

Li algebraning antisimmetrikligi sababli:

$$[e_i, e_j] = -[e_j, e_i]$$

bajariladi.

Bu algebra uchun

$$[L^2, L^2] = 0$$

bo‘ lganligi sababli u metabelian algebra deyiladi.

Differentsiyallash

Ta’rif-1. Agar $d: L \to L$ chiziqli akslantirish uchun quyidagi tenglik bajarilsa:

$$d([x, y]) = [d(x), y] + [x, d(y)] \quad \forall x, y \in L$$

U holda ushbu akslantirish berilgan L algebrasining differensiallashi deyiladi.

Har bir basis elementi uchun

$$D(e_i) = \sum_{j=1}^{7} a_{ji} e_j$$

deb olinadi

Avvalo:

$$e_3 = [e_1, e_2]$$

tenglikdan foydalanib $D(e_3) = D([e_1, e_2])$ hosil qilanadi.

Leybnits qoidasi yordamida:

$$D(e_3) = [D(e_1), e_2] + [e_1, D(e_2)]$$

tenglik olinadi.

Xuddi shu usulida

$$e_4 = [e_1, e_3],$$
$$e_5 = [e_1, e_4],$$
$$e_6 = [e_1, e_5],$$
$$e_7 = [e_1, e_6]$$

uchun tenglamalar sistemasi hosil qilinadi:

Natijada differentsiyallash operatorining umumiy matritsasi quyidagi ko‘ rinishga ega bo‘ ladi:

$$D=\begin{pmatrix} a_{11} & a_{12} & 0 & 0 & 0 & 0 & 0 \\ a_{21} & a_{22} & 0 & 0 & 0 & 0 & 0 \\ a_{31} & a_{32} & a_{11}+a_{22} & 0 & 0 & 0 & 0 \\ a_{41} & a_{42} & a_{32} & 2a_{11}+a_{22} & 0 & 0 & 0 \\ a_{51} & a_{52} & a_{42} & a_{21}+a_{32} & 3a_{11}+a_{22} & 0 & 0 \\ a_{61} & a_{62} & a_{52} & a_{21}+a_{42} & 2a_{21}+a_{32} & 4a_{11}+a_{22} & 0 \\ a_{71} & a_{72} & a_{62} & a_{52} & 2a_{21}+a_{42} & 3a_{21}+a_{32} & 5a_{11}+a_{22} \end{pmatrix}$$

Bu yerda $a_{ij} \in F$ixtiyoriy skalyarlar.

Lokal differentsiyallashlar

Ta'rif-2. Bizga $\Delta: L \to L$ chiziqli akslantirish berilgan bo' lsin. Agar L algebraning$\forall x \in L$ elementi uchun shunday D_x differensiallash topilib $\Delta(x) = D_x(x)$ tenglik bajarilsa, u holda Δ lokal differensiallash deyiladi.

Agar bu algebra uchun local differentsiyallash operatori ham yuqoridagi differentsiyallash matritasisi bilan aniqlanadi:

$$LocDer(L) = Der(L)$$

ya'ni har bir local differentsiyallash oddiy ma'noda differentsiyallash hisoblanadi.

Muhokama va munozara

Olingan natija shuni ko' rsatadiki, 7 o' lchamli metabelian filiform Li algebra uchun differentsiyallashlar strukturasi yuqori uchburchak ko' rinishiga ega. Bu holat filiform Li algebralarning tabiiy gradatsiyasi bilan bog' liq.

Differentsiyallash matritasining diagonal elementlari

$$a_{11}, a_{11}+a_{22}, 2a_{11}+a_{22}, \ldots, 5a_{11}+a_{22}$$

ko' rinishida ketma-ket o' suvchi struktura hosil bo' ladi.

Bu esa algebra ichki strukturasi differentsiyallashlar orqali qanday saqlanishini ko' rsatadi.

Xulosa

Ushbu maqolada, 7-o' lchamli metabelian filiform Li algebra uchun differentsiyallash operatorining umumiy ko' rinishi topiladi.

Asosiy natija

$$LocDer(L) = Der(L)$$

bo' lib, local differentsiyallashlar fazosi oddiy differentsiyallashlar fazosi bilan ustma-ust tushushi ko' rsatiladi.

Differentsiyallash operatorining matritasisi ko' rinishda beriladi.

$$D=\begin{pmatrix} a_{11} & a_{12} & 0 & 0 & 0 & 0 & 0 \\ a_{21} & a_{22} & 0 & 0 & 0 & 0 & 0 \\ a_{31} & a_{32} & a_{11}+a_{22} & 0 & 0 & 0 & 0 \\ a_{41} & a_{42} & a_{32} & 2a_{11}+a_{22} & 0 & 0 & 0 \\ a_{51} & a_{52} & a_{42} & a_{21}+a_{32} & 3a_{11}+a_{22} & 0 & 0 \\ a_{61} & a_{62} & a_{52} & a_{21}+a_{42} & 2a_{21}+a_{32} & 4a_{11}+a_{22} & 0 \\ a_{71} & a_{72} & a_{62} & a_{52} & 2a_{21}+a_{42} & 3a_{21}+a_{32} & 5a_{11}+a_{22} \end{pmatrix}$$

Annotatsiya. *Neft-gaz sanoatida, shuningdek kommunal xo‘ jaligi suv ta’minotida qo‘ llaniladigan mineral tuzlar to‘ planishi ingibitorlarini natriy lignosulfonat va organofosfonatlar asosida sintez qilish jarayonining texnologik parametrlari o‘ rganildi. Somondan ajratilgan lignin sulfolash va sulfonatlash orqali natriy lignosulfonatga aylantirilib, keyin nitrilotrimetilenfosfon kislota (NTF) va oksietilidendifosfon kislota (OEDF) bilan modifikatsiya qilindi. Modifikatsiyalashning maqbul parametrlari, xususan reagentlar miqdori, harorat, muhit pH qiymati va jarayon davomiyligi ko‘ rib chiqildi. Olingan tizimlarning ingibirlash samaradorligi, tuzlarga chidamliligi va termik barqarorligi taqqoslandi. Natriy lignosulfonatning OEDF va NTF bilan modifikatsiyalanishi fosfon guruhlarini kiritish va kompleks hosil qilish imkoniyatini oshirishi, shuningdek ultrabinafsha spektrda dastlabki natriy lignosulfonat spektridan farq qiluvchi signallar hosil bo‘ lishi bilan tavsiflandi.*

Kalit so‘ zlar: *natriy lignosulfonat, lignin, organofosfonatlar, OEDF, NTF, mineral tuzlar, ingibitor, fosfon guruhlari, ultrabinafsha spektr.*

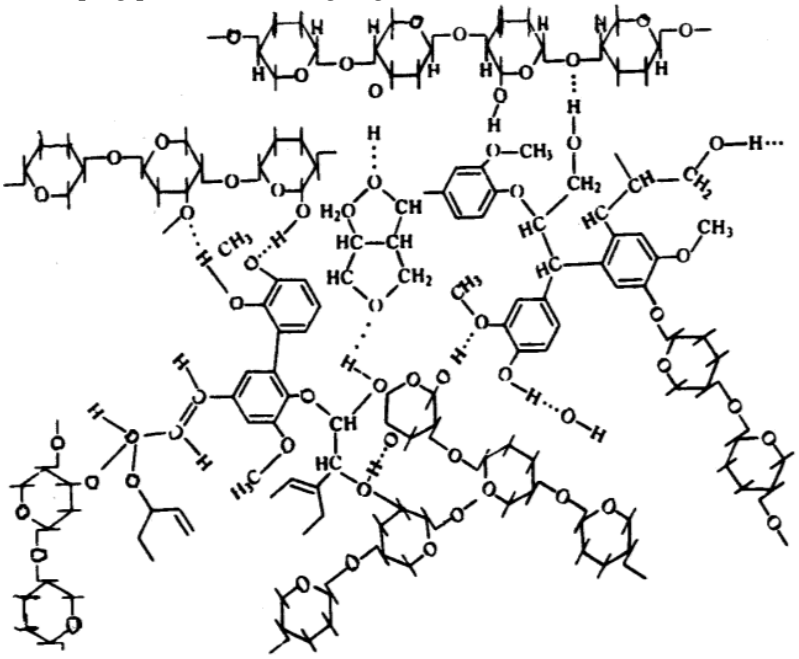
STUDY OF THE SYNTHESIS OF MINERAL SCALE INHIBITORS BASED ON SODIUM LIGNOSULFONATE AND ORGANOPHOSPHONATES

Abstract. *The technological parameters of the synthesis of mineral scale inhibitors based on sodium lignosulfonate and organophosphonates, used in the oil and gas industry as well as in municipal water supply, were studied. Lignin separated from straw was converted into sodium lignosulfonate through sulfonation and subsequent sulfonatization, and then modified with nitrilotrimethylene phosphonic acid (NTF) and oxyethylidene diphosphonic acid (OEDF). The optimal parameters of modification, including the reagent amount, temperature, pH of the medium and process duration, were considered. The inhibition efficiency, salt resistance and thermal stability of the obtained systems were compared. Modification of sodium lignosulfonate with OEDF and NTF was characterized by the introduction of phosphonate groups and an increased possibility of complex formation, as well as by the appearance of signals in the ultraviolet spectrum differing from the spectrum of the initial sodium lignosulfonate.*

Keywords: *sodium lignosulfonate, lignin, organophosphonates, OEDF, NTF, mineral salts, inhibitor, phosphonate groups, ultraviolet spectrum.*

ИССЛЕДОВАНИЕ СИНТЕЗА ИНГИБИТОРОВ МИНЕРАЛЬНЫХ СОЛЕЙ НА ОСНОВЕ ЛИГНОСУЛЬФОНАТА НАТРИЯ И ОРГАНОФОСФОНАТОВ

***Аннотация**. Изучены технологические параметры синтеза ингибиторов отложения минеральных солей на основе лигносульфоната натрия и органофосфонатов, применяемых в нефтегазовой промышленности, а также в коммунальном водоснабжении. Лигнин, выделенный из соломы, превращали в лигносульфонат натрия путём сульфирования и последующего сульфонатирования, после чего модифицировали нитрилотриметиленфосфоновой кислотой (НТФ) и оксиэтилидендифосфоновой кислотой (ОЭДФ). Рассмотрены оптимальные параметры модифицирования, включая количество реагентов, температуру, pH среды и продолжительность процесса. Сопоставлены ингибирующая эффективность, устойчивость к солям и термическая стабильность полученных систем. Модифицирование лигносульфоната натрия ОЭДФ и НТФ характеризовалось введением фосфонатных групп и повышением возможности образования комплексов, а также появлением сигналов в ультрафиолетовом спектре, отличающихся от спектра исходного лигносульфоната натрия.*

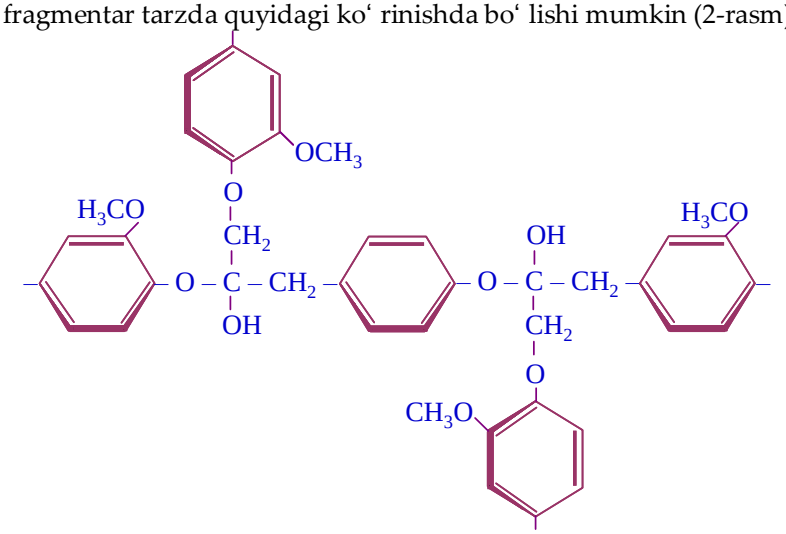


***Ключевые слова:** лигносульфонат натрия, лигнин, органофосфонаты, ОЭДФ, НТФ, минеральные соли, ингибитор, фосфонатные группы, ультрафиолетовый спектр.*

Kirish. Mineral tuzlarining cho‘ kishi neft-gaz quduqlari, quvurlar va texnologik jihozlarda oqim kesimining torayishi, ishlab chiqarish samaradorligining pasayishi va jihozlarning ishdan chiqishiga olib kelishi mumkin. Neft-gaz tizimlarida karbonatli, sulfidli va sulfatli tuzlar keng tarqalgan bo‘ lib, ularning hosil bo‘ lishi harorat, bosim, eritmaning to‘ yinish darajasi va gidrodinamik sharoitlar bilan bog‘ liq [1]. Mineral tuzlar hosil bo‘ lishini oldini olishda ingibitorlardan foydalanish keng qo‘ llaniladi; ayniqsa threshold-inhibitorlar kam miqdorlarda kristall nukleatsiyasi va o‘ sishini sekinlashtirishi mumkin [2]. Bunday tizimlarda fosfor saqlovchi birikmalar, polikarboksilatlar va sulfonatlangan polimerlar ishlatiladi [2]. Lignosulfonatlar syellyuloza-qog‘ oz sanoatida hosil bo‘ ladigan lignin hosilalari bo‘ lib, ularning funksional guruhlari va dispergirlovchi xususiyatlari suvli tizimlarda qo‘ llanish imkonini beradi. Natriy lignosulfonatning $CaCO_3$ cho‘ kishiga ta’siri bo‘ yicha tadqiqotlarda uning modifikatsiyalanmagan holdagi ingibirlash samaradorligi cheklanganligi, modifikatsiya esa ta’sirini oshirishi mumkinligi ko‘ rsatilgan [3]. Lignosulfonatning $CaCO_3$ minerallashuvida kristall fazasi va morfologiyasiga ta’sir ko‘ rsatishi ham qayd etilgan [4]. So‘ nggi tadqiqotlarda lignosulfonatlarni funksional guruhlar bilan modifikatsiyalash orqali barqaror va samarali ingibitorlar olishga e’tibor kuchaygan. Xususan, oksidlangan lignosulfonatlar kalsit cho‘ kishiga nisbatan dastlabki lignosulfonatlarga qaraganda ancha yuqori ingibirlash ta’sirini ko‘ rsatgan va kalsiyga chidamlilik hamda termik barqarorlik xususiyatlari bilan tavsiflangan [5]. Ingibitorlarning ishlash mexanizmi va ularni quduqlarda qo‘ llash usullarini tushunishda ingibitorning sirtda adsorbsiyalanishi, ushlab qolinishi va ajralishi muhim hisoblanadi [6]. Turli ingibitorlarning harorat va konsentratsiyaga bog‘ liq samaradorligi esa CaCO3 cho‘ kishini nazorat qilishda reagent tarkibi va ish sharoitlarini birgalikda baholash zarurligini ko‘ rsatadi [7]. Neft-gaz va neftni qayta ishlash sanoatida metall jihozlarni korroziyadan himoya qilish uchun organik va kompleksonat asosidagi ingibitorlarni ishlab chiqish muhim yo‘ nalishlardan biri hisoblanadi. OEDF ishtirokida tetragidroimidazo-[4,5-d]-imidazoldion-2,5 asosida olingan kompozisiyalar po‘ latni korroziyadan 90% dan ortiq himoya qilishi aniqlangan [8]. Shuningdek, Zn–NTF–OEDF asosidagi metallokompleks kompozisiyalar korroziya va mineral tuzlar to‘ planishiga qarshi ingibitor sifatida tadqiq etilgan [9]. Mineral tuzlar to‘ planishiga qarshi yangi aromatik diamin asosidagi ingibitorning samaradorligi 92–95% ni tashkil etgan [10]. Aromatik diamin asosidagi ingibitorlarda esa korroziyadan himoya samaradorligi alkil zanjiri uzunligiga bog‘ liq bo‘ lib, optimal strukturada 79,8% samaradorlik qayd etilgan [11]. MEE seriyali bis-karbamatlari ham ingibirlovchi xususiyatlarni namoyon qilib, MEE-1 past zichlikdagi polietilenning termooksidlanish barqarorligini 2,5–43,2 marta oshirgan [12], MEE-2 esa motor yoqilg‘ ilarining korrozion faolligini kamaytirish uchun istiqbolli qo‘ shimcha sifatida tavsiflangan [13]. Tetragidroimidazo-[4,5-d]-imidazoldion-2,5 asosidagi kompozision ingibitorlar esa turli agressiv muhitlarda 90% dan yuqori himoya samaradorligini namoyon qilgan [14]. Shu nuqtai nazardan, natriy lignosulfonat matrisasini OEDF va NTF kabi organofosfonatlar bilan modifikatsiyalash fosfonat guruhlarining kompleks hosil qilish xususiyatlarini polimer matrisasining dispergirlovchi ta’siri bilan birlashtirish imkonini beradi. Mazkur ishda natriy lignosulfonat va organofosfonatlar asosida mineral tuzlar to‘ planishi ingibitorlari sintezining texnologik parametrlari va modifikatsiyalangan tizimlarning spektral hamda ingibirlovchi xususiyatlari tadqiq qilingan.

Materiallar va metodlar. Tadqiqotda somondan ajratilgan lignin asosida olingan natriy lignosulfonat (Na-LS) xomashyo sifatida qo‘ llanildi. Na-LS OEDF (oksietilidendifosfon kislota) va NTF (nitrilotrimetilenfosfon kislota) bilan modifikatsiya qilindi. Sintez jarayonida reagentlar nisbati, harorat, pH va reaksiya davomiyligi o‘ zgartirilib, modifikatsiyaning texnologik parametrlari baholandi. Modifikatsiyalangan va modifikatsiyalanmagan Na-LS namunalarining spektral xususiyatlari ultrabinafsha (UB/UV) spektroskopiya orqali taqqoslandi. Shuningdek, ingibirlash

samaradorligi, tuzlarga chidamlilik va termik barqarorlik ko‘ rsatkichlari taqqosiy tarzda baholandi. Faylda qurilmaning aniq markasi yoki modeli ko‘ rsatilmagani sababli bu yerda qurilma nomi umumiy holda berildi.



Natijalar va muhokama. Neft-gaz sanoatida, shuningdek kommunal xo‘ jaligi suv ta’minotida katta miqdorlarda qo‘ llaniladigan reagentlardan biri mineral tuzlar to‘ planishi ingibitorlari bo‘ lib, natriy lignosulfonat va organofosfonatlar asosida sintez qilish jarayonining texnologik parametrlari o‘ rganildi. Mineral tuzlar to‘ planishi ingibitorlari sintez qilish uchun somondan ajratilgan ligninni sulfolash, so‘ ngra sulfonatlash orqali olingan natriy lignosulfonat organofosfonatlardan NTF va OEDF bilan modifikatsiyalandi. Ma’lumki, lignin tuzilishining mavjud sxemalari va uning uglevodlar bilan birikish usuli faqat gipotetik xarakterga ega (1-rasm).

1-rasm. Lignouglevod matritsasining tuzilishi

Lignosulfonatlarning suv ta’minotida qo‘ llanilishining o‘ ziga xosligi va sababi ularning ingibirlovchi xususiyatlari bo‘ lib, bu tarkibidagi aromatik qismda dolchin spirtlari: koniferil (I), sinap (II) va kumar (III) spirtlari mavjudligi bilan izohlanadi.

Polimerning monomer birligi sifatida koniferil spirtiga tegishli bo‘ lgan fenilpropan birligi (FPB) qabul qilingan. Ligninning aromatik qismi fragmentar tarzda quyidagi ko‘ rinishda bo‘ lishi mumkin (2-rasm).

2-rasm. Lignin makromolekulasi fragmenti

Sulfitli pishirishda delignifikatsiya qilish vaqtida lignin bilan bir vaqtda sodir bo‘ ladigan uchta asosiy reaksiya ma’lum:

- sulfirlanish reaksiyasi;
- gidrolitik parchalanish reaksiyasi;
- kondensatsiya reaksiyasi.

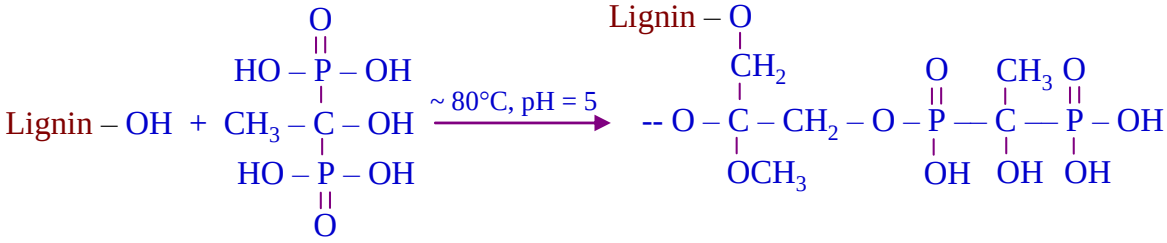
Qaynatish jarayonlari sulfirlovchi agent ishtirokida olib boriladi, bu agent asosan sulfit kislota (H_2SO_3) hisoblanadi.

Yuqorida qayd etilgan reaksiya turlari nukleofil almashinish mexanizmi bo‘ yicha kechadigan geterolitik reaksiyalar sifatida tasniflanadi va bunda fenilpropan bo‘ g‘ inining yon zanjiri nukleofil agentlar hujumiga uchraydi. Sulfirlash va gidrolitik parchalanish reaksiyalari ligninning erishiga yordam beradi. Ligninning sulfirlangan shakllari lignosulfonatlar deb ataladi va ular syellyuloza-qog‘ oz korxonalarining asosiy mahsuloti bo‘ lgan syellyuloza olish jarayonining qo‘ shimcha mahsulotlaridir. Biroq, qaynatish eritmalarining kuchli kislotali muhitida ligninning erishi kondensatsiya reaksiyasi tufayli sekinlashadi; bu reaksiya harorat oshishi va muhit pH ko‘ rsatkichi pasayishi bilan faollashib, ligninning erishiga hamda sulfirlanish qobiliyatiga to‘ sqinlik qiladi. Bundan tashqari, kislotali muhitda ligninning reaksiyaga kirishish qobiliyatini pasaytiradigan va uning faolsizlanishiga olib keladigan kolloid-kimyoviy o‘ zgarishlar yuz beradi. Qaynatish eritmasining ishqoriy muhitida esa demetillanish reaksiyasi kechadi va bu pirokatexinatlarning hosil bo‘ lishiga ko‘ maklashadi, bu esa lignosulfonatlarning oshlovchilik xususiyatlarini yaxshilash uchun juda qulaydir. Umuman, destruksiya dastlabki xomashyoni delignifikatsiyalashga yordam bersa, u bilan raqobatlashuvchi kondensatsiya reaksiyasi bu jarayonga to‘ sqinlik qiladi. Ligninni kondensatsiyadan himoya qilish sulfirlashdir, o‘ z navbatida, kondensatsiya reaksiyasi sulfirlash reaksiyasiga to‘ sqinlik qiladi. Shu bilan birga, uzoq vaqt muhokama qilingan FPE tarkibidagi sulfoguruh aynan qaysi holatda - α, β yoki γ - joylashgan degan savolning javobi prinsipial ahamiyatga ega emasligi aniqlanib, o‘ zining yakuniy yechimini topdi.

Ligninning to‘ rsimon strukturasining parchalanishi solvolitik destruksiya mexanizmi bo‘ yicha kechadi, bu esa kislotali sulfitli pishirishda yog‘ ochni yetarli darajada delignifikatsiyalashni ta’minlaydi. Biroq neytral va ishqoriy muhitlarda ligninning to‘ rsimon strukturasi deyarli parchalanmaydi, chunki solvolitik destruksiya faqat fenolli strukturalarda oraliq xinonmetil hosil bo‘ lishi orqali sodir bo‘ ladi. Aynan shu holat neytral lignosulfonatlarning fizik-kimyoviy xossalarining yaqqol namoyon bo‘ luvchi xususiyati hisoblanadi. Natijada lignin va uning sulfohosilasi - lignosulfonatning ham reaksion qobiliyati, ham eruvchanligining pasayishiga olib keluvchi kolloid-kimyoviy o‘ zgarishlar yuz beradi. Funksional guruhlarning (metoksil, fenol gidroksil, spirt) tarkibi va miqdori pishirish usullariga hamda qayta ishlanadigan xomashyo turlariga qarab o‘ zgaradi va bu lignosulfonat matrisasini modifikatsiyalash imkonini beradi. Natriy lignosulfonatini oksietilidendifosfon kislota (OEDF) va nitrilotrimetilenfosfon kislota (NTF) bilan modifikatsiyalashning maqbul (optimal) parametrlari tizimning yuqori sedimentasion barqarorligiga (ingibirlash samarasi 90-92% atrofida), tuzlar cho‘ kishini samarali ingibirlashga va burg‘ ilash qorishmalarining reologik xossalarini yaxshilashga qaratilgan bo‘ ladi.

Quyida ushbu jarayonning ilmiy va amaliy tadqiqotlarga asoslangan asosiy maqbul parametrlari keltirilgan. Modifikatsiyalashning maqbul texnologik parametrlari: reagentlarning nisbati (OEDF/NTF va lignosulfonat massasiga nisbatan), lignosulfonat matrisasiga fosfon guruhlarini samarali kiritish uchun OEDF va NTF ning umumiy miqdori lignosulfonat quruq massasiga nisbatan maqbul miqdori 5 - 8 % chegarasida (agar OEDF/NTF miqdori 8% dan oshib ketsa, tizimning yopishqoqligi haddan tashqari pasayib, gidrofillik muvozanati buziladi). Kimyoviy bog‘ lanish va propanol zanjiri bilan kompleks hosil bo‘ lishi uchun maqbul harorat 60 °C dan 80 °C gacha bo‘ lishi lozim (harorat 90 °C dan oshganda lignin yadrolarining termik destruksiyasi va kondensatsiyalanishi kuchayib, mahsulot sifati pasayadi). Muhit ko‘ rsatkichi pH: reaksiya muhitining maqbul pH ko‘ rsatkichi 4,5 - 5,5 (kuchsiz kislotali) oralig‘ ida bo‘ lishi kerak. Bu fosfon kislotalarining qisman dissosiatsiyalanishini va NLS ning funksional guruhlari bilan faol ta’sirlashishini ta’minlaydi. Jarayon davomiyligi: aralashtirish va kimyoviy modifikatsiyalanish-ning to‘ liq yakunlanishi uchun maqbul vaqt 1,5 - 2,5 soatni tashkil etadi.

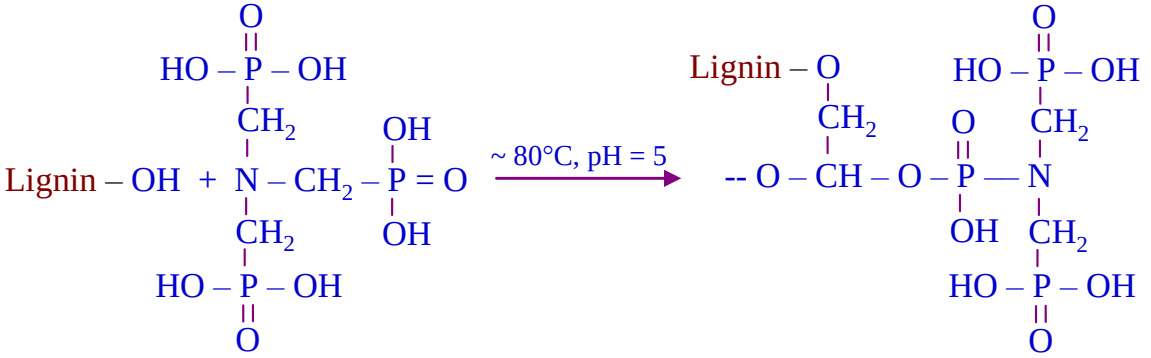
1-jadval



Modifikatsiyalangan tizimning taqqoslama xususiyatlari

Xususiyatlar va parametrlar	Na-LS	Na-LS + OEDF modifikatsiyasi	Na-LS + NTF modifikatsiyasi
Asosiy ta’sir mexanizmi	Yuza-aktivlik, dispergirlash	Fosfon guruhlarining fenilpropan zanjiriga birikishi	Kompleks hosil qilish va amino-metilen zanjirlari shakllanishi
Ingibirlash samaradorligi, %	70	92	88
Tuzlarga chidamlilik Ca^{2+}, Mg^{2+}	Past (tez cho‘ kadi)	Kalsiy ionlari past bo‘ lganda samarali	Kalsiy ionlari yuqori bo‘ lgan muhitda kuchli
Termik barqarorlik, °C	100 – 120	140 – 160	140 – 150

Modifikatsiyalashdan ko‘ zlangan asosiy maqsadlar: kolloid barqarorlikni oshirish - OEDF va NTF tarkibidagi fosfon guruhlari Na-LSning suvda eruvchanligini va qattiq zarralar yuzasida adsorbsiyalanish energiyasini keskin oshiradi; ingibirlash xususiyatini oshirish - modifikatsiyalangan tizim issiqlik almashinuvi apparatlarida va burg‘ ilash quduqlarida



karbonatli va sulfatli tuzlar, shu jumladan $CaCO_3$ cho‘ kishini to‘ xtatib qoladi; reologik nazorat - burg‘ ilash qorishmalarining yopishqoqligi va suv berishini (filtratsiyasini) yuqori harorat va polivalentli tuzlar agressiyasi sharoitida ham barqaror ushlab turadi. Lignin (va Na-LS) murakkab fazoviy polimer bo‘ lgani uchun, kimyoviy sxemalarda uning asosiy tarkibiy birligi bo‘ lgan fenilpropan zanjiri (gvayasil yoki siringil yadrolari) asos qilib olinadi. OEDF va NTF lignin matrisasi bilan vodorod bog‘ lari, efirlanish (eterifikatsiya) va ligninning yon zanjirlaridagi faol markazlar orqali bog‘ lanadi.

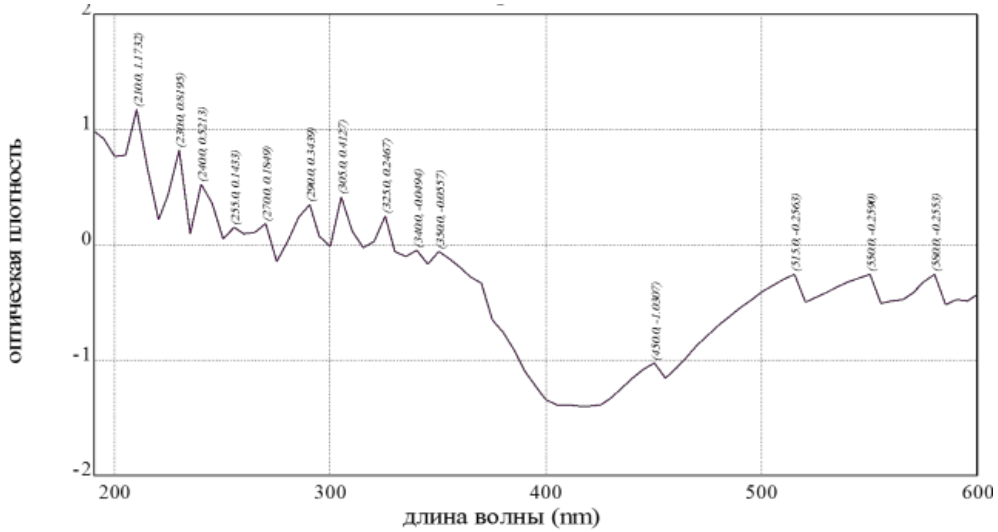
Quyida ushbu modifikatsiyalanishning asosiy kimyoviy reaksiya sxemalari keltirilgan. Na-LSning OEDF (oksietilidendifosfon kislota) bilan modifikatsiyalash reaksiyasi quyidagi sxema bo‘ yicha amalga oshadi:

Natijada lignin zanjirining chekka qismida OEDF ning kuchli xelatlovchi fosfon guruhlari hosil bo‘ ladi.

Na-LSni NTF (nitrilottrimetilenfosfon kislota) bilan modifikatsiyalash reaksiyasi:

NTF tarkibida uchlamchi azot atomi va uchta fosfon guruhi bo‘ lganligi sababli, u lignin bilan nafaqat efir bog‘ lari, balki donor-akseptor (koordinasion) va kuchli vodorod bog‘ lari tizimini hosil qiladi. Kislotali muhitda NTF qisman ionlashadi va Na-LSning sulfoguruhlari (-SO_3Na) hamda fenol gidroksillari bilan ta’sirlashadi.

Agar jarayonni umumiylashtirilgan makromolekulyar sxema sifatida tasvirlansa, mahsulot quyidagicha ko‘ rinishga ega bo‘ ladi:

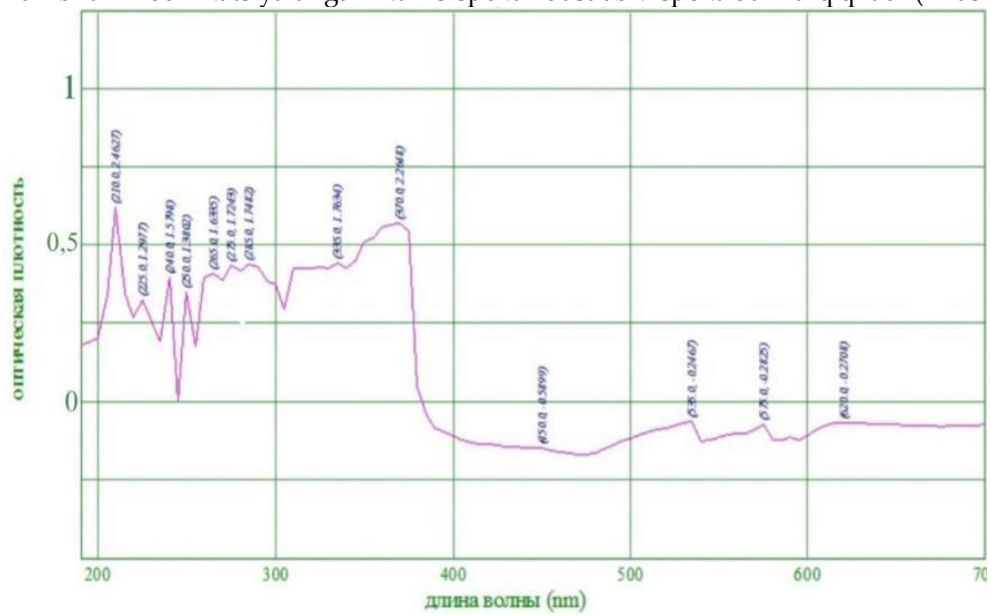


$$\text{НЛС (кўп тармоқли полимер)} + n(\text{Фосфонат}) \xrightarrow{\Delta,\ pH} [\text{НЛС}] \sim\sim\sim [\text{Фосфон гур}$$

Bunda modifikatsiyalangan molekula ikki xil vazifani bajaruvchi gibrid tuzilishga o‘ tadi:

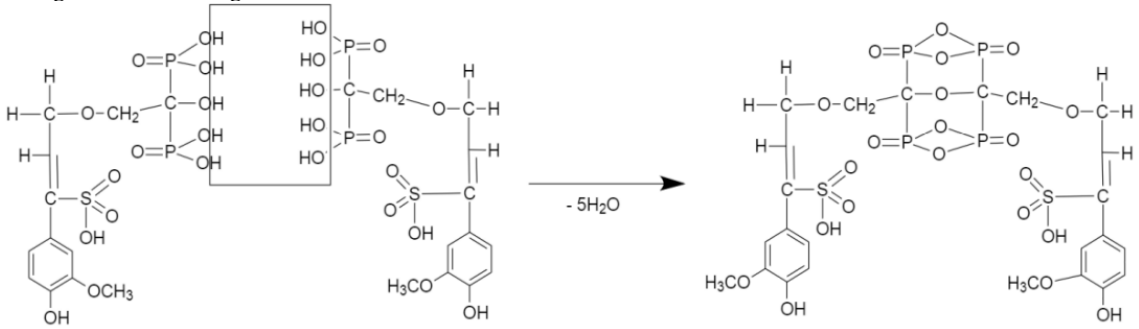
polimer qismi - lignin matrisasi: suvda zarrachalarni himoya qobig‘ i bilan o‘ rab, ularning yopishishiga yo‘ l qo‘ ymaydi (sedimentasion barqarorlik va dispergirlash);

faol qismi - fosfon guruhlari: suvdagi kalsiy (Ca^{2+}) va magniy (Mg^{2+}) ionlarini biriktirib oladi – xelatlar hosil qilida va tuz kristallari o‘ sishini to‘ xtatadi.



Na-LS eritmalarining OEDF fosfon guruhlari bilan modifikatsiyalanishidan oldingi va keyingi tarkib tuzilishi UB-spektrlari olindi (3-rasm).

3-rasm. OEDF fosfon guruhlari bilan modifikatsiyalanmagan Na-LS spektri



190-350 nm to‘ lqinlar diapazonida Na-LSning aromatik tashkil etuvchisi (ligninning fenilpropan zvenosidagi funksional guruhlar) aks etadi. 450 nm dan boshlab va undan keyingi uzun to‘ lqinli nurlanish sohasida spektrning uglevod qismini kuzatish mumkin.

Fosfon guruhlari bilan modifikatsiyalangan Na-LS spektri dastlabki spektrdan farq qiladi (4-rasm).

4-rasm. OEDF fosfon guruhlari bilan modifikatsiyalangan Na-LS spektri

λ=370 nm da cho‘ qqilar paydo bo‘ lishi kuzatiladi, bu esa Na-LS ning OEDF bilan o‘ zaro ta’sirida yangi birikmalar hosil bo‘ lishining xarakterli belgisidir.

5-rasm. Eterifikatsiya reaksiyasi natijasida murakkab efirning hosil bo‘ lishi

4-rasmdan ko‘ rinib turibdiki, organofosfonatlar bilan modifikatsiyalanmagan lignosulfonat spektri uchun λ=270–280 nm (OH-fenol guruhlari) to‘ lqin uzunligida minimal qiymatdagi cho‘ qqilar xos. OEDF ning fosfon guruhlari bilan modifikatsiyalanishi esa lignosulfonat spektrining ko‘ rinishini o‘ zgartiradi: optik zichlikning siljishi yuzaga keladi. Bu holat 370 nm to‘ lqin uzunligida avval kuzatilmagan cho‘ qqining paydo bo‘ lishida aks etadi va o‘ zaro ta’sir reaksiyasi kechganligidan dalolat beradi.

5-rasmga muvofiq, quyidagi tuzilishdagi birikma hosil bo‘ lishi mumkin. Bizningcha, lignosulfonat matrisasini modifikatsiyalash lignosulfonat monomer zvenosining alifatik propan zanjiriga fosfon fragmentini kiritish hisobiga amalga oshirilishi mumkin. Bu (HPO_3^{2-}) fragmentining kompleks hosil qilish xususiyatlari bilan izohlanadi. Fosforlovchi agentning fosfon guruhlari bir qator protonlangan shakllarda namoyon bo‘ ladi: PO_3^{3-}, PO_3H, PO_3H_2. Bunda PO_3 modifikatsiyalash jarayonida o‘ rni almashinadigan COO^- guruhiga nisbatan ancha yuqori elektrmanfiylikka ega. Bunday almashinish tetrayedr shaklidagi fosfonat-ionning stereokimyosi bilan asoslanadi, holbuki lignosulfonat fenilpropan zvenosining boshqa funksional guruhlari uchun yassi konfiguratsiya xosdir. Fosfon guruhlarini o‘ z ichiga olgan barcha ko‘ rsatilgan kompleksonlarni tarkibida bog‘ langan suvning yo‘ qligi birlashtirib turadi. Lignosulfonatda fenilpropan zvenosi alifatik zanjirining protonlanishi kompleks hosil qiluvchi kation (kalьsiy) atrofida lignosulfon kislotasi anionining yirik aglomeratlari hosil bo‘ lishiga olib kelishi mumkin. Fosfonli birikmalarga yuqori dentantlik ham xos bo‘ lib, bu ko‘ p sonli ligandlarni kompleks tuzilmalarga birlashtirib, lignosulfonatning fenilpropan zvenosi kompleksonlarini kalsiy kationlari bilan hosil qilish imkonini beradi.

Shunday qilib, yangi birikmaning paydo bo‘ lishi ulьtrabinafsha spektrda aks etadi va u dastlabki lignosulfonatning ultrabinafsha spektridan yaqqol farq qiladi. Qisqa to‘ lqinli sohada (200–400 nm) barcha cho‘ qqilar optik zichlik (D) oshishi tomoniga mutanosib ravishda siljigani (gipoxrom effekt) ko‘ rinadi. Bunda noaniq cho‘ qqilar yanada aniqroq (265 va 285 nm) cho‘ qqilarga aylangan, bu esa eterifikasiyalangan fenol fragmentlariga xosdir. 400 nm dan yuqori sohada, aksincha, dastlabki lignosulfonat spektri kichik giperxrom ta’sirga uchraydi: bunda 535 va 575 nm dagi cho‘ qqilar yo‘ qolib, 405 nm da aniq cho‘ qqi paydo bo‘ ladi. Bu gipsoxrom siljish mavjudligidan dalolat beradi va efir bog‘ lari hosil bo‘ lganining belgisidir. Bundan tashqari, 310–336 nm sohada "yelka" paydo bo‘ lgani ko‘ rinadi, bu esa yangi mahsulotlar hosil bo‘ lganini isbotlaydi. Optik zichlikning 390-410 nm sohada pasayishi bir qator olingan izolyasiyalangan xromofor tizimlarning yutilishidagi additiv farq bilan izohlanadi. Umuman olganda, keltirilgan ultrabinafsha spektrlar fosfon guruhlari bilan modifikatsiyalangan Na-LS asosidagi reagent tizimlari kompleksonatlar hosil bo‘ lishiga va efir guruhlarining paydo bo‘ lishiga olib kelishini ko‘ rsatadi.

Xulosa. Tadqiqot natijalariga ko‘ ra, somondan ajratilgan lignin asosida natriy lignosulfonat olinib, uning OEDF va NTF organofosfonatlari bilan modifikatsiyalanishi mineral tuzlar to‘ planishini ingibirlash uchun funksional tizim hosil qilish imkonini berdi. Modifikatsiyalash uchun organofosfonatlarning lignosulfonat quruq massasiga nisbatan 5–8 % miqdori, 60–80 °C harorat, pH 4,5–5,5 va 1,5–2,5 soat davomiylik maqbul parametrlar sifatida keltirilgan. Fayldagi taqqoslash natijalarida Na-LS uchun ingibirlash samaradorligi 70 %, OEDF bilan modifikatsiyalangan tizim uchun 92 %, NTF bilan modifikatsiyalangan tizim uchun 88 % qiymatlar keltirilgan. Modifikatsiyalangan tizimlarda termik barqarorlik va Ca^{2+} hamda Mg^{2+} ionlari ishtirokida ishlash xususiyatlari yaxshilanishi qayd etilgan. UB-spektrlarda OEDF bilan modifikatsiyadan keyin λ=370 nm sohasida yangi cho‘ qqi paydo bo‘ lishi, shuningdek 200–400 nm va 400 nm dan yuqori sohalarda spektr shaklining o‘ zgarishi modifikatsiya natijasida yangi funksional holatlar va efir guruhlari hosil bo‘ lishi bilan bog‘ langan. Umuman, olingan natijalar natriy lignosulfonat matrisasini organofosfonatlar bilan modifikatsiyalash mineral tuzlar to‘ planishini ingibirlovchi reagentlar tizimini shakllantirish uchun qo‘ llanishi mumkinligini ko‘ rsatadi.

Abstract: *Sulfur-containing compounds are among the most significant impurities in crude oil, determining the quality of motor fuels, the efficiency of petroleum refining, and the environmental characteristics of final products. This paper summarizes current views on the origin, composition, and distribution of sulfur compounds in different petroleum fractions. A comparative analysis of analytical methods for sulfur determination is presented, including X-ray fluorescence spectrometry, ultraviolet fluorescence, chromatographic, and electrochemical methods. The technological and environmental consequences of the presence of sulfur compounds in crude oil and petroleum products are considered. Modern approaches to desulfurization are compared, including hydrodesulfurization, oxidative, adsorption, extraction, and biotechnological desulfurization. It is shown that the most promising strategies are combined methods for deep purification of heavy petroleum fractions, based on the integration of selective catalytic systems, energy-efficient processes, and modern analytical platforms that provide rapid control of sulfur content directly within the technological cycle.*

Keywords: *petroleum, petroleum products, sulfur-containing compounds, desulfurization, hydrodesulfurization, analytical control.*

NEFT TARKIBIDAGI OLTINGUGURTLI BIRIKMALARNI TADQIQ ETISH VA ULARNI NAZORAT QILISH HAMDA YO‘ QOTISHNING Z AMONAVIY YONDASHUVLARI

Annotatsiya: *Oltingugurt saqlovchi birikmalar neft xomashyosidagi eng muhim qo‘ shimchalardan biri bo‘ lib, motor yoqilg‘ ilarining sifati, neftni qayta ishlash samaradorligi va yakuniy mahsulotlarning ekologik xususiyatlarini belgilaydi. Ushbu ishda turli neft fraksiyalaridagi oltingugurt birikmalarining kelib chiqishi, tarkibi va taqsimlanishi haqidagi zamonaviy qarashlar umumlashtirilgan. Oltingugurtni aniqlashning analitik usullari, jumladan rentgen-fluorestsent spektrometriya, ultrabinafsha fluorestsensiya, xromatografik va elektrokimyoviy usullar qiyosiy tahlil qilingan. Neft va neft mahsulotlarida oltingugurtli birikmalar mavjudligining texnologik hamda ekologik oqibatlari ko‘ rib chiqilgan. Gidrotozalash, oksidlovchi, sorbsion, ekstraksion va biotexnologik desulfurizatsiyani o‘ z ichiga olgan zamonaviy oltingugurtni yo‘ qotish usullari taqqoslangan. Og‘ ir neft fraksiyalarini chuqur tozalashning eng istiqbolli yo‘ nalishlari selektiv katalitik tizimlar, energiya tejamkor jarayonlar hamda texnologik sikl davomida oltingugurt miqdorini tezkor nazorat qilish imkonini beruvchi zamonaviy analitik platformalarni birlashtiruvchi kompleks usullar ekanligi ko‘ rsatildi.*

Kalit so‘ zlar: *neft, neft mahsulotlari, oltingugurtli birikmalar, desulfurizatsiya, gidrotozalash, analitik nazorat.*

СОВРЕМЕННЫЕ ПОДХОДЫ К ИССЛЕДОВАНИЮ СЕРОСОДЕРЖАЩИХ СОЕДИНЕНИЙ НЕФТИ И МЕТОДАМ ИХ КОНТРОЛЯ И УДАЛЕНИЯ

Аннотация: *Серосодержащие соединения относятся к числу наиболее значимых примесей нефтяного сырья, определяющих качество моторных топлив, эффективность нефтепереработки и экологические характеристики конечной продукции. В работе обобщены современные представления о происхождении, составе и распределении соединений серы в нефтяных фракциях различного типа. Проведён сравнительный анализ методов аналитического определения серы, включая рентгенофлуоресцентную спектрометрию, ультрафиолетовую флуоресценцию, хроматографические и*

электрохимические методы. Рассмотрены технологические и экологические последствия присутствия сернистых соединений в нефти и нефтепродуктах. Выполнено сопоставление современных подходов к десульфуризации, включающих гидроочистку, окислительное, сорбционное, экстракционное и биотехнологическое обессеривание. Показано, что наиболее перспективными являются комбинированные методы глубокой очистки тяжёлых нефтяных фракций, основанные на сочетании селективных каталитических систем, энергоэффективных процессов и современных аналитических платформ, обеспечивающих оперативный контроль содержания серы непосредственно в технологическом цикле.

Ключевые слова: *нефть, нефтепродукты, серосодержащие соединения, десульфуризация, гидроочистка, аналитический контроль.*

Introduction

Crude oil is a complex multicomponent system composed of a wide variety of hydrocarbon and heteroatomic compounds. In addition to hydrocarbons, petroleum contains oxygen-, nitrogen-, metal-, and sulfur-containing compounds that significantly affect the physicochemical properties of crude oil and the characteristics of its processing [1,2]. Among these heteroatomic constituents, sulfur-containing compounds are of particular importance because they largely determine the quality of petroleum products, the stability of process equipment, and the environmental characteristics of fuels [3].

Depending on sulfur content, crude oils are classified as low-sulfur, sulfurous, and high-sulfur. An increase in the concentration of sulfur compounds complicates the transportation and refining of crude oil, promotes equipment corrosion, and necessitates additional purification stages [4,5].

The composition of sulfur-containing compounds in petroleum systems is highly diverse. Crude oil contains mercaptans, sulfides, disulfides, thiophenes, benzothiophenes, and dibenzothiophenes [2]. Among them, alkyl-substituted dibenzothiophenes present the greatest technological challenge because of their high chemical stability and low reactivity under conventional hydrodesulfurization conditions [6,7].

The growing interest in sulfur removal is associated with increasingly stringent environmental regulations governing the quality of motor fuels. Current international standards limit sulfur content in gasoline and diesel fuels to approximately 10 mg/kg [8]. Compliance with these requirements has stimulated the development of highly efficient desulfurization technologies and the improvement of analytical methods for determining ultralow sulfur concentrations [9,10].

Sulfur compounds adversely affect most petroleum refining processes. Under high-temperature conditions, they accelerate corrosion, cause catalyst deactivation, and contribute to the formation of resinous and coke deposits [11,12]. During fuel combustion, sulfur compounds are converted into sulfur oxides, which participate in the formation of acid precipitation and atmospheric pollution [13].

At present, sulfur in crude oil and petroleum products is determined using X-ray fluorescence [14,17], fluorescence [15], chromatographic, and electrochemical analytical methods [16,17]. Particular attention is being paid to electroanalytical systems that combine high sensitivity, the possibility of miniaturization, and rapid measurement capabilities [18–20].

Despite advances in deep purification technologies, the effective removal of refractory organosulfur compounds remains an important challenge [5,21–23]. Consequently, combined catalytic [21,24], oxidative [22,25], sorption-based [26,27], and biotechnological approaches [28,29] aimed at achieving deeper desulfurization of heavy petroleum fractions are being actively investigated.

The aim of this study was to systematize current data on the composition and distribution of sulfur-containing compounds in crude oil and to comparatively analyze methods for their analytical determination as well as technologies for sulfur removal from petroleum feedstocks and petroleum products.

Materials and Methods

The informational basis of the study consisted of publications from leading international peer-reviewed journals and specialized industrial editions published between 2023 and 2026, focusing on the analytical determination of sulfur, petroleum product quality monitoring, and modern desulfurization technologies [9,30].

The selection of literature sources was based on the relevance of the studies, the reliability of experimental data, the reproducibility of analytical procedures, and the practical significance of the reported results for the petroleum refining industry. The review included studies containing data on the quantitative determination of sulfur, comparative evaluations of analytical techniques, and the efficiency of sulfur removal processes.

The methodological framework of the study was based on a comparative analytical approach involving the systematization of published data and the comparison of results obtained by different research groups. The sensitivity, selectivity, limits of detection, analysis time, and sample preparation requirements of various sulfur determination methods were comparatively evaluated.

In addition, a comparative assessment of current technologies for reducing sulfur content in petroleum feedstocks was performed, including catalytic hydrodesulfurization, oxidative desulfurization, sorption and extraction processes, as well as biotechnological methods for the removal of organosulfur compounds.

Results and Discussion

Origin and Distribution of Sulfur-Containing Compounds in Petroleum Feedstocks

The presence of sulfur in crude oil is associated with a combination of geochemical and biochemical processes occurring in sedimentary basins during the transformation of organic matter [1–3]. Anaerobic microorganisms play a significant role in this process by reducing sulfates to hydrogen sulfide, which subsequently participates in reactions leading to the formation of organosulfur compounds [28,29].

Sulfur-containing components in petroleum occur in both inorganic and organic forms. The most common species include hydrogen sulfide, mercaptans, sulfides, disulfides, thiophenes, benzothiophenes, and dibenzothiophenes. Their quantitative distribution depends on the origin of the crude oil, the degree of its thermal maturation, and its fractional composition.

Light petroleum fractions are characterized predominantly by low-molecular-weight mercaptans and sulfides, whereas heavy distillates contain increased amounts of polycyclic aromatic sulfur compounds [1,2]. Among these compounds, alkyl-substituted dibenzothiophenes are considered the most refractory because the sulfur atom is sterically shielded by hydrocarbon substituents, significantly hindering hydrodesulfurization processes [22].

Figure 1 presents a generalized scheme illustrating the distribution of the major classes of sulfur-containing compounds among petroleum fractions as a function of boiling point and molecular weight.

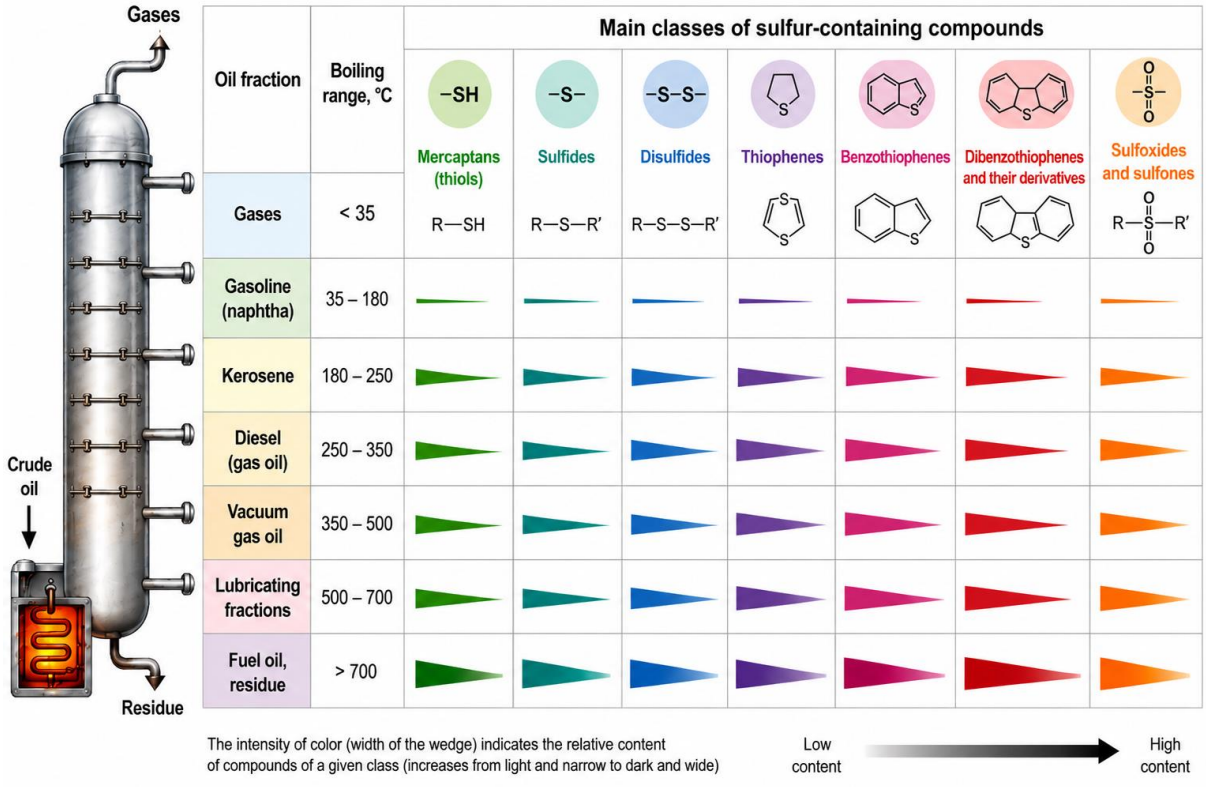

Figure 1. Distribution of the Main Classes of Sulfur-Containing Compounds in Petroleum Fractions

Influence of Sulfur-Containing Compounds on the Properties of Crude Oil and Petroleum Products

Sulfur-containing compounds exert a negative impact on petroleum refining processes, the performance characteristics of fuels, and the environmental safety of petroleum products. The most reactive sulfur species cause intensive corrosion of processing equipment, particularly in the presence of moisture and at elevated temperatures [11,12].

High-molecular-weight heterocyclic sulfur compounds are capable of participating in thermal condensation reactions leading to the formation of resinous substances and coke deposits [5]. This results in catalyst deactivation and deterioration of the operational efficiency of refining units [3,24].

The environmental consequences associated with the use of high-sulfur fuels are primarily related to the formation of sulfur oxides during fuel combustion. These compounds contribute to acid precipitation and the generation of toxic atmospheric aerosols, thereby adversely affecting environmental quality [13].

To systematize the major consequences associated with the presence of sulfur in crude oil and petroleum products, Table 1 summarizes the most characteristic effects of different classes of sulfur-containing compounds on the technological and environmental properties of petroleum products.

The obtained data indicate that the chemical nature and distribution of sulfur-containing compounds directly determine both the technological complexity of petroleum refining and the environmental characteristics of final petroleum products. This necessitates the development of highly efficient analytical control methods and the improvement of deep desulfurization technologies.

Table 1. Influence of the Main Classes of Sulfur-Containing Compounds on the Technological and Environmental Characteristics of Petroleum Products

Sulfur-Containing Compound	Characteristic Impact
Hydrogen sulfide	High toxicity and accelerated equipment corrosion
Mercaptans	Strong unpleasant odor, susceptibility to oxidation and corrosion
Sulfides and disulfides	Formation of resins and carbonaceous deposits
Thiophenes	Catalyst deactivation and reduced catalytic activity
Dibenzothiophenes	Resistance to hydrodesulfurization and accumulation in heavy fractions

Modern Methods for Analytical Determination of Sulfur

At present, a wide range of methods for sulfur determination in crude oil and petroleum products has been developed, including spectroscopic, chromatographic, and electrochemical approaches [9,10].

One of the most widely used techniques for total sulfur determination is ultraviolet fluorescence analysis, which is based on sample combustion followed by the determination of SO_2 according to fluorescence intensity [17]. This method is characterized by high sensitivity and good reproducibility of results.

X-ray fluorescence analysis is distinguished by its high measurement speed and minimal sample preparation requirements. Modern wavelength-dispersive systems allow sulfur determination at concentrations below 0.2 ppm [14].

Ion chromatography methods combined with thermal decomposition are employed for the analysis of heavy petroleum fractions and enable the simultaneous determination of sulfur and halogen-containing compounds.

In recent years, electrochemical analytical methods based on modified screen-printed electrodes have been actively developed [18,19]. Such systems provide high sensitivity, compact instrumentation, and the possibility of rapid on-site analysis directly at sampling locations.

Table 2 summarizes modern analytical methods used for sulfur determination in crude oil and petroleum products.

Table 2. Modern Analytical Methods for Sulfur Determination in Crude Oil and Petroleum Products

Method	Determined Sulfur Forms	Advantages	Limitations
UV fluorescence analysis	Total sulfur	High sensitivity	Requires sample combustion
X-ray fluorescence analysis	Total sulfur	No sample preparation required	Matrix effects
Ion chromatography	Sulfates and oxidation products	High selectivity	Complex sample preparation
Potentiometric titration	Active sulfur	Simplicity	Limited sensitivity
Electrochemical methods	Hydrogen sulfide, mercaptans	Rapid analysis	Electrode modification required

Technological Approaches to Reducing Sulfur Content in Petroleum Feedstocks

The principal industrial method for removing sulfur-containing compounds remains catalytic hydrodesulfurization, which is based on the interaction of organosulfur compounds with hydrogen in the presence of heterogeneous catalysts. The process is carried out at elevated temperatures and pressures using molybdenum-based catalysts promoted with nickel or cobalt [24].

Despite its high industrial efficiency, conventional hydrodesulfurization is insufficiently effective for the removal of alkyl-substituted dibenzothiophenes [4,5]. Steric shielding of the sulfur atom decreases the accessibility of active molecular sites for catalytic interaction.

As alternative approaches, oxidative desulfurization methods are being extensively investigated. In these processes, sulfur-containing compounds are converted into more polar sulfoxides and sulfones, which can subsequently be removed by extraction or sorption techniques.

Considerable interest has also been directed toward sorption technologies employing zeolites, carbon-based materials, metal–organic frameworks, and nanostructured adsorbents. The main advantages of these methods include mild operating conditions and environmental safety; however, their relatively limited sorption capacity still restricts large-scale industrial application.

Extraction methods are based on the use of polar solvents and ionic liquids for the selective removal of organosulfur compounds. These processes are characterized by comparatively simple process design, although subsequent regeneration of the extractants is required.

A separate research direction involves biodesulfurization, which is based on the ability of microorganisms to cleave carbon–sulfur bonds in organic molecules [31]. Biocatalytic processes proceed under mild conditions and are characterized by reduced energy consumption; however, their practical application is limited by the relatively low rate of biochemical transformations.

Figure 2 illustrates the principal desulfurization methods currently employed in the petroleum industry.

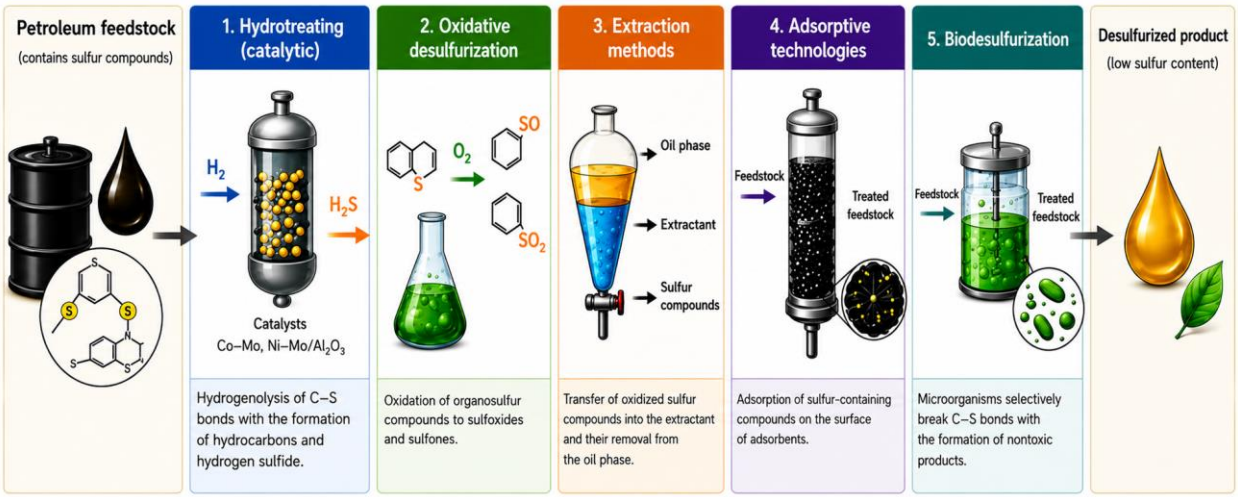

Figure 2. Modern Methods of Petroleum Desulfurization

To compare the principal advantages and limitations of current purification technologies, Table 3 presents a comparative characterization of the most widely used desulfurization methods.

Table 3. Comparative Characteristics of Technologies for Sulfur Removal from Petroleum Feedstocks

Desulfurization Method	Main Advantages	Main Limitations
Catalytic hydrodesulfurization	High productivity and well-established industrial implementation	High energy consumption and incomplete removal of refractory thiophenes
Oxidative desulfurization	Enhanced selectivity toward aromatic sulfur compounds	Requirement for oxidizing agents and additional purification stages
Extraction methods	Simple process design and equipment configuration	Limited efficiency of sulfur compound extraction
Sorption technologies	Environmental safety and mild operating conditions	Relatively low sorption capacity of adsorbent materials
Biodesulfurization	Energy efficiency and selective cleavage of C–S bonds	Low rate of biochemical transformations

Conclusion

The conducted analysis demonstrated that sulfur-containing compounds exert a significant influence on petroleum refining processes, the quality of motor fuels, and the environmental characteristics of petroleum products. It was established that light petroleum fractions predominantly contain low-molecular-weight sulfur compounds, whereas heavy distillates are characterized by increased concentrations of refractory polycyclic thiophenic structures.

Sulfur compounds were shown to promote equipment corrosion, catalyst deactivation, the formation of resinous and coke deposits, and increased emissions of sulfur oxides into the atmosphere. These factors highlight the necessity for improving both analytical control methods and deep desulfurization technologies.

A comparison of modern sulfur determination techniques indicates the high efficiency of X-ray fluorescence, fluorescence, and chromatographic analytical methods. Electrochemical sensor systems based on modified screen-printed electrodes remain a particularly promising direction due to their capability for rapid and sensitive on-site monitoring under industrial conditions.

It was also established that conventional hydrodesulfurization is insufficiently effective for the removal of refractory aromatic sulfur compounds. Therefore, combined desulfurization technologies integrating catalytic, oxidative, sorption-based, and biotechnological approaches appear to be the most перспективными for achieving deeper sulfur removal from petroleum feedstocks and petroleum products.

AZNEK FOSFORITLARINI TURLI KONSENTRATSIYALI EKSTRAKSION FOSFOR KISLOTASI BILAN FAOLLASHTIRISHNING FIZIK-KIMYOVIY VA TEXNOLOGIK QONUNIYATLARI

Kudiyarova Ayimxan Abdijabbarovna
Qoraqalpoq davlat universiteti "Kimyoviy injeniring" yo‘ nalishi 3-kurs doktoranti
Nurmurodov Tulkin Isomurodovich
Navoiy davlat konchilik va texnologiyalar universiteti, Ilmiy ishlar va innovatsiyalar bo‘ yicha prorektor,
Kimyoviy texnologiya kafedrasi texnika fanlari professori

Annotatsiya: *Ushbu maqolada Navoiy viloyatida joylashgan Aznek koni fosforitlarini turli konsentratsiyali (16,5% va 25,0%) ekstraksion fosfor kislotasi (EFK) bilan kimyoviy faollashtirish jarayonining fizik-kimyoviy va texnologik ko‘ rsatkichlari qiyosiy tadqiq etildi. Fosforit va kislota nisbatlari (50:10 dan 50:450 gacha hamda 50:15,15 dan 50:681,8 gacha), xomashyo dispersligi (0,2 va 0,5 mm), reaksiya harorati (60, 80, 100) va jarayon davomiyligi (20–120 min) bo‘ yicha keng qamrovli tahlillar o‘ tkazildi. Kislota konsentratsiyasi va me’yorining pulpa reologiyasiga, yuvilgan va quritilgan qoldiq massasiga, massaviy yo‘ qotish (pateriya) miqdoriga, to‘ yingan hamda siqilgan zichlikka, granulometrik tarkibga va suspenziya pH ko‘ rsatkichiga ta’siri aniqlandi. Shuningdek, karbonatli minerallar parchalanishi jarayonida gaz ajralishi tufayli yuzaga keladigan ko‘ piklanish kinetikasi va tizimdagi ekzotermik harorat profili modellashtirildi. Aniqlanishicha, kislota konsentratsiyasining 16,5% dan 25,0% ga oshishi dekompozitsiya chuqurligini kuchaytiradi, massaviy yo‘ qotishni 63,86% gacha yetkazadi va tizim pH qiymatini 2,11 gacha pasaytiradi. Tadqiqot natijalari mahalliy fosfat xomashyosi negizida fosforli o‘ g‘ itlar olish rejimlarini optimallashtirish uchun muhim ilmiy-texnik asos yaratadi.*

Kalit so‘ zlar: *Aznek fosforiti, ekstraksion fosfor kislotasi, konsentratsiya, faollashtirish, pulpa reologiyasi, to‘ yingan zichlik, siqilgan zichlik, fraksion tarkib, ko‘ piklanish kinetikasi, pH qiymati.*

ФИЗИКО-ХИМИЧЕСКИЕ И ТЕХНОЛОГИЧЕСКИЕ ЗАКОНОМЕРНОСТИ АКТИВАЦИИ АЗНЕКСКИХ ФОСФОРИТОВ ЭКСТРАКЦИОННОЙ ФОСФОРНОЙ КИСЛОТОЙ РАЗЛИЧНОЙ КОНЦЕНТРАЦИИ

Аннотация: *В данной статье представлено сравнительное исследование физико-химических и технологических параметров процесса химической активации фосфоритов из месторождения Азнек в Навоийской области с различными концентрациями (16,5% и 25,0%) экстрактивной фосфорной кислоты (ЭФК). Проведены обширные анализы соотношений фосфорита и кислоты (от 50:10 до 50:450 и от 50:15,15 до 50:681,8), дисперсии сырья (0,2 и 0,5 мм), температуры реакции (60, 80, 100) и продолжительности процесса (20–120 мин). Определено влияние концентрации и скорости кислоты на реологию пульпы, массу промытого и высушенного остатка, потерю массы (патерию), плотность в насыщенном и уплотненном состоянии, гранулометрический состав и pH суспензии. Также смоделирована кинетика пенообразования за счет выделения газа при разложении карбонатных минералов и экзотермический температурный профиль в системе. Было установлено, что увеличение концентрации кислоты с 16,5% до 25,0% увеличивает глубину разложения, повышает потерю массы до 63,86% и снижает значение pH системы до 2,11. Результаты исследования предоставляют важную научно-техническую основу для оптимизации режимов производства фосфорных удобрений на основе местного фосфатного сырья.*

Ключевые слова: *фосфорит Азнека, экстрактивная фосфорная кислота, концентрация, активация, реология пульпы, плотность насыщения, плотность уплотнения, фракционный состав, кинетика пенообразования, значение pH.*

PHYSICOCHEMICAL AND TECHNOLOGICAL REGULARITIES OF ACTIVATION OF AZNEK PHOSPHORITES WITH EXTRACTIVE PHOSPHORIC ACID OF VARIOUS CONCENTRATIONS

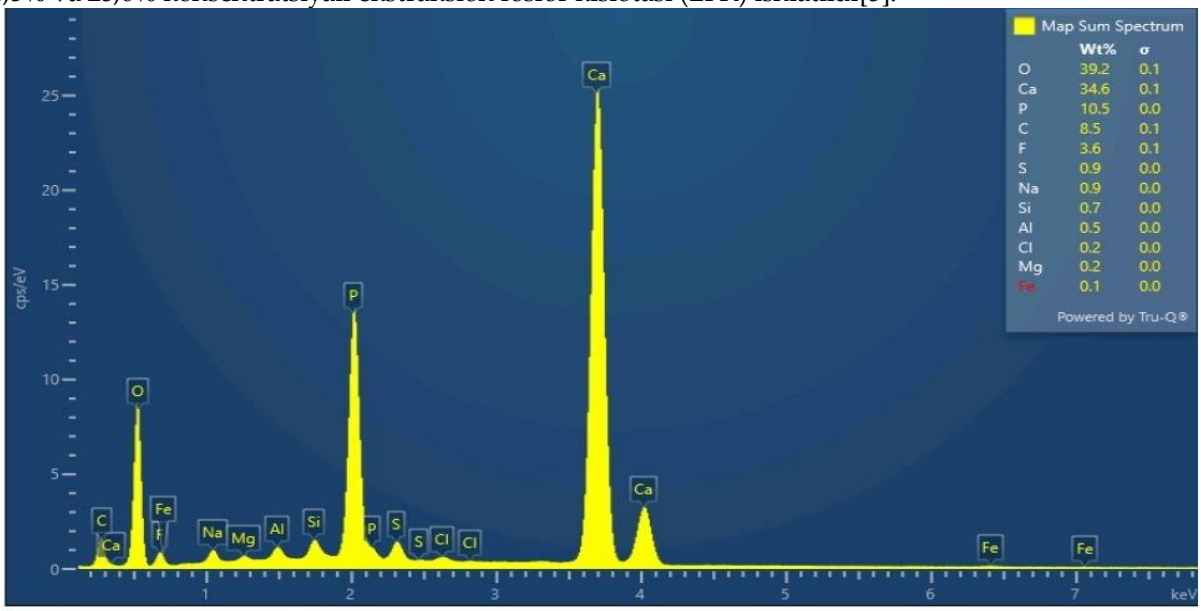
Abstract: *This article presents a comparative study of the physicochemical and technological parameters of the chemical activation process of phosphorites from the Aznek deposit in Navoi region with different concentrations (16.5% and 25.0%) of extractive phosphoric acid (EFK). Extensive analyses were conducted on the ratios of phosphorite and acid (from 50:10 to 50:450 and from 50:15.15 to 50:681.8), raw material dispersion (0.2 and 0.5 mm), reaction temperature (60, 80, 100) and process duration (20–120 min). The effect of acid concentration and rate on pulp rheology, washed and dried residue mass, mass loss (pateria), saturated and compacted density, granulometric composition and pH of the suspension were determined. Also, the kinetics of foaming due to gas evolution during*

the decomposition of carbonate minerals and the exothermic temperature profile in the system were modeled. It was found that an increase in acid concentration from 16.5% to 25.0% increases the depth of decomposition, increases mass loss to 63.86%, and reduces the pH value of the system to 2.11. The results of the study provide an important scientific and technical basis for optimizing the production regimes of phosphorus fertilizers based on local phosphate raw materials.

Keywords: *Aznek phosphorite, extractive phosphoric acid, concentration, activation, pulp rheology, saturated density, compacted density, fractional composition, foaming kinetics, pH value.*

KIRISH (INTRODUCTION)

O‘ zbekiston Respublikasida mineral o‘ g‘ itlar ishlab chiqarish sanoatini rivojlantirish hamda tuproq unumdorligini oshirishda mahalliy past va o‘ rta navli fosforit konlaridan oqilona foydalanish strategik ahamiyatga ega. Markaziy Qizilqum fosforitlari havzasiga mansub Aznek koni fosforitlari tarkibida kalsiy oksidi va karbonat minerallari (kalsit, dolomit) miqdorining yuqoriligi hamda CaO ning P_2O_5 ga nisbatining kattaligi bilan ajralib turadi[1-2].Bunday xomashyoni to‘ liq sulfat kislotali usulda ekstraksiyalash ortiqcha kislota sarfiga va utilizatsiyasi ekologik hamda texnologik jihatdan og‘ ir bo‘ lgan fosfogips chiqindisining haddan tashqari ko‘ p hosil bo‘ lishiga olib keladi.Fosforit xomashyosini ekstraksion fosfor kislotasi (EFK) bilan faollashtirish (to‘ liqsiz parchalash) jarayoni ushbu muammoni bartaraf etuvchi istiqbolli yo‘ nalish hisoblanadi[3]. Mazkur usulda qo‘ shimcha ballast gips cho‘ kmasi ajralmaydi, balki sarflangan kislota tarkibidagi fosfor yakuniy o‘ g‘ it mahsulotiga to‘ liq o‘ tib, uning samaradorligini oshiradi. Jarayonning asosiy kimyoviy mexanizmi erishi qiyin bo‘ lgan kalsiy ftorapatit hamda karbonatlarning kislota bilan ta’sirlashib, suvda va o‘ simliklar tomonidan oson o‘ zlashtiriladigan monokalsiyfosfat ($Ca(H_2PO_4)_2$) va dikalsiyfosfat ($CaHPO_4$) shakllariga aylanishiga asoslanadi. Fosfaritni kislota bilan parchalaganimizda quyidagi (1-2) kimyoviy reaksiya sodir bo‘ ladi



$$Ca_5(PO_4)_3F + 7H_3PO_4 + 5H_2O = 5Ca(H_2PO_4)_2 \cdot H_2O + HF \quad (1)$$

$$CaCO_3 + 2H_3PO_4 = Ca(H_2PO_4)_2 + H_2O + CO_2 \quad (2)$$

Biroq fosforit tarkibidagi karbonatlar dekompozitsiyaga uchraganda kuchli karbonat angidrid (CO_2) gazi ajraladi, bu esa reaktor hajmida intensiv ko‘ piklanishni keltirib chiqaradi[8].Ko‘ piklanish darajasi va tizimning reologik xatti-harakati qo‘ llanilayotgan EFK ning konsentratsiyasi va me’yoriga, haroratga hamda zarrachalar dispersligiga bevosita bog‘ liq. Ushbu tajriybaning maqsadi — Aznek koni fosforitlarini turli konsentratsiyali (16,5% va 25,0 %) ekstraksion fosfor kislotasi bilan faollashtirish jarayonining fizik-kimyoviy va texnologik parametrlarini (massaviy o‘ zgarishlar, zichlik, granulometriya, suspenziya pH qiymati, harorat kinetikasi va ko‘ piklanish dinamikasi) kompleks qiyosiy tadqiq qilishdan iborat[7].

METODIKA (MATERIALS AND METHODS)

Xomashyo va reagentlar: Tadqiqot obyekti sifatida Navoiy viloyatining Aznek koni fosforiti tanlab olindi. Boshlang‘ ich xomashyoning element tarkibi zamonaviy skanerlovchi elektron mikroskopiya (SEM/EDX) usulida tahlil qilindi (1-rasm). Olingan spektr tahliliga ko‘ ra, namunaning asosiy massasini kalsiy (Ca - 34,6%), kislorod (O - 39,2%), fosfor (P - 10,5%) hamda karbonat faza mavjudligini tasdiqlovchi uglerod (C - 8,5%) tashkil etadi. Bu ko‘ rsatkichlar fosforit tarkibida kalsit va apatit minerallari ustunlik qilishini hamda xomashyoning yuqori karbonatli ekanligini ko‘ rsatadi. Xomashyo maydalandi va standart elaklar yordamida 0,5 mm hamda 0,2 mm o‘ lchamdagi fraksiyalarga ajratildi. Reagent sifatida 16,5% va 25,0% konsentratsiyali ekstraksion fosfor kislotasi (EFK) ishlatildi[5].

1-rasm. Elektron skanerlovchi mikroskopda Aznek koni rudasining kimyoviy tahlili

Laboratoriya tajribasi va jihozlar: Faollashtirish jarayoni doimiy haroratni saqlab turuvchi suv hammomi, mexanik aralashtirgich (aralashtirish tezligi bir maromda) va termojuft bilan ta'minlangan laboratoriya reaktorida olib borildi. Barcha tajribalarda dastlabki fosforit massasi 50 g qilib olindi.

- 16,5% li EFK bilan reaksiyalar fosforit : EFK = 50:10 dan 50:450 gacha bo‘ lgan massaviy nisbatlarda o‘ rganildi.
- 25,0% li EFK bilan esa stexiometrik va texnologik me'yorlarga mos ravishda fosforit : EFK = 50:15,15 dan 50:681,8 gacha bo‘ lgan nisbatlarda olindi.
- Jarayon harorati 60, 80 va 100 °C da, reaksiya vaqti esa 20, 40, 60 va 120 daqiqa davomida o‘ rganildi.

O‘ lchash va tahlil usullari:

1.**Ko‘ piklanish kinetikasi:** Reaktor devoriga o‘ rnatilgan o‘ lchov shkalasi bo‘ yicha reaksiya boshlangan dastlabki daqiqalardan boshlab vaqt bo‘ yicha ko‘ pik qatlamining balandligi (sm) qayd etildi.

2.**Harorat dinamikasi:** Reaksiyaning ekzotermik samarasini o‘ rganish maqsadida reaktor ichidagi pulpa harorati har 10 daqiqa oralig‘ ida o‘ lchab borildi.

3.**Massa va yo‘ qotish (pateriya):** Reaksiya yakunlangach, hosil bo‘ lgan cho‘ kma 250 g distillangan suv bilan yuvildi, vakuum-filtrda ajratildi va nam holatdagi massasi tortildi. So‘ ngra cho‘ kma quritish shkafida 60°C Charoratda doimiy og‘ irlikkacha quritilib, quruq qoldiq massasi va massaviy yo‘ qotish % hisoblandi[9].

4.**Zichlik va disperslik tahlili:** Yuvilgan va quritilgan qoldiqning to‘ yingan (erkin to‘ kilish zichligi) va siqilgan zichligi standart usulda (100 sm li silindrda tebranish platformasida) aniqlandi. Granulometrik tarkib 0,5, 1,0, 2,0, 3,0 mm va >3,0mm elak to‘ plamida fraksiyalarga ajratish yo‘ li bilan baholandi.

5.**pH ko‘ rsatkichi:** Namunaning 10%-li suvli suspenziyasi tayyorlanib, 27°C haroratda laboratoriya pH-metrida o‘ lchandi[7].

NATIJALAR VA ULARNING MUHOKAMASI (RESULTS AND DISCUSSION)

1. Pulpa reologiyasi, massa o‘ zgarishi va zichlik ko‘ rsatkichlari;

Kislota miqdori va konsentratsiyasining ortishi tizimning agregat holatini tubdan o‘ zgartiradi. 1-jadval (16,5 %li EFK) va 2-jadval (25,0% li EFK) ko‘ rsatkichlaridan ko‘ rinadiki, fosforitga nisbatan kislota sarfi kam bo‘ lganda mahsulot quruq kukunsimon shaklda bo‘ ladi. Kislota ulushi oshishi bilan tizim avval quyuq bo‘ tqasimon, so‘ ngra oquvchan suyuq va nihoyat juda suyuq fazaga o‘ tadi. Fosforit zarrachalarining o‘ lchami kamayishi va qattiq faza konsentratsiyasining o‘ zgarishi pulpa reologiyasiga sezilarli ta'sir ko‘ rsatib, Nyuton oquvchanlik dinamikasini keltirib chiqaradi[10].

1-jadval. Aznek koni fosforitlarini 16,5 % li EFK bilan qayta ishlash ko‘ rsatkichlari

Massaviy yo‘ qotish (pateriya) va kislota konsentratsiyasi o‘ rtasidagi bog‘ liqlik:

• 16,5% li EFK ishlatilganda massaviy yo‘ qotish 15,03% dan 48,0% gacha bo‘ lgan oraliqda o‘ zgarsa, 25,0% li EFK qo‘ llanilganda bu ko‘ rsatkich sezilarli darajada ortib, 22,50% dan 63,86% gacha yetadi.25% li EFK ning kimyoviy faolligi yuqoriligi sababli fosforit mineral panjarasining parchalanishi va kalsiy ionlarining eritmaga o‘ tishi ancha jadal kechdi.

• Haroratning 60 °C dan 100 °C ga ko‘ tarilishi parchalanish darajasini oshiradi: 25% li EFK da 50:606 nisbatda yo‘ qotish 60 °C dagi 55,51% dan 100 °C da 63,86% ga yetdi.

Zichlik va suspenziya, pH dinamikasi:

• 16,5% li kislotada to‘ yingan zichlik 1,1363 g/sm³ dan 0,4666 g/sm³ gacha, siqilgan zichlik esa 1,3224 g/sm³ dan 0,6493 g/sm³ gacha pasayadi.

• 25,0% li kislotada esa kislota ulushi yuqori bo‘ lganda (50:681,8) to‘ yingan zichlik 0,384 g/sm³ gacha pasayadi. Bu holat mineral fazalarning intensiv erishi natijasida qoldiq zarrachalarda g‘ ovakdor tuzilmalarning hosil bo‘ lishi bilan izohlanadi[4].

• Kislota konsentratsiyasi oshishi bilan eritmaning buferlik xususiyati o‘ zgaradi.16,5% li kislotada pH ko‘ rsatkichi 6,38 dan 4,32 gacha o‘ zgarsa, 25,0% li kislotada erkin vodorod ionlari faolligi yuqori bo‘ lgani sababli pH keskin pasayib, 5,55 dan 2,28 gacha tushadi[9].

2. Harorat kinetikasi va ekzotermik samaradorlik

Fosforitning kislotali parchalanishi issiqlik ajralishi (ekzotermik effekt) bilan boradi. 3-4 jadvallarda da 16,5 %va 25,0% li EFK ishlatilganda reaktor zonasidagi harorat profili keltirilgan.

25,0 %li kislotada reaksiyaning ekzotermik effekti ancha yuqori bo‘ lib, dastlabki 10–20 daqiqa davomida harorat tez ko‘ tariladi. Masalan, 100°C sharoitda 16,5 % li EFK da harorat 85°C gacha ko‘ tarilgan bo‘ lsa, 25% li EFK da 98°C gacha yetadi. 30–40 daqiqadan so‘ ng faol kimyoviy jarayon sekinlashib, tizim harorati muvozanatlashadi[7].

3. Ko‘ pik hosil bo‘ lish kinetikasi va uning reologik xususiyatlari

Aznek fosforitini kislota bilan faollashtirishda ko‘ piklanish asosiy texnologik cheklovchi omil hisoblanadi. 5 va 6 jadvallarda 16,5% li va 25 % li EFK ta’sirida ko‘ pik qatlamining vaqt bo‘ yicha o‘ zgarish dinamikasi aks ettirilgan. Kinetik qonuniyatlar shuni ko‘ rsatadiki: Reaksiyaning dastlabki 5 daqiqasida karbonat minerallarining kislota bilan tezkor ta’siri hisobiga eng maksimal ko‘ pik balandligi (16,5 % li EFK da 17,5 sm gacha, 25% li EFK da 24 sm gacha) kuzatiladi. Harorat oshishi (80–100°C) ko‘ pikning dastlabki hosil bo‘ lish tezligini oshirsa-da, qovushqoqlikning kamayishi sababli ko‘ pikning parchalanishi va so‘ nishini tezlashtiradi (15–20 daqiqada ko‘ pik keskin pasayadi). Xomashyo dispersligi 0,5 mm dan 0,2mm kamaytirilganda, solishtirma sirt yuzasi kengayishi tufayli gaz ajralishi tezlashadi, lekin hosil bo‘ lgan mayda qattiq zarrachalar ko‘ pik plyonkasini barqarorlashtirib, uning uzoqroq saqlanishiga olib keladi.Reaktordagi jarayonning 45–60 daqiqasiga kelib gaz ajralishi to‘ liq muvozanatlashadi[6].

3-jadval. Reaksiyaning vaqt bo‘ yicha harorat dinamikasi (T, °C)

XULOSA (CONCLUSION)

1.Aznek koni fosforitlarini 16,5 % va 25,0 % konsentratsiyali ekstraksion fosfor kislotasi bilan faollashtirish jarayonining fizik-kimyoviy va reologik qonuniyatlari har tomonlama tadqiq etildi.

2.Kislota konsentratsiyasining 16,5 % dan 25,0 % ga oshishi xomashyoning kimyoviy parchalanish chuqurligini sezilarli oshirib, massaviy yo‘ qotishni (pateriya) 48,02 % dan 63,86 % gacha ko‘ taradi va hosil bo‘ lgan suspenziya pH ko‘ rsatkichini 4,32 dan 2,11 gacha pasaytiradi.

3.Kislota me’yori ortishi bilan mahsulotning to‘ yingan zichligi 1,136 g/sm^3 dan 0,384 g/sm^3 gacha pasayadi, bu qoldiq faza morfologiyasining o‘ zgarishi va yuqori g‘ ovakdor tuzilma shakllanishi bilan izohlanadi.

4.Haroratning 60 C◦ dan 100 C◦ ga ko‘ tarilishi reaksiyaning ekzotermik jadalligini kuchaytiradi va ko‘ pik qatlamining so‘ nish vaqtini qisqartiradi.

5.Sanoat sharoitida Aznek fosforitlarini qayta ishlashda reaktor hajmidan samarali foydalanish, ortiqcha ko‘ piklanishning oldini olish va maqbul reologik ko‘ rsatkichlarga erishish uchun jarayonni 25% li EFK bilan 50:203 – 50:303 nisbatda, 60 C◦ haroratda va 40–60 daqiqa davomiylikda olib borish texnologik jihatdan eng optimal rejim sifatida tavsiya etiladi.

DEVELOPMENT AND FEACN CLASSIFICATION OF A DRY LUBRICANT COMPOSITE FOR STEEL WIRE DRAWING BASED ON LOCALLY AVAILABLE RAW MATERIALS

Dilrabo Abduvahobovna Parpiyeva
Independent Researcher, Namangan State University
G‘ olibjon Alisherovich Doliyev
Professor, Department of Chemistry, Namangan State University
Rahmatilla Dehqanov Sultonovich
doctor of Technical Sciences (DSc)

Abstract:*The article presents the development of a dry lubricant composite based on locally available raw materials for cold drawing of steel wire and the results of laboratory and industrial testing. The composite contains kaolin, borax, talc, sodium stearate, sodium acetate, and calcium acetates. Its stability during wire drawing, adhesion to the metal surface, thermal resistance, influence on die wear, and effect on the surface quality of drawn wire were investigated. The developed composite demonstrated stability in the temperature range of 250–300 °C, while its adhesion to the metal surface was 12% higher than that of imported analogues. Its production cost was 2–3 times lower than that of imported compositions. The main technological parameters and material balance were established under industrial conditions, and an experimental batch of 3000 kg was produced. Based on its composition, functional purpose, physical form, and application, FEACN/TIF TN code 3403 10 10 01 was recommended for the product.*

Keywords: *steel wire, cold drawing, dry lubricant composite, kaolin, talc, borax, adhesion, drawing die, local raw materials, FEACN, TIF TN, 3403 10 10 01.*

MAHALLIY MAVJUD BO‘ LGAN XOM ASBOBLAR ASOSINDA PO‘ LAT SIMLARNI CHIZISH UCHUN QURUQ MOYLASH COMPOZITINI ISHLAB CHIQISH VA FEACN TASNIFI

Annotatsiya: *Maqolada mahalliy xom ashyolar asosida po‘ lat simlarni sovuq holda cho‘ zish jarayonida foydalanish uchun ishlab chiqilgan quruq surkov kompozitining texnologik va ekspluatatsion xususiyatlari hamda laboratoriya va ishlab chiqarish sharoitidagi sinov natijalari keltirilgan. Kompozit tarkibiga kaolin, boraks, talk, natriy stearati, natriy atsetati va kalsiy atsetatlari kiritilgan. Kompozitning filera orqali sim o‘ tish jarayonidagi barqarorligi, metall sirtiga adgeziyasi, harorat ta’siriga chidamliligi, filera yeyilishiga ta’siri va sim sirtining sifati o‘ rganilgan. Tajriba natijalariga ko‘ ra, kompozit 250–300 °C harorat oralig‘ ida barqarorlikni namoyon qilgan, metall sirtiga adgeziyasi import analoglariga nisbatan 12 % yuqori bo‘ lgan. Mahsulot tannarxi import kompozitsiyalariga nisbatan 2–3 marta past bo‘ lgan. Ishlab chiqarish sharoitida asosiy texnologik parametrlar va moddiy balans ishlab chiqilib, 3000 kg miqdorida tajriba partiyasi tayyorlangan. Mahsulotning tarkibi, funksional vazifasi va qo‘ llanish sohasidan kelib chiqib, TIF TN bo‘ yicha 3403 10 10 01 kodi tavsiya etilgan.*

Kalit so‘ zlar: *po‘ lat sim, sovuq cho‘ zish, quruq surkov kompoziti, kaolin, talk, boraks, adgeziya, filera, mahalliy xom ashyo, TIF TN, 3403 10 10 01.*

РАЗРАБОТКА И КЛАССИФИКАЦИЯ СУХОГО СМАЗОЧНОГО КОМПОЗИТА ДЛЯ ВОЛОЧЕНИЯ СТАЛЬНОЙ ПРОВОЛОКИ НА ОСНОВЕ МЕСТНЫХ СЫРЬЕВЫХ МАТЕРИАЛОВ

Аннотация*: В статье представлены результаты разработки сухой смазочной композиции на основе местного сырья для холодного волочения стальной проволоки и ее лабораторных и производственных испытаний. В состав композиции входят каолин, бура, тальк, стеарат натрия, ацетат натрия и ацетаты кальция. Исследованы стабильность композиции при волочении проволоки, адгезия к металлической поверхности, термостойкость, влияние на износ волоки и качество поверхности проволоки. Установлено, что композиция сохраняет стабильность в диапазоне 250–300 °C, а ее адгезия к поверхности металла на 12 % выше по сравнению с импортными аналогами. Себестоимость композиции в 2–3 раза ниже импортных аналогов. В производственных условиях разработаны основные технологические параметры и материальный баланс, изготовлена опытная партия объемом 3000 кг. На основании состава, функционального назначения и области применения предложен код ТН ВЭД 3403 10 10 01.*

INTRODUCTION

Cold drawing of steel wire is a widely used technological process for obtaining products with specified geometric dimensions, surface quality, and mechanical properties. During drawing, the wire is pulled through a die under considerable contact pressure and frictional interaction between the metal and the die. Therefore, the properties of the processed material and the technological conditions of deformation directly influence the quality and stability of the process [1,2]. The efficiency of mechanical-processing operations depends on process stability, dimensional accuracy, surface quality, productivity, and rational use of materials [3,4]. In cold wire drawing, inadequate lubrication may increase frictional resistance, drawing force, thermal effects, and die wear and may cause deterioration of the wire surface. An effective dry lubricant should form a stable protective layer between the wire and the die and retain its functional properties during deformation. From a tribological standpoint, the composition and structure of a lubricant determine its ability to reduce direct contact between interacting surfaces and maintain stable lubrication conditions.

Previous research by Parpiyeva and Doliyev demonstrated the possibility of obtaining lubricant composites from locally available raw materials with favorable physicochemical and tribological properties [5]. These results provide a basis for developing specialized dry lubricants for metal-forming processes.

The use of local raw materials is also economically important. Localization can reduce dependence on imported technological materials, decrease production costs, and promote the efficient use of domestic mineral and chemical resources. At the same time, classification of a newly developed material within the Foreign Economic Activity Commodity Nomenclature (FEACN/TIF TN) is important for its future commercialization and foreign economic circulation [6,8].

The aim of this study was to develop a dry lubricant composite based on locally available raw materials for cold drawing of steel wire, evaluate its technological and operational characteristics under laboratory and industrial conditions, determine its economic efficiency, and substantiate its FEACN/TIF TN classification.

MATERIALS AND METHODS

The investigated dry lubricant composite was prepared from kaolin, borax, talc, sodium stearate, sodium acetate, and calcium acetates. The components were selected with the aim of obtaining a homogeneous dry material capable of forming and retaining a lubricating layer in the metal–die contact zone.

The technological preparation included raw-material preparation, preliminary mechanical treatment, dosing, dry mixing, homogenization, and quality control. The technological sequence was selected taking into account the general principles of technological-process organization, material utilization, product quality, and production efficiency [7,8].

The functional properties of the composite were evaluated during steel-wire drawing through the die. The main evaluation criteria were:

- continuity and stability of wire passage through the die;
- occurrence of wire breakage and deformation;
- adhesion and retention of the composite on the metal surface;
- thermal stability;
- condition and wear of the drawing die;
- surface quality of the drawn wire;
- economic efficiency.

The behavior of the steel wire was considered in relation to the general principles of materials science and deformation processing [5,6]. Previous research on local-raw-material-based lubricant composites was also used as a scientific basis for assessing their physicochemical and tribological behavior .

Following laboratory preparation, the composition was tested under industrial conditions at “IFODA Agro Kimyo Himoya” JV LLC and the “MEXMASH” metalworking plant. During industrial testing, raw-material consumption, technological losses, homogeneity of the mixture, stability of wire drawing, lubricant retention, and the condition of the die and wire surface were monitored.

RESULTS AND DISCUSSION

The experimental results showed that the developed composite performed effectively during steel-wire drawing. Continuous passage of the wire through the drawing die was maintained, and no wire breakage was observed under the investigated conditions. No significant visible surface defects were detected on the drawn wire.

The obtained results correspond to general technological requirements for metal deformation processes, in which process stability and product quality are important indicators of technological efficiency [5,7,8].

3.1. Thermal stability and adhesion

One of the important characteristics of the developed composite was its behavior under elevated temperatures generated by friction. The experimental results showed that the composite retained its technological properties within the temperature range of **250–300 °C**.

Thermal stability is important for dry lubricants because the lubricant layer is simultaneously subjected to mechanical loading and thermal effects in the working zone. The preservation of functional properties within the investigated temperature interval indicates the suitability of the composite for the studied drawing conditions.

The adhesion of the composite to the metal surface was also evaluated. The obtained results demonstrated that the adhesion of the developed composite was **12% higher than that of the imported reference analogues**.

Higher adhesion is technologically significant because stable retention of the lubricant on the wire surface facilitates preservation of the lubricating layer within the friction zone. This can reduce direct metal–die interaction and contribute to stable drawing conditions. The importance of physicochemical and tribological characteristics of local-raw-material-based lubricant composites was also demonstrated in previous research.

During laboratory and industrial tests, the developed composite demonstrated stable behavior in the drawing zone. No wire breakage was recorded, and continuous wire passage through the die was maintained.

After testing, no excessive wear of the working surface of the drawing die was observed under the investigated conditions. The wire surface also remained free from significant visible defects.

The condition of the drawing die and the quality of the wire surface are important indicators of technological efficiency. Material properties and deformation conditions influence the behavior of steel during processing [5,6], while rational organization of the technological process is necessary to maintain quality and productivity.

The combined results of adhesion, thermal stability, continuous drawing, and absence of significant surface defects indicate that the developed composite possesses the functional characteristics required for the investigated dry-lubrication process.

The use of locally available raw materials provided a significant economic advantage. The production cost of the developed composite was approximately **2–3 times lower than that of the imported Chinese and Russian analogues** considered in the study.

Compared with certain imported lubricant composites, the locally developed material was found to be **up to 45% less expensive**.

The economic effect is associated with the availability of local raw materials and the possibility of localized production. Reduction of material costs and technological losses is consistent with the general principles of production efficiency and technological-process optimization.

After laboratory optimization, the composition was tested under industrial conditions. The production technology included preparation of raw materials, mechanical treatment, dosing, dry mixing, homogenization, and quality control.

During industrial production, uniform distribution of the components and homogeneity of the finished composite were monitored. The technological losses and material consumption were also considered in establishing the material balance.

The industrial tests confirmed stable application of the composite to the wire surface and its retention in the friction zone. Continuous wire passage through the die was maintained, no wire breakage was recorded, and no significant surface deterioration was observed.

An experimental batch of **3000 kg** was successfully produced. This result confirms the technological feasibility of transferring the developed composition from laboratory preparation to industrial-scale production.

The results also extend the authors' previous investigations of lubricant composites based on local raw materials. While the previous research focused on physicochemical and tribological characteristics, the present study demonstrates the practical applicability of the developed material to steel-wire drawing.

FEACN/TIF TN CLASSIFICATION

An important practical aspect of the study was the classification of the developed dry lubricant composite according to the Foreign Economic Activity Commodity Nomenclature (FEACN/TIF TN).

The classification of goods should take into account their composition, physical form, functional purpose, and field of application. The TIF TN system provides the basis for systematic identification and coding of goods involved in foreign economic activity.

The developed composite is a dry lubricant intended for technological lubrication during cold drawing of steel wire. Therefore, its functional purpose is associated with providing lubrication in the metal–die contact zone.

According to **Information Letter No. 29/05-25-2972 dated December 16, 2025**, issued by the Central Customs Laboratory of the Customs Committee under the Ministry of Economy and Finance of the Republic of Uzbekistan, the

composition and functional characteristics of the lubricant composite developed by D.A. Parpiyeva were examined, and **commodity code 3403 10 10 01** was recommended for the product.

The classification result is important for the further commercialization of the developed material because a defined commodity code facilitates product identification in foreign economic activity, customs procedures, statistical accounting, and market circulation.

The proposed classification should be considered within the applicable edition of the TIF TN and the relevant decisions of the competent customs authorities. Thus, the classification result represents an important organizational step in transferring the developed composite from a research product to a commercially identifiable technological material.

CONCLUSION

A dry lubricant composite based on locally available raw materials was developed for cold drawing of steel wire. The composition contains kaolin, borax, talc, sodium stearate, sodium acetate, and calcium acetates.

Laboratory and industrial testing demonstrated the technological suitability of the composite. It retained its functional properties within the temperature range of **250–300 °C**, while its adhesion to the metal surface was **12% higher than that of imported reference analogues**. During the drawing tests, continuous wire passage through the die was maintained, no wire breakage was observed, and no significant surface defects were detected. No excessive wear of the drawing die was observed under the investigated conditions.The use of local raw materials provided a considerable economic advantage. The production cost of the developed composite was approximately **2–3 times lower than that of the imported analogues**, and in comparison with certain imported compositions it was up to **45% lower**.

The principal technological parameters and material balance were established under industrial conditions, and an experimental batch of **3000 kg** was produced. This confirms the possibility of industrial-scale preparation of the developed composite. The study continues the authors' previous research on lubricant composites based on local raw materials and extends it toward practical application in steel-wire drawing.

According to Information Letter No. 29/05-25-2972 of the Central Customs Laboratory, **FEACN/TIF TN code 3403 10 10 01** was recommended for the developed lubricant composite [4]. This result creates an important basis for its identification, commercialization, and future introduction into foreign economic activity within the relevant TIF TN regulatory framework.

The developed composite therefore has technological and economic potential as an import-substituting dry lubricant for steel-wire drawing based on locally available raw materials.

Annotatsiya. *Maqolada raps moyi ishlab chiqarish jarayonida hosil bo‘ ladigan raps shrotining kimyoviy tarkibi, oqsil fraksiyalari (kruciferin va napin), antioziqaviy komponentlari, oqsilni ishqoriy ekstraksiya va izoelektrik cho‘ ktirish usulida ajratish sharoitlari hamda olingan oqsilning funksional xususiyatlari bo‘ yicha xalqaro adabiyotlar tahlil qilingan. Moy olish usuli va ajratish sharoitining oqsil chiqimi, tozaligi va funksional xususiyatlariga ta’siri solishtirilgan. O‘ zbekistonda yetishtirilgan rapsdan olingan shrotning sifatini baholash uchun ko‘ rsatkichlar va aniqlash usullari majmui asoslangan.*

Kalit so‘ zlar: *raps, raps shroti, oqsil konsentrati, kruciferin, napin, ishqoriy ekstraksiya, izoelektrik cho‘ ktirish, funksional xususiyatlar, sifat ko‘ rsatkichlari, glyukozinolatlar.*

ФУНКЦИОНАЛЬНЫЕ СВОЙСТВА И ПОКАЗАТЕЛИ КАЧЕСТВА ШРОТА, ПОЛУЧЕННОГО ИЗ РАПСА, ВЫРАЩЕННОГО В УЗБЕКИСТАНЕ

Аннотация. *В обзоре систематизированы данные о химическом составе рапсового шрота, белковых фракциях (круциферин и напин), антипитательных веществах, условиях выделения белка щелочной экстракцией с изоэлектрическим осаждением и функциональных свойствах полученных белковых концентратов. Сопоставлено влияние способа получения масла и условий выделения на выход, чистоту и функциональность белка. Обоснован перечень показателей качества и методов их определения для оценки шрота из рапса, выращиваемого в Узбекистане.*

Ключевые слова: *рапс, рапсовый шрот, белковый концентрат, круциферин, напин, щелочная экстракция, изоэлектрическое осаждение, функциональные свойства, показатели качества, глюкозинолаты.*

FUNCTIONAL PROPERTIES AND QUALITY INDICATORS OF MEAL OBTAINED FROM RAPESEED GROWN IN UZBEKISTAN

Abstract. *This review summarizes published data on the chemical composition of rapeseed meal, its protein fractions (cruciferin and napin), antinutritional compounds, the isolation of protein by alkaline extraction and isoelectric precipitation, and the functional properties of the resulting protein concentrates. The influence of the oil-production route and isolation conditions on protein yield, purity and functionality is compared. A set of quality indicators and analytical methods is proposed for assessing meal obtained from rapeseed grown in Uzbekistan.*

Keywords: *rapeseed, rapeseed meal, protein concentrate, cruciferin, napin, alkaline extraction, isoelectric precipitation, functional properties, quality indicators, glucosinolates.*

1. KIRISH

Aholi sonining o‘ sishi va oziq-ovqat xavfsizligiga talabning kuchayishi to‘ liq qimmatli oqsil manbalariga ehtiyojni oshirmoqda. Bu ehtiyojni qondirishning asosiy yo‘ nalishlaridan biri o‘ simlik oqsillaridan, jumladan moy-yog‘ sanoatining ikkilamchi mahsulotlaridan foydalanishdir [1–3]. Raps (*Brassica napus* L.) soyadan keyin dunyoda ikkinchi yirik moyli ekin bo‘ lib, 2024/2025-yilda jahonda raps shroti ishlab chiqarish taxminan 49,3 mln tonnaga yetgan [1]. Hozirda shrot asosan chorvachilik va parrandachilikda em-xashak sifatida, qisman o‘ g‘ it sifatida ishlatiladi [1].

O‘ zbekistonda moy-yog‘ sanoati oziq-ovqat tarmog‘ ining muhim qismi hisoblanadi: 240 dan ortiq korxonada 2019-yilda taxminan 280 ming tonna o‘ simlik moyi va 650 ming tonnadan ortiq moyli ekinlar shroti ishlab chiqarilgan [4].

Parrandachilikning rivojlanishi oqsilli xomashyoga talabni oshirmoqda: 2025/26-mavsumda Rossiya raps shroti eksportining asosiy xaridori O‘ zbekiston bo‘ lib, xarid hajmi 94 % ga oshib, 262 ming tonnaga yetgan [5]. Ekspertlar prognoziga ko‘ ra, mamlakatda raps moyi hajmi 3 ming tonnadan 2030-yilga borib 20 ming tonnagacha, 2035-yilga borib 40 ming tonnagacha o‘ sishi kutilmoqda [6]; bu mahalliy raps shrotining ham ko‘ payishi ehtimolini ko‘ rsatadi.

Raps tuproq pH qiymati 5,5–8,3 bo‘ lgan yaxshi drenajlangan tuproqlarda o‘ sadi va sho‘ rlanishga o‘ rtacha chidamli [7]. Biroq shrot sifati (oqsil, yog‘ , antioziqaviy moddalar miqdori) nav, o‘ stirish sharoiti va moy olish usuliga kuchli bog‘ liq [1], shu sababli xorijiy ma’lumotlarni O‘ zbekiston sharoitidagi xomashyoga bevosita ko‘ chirib bo‘ lmaydi. Biz ko‘ rib chiqqan manbalarda mahalliy rapsdan olingan shrotning tarkibi va funksional xususiyatlari bo‘ yicha tizimlashtirilgan ma’lumot topilmadi.

Obzorning maqsadi — raps shrotining tarkibi, oqsil fraksiyalari, antioziqaviy komponentlari, oqsilni ajratish usullari va olingan oqsilning funksional xususiyatlari bo‘ yicha xalqaro tajribani tizimlashtirish hamda O‘ zbekistonda yetishtirilgan rapsdan olingan shrotni baholash uchun ko‘ rsatkichlar majmuasini asoslashdir. Maqsadga erishish uchun quyidagi **vazifalar** belgilandi:

- shrot tarkibining moy olish usuliga bog‘ liqligini tahlil qilish;
- asosiy oqsil fraksiyalari va antioziqaviy moddalarni tavsiflash;
- ishqoriy ekstraksiya va izoelektrik cho‘ ktirish sharoitlarining natijaga ta’sirini solishtirish;
- funksional xususiyatlar va ularni baholash usullarini umumlashtirish;
- mahalliy shrotni baholash uchun sifat ko‘ rsatkichlari va usullar ro‘ yxatini tavsiya etish.

2. ADABIYOTLARNI TAHLIL QILISH USULI

Adabiyotlar ochiq xalqaro ilmiy bazalar (PubMed Central, MDPI, ScienceDirect, Wiley) va Google Scholar orqali “rapeseed meal”, “canola protein”, “isoelectric precipitation”, “functional properties”, “glucosinolates” kalit so‘ zlari bilan qidirildi (2026-yil sentyabr holatiga). Asosiy e’tibor so‘ nggi yillarda nashr etilgan maqolalarga, shuningdek, yo‘ nalishdagi klassik sharhlarga qaratildi. Mahalliy moy-yog‘ sanoati va bozor ma’lumotlari tarmoq analitik manbalaridan olindi.

3. RAPS SHROTINING KIMYOVIY TARKIBI

Shrot tarkibi moy olish yo‘ liga bog‘ liq. Mexanik siqish shrotda ko‘ proq yog‘ qoldiradi; keyingi erituvchi ekstraksiyasi yog‘ ni yanada kamaytirib, quruq moddadagi oqsil, kletchatka va kul ulushini nisbatan oshiradi [1]. Bir partiya raps ustida o‘ tkazilgan taqqoslashda siqilgan shrotda 210 g/kg yog‘ va 294 g/kg xom oqsil, erituvchi bilan ekstraksiyalangan shrotda esa 18–23 g/kg yog‘ va 376–382 g/kg xom oqsil aniqlangan [1] (1-jadval). Bu farq oqsilning mutlaq ortishi emas, balki yog‘ chiqarilgandan keyingi nisbiy konsentrlanish natijasidir. Umuman, raps shrotida oqsil miqdori taxminan 35–40 % ni tashkil etadi [8].

1-jadval. Raps shrotining tarkibi bo‘ yicha adabiyot ma’lumotlari

Ko‘ rsatkich	Adabiyotdagi qiymat	Manba
Yog‘ , g/kg quruq modda	siqilgan shrot — 210; erituvchi bilan ekstraksiyalangan — 18–23	[1]
Xom oqsil, g/kg quruq modda	siqilgan shrot — 294; ekstraksiyalangan — 376–382	[1]
Oqsil (umumiy oraliq), %	35–40	[8]
Fitin kislotasi, %	2–5 (nav va usulga qarab o‘ zgaradi)	[1]
Glyukozinolatlar (sovuq siqilgan shrot), μmol/g	taxminan 16	[1]
Po‘ st ulushi	urug‘ massasining 18,2 %; neytral-detergent tolaning ~73 % va ligninning ~95 % ini saqlaydi	[1]
Umumiy ovqat tolasi, g/kg	300 (qora urug‘ li *B. elvis* shroti)	[1]

Issiqlik ta’siri ham muhim: kuchliroq qizdirilgan (oldindan siqilgan, issiq siqilgan, tostlangan) shrotda oqsil kletchatka matritsasi bilan mustahkamroq bog‘ lanadi, eruvchanlik va lizin, sistein miqdori kamayadi [1]. Yumshoq sharoitda sovuq siqilgan va oldindan siqilgan kunjaradan oqsilning maksimal ajratilishi mos ravishda 52,3 va 36,7 % bo‘ lgan [9]; [1] sharhida keltirilgan boshqa ishda oqsil qaytishi sovuq siqilgan, issiq siqilgan va erituvchi bilan ekstraksiyalangan shrotda 45, 26 va 5 % ni tashkil etgan. Demak, zavodda qo‘ llanadigan texnologik rejim (sovuq yoki issiq siqish, erituvchi, tostlash harorati) shrotdan oqsil ajratish imkoniyatini oldindan belgilaydi.

4. ANTIOZIQAVIY KOMPONENTLAR

Raps shrotining oziq-ovqatda keng qo‘ llanishini cheklovchi asosiy omillar — glyukozinolatlar, fitin kislotasi, fenol birikmalari (asosan sinapin va sinap kislotasi) hamda kletchatka [1]. Fenol birikmalari mahsulotga achchiq ta’m va to‘ q rang beradi [1]. Fitin kislotasi (myo-inozitol geksafosfat) saqlovchi oqsillar bilan birga harakatlanadi va Ca^{2+}, Mg^{2+}, Zn^{2+}, Fe^{2+} ionlari bilan kompleks hosil qilib, minerallarning o‘ zlashtirilishi hamda oqsil eruvchanligi va hazmlanuvchanligiga ta’sir qiladi [1]. Po‘ st urug‘ massasining atigi 18,2 % ini tashkil etsa-da, kletchatka va ligninning asosiy qismini saqlaydi,

shuning uchun po‘ stni ajratish va maydalash–elash orqali oqsil ulushini oshirish mumkin: eng mayda fraksiyada xom oqsil 368 dan 420 g/kg gacha ortib, umumiy ovqat tolasi 300 dan 214 g/kg gacha kamaygan [1].

Antioziqaviy moddalarni kamaytirishning asosiy yo‘ llari quyidagilar: (i) suv yoki suv-spirtli yuvish — pilot masshtabda po‘ stsizlantirilgan shrotni ikki marta suv bilan ishlash glyukozinolatlarning taxminan 98 % ini chiqargan, biroq quruq moddaning 30 % i va xom oqsilning ~25 % i ham ekstraktga o‘ tgan [1]; (ii) ishqoriy ekstraksiya va kislotali cho‘ ktirish — glyukozinolatlarning suvda eruvchan qismi supernatant va membrana permeatiga o‘ tadi [1]; (iii) fitaza bilan ishlov — oqsil ekstraksiyasi 72,1 % ga yetgan, konsentratda fitat ≈1 g/kg gacha kamaygan [1]; (iv) mikrobial fermentatsiya — aralash madaniyatlarda fitin kislotasi 42 %, glyukozinolatlar 99 % gacha kamaygan [1]. Sovuq siqilgan shrotda myrosinaza faolligi saqlanadi; suv qo‘ shilganda glyukozinolatlar tez gidrolizlanib, toksik nitrillar va goitrin hosil qilishi mumkin [1]. Shu sababli faqat glyukozinolatlar emas, ularning gidroliz mahsulotlarini ham nazorat qilish lozim.

5. OQSILNI AJRATISH USULLARI

Oqsilni ajratishning eng keng tarqalgan usuli — ishqoriy ekstraksiya va undan keyingi izoelektrik cho‘ ktirish [2, 3]. Ishqoriy muhitda oqsil molekulalarining manfiy zaryadi va o‘ zaro itarilishi ortadi, oqsil eritmaga o‘ tadi; pH kislotali sohaga tushirilganda eruvchanlik kamayib, oqsil cho‘ kadi [1]. Adabiyotlarda ekstraksiya pH i asosan 9–12 oralig‘ ida o‘ rganilgan (2-jadval). pH ortishi eruvchanlikni oshiradi (pH 9 dan 13 gacha taxminan 15 %), biroq kuchli ishqoriy sharoit fenol–oqsil o‘ zaro ta’sirini, rang o‘ zgarishini va oqsil agregatsiyasini kuchaytiradi [14].

2-jadval. Oqsil ajratish sharoitlari va natijalar

Usul va sharoit	Natija	Manba
Ekstraksiya pH 10,5, 1:10, 4 °C, 3 soat; cho‘ ktirish pH 5,0 (beshta raps navi)	oqsil qaytishi 26–41 %	[1]
Ekstraksiya pH 12, shrot konsentratsiyasi 15 %, tuzsiz	ekstraksiya unumi 58,12 %	[1]
Ekstraksiya pH 9, cho‘ ktirish pH 4,5	mahsulot chiqimi 65,08 %; rang qorayishi va antioziqaviy moddalar kam	[1]
Sovuq siqilgan kunjara: ekstraksiya pH 10,5, cho‘ ktirish pH 4,0	ajratish koeffitsienti 52 %; chiqim 33 %; oqsil 64 %	[13]
Fitaza bilan dastlabki ishlov, keyin ishqoriy ekstraksiya	ekstraksiya 72,1 %; fitat ≈1 g/kg	[1]
Membrana bilan tozalash (5 kDa)	oqsil miqdori 45,1 –63,4 %	[1]

Jadvaldan ko‘ rinadiki, bir xil sxema xomashyo turi va sharoitga qarab turlicha natija beradi. Ahlström va boshq. ishida cho‘ ktirishning eng yuqori chiqimi pH 4,0 da (33 %) kuzatilgan, biroq emulsiyani eng barqaror ushlagan oqsil pH 5,0–6,0 da cho‘ ktirilgan [13]: ya’ni «eng ko‘ p chiqim» va «eng yaxshi funksional xususiyat» bir nuqtaga to‘ g‘ ri kelmaydi. Ishqoriy ekstraksiyaga muqobillar — tuzli ekstraksiya (rang, ta’m, eruvchanlik va emulsiyalash bo‘ yicha yaxshiroq, lekin napin ulushi yuqori), fermentli ekstraksiya, ultratovush [15] hamda membrana (ultrafiltratsiya) usullari; ular sifatni yaxshilaydi, biroq jarayonni murakkablashtiradi [1]. Shu bois ekstraksiya sharoitini faqat oqsil chiqimi bo‘ yicha emas, chiqim, tozalik, funksional xususiyat va xavfsizlik ko‘ rsatkichlari majmui bo‘ yicha tanlash maqsadga muvofiq.

6. FUNKSIONAL XUSUSIYATLAR

Oqsil konsentratining oziq-ovqatda qo‘ llanilishi eruvchanlik, suv va yog‘ ni ushlab qolish qobiliyati (SUQ, YUQ), emulsiyalash, ko‘ pik hosil qilish va gel hosil qilish xususiyatlari bilan belgilanadi [2, 3]. Bu ko‘ rsatkichlar ekstraksiya usuliga kuchli bog‘ liq: Tan va boshq. sharhiga ko‘ ra, ishqoriy ekstraktlar odatda funksional ingrediyent sifatida unchalik mos emas, emulsiyalash bo‘ yicha esa turli ishlarda qarama-qarshi natijalar olingan, shu sababli funksional xususiyatlarni o‘ lchashda yagona tizimli yondashuv zarur [2]. Cho‘ ktirish pH i emulsiya barqarorligiga ta’sir qiladi [13]. Ketma-ket izoelektrik cho‘ ktirishda olingan izolyatlar oqsil va fenol miqdori, molekulyar massa taqsimoti, eruvchanlik, suv va yog‘ ni bog‘ lash, emulsiyalash hamda ko‘ pik hosil qilish xususiyatlari bilan farqlangan [1]. Membrana bilan tozalash oqsil miqdorini oshirib, ko‘ pik barqarorligi va yuza plyonkalar mustahkamligini yaxshilagan [1]. Ishlov davomida oqsil konformatsiyasi va eruvchanligi o‘ zgarishi mumkinligi sababli [1] quritish rejimi ham alohida optimallashtirilishi lozim. Funksional xususiyatlar mahsulot muhitiga (pH, tuz, harorat) bog‘ liq bo‘ lgani uchun ularni faqat suvli tizimda emas, qo‘ llanish sharoitiga yaqin muhitda ham baholash maqsadga muvofiq.

7. SIFAT KO‘ RSATKICHLARI VA BAHOLASH USULLARI

O‘ zbekistonda yetishtirilgan rapsdan olingan shrot va undan ajratilgan oqsil konsentratini baholashda uch guruh ko‘ rsatkichni aniqlash tavsiya etiladi: asosiy tarkib; xavfsizlik va ozuqaviy qiymat; funksional xususiyatlar (3-jadval). Har bir namunaga nav, o‘ stirilgan hudud, hosil yili va moy olish usuli ko‘ rsatilishi kerak, chunki ular natijaga bevosita ta’sir

qiladi [1]. Tajribalar kamida uch marta takrorlanib, natijalar o‘ rtacha qiymat va standart og‘ ish bilan beriladi. Ajratish samaradorligi quyidagi formulalar bilan baholanadi:

$$Y = (m_1 / m_0) \times 100\ \%, \qquad R = (m_1 \times P_1) / (m_0 \times P_0) \times 100\ \%,$$

bu yerda Y — oqsil mahsuloti chiqimi, %; R — oqsilning qayta tiklanish darajasi, %; m_0 — boshlang‘ ich shrot massasi, g; m_1 — olingan quruq oqsil mahsuloti massasi, g; P_0 va P_1 — mos ravishda shrot va mahsulotdagi oqsil ulushi.

3-jadval. Raps shroti va oqsil konsentratining tavsiya etiladigan sifat ko‘ rsatkichlari

Guruh	Ko‘ rsatkich	Aniqlash usuli (standart)
Asosiy tarkib	Namlik, %	Quritish usuli (ISO 6496)
	Xom oqsil, % (konversiya koeffitsienti ko‘ rsatiladi)	Kjeldal usuli (ISO 5983-2) yoki Dumas
	Yog‘ , %	Ekstraksiya usuli (ISO 6492)
	Kul, %	Kullash usuli (ISO 5984)
	Xom kletchatka, %	Standart usul (ISO 6865)
Xavfsizlik	Glyukozinolatlar, μmol/g	HPLC (ISO 9167-1)
	Fitin kislotasi, %	HPLC yoki kolorimetrik usul
	Fenol birikmalari (sinapin)	HPLC yoki spektrofotometrik usul
Funksional	Eruvchanlik, % (turli pH da)	Eruvchan oqsilni aniqlash (Kjeldal/Louri)
	SUQ va YUQ, g/g	Suv va yog‘ ni bog‘ lash (sentrifugalash)
	Emulsiyalash qobiliyati va barqarorligi	Emulsiya hosil qilish va vaqt bo‘ yicha saqlanish
	Ko‘ pik hosil qilish qobiliyati va barqarorligi, %	Ko‘ pik hajmini o‘ lchash

8. OZIQ-OVQATDA QO‘ LLASH IMKONIYATLARI

Raps oqsil konsentrati oziq-ovqat mahsulotlarining oqsil miqdorini oshirish uchun non va un-qandolat mahsulotlarida, go‘ shtli va kolbasa mahsulotlarida (bog‘ lovchi va emulgator sifatida), souslar va emulsiya turidagi mahsulotlarda, o‘ simlik asosidagi sut o‘ rnini bosuvchi mahsulotlarda hamda sport va parhez oziq-ovqatlarida qo‘ llanilishi mumkin. Bu yo‘ nalishlar konsentratning funksional xususiyatlariga asoslangan taxminiy yo‘ nalishlar bo‘ lib, retsepturani organoleptik va fizik-kimyoviy tahlil asosida ishlab chiqish zarur, chunki konsentrat ulushi ortganda achchiq yoki begona ta’m va tekstura o‘ zgarishi kuzatilishi mumkin [1]. Sharhlarda ta’kidlanishicha, oziq-ovqat uchun mo‘ ljallangan oqsil rang, ta’m, antioziqaviy moddalar va funksionallik bo‘ yicha qat’iy nazoratni talab qiladi, em-xashak va fermentatsiya uchun esa murakkabroq tarkibli fraksiyalar ham yetarli [1]. O‘ zbekistonda raps shroti importi ortayotganini [5] hisobga olsak, mahalliy xomashyo asosida oqsil bilan boyitilgan fraksiyalar (po‘ stni ajratish va elash orqali) olish import bog‘ liqligini kamaytirish nuqtayi nazaridan istiqbolli yo‘ nalish bo‘ lishi mumkin.

9. NATIJALAR VA MUHOKAMA

Tahlil shuni ko‘ rsatadiki, raps shrotining sifati va undan oqsil ajratish samaradorligi eng avvalo moy olish usuli bilan belgilanadi: sovuq siqilgan shrotdan oqsil ajratish ancha oson, kuchli qizdirilgan va erituvchi bilan ekstraksiyalangan shrotdan esa qiyin [1, 9]. Ikkinchidan, ishqoriy ekstraksiya va izoelektrik cho‘ ktirish keng o‘ rganilgan bo‘ lsa-da, natijalar xomashyo va sharoitga qarab keng oraliqda o‘ zgaradi, eng yuqori chiqim esa eng yaxshi funksional xususiyatlarni kafolatlamaydi [13]. Uchinchidan, konsentratning oziq-ovqat sifatidagi yaroqliligi glyukozinolatlar, fitin kislotasi va fenol birikmalari miqdori bilan chambarchas bog‘ liq.

Aniqlangan bo‘ shliq shundaki, O‘ zbekiston sharoitida yetishtirilgan raps navlarining shrotini tarkib, antioziqaviy moddalar va funksional xususiyatlar bo‘ yicha taqqoslovchi ma’lumotlar yetarli emas. 3-jadvalda keltirilgan ko‘ rsatkichlar majmuasi bo‘ yicha mahalliy namunalarni tizimli o‘ rganish, ularni yuqorida keltirilgan xorijiy ma’lumotlar bilan solishtirish va ekstraksiya parametrlarini (pH 8–12, harorat 30–50 °C, vaqt 30–90 min, xomashyo:suv 1:10–1:20, cho‘ ktirish pH 3,5–5,5) ko‘ p omilli tajriba rejalashtirish asosida optimallashtirish keyingi tadqiqotlarning asosiy yo‘ nalishi bo‘ lishi mumkin.

XULOSA

- Raps shrotidagi oqsil miqdori taxminan 35–40 % bo‘ lib, moy olish usuliga qarab o‘ zgaradi; erituvchi bilan ekstraksiyalangan shrotda oqsil nisbatan yuqori, lekin undan oqsil ajratish qiyinroq.
- Antioziqaviy moddalar (glyukozinolatlar, fitin kislotasi, fenollar, kletchatka) oziq-ovqat maqsadidagi qo‘ llanishni cheklaydi va texnologiyada alohida hisobga olinishi zarur.

• Ishqoriy ekstraksiya va izoelektrik cho‘ ktirish eng ko‘ p o‘ rganilgan usul; optimal sharoitni oqsil chiqimi, tozaligi, funksional xususiyatlari va xavfsizligi majmui bo‘ yicha tanlash kerak.

• O‘ zbekistonda yetishtirilgan rapsdan olingan shrotni baholash uchun 3-jadvalda keltirilgan ko‘ rsatkichlar majmuasi tavsiya etiladi; mahalliy namunalar bo‘ yicha eksperimental ma’lumotlar to‘ plash keyingi bosqich vazifasidir.

Abstract: *Zeolite molecular sieves are widely used for deep dehydration of natural gas because of their high affinity for water, well-defined micropore structure and ability to achieve very low outlet water concentrations. During long-term cyclic operation, however, the adsorbent gradually loses performance as a result of hydrothermal aging, carbonaceous deposits, adsorption of methanol and heavier hydrocarbons, pore blockage, binder deterioration and mechanical attrition. Complete replacement of the molecular sieve bed produces a significant solid-waste stream even though a substantial part of the spent material may retain crystalline structure and recoverable adsorption capacity. This review and technological assessment summarizes recent data on the deactivation and regeneration of 3A, 4A, 5A and 13X molecular sieves used in gas dehydration and proposes an integrated reprocessing route. The proposed route includes feed identification and segregation, removal of fines, analytical diagnosis, low-temperature drying, thermal desorption, controlled oxidative removal of carbonaceous residues when justified, cooling under dry gas, grading, water-adsorption testing and mechanical quality control. Depending on the recovered performance, regenerated material may be returned to dehydration service, redirected to less demanding adsorption duties, or converted into an aluminosilicate secondary raw material. The article is literature-based and does not report original plant trials; therefore, the temperature windows and acceptance criteria are presented as screening ranges that must be validated for the exact commercial zeolite, binder and contamination profile.*

Keywords: *natural gas dehydration; molecular sieve; zeolite; spent adsorbent; regeneration; reprocessing; thermal treatment; coke removal; circular economy.*

GAZNI QURITISHDA ISHLATILGAN ISHLATILGAN SEOLITLARNI QAYTA ISHLASH TEXNOLOGIYASINI ISHLAB CHIQISH: SHARH VA TEXNOLOGIK BAHOLASH

Annotatsiya: *Seolit molekulyar elaklar suvga yuqori moyilligi, aniq shakllangan mikrog‘ ovak tuzilishi va chiqish oqimidagi suv konsentratsiyasini juda past darajagacha kamaytirish imkoniyati tufayli tabiiy gazni chuqur quritishda keng qo‘ llaniladi. Biroq uzoq muddatli siklik ishlash jarayonida adsorbent gidrotermik qarish, uglerodli cho‘ kindilar hosil bo‘ lishi, metanol va og‘ ir uglevodorodlarning adsorbsiyalanishi, g‘ ovaklarning tiqilib qolishi, bog‘ lovchi moddaning yemirilishi hamda mexanik ishqalanish natijasida o‘ z samaradorligini asta-sekin yo‘ qotadi. Molekulyar elak qatlamini to‘ liq almashtirish katta miqdorda qattiq chiqindi hosil qiladi, holbuki ishlatilgan materialning muayyan qismi kristall tuzilishini saqlab qolishi va qayta tiklanishi mumkin bo‘ lgan adsorbsion sig‘ imga ega bo‘ lishi mumkin. Mazkur sharh va texnologik baholashda gazni quritishda qo‘ llaniladigan 3A, 4A, 5A va 13X molekulyar elaklarning faolsizlanishi va regeneratsiyasi bo‘ yicha so‘ nggi ma’lumotlar umumlashtirilgan hamda kompleks qayta ishlash texnologiyasi taklif etilgan. Taklif etilayotgan texnologiya xomashyoni aniqlash va saralash, mayda zarrachalarni olib tashlash, analitik diagnostika, past haroratda quritish, termik desorbsiya, zarur hollarda uglerodli qoldiqlarni nazorat ostida oksidlovchi usulda olib tashlash, quruq gaz muhitida sovitish, fraksiyalash, suvni adsorbsiyalash qobiliyatini sinash va mexanik sifat nazoratini o‘ z ichiga oladi. Qayta tiklangan materialning xususiyatlariga qarab, regeneratsiyalangan seolit quritish jarayoniga qaytarilishi, talablari nisbatan past bo‘ lgan adsorbsion jarayonlarga yo‘ naltirilishi yoki alumosilikat ikkilamchi xomashyoga aylantirilishi mumkin. Maqola adabiyotlar sharhi asosida tayyorlangan bo‘ lib, unda sanoat qurilmasidagi original sinovlar natijalari keltirilmagan. РАЗРАБОТКА ТЕХНОЛОГИИ ПЕРЕРАБОТКИ ОТРАБОТАННЫХ ЦЕОЛИТОВ, ИСПОЛЬЗУЕМЫХ ДЛЯ ОСУШКИ ГАЗА: ОБЗОР И ТЕХНОЛОГИЧЕСКАЯ ОЦЕНКА

Аннотация: *Цеолитовые молекулярные сита широко применяются для глубокой осушки природного газа благодаря их высокой сродству к воде, хорошо сформированной микропористой структуре и способности обеспечивать очень низкую концентрацию воды на выходе. Однако при длительной циклической эксплуатации адсорбент постепенно теряет свои эксплуатационные характеристики вследствие гидротермического старения, образования углеродистых отложений, адсорбции метанола и тяжёлых углеводородов, блокировки пор, разрушения связующего и механического истирания. Полная замена слоя молекулярного сита приводит к образованию значительного потока твёрдых отходов, несмотря на то, что существенная часть отработанного материала может сохранять кристаллическую структуру и восстанавливаемую адсорбционную способность. В настоящем обзоре и технологической оценке обобщены современные данные о дезактивации и регенерации молекулярных сит 3A, 4A, 5A и 13X, применяемых для осушки газа, и предложен интегрированный маршрут переработки. Предлагаемый маршрут включает идентификацию и сортировку исходного материала, удаление мелких частиц, аналитическую диагностику, низкотемпературную сушку, термическую десорбцию, контролируемое окислительное удаление углеродистых остатков в обоснованных случаях, охлаждение в среде сухого газа, классификацию по фракциям, испытание водоадсорбционной способности и механический контроль качества. В зависимости от восстановленных эксплуатационных характеристик регенерированный материал может быть возвращён в процесс осушки, направлен на менее требовательные адсорбционные процессы или преобразован во вторичное алюмосиликатное сырьё. Статья основана на анализе литературных данных и не содержит результатов оригинальных промышленных испытаний; поэтому температурные диапазоны и критерии приемки представлены как предварительные диапазоны для скрининговой оценки, которые должны быть подтверждены для конкретного коммерческого цеолита, связующего и профиля загрязнений.*

Ключевые слова: *осушка природного газа; молекулярное сито; цеолит; отработанный адсорбент; регенерация; переработка; термическая обработка; удаление кокса; циркулярная экономика.*

Highlights

- Spent gas-dehydration molecular sieves should be diagnosed before regeneration because deactivation mechanisms are not identical.
- Methanol and hydrocarbon contamination can produce persistent carbonaceous residues and substantial water-capacity loss.
- Excessively severe regeneration can accelerate structural aging; temperature must therefore be optimized rather than maximized.
- A staged reprocessing scheme combining desorption, controlled decoking and post-treatment qualification is proposed.
- Recovered adsorbent should be routed according to measured adsorption capacity and mechanical integrity, not visual appearance alone.

1. Introduction

Removal of water vapor is a critical step in natural-gas processing. Water promotes corrosion in the presence of acid gases, contributes to gas-hydrate formation at high pressure and low temperature, and can freeze or interfere with cryogenic and downstream separation equipment. Solid-desiccant dehydration is especially important when very low water concentrations or low dew points are required. Among commercial solid desiccants, zeolite molecular sieves are distinguished by strong water affinity, selective micropores and high thermal stability, and LTA-type molecular sieves such as 3A and 4A are widely used in gas-processing service [1-4].

Industrial molecular-sieve beds are operated cyclically, usually by temperature-swing adsorption (TSA). One bed adsorbs water while another is regenerated with heated gas and then cooled before returning to adsorption duty. In an ideal cycle only reversibly adsorbed water is removed. In real plants, however, the sieve is exposed to repeated heating and cooling, contaminants in the gas stream, upstream carryover and mechanical stresses. These factors may progressively reduce water uptake and shorten breakthrough time. Recent studies show that adsorbent aging is not a minor secondary issue but a defining factor in dehydration-unit performance [4,5].

A common operational response is complete replacement of the adsorbent bed. This approach restores drying capacity but transfers the problem to waste management and increases replacement cost. The central assumption of the present article is different: spent molecular sieve should first be treated as a potentially recoverable process material. The key question is not whether every spent pellet can be returned to its original duty, but which fraction can be regenerated safely, how much capacity can be restored, and what secondary use is technically justified for the remaining fraction. This requires a diagnostic and decision-based reprocessing technology rather than a single universal heating procedure.

The objective of this work is to analyze the main mechanisms responsible for degradation of zeolites used in gas dehydration, compare available regeneration approaches, and formulate an integrated technology for reprocessing spent molecular sieves. The article follows the format of a review and conceptual technological assessment. No original industrial performance data are reported; proposed operating windows must therefore be confirmed experimentally before scale-up.

2. Methodology of the Review and Technological Assessment

The assessment was developed from recent peer-reviewed literature on natural-gas dehydration, molecular-sieve aging, contaminant exposure, thermal cycling and regeneration of deactivated zeolites. Particular attention was given to industrial LTA and FAU materials and to studies published from 2018 to 2026. Earlier references were used only where they provide basic engineering context. The evaluation criteria were: (i) ability to remove reversibly adsorbed water; (ii) ability to remove organic or carbonaceous deposits; (iii) preservation of zeolite crystallinity and pore structure; (iv) mechanical integrity of shaped pellets; (v) energy and gas demand; (vi) process safety and controllability; and (vii) feasibility of subsequent reuse or material recovery.

The literature demonstrates that the same spent molecular sieve can contain several forms of deactivation simultaneously. For this reason, regeneration technologies were not ranked by maximum temperature alone. Instead, the proposed process uses diagnosis to select the minimum treatment severity necessary to remove the dominant contaminant while limiting additional thermal or hydrothermal damage.

3. Zeolites Used in Gas Dehydration and Their Deactivation

3.1. Functional role of molecular sieves

Zeolites are crystalline aluminosilicates containing molecular-scale pores and exchangeable cations. Their hydrophilicity originates from framework aluminum and associated charge-compensating cations, which create strong electrostatic interactions with water. Commercial gas-dehydration products are generally shaped as beads or extrudates and may contain approximately 10-20 wt.% binder, depending on product formulation. LTA zeolites are widely used for water removal, while 13X (FAU topology) can offer higher pore volume but also admits larger molecules. Molecular-sieve selection therefore reflects both the target water specification and the risk of co-adsorbing hydrocarbons or other contaminants [1,6].

3.2. Major deactivation mechanisms

Spent adsorbent performance is controlled by a combination of reversible loading and irreversible or partly irreversible aging. The most important mechanisms are summarized in Table 1. Reversible water loading should be removed during normal regeneration. More persistent capacity loss is associated with carbonaceous residues, pore blockage, chemical contamination, structural changes and attrition. A 2022 study of 4A, 5A and 13X molecular sieves exposed to methanol and heptane showed that methanol could cause particularly severe loss of water-vapor adsorption capacity; water uptake in methanol-exposed samples was about 50% below that of fresh zeolites, with nonvolatile residual hydrocarbons identified as an important cause [2].

Hydrocarbon exposure is also important. Accelerated aging experiments simulating TSA operation found n-heptane to be a major factor promoting zeolite aging under the tested conditions [3]. In addition, repeated temperature cycling can itself alter adsorbent performance. Jacobs et al. reported that long-term cycling degradation depended strongly on regeneration temperature. For 13X, capacity loss after 5,000 cycles increased as the tested regeneration temperature rose, whereas 4A was considerably more stable under the same high-temperature cycling experiment [4]. The result does not imply that one universal temperature is optimal; it shows that regeneration severity must be matched to material type and service history.

Table 1. Main causes of spent molecular-sieve deactivation in gas dehydration.

Deactivation mechanism	Typical origin	Diagnostic indicators	Reprocessing implication
Residual water loading	Incomplete normal regeneration, poor heat distribution	High mass loss at low/intermediate temperature; low initial capacity	Dry-gas thermal desorption may be sufficient
Hydrocarbon / methanol-derived deposits	Feed carryover, methanol injection, condensable hydrocarbons	CHNS/TGA carbon signal; darkening; reduced micropore uptake	May require controlled oxidative decoking after inert desorption
Pore blockage by oil or heavy organics	Compressor oil, glycol, condensate, heavy hydrocarbon carryover	High extractables; FTIR organic bands; low BET/micropore volume	Pre-cleaning or staged thermal treatment; severe cases may be rejected

Hydrothermal / thermal aging	Repeated TSA cycles, excessive regeneration severity	Reduced crystallinity or altered adsorption kinetics	Avoid unnecessary high temperature; verify XRD and water capacity
Binder damage and attrition	Thermal stress, pressure drop, handling	Fines generation, reduced crush strength	Screen out fines; mechanically weak pellets should not return to primary bed
Inorganic contamination	Corrosion products, salts, particulates	XRF/SEM-EDS changes; ash increase	Physical separation or secondary use may be more rational than reactivation

4. Current Approaches to Regeneration and Reprocessing

4.1. Thermal desorption with dry gas

Thermal desorption is the basic regeneration mechanism for water-loaded molecular sieves. Heating lowers the equilibrium loading and releases strongly adsorbed water, while a dry purge removes desorbed vapor from the bed. Published engineering literature commonly places complete water desorption from zeolites in a high-temperature range, and cyclic industrial practice typically uses a controlled heating, soak and cooling sequence rather than abrupt heating [1,2]. For spent adsorbent reprocessing, however, the purpose differs from routine bed regeneration: the goal is to recover capacity without adding new thermal damage. Therefore, a screening program should begin with the mildest temperature capable of removing water and volatile contaminants.

4.2. Controlled thermal oxidation for carbonaceous deposits

When TGA, CHNS, FTIR or other analyses confirm persistent organic or carbonaceous residues, inert thermal desorption alone may not restore micropore accessibility. Controlled oxidation can remove coke-like deposits, but the treatment window must remain below the temperature at which the zeolite framework or binder loses integrity. A 2025 study of 3A molecular sieves removed from a gas refinery after four years of service found that heating could regenerate deactivated material and that the zeolite structure remained essentially unchanged up to approximately 550 degrees C; significant structural change occurred at higher temperatures. Even after regeneration in the investigated 400-550 degrees C range, water capacity remained about 40% lower than fresh material, showing that decoking can recover performance without necessarily restoring the virgin state [7].

For aged industrial 4A molecular sieves, a 2025 study also reported improvement of dehydration capacity after heat treatment under oxygen-enriched air [8]. These results support a controlled oxidative step for selected spent batches, but they do not justify direct air calcination at the maximum temperature. Local hot spots, exothermic coke combustion and binder sensitivity must be considered. A practical technology should therefore use staged oxygen introduction and temperature monitoring after the volatile fraction has first been removed under inert or low-oxygen conditions.

4.3. Chemical washing and solvent extraction

Chemical or solvent washing can in principle remove oils, glycols, salts or other surface contaminants. Nevertheless, zeolite molecular sieves are ion-exchange materials, and aggressive acids, bases or high-water washing conditions can alter cation form, framework aluminum, binder properties and pellet strength. Chemical washing should therefore not be treated as a universal first step. It is most defensible when the contaminant has been identified and a compatibility test confirms that the washing agent does not reduce crystallinity, water capacity or mechanical strength. For hydrocarbon-dominated contamination, thermal separation is generally simpler to integrate with gas-plant practice.

4.4. Mechanical classification and secondary material routes

A meaningful fraction of removed molecular sieve may be physically damaged rather than chemically exhausted. Fines and broken pellets increase pressure drop and are unsuitable for return to a primary dehydration vessel, even if their intrinsic adsorption capacity remains high. Screening should therefore be an explicit reprocessing stage. Material that fails mechanical acceptance but retains aluminosilicate structure can be evaluated for less demanding adsorptive duties or as an aluminosilicate feedstock. General spent-adsorbent literature emphasizes a hierarchy of regeneration for reuse, secondary functional use and, only when necessary, safe disposal [9].

Table 2. Comparative assessment of regeneration options for spent gas-dehydration zeolites.

Method	Best-suited contamination	Main benefit	Main limitation / risk	Recommended role
Dry-gas thermal desorption	Water and volatile organics	Simple, compatible with TSA practice	May not remove coke-like residues	First regeneration stage

Controlled oxidative thermal treatment	Coke / persistent carbonaceous deposits	Restores blocked pore volume	Exotherm, framework and binder damage at excessive severity	Conditional second stage after diagnosis
Solvent washing	Oil, glycol or selected organics	Targets extractable contamination	Solvent recovery; possible pellet/binder effects	Case-specific pre-treatment
Acid/base washing	Selected inorganic contaminants	Can dissolve salts or deposits	May alter zeolite chemistry and ion-exchange state	Not a default route; use only after compatibility testing
Screening / air classification	Fines and broken pellets	Improves hydraulic/mechanical quality	Does not restore adsorption capacity	Mandatory physical conditioning
Material recovery / secondary use	Adsorbent that cannot meet primary-bed specification	Reduces disposal and preserves material value	Requires contaminant and application-specific qualification	Final route for non-primary-grade material

5. Proposed Integrated Technology for Reprocessing Spent Zeolite

The proposed technology is based on a decision tree rather than a fixed one-temperature treatment. Each batch is first identified by zeolite type, supplier or product grade, years of service, bed position and known process upsets. Mixing unknown 3A, 4A, 5A and 13X wastes before characterization should be avoided because pore size, cation form, binder and thermal behavior differ. The integrated sequence is shown in Figure 1.

Figure 1. Proposed integrated route for reprocessing spent zeolite molecular sieves from gas-dehydration service.

5.1. Stage 1 - receipt, segregation and safe conditioning

Spent adsorbent should be transferred in closed containers where practical and accompanied by process-history information. The first technical decision is whether the material has been exposed to hazardous compounds that would constrain reuse or thermal treatment. Representative samples are taken from each batch. Oversize foreign matter and excessive fines are removed by sieving. The mass fraction of fines is recorded because it is an indirect indicator of attrition and bed deterioration.

5.2. Stage 2 - diagnostic characterization

The minimum recommended diagnostic package is: moisture/volatile loss, TGA/DTG, XRD, FTIR, CHNS or total carbon, water adsorption capacity, particle-size distribution and crush-strength or attrition testing. BET or micropore analysis, XRF and SEM-EDS are added when available. Comparison with an unused reference sample from the same product grade is strongly preferred. This stage prevents two costly errors: over-treating material whose main problem is reversible loading, and attempting to regenerate material whose framework or mechanical integrity has already failed.

5.3. Stage 3 - low-temperature drying and inert desorption

A preliminary drying/desorption step should remove free moisture, weakly adsorbed water and volatile hydrocarbons before any oxidative treatment. For laboratory development, a staged screening range of approximately 105-150 degrees C for initial drying followed by 200-320 degrees C under dry inert or oxygen-lean purge can be evaluated. These values are not universal plant set points; they are a rational experimental window that brackets water desorption while remaining less severe than high-temperature decoking. Mass loss and off-gas composition should be monitored to determine whether volatile removal is complete.

5.4. Stage 4 - controlled decoking when required

If carbon analysis and TGA show a significant nonvolatile organic fraction after inert desorption, a controlled oxidative stage can be tested. A practical laboratory screening window is approximately 350-500 degrees C with gradual introduction of oxygen-containing gas and strict bed-temperature control. The upper limit must be material-specific. The

2025 study on spent 3A molecular sieve found structural preservation up to about 550 degrees C under its experimental conditions but deterioration at higher temperature [7]. Accordingly, 550 degrees C should be treated as an evidence-based caution boundary for that particular 3A material, not as a routine operating target for every zeolite.

5.5. Stage 5 - cooling, grading and qualification

After regeneration, the adsorbent should be cooled under dry gas to prevent immediate readsorption of atmospheric moisture. The regenerated material is then screened again to remove newly generated fines and subjected to water-capacity and mechanical testing. The decisive parameter is not color change but restored function. For process development, a restoration coefficient can be defined as Kq = qreg/qfresh x 100%, where qreg is the equilibrium or standardized dynamic water capacity of the regenerated sample and qfresh is the corresponding value for fresh product. A mechanical retention coefficient can similarly be defined from crush strength or attrition data. Acceptance limits must be set by the plant, equipment design and product specification.

Table 3. Suggested laboratory screening matrix for technology development (not universal operating specifications).

Stage	Purpose	Variables to screen	Primary control	Decision
Feed characterization	Identify deactivation mechanism	Bed position, service time, contaminant history	XRD, FTIR, TGA/DTG, CHNS, water capacity, crush strength	Select treatment route
Initial drying	Remove free/weakly bound moisture	Approx. 105-150 degrees C; time; purge flow	Mass loss, outlet humidity	Proceed when moisture stabilizes
Thermal desorption	Remove strongly adsorbed water/volatiles	Approx. 200-320 degrees C; heating rate; purge gas	TGA correlation, off-gas, water capacity	Stop if capacity is adequately restored
Controlled oxidation	Remove persistent carbonaceous deposits	Approx. 350-500 degrees C; oxygen concentration; residence time	Bed temperature, CO/CO2, residual carbon, XRD	Optimize minimum severity
Cooling	Prevent readsorption and thermal shock	Dry-gas cooling rate	Outlet temperature/dew point	Ready for testing
Qualification	Determine reuse route	Capacity, kinetics, crush strength, attrition, fines	Kq and mechanical retention	Primary reuse / secondary use / reject

6. Qualification Criteria and Reuse Strategy

A regenerated batch should not automatically return to the original dryer. Qualification should compare fresh, spent and regenerated samples using the same protocol. At minimum, the comparison should include equilibrium or standardized water uptake, dynamic breakthrough behavior, adsorption/desorption kinetics and mechanical integrity. XRD alone is insufficient: a sample can remain crystalline while losing meaningful water capacity because of pore blockage or binder-related effects [2].

For pilot development, the following routing concept is recommended. Material that recovers close to fresh adsorption performance and passes mechanical tests can be considered for blending trials or controlled return to dehydration service. Material with moderate capacity recovery but acceptable strength can be tested in less demanding pre-drying or guard-bed service. Material that is structurally intact but mechanically unsuitable may be ground and evaluated as a secondary aluminosilicate adsorbent or raw material, subject to contaminant assessment. Material with hazardous contamination, irreversible structural collapse or unacceptable leaching behavior should be directed to regulated disposal. Numerical acceptance thresholds should be established from plant specifications and pilot data rather than copied generically between facilities.

Table 4. Decision matrix for regenerated zeolite routing.

Measured condition after treatment	Interpretation	Preferred route
High water-capacity recovery + acceptable kinetics + acceptable strength	Functional adsorbent largely restored	Pilot return to gas-dehydration service or blending with fresh sieve
Moderate capacity recovery + good mechanical integrity	Adsorbent still functional but may not meet deep-drying duty	Secondary drying, guard-bed or less stringent adsorption service

Low adsorption recovery + retained aluminosilicate structure	Micropore function substantially impaired	Material recovery / alternative adsorbent or mineral raw-material research
Severe framework loss, high attrition or hazardous contamination	Regeneration is technically or environmentally unjustified	Controlled disposal according to waste classification

7. Mechanistic Basis of the Proposed Technology

The logic of the process can be understood by separating reversible adsorption from irreversible obstruction. Water molecules are strongly attracted to zeolite cations and framework oxygen; heat and a dry purge shift the adsorption equilibrium and remove them. Hydrocarbon-derived deposits behave differently. They may occupy pore volume, cover adsorption sites or create diffusion barriers. The molecular-simulation analysis reported for deactivated 3A material showed that coke in zeolite cavities reduces the interaction energy between water and the zeolite, consistent with lower water uptake [7]. Removing the deposit can therefore restore part of the effective adsorption volume.

At the same time, regeneration itself can become a source of degradation. Long-term cycling data show a temperature-dependent loss of adsorption capacity, particularly for 13X under severe repeated thermal treatment [4]. A separate 2023 study examining CO2 and water effects over many cycles also demonstrated that process-fluid composition can influence degradation behavior [10]. Thus, the correct engineering objective is not maximum coke burnoff at maximum temperature; it is maximum useful capacity recovery at the lowest severity that preserves structure and mechanical strength.

8. Environmental and Techno-Economic Considerations

Reprocessing can reduce the volume of solid adsorbent sent to disposal and can defer purchase of replacement molecular sieve. The benefit, however, depends on energy consumption, purge-gas demand, off-gas treatment, yield of mechanically acceptable product and the number of additional service cycles obtained. A proper techno-economic study should therefore report at least: mass yield of reusable pellets, restored water capacity, regeneration energy per kilogram of accepted product, purge-gas consumption, off-gas treatment requirement, fraction routed to secondary use, and avoided disposal and replacement cost.

Environmental assessment must also consider the fate of removed contaminants. Oxidative decoking converts organic residues to gaseous products and may generate CO, CO2 and volatile compounds that require controlled exhaust handling. Solvent washing transfers contaminants to a liquid waste stream and therefore should only be used when solvent recovery and wastewater management are justified. The circular economy advantage of regeneration is real only when the secondary emissions and residues are included in the system boundary [9].

9. Research Gaps and Experimental Program

The principal research gap is the limited amount of public data on spent molecular sieves removed from real gas-processing plants. Aging is strongly dependent on gas composition, upstream separation quality, methanol or glycol carryover, regeneration history, bed temperature profile and adsorbent formulation. Recent work on industrial 4A samples taken from different levels of a dehydration column shows the value of spatially resolved sampling because residual properties can vary with bed position [8].

A defensible experimental program should therefore compare samples from the top, middle and bottom of the actual industrial bed. The recommended sequence is: (i) baseline characterization of fresh and spent zeolite; (ii) mild thermal-desorption screening; (iii) controlled oxidative regeneration only for samples with persistent carbonaceous residues; (iv) optimization by water-capacity recovery and mechanical retention, not by carbon removal alone; (v) repeated adsorption-regeneration cycles on the recovered adsorbent; (vi) dynamic breakthrough testing with representative wet gas; and (vii) pilot-scale pressure-drop and attrition evaluation. This would convert the present conceptual route into an original research article with plant-specific performance and economic data.

10. Conclusion

Spent zeolite molecular sieves from gas-dehydration units should not automatically be considered irrecoverable waste. Recent literature shows that the dominant causes of performance loss include methanol- and hydrocarbon-derived deposits, coking, repeated thermal cycling, pore blockage, binder deterioration and mechanical attrition. At the same time, published regeneration studies demonstrate that controlled heat treatment can recover part of the dehydration capacity of aged 3A and 4A molecular sieves. The critical limitation is that severe heating can also accelerate irreversible degradation, and complete restoration to fresh-sieve performance is not guaranteed.

The most rational reprocessing technology is therefore a staged diagnostic route: segregation and screening; physicochemical diagnosis; mild drying and inert desorption; controlled oxidative decoking only when justified; dry-gas cooling; mechanical classification; and performance qualification. Reuse decisions should be based on measured water

adsorption, breakthrough behavior and mechanical strength. This approach can create three value streams - regenerated adsorbent for primary service, lower-grade adsorbent for secondary service, and aluminosilicate material for further recovery - while minimizing the fraction that requires disposal. Plant-specific laboratory and pilot validation remains essential before industrial implementation.

OQOVA SUVLARNI SIMOB(II) IONLARIDAN TOZALASHDA EPIXLORGIDRIN ASOSIDAGI POLIFUNKSIONAL SORBENTNING EKOLOGIK SAMARADORLIGINI BAHOLASH

Allanov Abdigaffor Berdiyorovich
Qarshi davlat universiteti doktoranti, Qarshi shahri, O‘ zbekiston Respublikasi
Nurqulov Fayzulla Nurmuminovich
texnika fanlari doktori, professor, bo‘ lim mudiri, Toshkent kimyo texnologiya ilmiy-tadqiqot instituti, Toshkent shahri, O‘ zbekiston Respublikasi.

Annotatsiya. *Mazkur tadqiqotda oqova suvlarni Hg(II) ionlaridan tozalash uchun epixlorgidrin asosida modifikatsiyalangan kraxmal karbamat polifunksional sorbentining olinishi, strukturaviy xususiyatlari va ekologik samaradorligi baholandi. Kraxmal karbamid bilan funksionallashtirilib, keyinchalik epixlorgidrin yordamida modifikatsiyalandi. Reaksiya davomiyligining mahsulot unumiga ta’siri o‘ rganilib, 3,0 soatda maksimal 83,2 % unum qayd etildi. Sorbentning strukturaviy o‘ zgarishlari IQ-spektroskopiya yordamida tahlil qilinib, C=O, C–N/C–O va C–O–C guruhlariga xos yutilish sohalaridagi siljishlar polimer matritsaning kimyoviy muhitida o‘ zgarish sodir bo‘ lganini ko‘ rsatdi. Termik barqarorlik TGA–DTA usulida baholanib, materialning ko‘ p bosqichli termik parchalanish xususiyati aniqlandi. Hg(II) ionlarini ajratish samaradorligi kolonka sharoitida tekshirildi. KrK–EXG (1:3) sorbenti boshlang‘ ich 1,615 ppb Hg^{2+} konsentratsiyasini 0,0742 ppb gacha kamaytirib, 95,4 % tozalash samaradorligini ta’minladi. Olingan natijalar mazkur sorbentning simob ionlarini saqlovchi oqova suvlarni chuqur tozalashda istiqbolli material ekanligini ko‘ rsatadi.*

Kalit so‘ zlar: *oqova suv, simob(II) ionlari, epixlorgidrin, kraxmal karbamat, polifunksional sorbent, sorbsiya, IQ-spektroskopiya, TGA–DTA, tozalash samaradorligi, ekologik samaradorlik.*

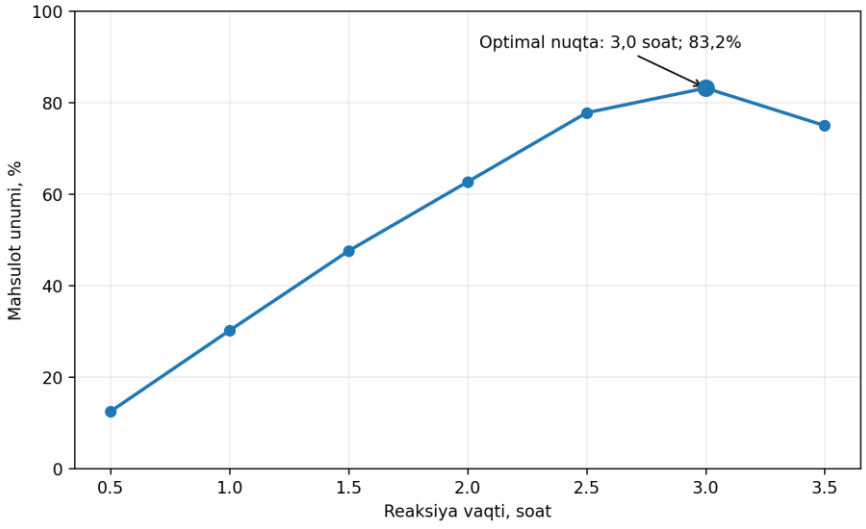
ОЦЕНКА ЭКОЛОГИЧЕСКОЙ ЭФФЕКТИВНОСТИ ПОЛИФУНКЦИОНАЛЬНОГО СОРБЕНТА НА ОСНОВЕ ЭПИХЛОРГИДРИНА ПРИ ОЧИСТКЕ СТОЧНЫХ ВОД ОТ ИОНОВ РТУТИ(II)

Аннотация. *В работе исследован модифицированный эпихлоргидрином полифункциональный сорбент на основе карбамата крахмала, предназначенный для удаления ионов Hg(II) из сточных вод. Крахмал предварительно функционализировали карбамидом, после чего осуществляли модификацию эпихлоргидрином. Установлено влияние продолжительности реакции на выход продукта; максимальный выход 83,2 % достигнут при продолжительности процесса 3,0 ч. Структурные изменения сорбента исследованы методом ИК-спектроскопии. Смещения полос поглощения, характерных для групп C=O, C–N/C–O и C–O–C, свидетельствуют об изменении химического окружения функциональных групп полимерной матрицы. Термическая устойчивость материала оценена методом TGA–DTA, выявившим многостадийный характер термической деструкции. Эффективность удаления ионов Hg(II) определена в колонных условиях. Наиболее высокий результат продемонстрировал сорбент KrK–EXG (1:3), снизивший концентрацию Hg^{2+} с 1,615 до 0,0742 ppb при эффективности очистки 95,4 %. Полученные результаты подтверждают перспективность разработанного сорбента для экологически эффективной очистки сточных вод от соединений ртути.*

Ключевые слова: *сточные воды, ионы ртути(II), эпихлоргидрин, карбамат крахмала, полифункциональный сорбент, сорбция, ИК-спектроскопия, TGA–DTA, эффективность очистки, экологическая эффективность.*

ASSESSMENT OF THE ENVIRONMENTAL EFFICIENCY OF AN EPICHLOROHYDRIN-BASED POLYFUNCTIONAL SORBENT FOR THE REMOVAL OF MERCURY(II) IONS FROM WASTEWATER

Abstract. *This study evaluates the structural properties and environmental performance of an epichlorohydrin-modified starch carbamate polyfunctional sorbent developed for the removal of Hg(II) ions from wastewater. Starch was initially functionalized with urea and subsequently modified with epichlorohydrin. The effect of reaction time on product yield was investigated, and the maximum yield of 83.2% was achieved after 3.0 h. Structural changes in the sorbent were characterized by FTIR spectroscopy. Shifts in the absorption bands assigned to C=O, C–N/C–O, and C–O–C groups indicated changes in the chemical environment of the polymer matrix after modification. Thermal stability was evaluated by TGA–DTA, revealing a multistage thermal degradation behavior. Hg(II) removal efficiency was examined under column conditions. Among the investigated compositions, the KrK–EXG (1:3) sorbent exhibited the highest performance, decreasing the Hg^{2+} concentration from 1.615 to 0.0742 ppb and achieving a removal efficiency of 95.4%. The*

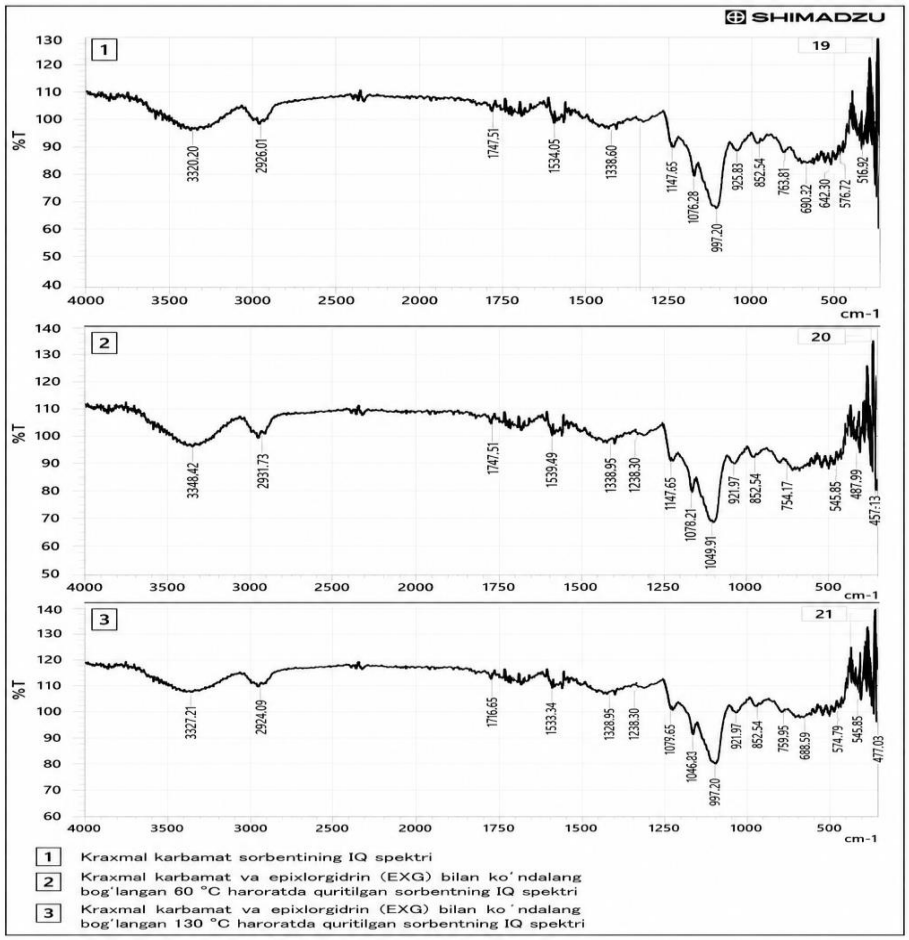


obtained results demonstrate the potential of the developed polyfunctional sorbent for environmentally efficient treatment of mercury-containing wastewater.

Keywords: *wastewater, mercury(II) ions, epichlorohydrin, starch carbamate, polyfunctional sorbent, sorption, FTIR spectroscopy, TGA-DTA, removal efficiency, environmental performance.*

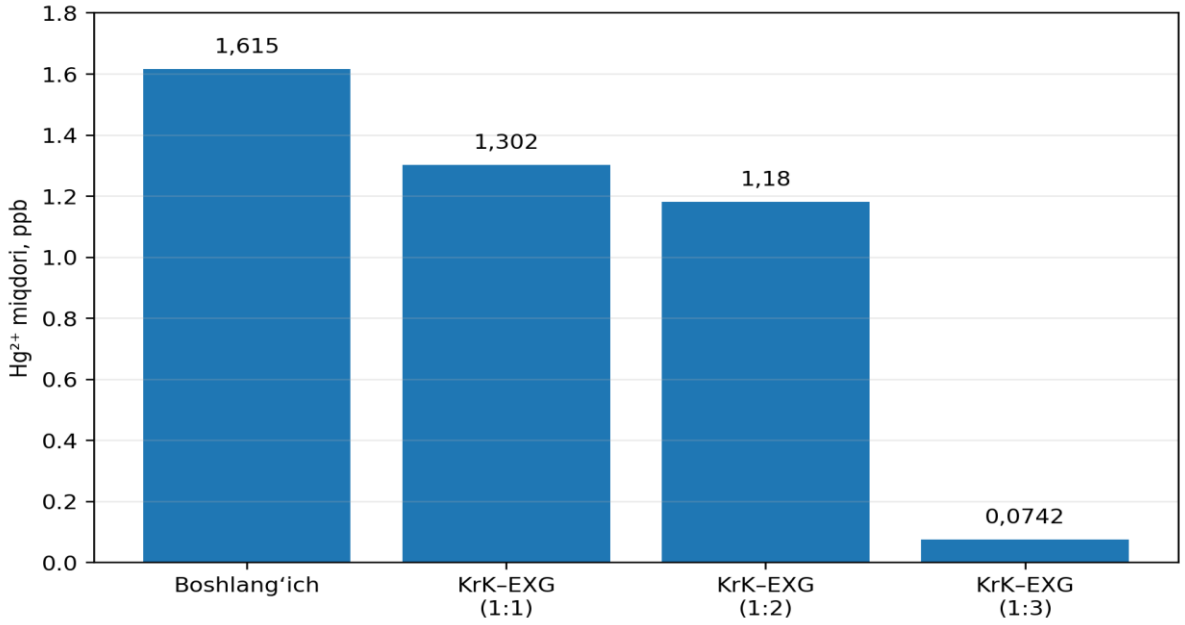
Kirish. Sanoat oqova suvlarida og‘ ir metallar, xususan simob ionlari konsentratsiyasini oshib borishi suv ekotizimlari barqarorligi va inson salomatligi uchun jiddiy ekologik xavf tug‘ diradi. Simob biologik muhitda saqlanib qolishi, oziq zanjirida to‘ planishi va yuqori toksikligi sababli ustuvor nazorat qilinadigan ifloslantiruvchilardan hisoblanadi [1,2]. Oqova suvlarni tozalashda adsorbsiya texnologiyalari soddaligi, energiya sarfining nisbatan pastligi va past konsentratsiyadagi metall ionlarini ajratish imkoniyati bilan istiqbolli yondashuvdir [3,4]. Qayta tiklanuvchi, biologik parchalanadigan va ko‘ p sonli gidroksil guruhlariga ega kraxmal ekologik xavfsiz sorbent matritsasi sifatida alohida ahamiyatga ega. Biroq tabiiy kraxmalning sorbsion faolligi va suv muhitidagi strukturaviy barqarorligi cheklangan bo‘ lib, uni funksionallashtirish va modifikatsiyalash talab etiladi [5, 6, 7]. Karbamid bilan modifikatsiya kraxmal tarkibiga azot saqlovchi faol markazlarni kiritish, epixlorgidrin esa uch o‘ lchamli, suvda erimaydigan polimer tarmog‘ ini shakllantirish imkonini beradi. Bunday yondashuv metall ionlari bilan koordinatsion va boshqa sirt o‘ zaro ta’sirlarini kuchaytirishi mumkin. So‘ nggi tadqiqotlarda kraxmal asosidagi adsorbentlar uchun real oqova suvlar, uzluksiz oqim sharoiti va tuzilish-xossa bog‘ liqligini birgalikda baholash yetarli emasligi qayd etilgan [8]. Bu esa tadqiqotning dolzarbligini oshiradi. Shu nuqtai nazardan, ushbu tadqiqotning maqsadi kraxmal karbamat–epixlorgidrin asosidagi polifunksional sorbentni sintez qilish, uning optimal modifikatsiya sharoitlarini aniqlash, IQ-spektroskopik va TGA-DTA xususiyatlarini tavsiflash hamda Hg^{2+} ionlari bilan ifloslangan texnologik oqova suvni tozalash samaradorligini ekologik mezonlar asosida baholashdan iborat.

Materiallar va metodlar. Kraxmal karbamat sintezi uchun 10 g kraxmal, 3 g karbamid va 0,21 g natriy asetat ishlatildi. Karbamid va katalizator 30 ml distillangan suvda eritilib, kraxmal bilan 40–50 °C da 1 soat aralashtirildi. Mahsulot filtrlandi, 102–105 °C da 4 soat termik ishlovdan o‘ tkazildi va suvda eruvchan qoldiqlarni chiqarish uchun 4–5 marta distillangan suv bilan yuvildi. Keyingi modifikatsiyada kraxmal karbamat epixlorgidrin bilan turli massa nisbatlarida (1:1, 1:2 va 1:3) ishlov berildi; namunaviy sintezda 5,0 g kraxmal karbamatga 2,5 g epixlorgidrin qo‘ shilib, sistema 60 °C da aralashtirildi va 130 °C da 2 soat termik ishlov berildi. Reaksiya davomiyligining unumga ta’siri 0,5–3,5 soat oralig‘ ida baholandi. Strukturaviy o‘ zgarishlar SHIMADZU IRAffinity-1S FTIR spektrometrida, termik barqarorlik TGA-DTA usulida o‘ rganildi. Hg^{2+} sorbsiyasi kolonka sharoitida tekshirilib, qoldiq simob ETsG-2A analizatorida aniqlandi. Har bir tajriba besh marta takrorlandi; tozalash samaradorligi $\eta=((C_0-C_e)/C_0)\times100\%$ formula bo‘ yicha hisoblandi. Natijalar o‘ rtacha qiymatlarda ifodalandi.



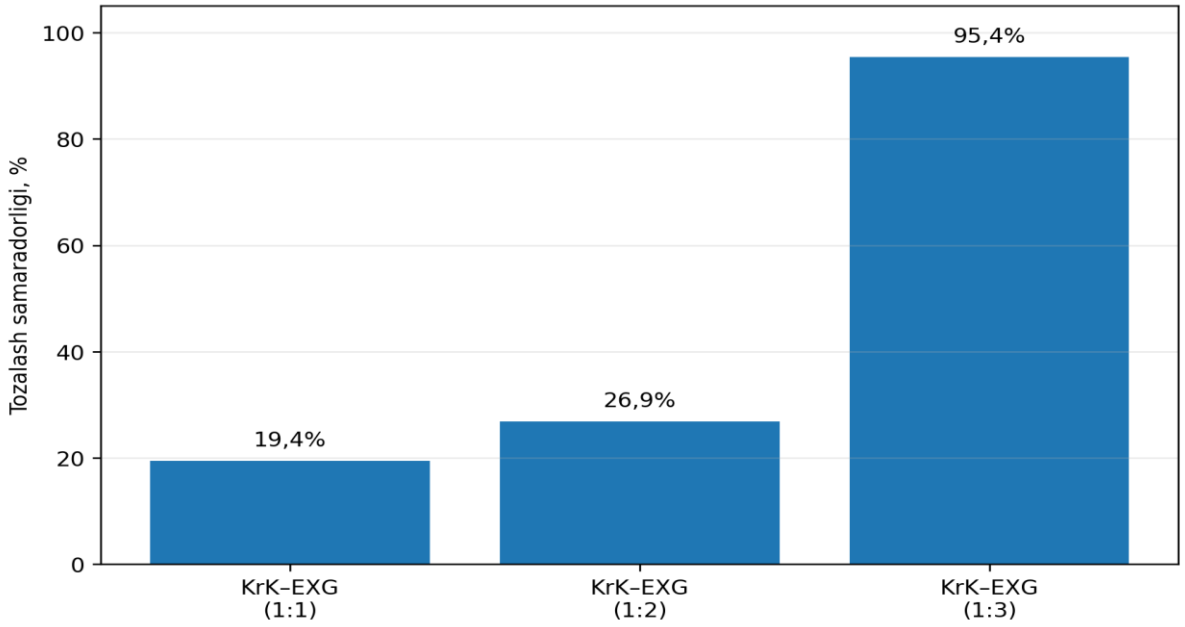
Natijalar va ularning muhokamasi. Kraxmal karbamat–epixlorgidrin asosidagi sorbent sintezi yuqori sorbsion faollik, strukturaviy barqarorlik va ekologik xavfsizlikni ta’minlashga qaratilgan muhim ilmiy-amaliy yo‘ nalish sifatida e’tirof etiladi. Kraxmal qayta tiklanuvchi tabiiy polisaxarid bo‘ lib, makromolekula tarkibidagi ko‘ p sonli gidroksil guruhlari uning kimyoviy funksionallashtirilishiga imkon beradi. Reaksiya davomiyligining mahsulot unumiga ta’siri va optimal vaqtini aniqlash. Modifikatsiyalaish jarayonining davomiyligi mahsulot unumiga sezilarli ta’sir ko‘ rsatgan. Reaksiya vaqti 0,5 soatdan 3,0 soatgacha oshirilganda unum 12,5 % dan 83,2 % gacha ortgan. 3,5 soatga uzaytirilganda esa unum 75,0 % gacha kamaygan. Shu sabab 3,0 soat tajriba qatoridagi optimal reaksiya davomiyligi sifatida qabul qilinadi.

1-rasm. Kraxmal karbamatning epixlorgidrin bilan modifikatsiyalashreaksiyasi unumining vaqtga bog‘ liqligi



Grafikda 0,5–3,0 soat oralig‘ ida unumning uzluksiz oshishi reaksiyaning kinetik rivojlanishini ifodalaydi. 3,0 soatdan keyingi pasayish uzoq termik ta’sir sharoitida yon jarayonlar, funksional guruhlarning qisman o‘ zgarishi yoki yuvish jarayonidagi mahsulot yo‘ qotishlari bilan bog‘ liq bo‘ lishi mumkin.

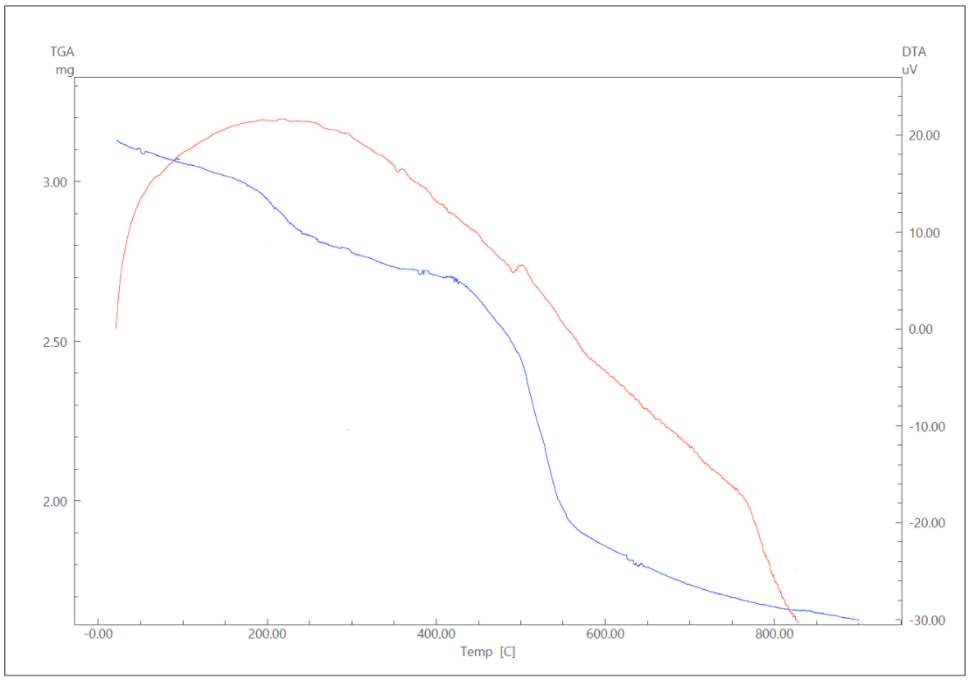
KrK–EXG sorbentining IQ-spektroskopik tahlili. IQ-spektroskopik tadqiqot KrK–EXG namunasini 60°C haroratdagi modifikatsiyasi 3348,42 sm^{-1} sohadagi keng yutilish –OH va –NH guruhlarining valent tebranishlariga; 2933,73 sm^{-1} signal alifatik C–H bog‘ lariga; 1747,51 sm^{-1} yutilish esa karbonil C=O guruhiga moslashtirilgan. 1543,05 sm^{-1} soha N–H deformatsion va C–N tebranishlari, 1143,79; 1076,28 va 1004,91 sm^{-1} sohalar esa asosan C–O va C–O–C bog‘ lari bilan bog‘ langan. KrK–EXG namunasi 130 °C termik ishlovdan keyingi qiyosiy tahlilda eng muhim o‘ zgarish karbonil sohasida qayd etilgan: C=O signali 1747,51 sm^{-1} dan 1716,65 sm^{-1} gacha siljigan. Shuningdek C–N/C–O sohasida taxminan 1338,60 → 1328,95 sm^{-1} va C–O–C sohasida 1049,91 →1046,63 sm^{-1} siljishlar keltirilgan. Bunday o‘ zgarishlar funksional guruhlarning lokal elektron va vodorod-bog‘ lanish muhiti o‘ zgarganini ko‘ rsatadi hamda modifikatsiyalash natijasidagi strukturalarni bog‘ lanishi deb qarash mumkin.



2-rasm. - Kraxmal karbamat va uning epixlorgidrin (EXG) bilan ko‘ ndalang bog‘ langan hosilalarining IQ-spektrlaridagi strukturaviy o‘ zgarishlar: 1 — kraxmal karbamat; 2 — epixlorgidrin bilan ko‘ ndalang bog‘ langan va 60 °C da quritilgan KrK–EXG sorbenti; 3 — epixlorgidrin bilan ko‘ ndalang bog‘ langan va 130 °C da termik ishlov berilgan KrK–EXG sorbenti.

KrK–EXG sorbentini Hg^{2+} ionlarini sorbsiyalash va oqova suvni tozalash samaradorligi. KrK–EXG sorbentlarining amaliy samaradorligi tarkibida Hg^{2+} ionlari mavjud texnologik oqova suvni kolonka usulida tozalash orqali baholangan. Boshlang‘ ich eritmadagi Hg^{2+} miqdori 1,615 ppb bo‘ lgan. KrK–EXG (1:1) namunasidan keyin qoldiq konsentratsiya 1,302 ppb, KrK–EXG (1:2) da 1,180 ppb va KrK–EXG (1:3) da 0,0742 ppb ni tashkil etgan. Har bir sinov besh marta takrorlangan va jadvalda o‘ rtacha qiymatlar berilgan.

3-rasm. KrK–EXG tarkibiga bog‘ liq holda oqova suvdagi qoldiq Hg^{2+} miqdorining o‘ zgarishi



Tozalash samaradorligi $\eta = ((C_0 - C_e)/C_0) \times 100$ % ifoda orqali hisoblanadi. Bu yerda C_0 — boshlang‘ ich Hg^{2+} konsentratsiyasi, C_e — sorbentdan o‘ tkazilgandan keyingi qoldiq konsentratsiya. Hisoblangan qiymatlar 1:1, 1:2 va 1:3 tarkiblar uchun mos ravishda 19,4; 26,9 va 95,4 % ni tashkil etadi.

4-rasm. KrK–EXG sorbentlari bilan Hg^{2+} ionlarini chiqarib tashlash samaradorligi

KrK–EXG sorbentlarini 1:1 dan 1:2 nisbatga o‘ tishda samaradorlik nisbatan oshganligi aniqlandi. KrK–EXG sorbentini 1:3 tarkibda 95,4 % gacha keskin ko‘ tarilish kuzatildi. Bu natija KrK–EXG (1:3) namunasida Hg^{2+} ionlarini ushlab qolishga qulayroq strukturaviy va funksional muhit shakllanganini ko‘ rsatadi.

KrK–EXG (1:3) namunasining DTG tahlili. KrK–EXG (1:3) polifunksional sorbentining termik barqarorligi TGA-DTA usuli yordamida baholandi. Termogramma materialning qizdirish jarayonida ko‘ p bosqichli termik o‘ zgarishga uchrashini ko‘ rsatadi. Dastlabki, taxminan 25-200 °C oralig‘ ida massa yo‘ qotilishi nisbatan kichik bo‘ lib, bu sorbent yuzasi va polimer matritsasida fizik adsorbsiyalangan hamda kuchsiz bog‘ langan suvning ajralishi bilan izohlanadi. 200-430 °C diapazonda massa asta-sekin kamayib, karbamat fragmentlarining qisman parchalanishi va polisaxarid skeletining dastlabki destruksiyasi sodir bo‘ lishi mumkin.

5-rasm. Kraxmal karbamat–epixlorgidrin asosidagi KrK–EXG (1:3) sorbentining termik barqarorligini tavsiflovchi TGA va DTA termogrammalari.

Eng muhim termik o‘ zgarish 430-560 °C oralig‘ ida kuzatiladi. Ushbu sohada TGA egri chizig‘ ining keskin pasayishi kraxmal-karbamat skeleti va epixlorgidrin modifikatsiyasi natijasidagi bog‘ lanishlar polimer tarmog‘ ining intensiv destruksiyasiga mos keladi. DTA egri chizig‘ ida ayni harorat oralig‘ iga yaqin termik effektning kuzatilishi ushbu parchalanish jarayoni sezilarli energetik o‘ zgarish bilan kechishini ko‘ rsatadi. 560 °C dan yuqori haroratlarda massa yo‘ qotilishi sekinlashadi va chuqur destruksiya hamda qoldiqning shakllanishi ustunlik qiladi. Termogramma yakunida qoldiq massaning sezilarli darajada saqlanishi material tarkibida yuqori haroratga natijasida koks qatlam hosil bo‘ lishini ko‘ rsatadi.

Umumiy xulosa. Tadqiqot natijalari kraxmalni karbamid bilan funksionallashtirish va keyinchalik epixlorgidrin yordamida modifikatsiyalash orqali suvda erimaydigan, kislorod va azot saqlovchi funksional markazlarga ega polifunksional sorbent olish mumkinligini ko‘ rsatadi. Reaksiya davomiyligi bo‘ yicha 3,0 soatlik ishlov 83,2 % maksimal unum bilan tajriba qatoridagi optimal nuqta bo‘ lgan. IQ-spektroskopiyada C=O, C–N/C–O va C–O–C diapazonlaridagi siljishlar polimer matritsaning kimyoviy muhiti qayta tashkil topganini ko‘ rsatadi.

Hg^{2+} ionlarini chiqarib tashlash bo‘ yicha KrK–EXG (1:3) namuna aniq ustunlik namoyon etib, boshlang‘ ich 1,615 ppb konsentratsiyani 0,0742 ppb gacha kamaytirgan va 95,4 % tozalash samaradorligini ta’minlagan. Shu sabab ushbu tarkib o‘ rganilgan nisbatlar orasida eng istiqbolli sorbent sifatida baholash mumkin.

KOBALT (II) IONINI SORBSION-SPEKTROSKOPIK ANIQLASH

Davronova Norniso Faxriddin qizi
Toshkent kimyo-texnologiya instituti Kimyo kafedrasi katta o‘ qituvchisi k.f.PhD
Email:davronovanorniso@gmail.com

Annotatsiya. *Ushbu tadqiqotda Co(II) ionlarini sorbsion-spektroskopik usul yordamida aniqlashning samarali usuli ishlab chiqildi. Analitik reagent sifatida PPA-1 tolasimon sorbentiga immobilizatsiyalangan 1-nitrozo-2-naftol-3,6-disulfonik kislota natriyli tuzi (Nitrozo R tuzi) qo‘ llanildi. Tadqiqot davomida reagentni immobilizatsiya qilishning maqbul sharoitlari, maksimal nur yutish va nur qaytarish spektrlari hamda Co(II) ionlari bilan kompleks hosil qilish xususiyatlari o‘ rganildi. Olingan natijalar immobilizatsiyalangan Nitrozo R tuzining Co(II) ionlari bilan 419 nm to‘ lqin uzunligida barqaror kompleks hosil qilishini ko‘ rsatdi. Ishlab chiqilgan usul tabiiy va texnogen suv namunalarida sinovdan o‘ tkazildi hamda uning yuqori sezgirlik, selektivlik va takrorlanuvchanlikka ega ekanligi aniqlandi.*

Kalit so‘ zlar: *Co(II) ioni, kobalt, Nitrozo R tuzi, PPA-1 tolasimon sorbenti, sorbsion-spektroskopik usul, immobilizatsiya, kompleks hosil bo‘ lishi, spektrofotometriya.*

СОРБЦИОННО-СПЕКТРОСКОПИЧЕСКОЕ ОПРЕДЕЛЕНИЕ ИОНА КОБАЛЬТА (II)

Аннотация: *В данном исследовании разработан эффективный метод определения ионов Co(II) сорбционно-спектроскопическим методом. В качестве аналитического реагента использована натриевая соль 1-нитрозо-2-нафтол-3,6-дисульфоновой кислоты (соль Нитрозо R), иммобилизованная на волокнистом сорбенте ППА-1. В ходе исследования изучены оптимальные условия иммобилизации реагента, спектры максимального поглощения и отражения света, а также особенности комплексообразования с ионами Co(II). Полученные результаты показали, что иммобилизованная соль Нитрозо R образует устойчивый комплекс с ионами Co(II) при длине волны 419 нм. Разработанный метод был апробирован на образцах природных и техногенных вод, при этом установлены его высокая чувствительность, селективность и воспроизводимость.*

Ключевые слова: *ион Co(II), кобальт, соль Нитрозо R, волокнистый сорбент ППА-1, сорбционно-спектроскопический метод, иммобилизация, комплексообразование, спектрофотометрия.*

SORPTION-SPECTROSCOPIC DETERMINATION OF COBALT (II) ION

Abstract: *An effective method for the determination of Co(II) ions by sorption-spectroscopic analysis was developed in this study. The sodium salt of 1-nitroso-2-naphthol-3,6-disulfonic acid (Nitroso R salt), immobilized on a PPA-1 fibrous sorbent, was used as the analytical reagent. During the study, the optimal conditions for reagent immobilization, the maximum absorption and reflection spectra, and the complex formation properties with Co(II) ions were investigated. The obtained results demonstrated that the immobilized Nitroso R salt forms a stable complex with Co(II) ions at a wavelength of 419 nm. The developed method was tested on natural and technogenic water samples, demonstrating high sensitivity, selectivity, and reproducibility.*

Keywords: *Co(II) ion, cobalt, Nitroso R salt, PPA-1 fibrous sorbent, sorption-spectroscopic method, immobilization, complex formation, spectrophotometry.*

Kirish. Hozirgi kunda antropogen ifloslanish hisoblanuvchi zaharli metallarning atrof-muhitga tarqalishi, ekologik muammolarning sezilarli darajada ortishiga sabab bo‘ lmoqda. Atrof-muhitga tarqalgan og‘ ir va zaharli metallarni miqdorini nazorat qilish muhim ekologik-tahliliy vazifadir. Shu jumladan kobalt ionlarini atrof-muhit obyektlaridan organik reagentlar yordamida aniqlashning selektiv, qayta takrorlanuvchi, sezgir zamonaviy uslublarini yaratish muhim ahamiyat kasb etmoqda.

Jahonda og‘ ir metallarni aniqlashda ultramikromiqdorlarini tahlil qilishga imkon beradigan ko‘ plab fizik va fizik-kimyoviy usullar yaratish bo‘ yicha ilmiy izlanishlar olib borilmoqda. Lekin ular ham har doim kerakli sezgirlik va selektivlikka ega bo‘ lmaydi. Bu borada tolasimon tashuvchilarga organik reagentlarni immobillash orqali zaharli

metallarni ruxsat etilgan chegaraviy miqdor va undan past darajada hamda analitik va funktsional faol guruhlari zarur sezgirlikni va tanlab ta'sir etuvchanligini oshirish mexanizmini aniqlashga alohida e'tibor qaratilmoqda.

Mavzuga oid adabiyotlar tahlili. Atrof-muhitda kobalt asosan oksidlanish darajasi +2 va +3 holatida sulfid va arsenid shaklida uchraydi. Yer osti va yer usti suvlarida uning konsentratsiyasi 5mg×l^{-1} dan past konsentartsiyada bo‘ ladi. Kobalt atrof-muhitga tabiiy yo‘ llar orqali ob-havoning buzilishi, toshlarning yemirilishi, va vulqonlarning faolligi natijasida hamda atrof muhit obyektlariga suv, konlarda qazish va eritish kabi jarayonlar orqali kelib tushadi [1]. Kobalt va uning birikmalari inson hayot faoliyatning bir qismi hisoblanadi. Co vitamin B_{12} ning metall komponenti sifatida biologik jihatdan muhim rol o‘ ynaydi. Biroq Co ionining organizmga keragidan ortiqcha miqdori turli xil noxush oqibatlarga olib keladi [2]. Shu sababli atrof-muhit obyektlarida kobalt ionlarini aniqlash muhim ahamiyat kasb etadi. Hozirgi kunda og‘ ir va zaharli metallarni aniqlashning spektofotometrik usullari keng tarqalgan.

1 - jadval

Kobalt(II) ionlarini turli organik reagentlar bilan spektrofotometrik aniqlash usullari

№	Analitik reagent nomi	obyekt	Q_{min} mkg/l	Ada.
1	4-(2-Gidroksi-naftalen-1-ylazo)-N-tiazol-2-il-benzolsulfanilamid	Suvli eritma namunalari	1,7-8,4×10^{-5} mol/l^{-1}	[3]
2	etil4-(5-asetil-2,3,4-trihidroksifenil) diazenilbenzoat (EATDB)	Vitamin	1mkg/l^{-1}	[4]
3	2-[(2-simobxlorid, 4-metilfenilImino] metil fenol	Suv havzalari	0,5-50mkg/l	[5]
4	2,6-ditiol-4-tert-butilfenol	Suv namunasida	0,2-20 mkg/ml	[6]
5	2-(bifenil-4-il)-3-((2-(2,4-dinitrofenil)gidrazono)metil) imidazo[1,2-a]piridin	B_{12} vitamini in'ektsiya namunalarini	0,1 mkg/ml	[7]
6	xromogen reagent	Farmatsev tika namunalari	1,786-11, mkg / ml	[8]
7	Gabapentinni 8-gidroksixinolin	Tabiiy suv havzalarida	2 – 25 mkg/ml	[9]
8	(1,5-dimetil-2-fenil-4-((2,3,4-trihidroksifenil) diazenil)	Suv namunalari	1-25 mkg/ml	[10]

Spektrofotometrik usulda kompleks hosil bo‘ lishi faqat eritmada bo‘ lishi, ko‘ p vaqt talab qilishi va asbob uskunalar zarur bo‘ ishi bilan bir qancha kamchiliklarni o‘ z ichiga oladi. Turli usullar orasida spektrofotometriyani takomillashtirilgan varianti sorbsion-spektroskopik usul alohida afzalliklari bilan ajralib turadi. Immobillangan organik reagentlar yordamida kobalt ionini aniqlash uchun ma'lum bir laboratoriya sharoiti talab qilinmaydi, ekologik toza, tezkor va iqtisodiy jihatdan tejamkor usuldir. Immobillangan organik reagentlar yordamida kobalt ionini aniqlash usuli bir vaqtning ozida metall ioni konsentrlash, aniqlash va ajratish imkonini beradi. Shu sababli ilmiy tadqiqot ishida sorbsion-spektroskopik usuldan foydalanildi [11].

Tadqiqot metodologiyasi. 1-nitrozo-2-naftol-3,6-disulfonik kislota natriyli tuzi (nitrozo R- tuzi) Ar=$(NO(HO)C_{10}H_4(SO_3Na)_2)$=377,35 organik reagent eritmasini tayyorlash uchun analitik tarozida 0,37735 gr reagentni tortib olib hajmi 100 ml bo‘ lgan o‘ lchov kolbasida distillangan suvda eritildi va 0,001M li eritmasi hosil bo‘ ldi. Gidroksilamin bilan faollashtirilgan poliakrilonitril(nitron) tolasini polietilenamin bilan modifikatsiyalash orqali olingan anionit tolasimon sorbent 0,2 g dan analitik tarozida 0,0001 g aniqlikda o‘ lchab olindi. O‘ lchab olingan qattiq holatdagi tolasimon sorbent 0,1 M xlorid kislotaning standart eritmasida bir sutka mobaynida bo‘ ktirildi, so‘ ng distillangan suv yordamida pH=7 ga kelguncha yuvildi va Petri chashkalarida saqlandi .

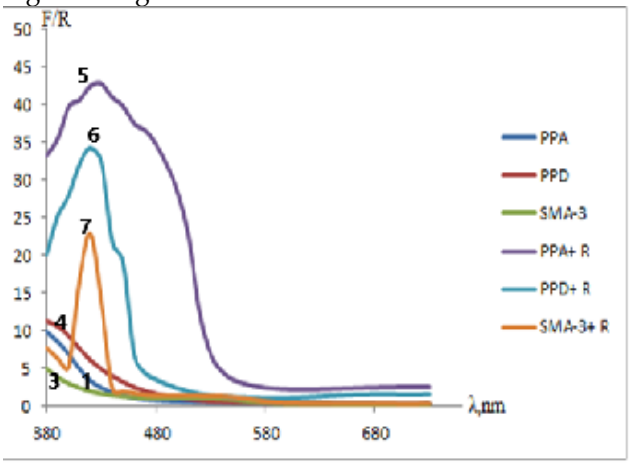
Reagent	**Tashuvchi**	**pH**	**Bufer aralashma hajmi, ml**	**Yutilish maksimumi, nm**	**V_{min}**
Nitrozo R tuzi	PPA-1	6,5	5,00	380	2-5

a) b)

1-rasm. Nitrozo R tuzuning elektrostatik potensial yuzasi (a) va elektron bulut zichligi (b)

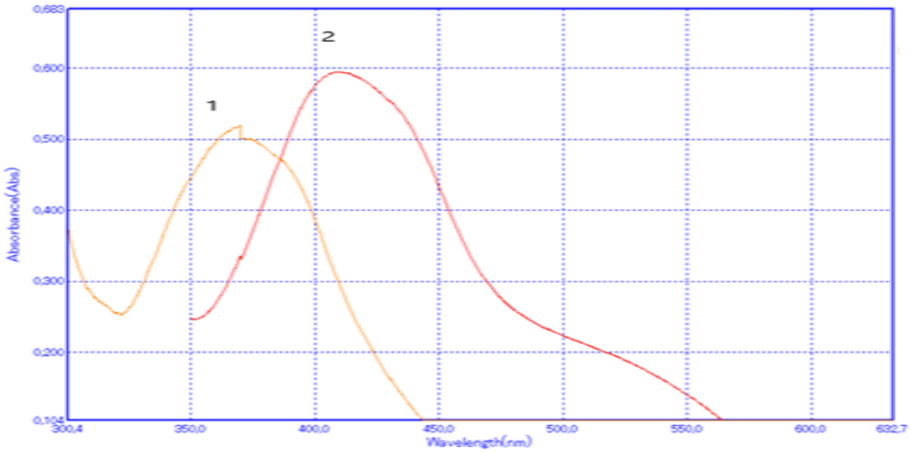


Tahlil va natijalar. Nitrozo R tuzini maksimal nur yutush spektrini aniqlash. . 0,1 % nitrozo R tuzining standart eritmasiga 0,2g PPA-1 tola solinib, eritmalarning optik zichliklari immobillashdan avvalgi va keyingi solishtirma eritmaga nisbatan o‘ lchandi. Olingan natijalar 2-rasmda keltirilgan.

2-rasm. Nitrozo R tuzining immobillashdan avval va keyingi nur yutish spektrlari

Turli xil sorbentlarga immobillangan reagentlar eritmasining dastlabki va keyingi eritmalarning optik zichliklari EMC-30PC-UV va UV-5100 VIS spektrofotometrlarda o‘ lchandi. Bu o‘ lchovlar yordamida, reagentlar immobillanganidan so‘ ng eritmalarning optik zichligi o‘ zgarishini aniqlash mumkin bo‘ ldi. Tanlangan reagentlarning to‘ lqin uzunligi immobillashdan oldin va keyin o‘ zgarmadi. Biroq, immobillash jarayoni natijasida sorbsiya darajasiga ko‘ ra optik zichlik qiymatlari turlicha bo‘ ldi. Bu o‘ zgarishlar sorbent va reagentlar o‘ rtasidagi kompleks hosil bo‘ lishi bilan bog‘ liq bo‘ lib, ularning reaksiyaviyligini va sezgirligini ko‘ rsatadi. Bu natijalar, PPA-1 tolasining nitrozo R tuzini immobillash uchun ideal sorbent ekanligini tasdiqlaydi va keyingi tahlil va tadqiqotlar uchun samarali asos yaratadi. Tahlillar natijasiga ko‘ ra nitrozo R- tuzi reagentiga PPA-1 tola muvofiq keluvchi sorbent sifatida tanlandi.

Nitrozo R- tuzi reagentini turli tolasimon sorbentlar bilan immobillanish jarayonini nur qaytarish spektrlari olindi va Kubelka-Munka funksiyasida hisoblashnatijalariga ko‘ ra eng yuqori analitik signal tolasimon sorbent PPA-1da kuzatildi. Shu sababli, ikkala organik reagentimizni immobillash uchun PPA-1 tolasi sorbent sifatida tanlandi.



3-rasm. Turli tolalar va ularga immobillangan Nitrozo R tuzi ning olingan nur qaytarish spektrlari

PPA-1 tolamiz eng yuqori nur qaytarish spektrini ko‘ rsatgani uchun, uni immobillangan reagentlar uchun optimal sorbent sifatida tanlab olindi.

Immobillangan nitrozo R tuzining Co(II) ionlari bilan hosil qilgan kompleksining maksimal nur yutush spektrining aniqlash. Kobalt komplekslarining maksimal yorug‘ lik yutilish sohasini aniqlash uchun immobillangan organik reagentlar bilan tavsiflangan uslub bo‘ yicha quyidagi jarayon bajarildi: 25 ml hajmli kolbaga 1 mldan (10 mkg) kobalt eritmalari qo‘ shildi. So‘ ngra, pH =6,5 bo‘ lgan sitratli bufer eritmalaridan 10 ml qo‘ shildi. Ushbu eritmalar ustiga tanlangan nitroso R tuzi bilan immobillangan tashuvchilar quyildi. Eritmalar yaxshilab aralashtirilganidan so‘ ng, turli to‘ lqin uzunliklarida, qalinligi 1 sm bo‘ lgan kyuvetda spektrofotometrda optik zichlik o‘ lchandi .Tahlil natijalar shuni ko‘ rsatadiki nitrozo R-tuzi reagentining Co^{2+} ioni bilan hosil qilgan kompleks (qizil rangli) esa 419 nm bo‘ lib, ular o‘ rtasidagi farq aniq belgilandi.

Olingan natijalarni to‘ g‘ riligini isbotlash maqsadida immobillangan reagentlar va kompleks hosil bo‘ lgan tolaning nur qaytarish spektrini o‘ lchandi. Nur qaytarish spektri natijalarini Kubelka-Munka funksiyasiga o‘ tkazganda, minimum maksimumga aylanishi va nur yutulish spektrining maksimal sohalari bilan bir xil bo‘ lishi aniqlandi.

4-rasm. Nitrozo R tuzining (1) va Co^{2+} ioni bilan hosil qilgan kompleksi (2) ning maksimal nur yutish spektri λ_{max}=419 nm

Bu kuzatish natijalari, yutulish spektri va qaytarish spektri orasidagi bog‘ liqlikni tasdiqlaydi, ya’ni nur yutishning maksimal sohasining nur qaytarish spektrida ham o‘ sha to‘ lqin uzunligida aks etishini ko‘ rsatadi.

Ishlab chiqilgan usulning raqobatbardoshligini tekshirish. Ishlab chiqilgan usulni raqobatbardoshligini tekshirish maqsadida texnogen suvlarda kobalt(II) ionlarini sorbsion-spektroskopik va boshqa usullar o‘ zaro solishtirilib ko‘ rildi.

3 - jadval

Ishlab chiqilgan sorbsion spektroskopik usul yordamida tabiiy obyektlardan kobalt(II) ionini aniqlash va ajratib olish tahlil natijalarini baholash

3- jadvaldagi tahlil natijalaridan ma’lumki ishlab chiqilgan sorbsion-spektroskopik usul yordamida nafaqat kobalt (II) ionilari miqdori yuqori sezgirlikda aniqlanadi va kobalt ionlarining sorbsion samaradorligi 95% dan yuqorililigi sababli ushbu metall ionlarini oqava suvlardan ajratib olish imkonini ham beradi.

Xulosa va takliflar. Tadqiqot natijasida Co(II) ionlarini sorbsion-spektroskopik usulda aniqlash uchun PPA-1 tolasimon sorbentiga immobilizatsiyalangan Nitrozo R tuzi analitik reagent sifatida tavsiya etildi. Reagentni immobilizatsiya qilishning maqbul sharoitlari aniqlandi hamda Co(II) ionlari bilan 419 nm to‘ lqin uzunligida barqaror kompleks hosil qilishi isbotlandi. Ishlab chiqilgan usul tabiiy va texnogen suv namunalarida yuqori sezgirlik, selektivlik va takrorlanuvchanlikni namoyon etdi. Olingan natijalar taklif etilgan usulning Co(II) ionlarini aniqlash va suv muhitidan ajratib olishda samarali hamda amaliy qo‘ llash uchun istiqbolli ekanligini ko‘ rsatdi.

Abstract*:This article investigates the molecular docking-based interaction of selected amino acids contained in the "As-Capsipol" food supplement with the cyclooxygenase-2 (COX-2) enzyme. Arginine, phenylalanine, glutamic acid, tyrosine, and tryptophan were selected as ligands, and their binding affinity, inhibition constant, and interaction profiles with amino acid residues in the active site of the enzyme were evaluated. According to the results, tryptophan and tyrosine exhibited relatively high binding affinity toward COX-2, which may be important for explaining the potential molecular mechanism underlying the anti-inflammatory activity of the "As-Capsipol" complex. The obtained findings provide a scientific basis for evaluating the biological activity of this food supplement using an* in silico *approach.*

Keywords: *As-Capsipol, COX-2, molecular docking, amino acids, tryptophan, tyrosine, arginine, binding affinity, inflammation,* in silico.

ОЦЕНКА ВЗАИМОДЕЙСТВИЯ АМИНОКИСЛОТ, СОДЕРЖАЩИХСЯ В ПИЩЕВОЙ ДОБАВКЕ "AS-CAPSIPOL", С ФЕРМЕНТОМ ЦИКЛООКСИГЕНАЗОЙ-2 (COX-2) НА ОСНОВЕ МОЛЕКУЛЯРНОГО ДОКИНГА

Аннотация*:В данной статье изучено взаимодействие отдельных аминокислот, входящих в состав пищевой добавки «As-Capsipol», с ферментом циклооксигеназой-2 (COX-2) на основе молекулярного докинга. В качестве лигандов были выбраны аргинин, фенилаланин, глутаминовая кислота, тирозин и триптофан; оценены их аффинность связывания, константа ингибирования, а также профили взаимодействия с аминокислотными остатками активного центра фермента. Согласно полученным результатам, триптофан и тирозин проявили относительно высокую аффинность связывания с COX-2, что может иметь важное значение для объяснения предполагаемого молекулярного механизма противовоспалительного действия комплекса «As-Capsipol». Полученные данные служат научной основой для оценки биологической активности данной пищевой добавки с использованием подхода* in silico.

Ключевые слова: *As-Capsipol, COX-2, молекулярный докинг, аминокислоты, триптофан, тирозин, аргинин, аффинность связывания, воспаление,* in silico.

"AS-CAPSIPOL" OZIQ-OVQAT QO' SHILMASI TARKIBIDAGI AMINOKISLOTALARNING COX-2 FERMENTI BILAN MOLEKULYAR DOKING ASOSIDAGI O' ZARO TA'SIRINI BAHOLASH

Annotatsiya; *Ushbu maqolada "As-Capsipol" oziq-ovqat qo' shilmasi tarkibidagi ayrim aminokislotalarning siklooksigenaza-2 (COX-2) fermenti bilan molekulyar doking asosidagi o' zaro ta'siri o' rganildi. Tadqiqotda arginin, fenilalanin, glutamin kislota, tirozin va triptofan ligand sifatida tanlanib, ularning bog' lanish affiniteti, ingibitsiya konstantasi hamda faol markazidagi aminokislota qoldiqlari bilan o' zaro ta'sir profillari baholandi. Natijalarga ko' ra, triptofan va tirozin COX-2 bilan nisbatan yuqori bog' lanish affinitetini namoyon qilib, "As-Capsipol" majmuasining yallig' lanishga qarshi ehtimoliy molekulyar mexanizmini izohlashda muhim ahamiyat kasb etishi mumkin. Olingan natijalar mazkur oziq-ovqat qo' shilmasining biologik faolligini in silico yondashuv asosida ilmiy baholashga xizmat qiladi.*

Kalit so‘ zlar: *As-Capsipol, COX-2, molekulyar doking, aminokislotalar, triptofan, tirozin, arginin, bog‘ lanish affiniteti, yallig‘ lanish, in silico.*

INTRODUCTION

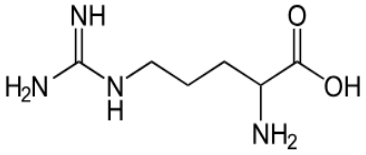
In recent years, scientific interest in the study of bioactive dietary supplements, phytocomplexes of natural origin, and their molecular mechanisms of action has been steadily increasing. In particular, the evaluation of the pharmacobiological potential of supplements developed on the basis of natural components is of significant scientific and practical importance in pathological conditions associated with inflammation, oxidative stress, and liver injury. This approach is closely related to the search for safer, biologically compatible agents with multicomponent mechanisms of action compared with synthetic drugs.

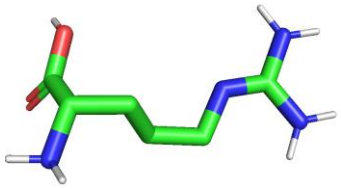
Inflammation is a complex protective response of the organism to various endogenous and exogenous factors. However, when this process becomes prolonged or uncontrolled, it may lead to tissue damage, metabolic disturbances, and the development of chronic diseases. Prostaglandins, cytokines, reactive oxygen species, and other mediators play an important role in this process. In particular, cyclooxygenase enzymes are involved in the biosynthesis of prostaglandins through arachidonic acid metabolism and are considered among the key factors determining the molecular basis of inflammatory responses.

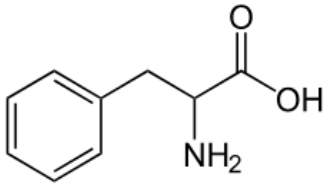
Cyclooxygenase-2 (COX-2) is an inducible enzyme that is expressed at low levels under normal physiological conditions; however, its activity markedly increases during inflammation, oxidative stress, infectious processes, and tissue injury. Activation of COX-2 enhances the formation of prostaglandin E2 and other pro-inflammatory mediators, thereby contributing to pain, edema, increased vascular permeability, and modulation of the immune response. Therefore, COX-2 is regarded as a promising molecular target in many inflammatory diseases, including hepatitis and inflammatory lesions of liver tissue.

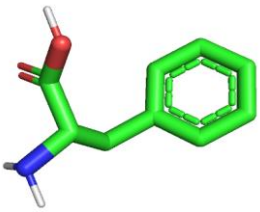
Molecular docking is an effective in silico approach that enables the preliminary assessment of the binding energy, spatial orientation, types of interactions with amino acid residues, and potential inhibitory activity of biologically active compounds against protein targets. This method represents an important complementary stage to laboratory experiments and is widely used to elucidate the molecular mechanisms of natural compounds, select promising ligands, and provide a scientific basis for subsequent experimental studies.

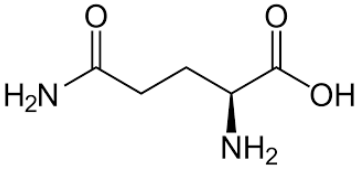
The aim of the present study was to evaluate the molecular docking-based binding properties of selected amino acids contained in the “As-Capsipol” dietary supplement with the COX-2 protein, as well as to determine their binding affinity, inhibition constant, and ligand–protein interaction profiles. The results of this study may contribute to explaining the possible molecular mechanisms underlying the anti-inflammatory activity of the “As-Capsipol” complex and to its scientific substantiation as a bioactive dietary supplement.

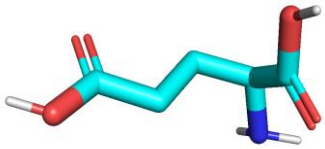


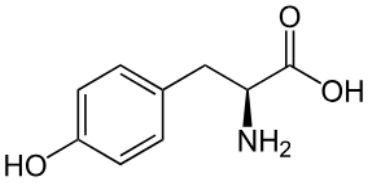


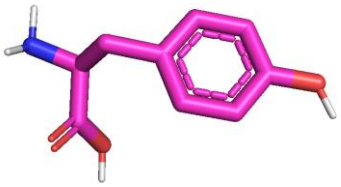


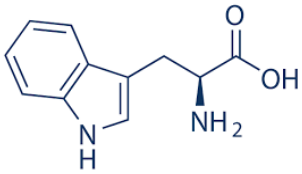


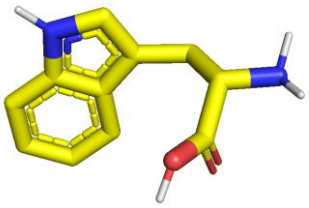












MATERIALS AND METHODS

All computational analyses were performed using freely available academic software tools. The three-dimensional structures of the selected target proteins, including cyclooxygenase-2 (COX-2, PDB ID: 5IKR), were retrieved from the Protein Data Bank (PDB) database. The structures of the ligands representing the amino acids contained in the “As-Capsipol” dietary supplement were obtained from the PubChem database. Their three-dimensional conformations were downloaded in appropriate formats, and their geometries were optimized prior to the docking procedure (Table 1). Protein preparation and structural analysis were carried out using PyMOL software, version 1.2 [1].

The active binding sites of the proteins were identified using Discovery Studio software, which allowed accurate localization of the docking regions. Visualization and analysis of ligand–protein interactions were also performed using PyMOL.

Molecular docking simulations were conducted using AutoDock 4.2 software. AutoDock Tools (ADT) was used for the preparation of proteins and ligands for docking. During this process, polar hydrogen atoms were added, partial charges were assigned, and rotatable bonds in the ligands were defined. The grid box parameters were set based on the previously predicted active sites [2]. This methodology enabled reliable prediction of the binding modes of the ligands with the target proteins, their spatial orientations, and their interaction profiles.

Table 1. Structural representation of the selected amino acid ligands used in molecular docking analysis in 2D and 3D formats

Ligands	2D	3D
Arginine		
Phenylalanine		
Glutamic acid		
Tyrosine		
Tryptophan		

Preparation of Ligand and Protein Files:

Prior to molecular docking, all PDB structures retrieved from the Protein Data Bank were subjected to a comprehensive preprocessing procedure, since the original files obtained from the PDB database are not fully suitable for direct docking analysis [3]. Such structures often contain crystallographic water molecules, co-crystallized ligands, ions, and other heteroatoms, which may adversely affect the accuracy of docking calculations.

Each protein structure was imported into AutoDock Tools (ADT) for preparation. Crystallographic water molecules and all non-essential heteroatoms were removed to eliminate undesirable interactions. Co-crystallized ligands were deleted prior to docking simulations; however, when necessary, they were preserved separately for validation purposes [4]. In addition, all non-protein components, including metal ions such as calcium, were removed to prevent artificial electrostatic effects under the rigid receptor docking model and to ensure a uniform preparation procedure for all target proteins.

The structural integrity of the selected protein models was visually inspected using PyMOL. Particular attention was paid to the presence or absence of missing amino acid residues in functionally important regions. No missing residues of critical importance were detected in the selected models [5]. In the next step, polar hydrogen atoms were added to better represent electrostatic properties, and Kollman united atom charges were assigned. In accordance with standard ADT protocols, the protonation states were adjusted to approximate physiological conditions (pH 7.4). The prepared receptor structures were subsequently saved in ".pdbqt" format, which contains information on atom types and partial charges required for docking calculations.

Ligand preparation was performed using a similar procedure. The selected amino acid ligands were imported into ADT, hydrogen atoms were added, and Gasteiger partial charges were assigned. In accordance with the standard AutoDock protocol, nonpolar hydrogens were merged [6]. To ensure conformational flexibility during the docking process, rotatable bonds and root atoms were automatically detected by the software. In the final step, the ligands were saved in ".pdbqt" format, containing all the structural and electrostatic information required for subsequent docking simulations [7].

Calculation of the Inhibition Constant (Ki) Based on Binding Energy:

In molecular docking studies, the affinity between a ligand and its target protein is usually expressed in terms of the free binding energy (ΔG), which is measured in kcal/mol. A lower, i.e., more negative, ΔG value indicates a stronger and more energetically favorable interaction between the ligand and the protein. The inhibition constant (Ki), which reflects the binding strength of the ligand, can be estimated from the calculated binding energy using the standard thermodynamic relationship [8]:

$$Ki = e^{\wedge}\frac{\Delta G x 1000}{RxT}$$

Where:

Ki is the inhibition constant, expressed in mol/L;
ΔG is the free binding energy, expressed in kcal/mol;
R is the universal gas constant, equal to 1.987 cal/(mol·K);
T is the temperature on the Kelvin scale, usually taken as 298.15 K;
1000 is the conversion factor used to convert kcal to cal.

Computational Tools and Databases Used in Molecular Docking Analysis:

An *in silico* molecular docking study was conducted to identify the possible molecular mechanisms underlying the biological activity of the "As-Capsipol" complex. Although the "As-Capsipol" complex contains a range of amino acids, several representative compounds, namely arginine, phenylalanine, glutamic acid, tyrosine, and tryptophan, were selected for the targeted docking analysis. Their selection was based primarily on their binding affinity profiles and biological significance.

These amino acids were selected because they demonstrated favorable binding energies toward the target proteins investigated in the preliminary docking results. Among them, tryptophan and tyrosine showed the most pronounced binding affinity toward several target proteins, indicating their strong interaction potential [9]. Phenylalanine also exhibited consistently favorable binding energies, suggesting its possible role in stabilizing ligand–protein complexes through hydrophobic interactions and π–π stacking interactions between aromatic rings.

Arginine was included in the analysis because of its ability to form strong electrostatic interactions and hydrogen bonds through its positively charged guanidinium group. This property facilitates its interaction with negatively charged amino acid residues located in the active sites of proteins [10]. Glutamic acid, as a negatively charged amino acid, was selected based on its ability to participate in ionic interactions and its involvement in the regulation of inflammatory signaling pathways.

The docking analysis was performed against a key protein target involved in the development of inflammatory processes and liver injury. Cyclooxygenase-2 (COX-2, PDB ID: 5IKR) was selected as the target protein. This protein target was chosen because it plays a central role in inflammatory signaling pathways and in the pathogenesis of liver diseases [11].

Quantitative determination of the amino acid content in the sample:

The precipitation of proteins and peptides from the aqueous extract of the As-Capsipol food supplement was carried out in centrifuge tubes. For this purpose, 1 mL of the investigated sample was mixed with an equal volume, namely 1 mL, of 20% trichloroacetic acid (TCA). After 10 minutes, the precipitated proteins were separated by centrifugation at 8000 rpm for 15 minutes. Then, 0.1 mL of the obtained supernatant was collected and subjected to lyophilization.

The dried residue was subsequently evaporated, dissolved in a triethylamine–acetonitrile–water mixture at a ratio of 1:7:1, and dried again. This procedure was repeated twice in order to neutralize residual acidity. Free amino acids were reacted with phenyl isothiocyanate (PITC) and converted into phenylthiocarbamyl (PTC) amino acid derivatives according to the method described by Steven A. and Cohen Daviel [12]. The results obtained are summarized in Table 2.

The identification of amino acid derivatives was performed using high-performance liquid chromatography (HPLC). The analytical conditions were as follows: an Agilent Technologies 1200 chromatographic system equipped with a DAD detector and a Discovery HS C18 column (75×4.6 mm) was used. Mobile phase A consisted of 0.14 M sodium acetate (CH_3COONa) containing 0.05% triethylamine (TEA), adjusted to pH 6.4, while acetonitrile (CH_3CN) was used as mobile phase B. The flow rate was set at 1.2 mL/min, and detection was performed at a wavelength of 269 nm. The gradient program for solvent B was as follows: 1-6% from 0 to 2.5 min; 6-30% from 2.51 to 40 min; 30-60% from 40.1 to 45 min; 60-60% from 45.1 to 50 min; and 60-0% from 50.1 to 55 min.

Table 2. Amino acid composition and quantitative content of the As-Capsipol food supplement

Amino acids	**As-Capsipol**
	Concentration (mg/g)
Glutamic acid	1.237

Arginine	0.458
Tyrosine	1.115
Tryptophan	7.147
Phenylalanine	2.037

Rationale for the selection of representative amino acid ligands:

The selection of arginine, phenylalanine, glutamic acid, tyrosine, and tryptophan as representative ligands was based on a combination of analytical, structural, and biological criteria. First, these amino acids were experimentally detected in the As-Capsipol food supplement by HPLC analysis, confirming their real presence in the investigated sample. Second, they represent different chemical classes of amino acids, including acidic amino acids (glutamic acid), basic amino acids (arginine), and aromatic amino acids (phenylalanine, tyrosine, and tryptophan). This chemical diversity is important because it allows the evaluation of different types of ligand-protein interactions, such as hydrogen bonding, electrostatic interactions, hydrophobic contacts, and π-mediated interactions within the COX-2 binding site.

In addition, these amino acids were selected due to their potential biological relevance to inflammatory and metabolic processes. Arginine may participate in immune regulation and nitric oxide-related pathways, glutamic acid is involved in nitrogen metabolism and cellular signaling, whereas aromatic amino acids such as phenylalanine, tyrosine, and tryptophan may contribute to hydrophobic and π-related interactions with protein targets. Among them, tyrosine and tryptophan are of particular interest because of their relatively high binding affinity toward COX-2 in the preliminary docking results. Therefore, the selected amino acids can be considered chemically diverse and biologically informative representative constituents of the As-Capsipol complex for targeted molecular docking analysis.

Table 3. Criteria for the selection of representative amino acid ligands from the As-Capsipol complex

Amino acid	Selection criterion	Rationale for representativeness
Glutamic acid	Acidic amino acid	Selected to evaluate the potential of acidic amino acids to interact with COX-2 through electrostatic interactions and hydrogen bonding.
Arginine	Basic amino acid	Represents positively charged amino acids; its guanidinium group can form strong hydrogen bonds and electrostatic interactions with residues in the COX-2 binding site.
Phenylalanine	Hydrophobic aromatic amino acid	Selected to assess hydrophobic contacts and π-mediated interactions associated with aromatic amino acid residues.
Tyrosine	Polar aromatic amino acid	Represents aromatic amino acids capable of forming both hydrogen bonds and π-alkyl interactions within the COX-2 active region.
Tryptophan	Indole-containing aromatic amino acid	Detected at a relatively high level in the sample and showed the strongest binding affinity toward COX-2, supporting its relevance as an informative representative ligand.

The selected amino acids were considered chemically diverse and biologically informative representative constituents of the As-Capsipol complex for targeted molecular docking analysis.

RESULTS AND DISCUSSION

Cyclooxygenase-2 (COX-2) is an inducible enzyme that plays an important role in the conversion of arachidonic acid into prostaglandins, particularly during inflammatory responses. Unlike COX-1, which is constitutively expressed in most tissues and participates in the maintenance of physiological homeostasis, COX-2 expression is generally low under normal conditions. However, its expression markedly increases under the influence of inflammatory stimuli such as cytokines, oxidative stress, and viral infections. Under hepatitis conditions, COX-2 has been shown to play an important role in the pathogenesis and progression of hepatic inflammation [10].

Various forms of hepatitis, including viral hepatitis such as hepatitis B and C, are associated with increased COX-2 expression in hepatocytes and non-parenchymal liver cells. This activation leads to enhanced production of prostaglandin E2 (PGE2). PGE2 contributes to hepatic inflammation by promoting vasodilation, increasing vascular permeability, and modulating immune responses. In addition, PGE2 may influence the balance between pro-inflammatory and anti-inflammatory cytokines, thereby affecting the severity and duration of liver injury [11].

Chronic activation of COX-2 in hepatitis is also associated with the progression of liver diseases toward fibrosis, cirrhosis, and hepatocellular carcinoma. There is evidence that COX-2-derived mediators may stimulate the activation of hepatic stellate cells, leading to excessive accumulation of extracellular matrix components and the development of fibrosis. Furthermore, COX-2 may contribute to carcinogenesis by enhancing cell proliferation, suppressing apoptosis, and

promoting angiogenesis within the hepatic microenvironment. Due to its important involvement in hepatic inflammation and disease progression, COX-2 is considered a promising therapeutic target in hepatitis-related conditions [2]. Selective inhibition of COX-2 has been proposed as a strategy to reduce hepatic inflammation and limit disease progression. However, the therapeutic use of COX-2 inhibitors should be carefully evaluated, particularly because of the potential systemic adverse effects associated with long-term administration.

Arginine exhibited a binding affinity of −6.1 kcal/mol toward COX-2. This corresponds to a Ki value of approximately 3.4×10^{-5} M, or about 34 μM, indicating moderate inhibitory potential and stable interaction within the active region of the enzyme. The docking simulation was performed using a grid box centered at the coordinates center_x = 36.323000, center_y = 26.465000, and center_z = 23.686000. This allowed the ligand to be accurately positioned within the functional binding pocket of COX-2 (Figure 1).

According to the docking analysis, arginine formed conventional hydrogen bonds with Gln192, Ser353, Leu352, and Met522 (Figure 2). At the same time, an unfavorable positive–positive interaction was observed with Arg513. The affinity toward these amino acid residues can be explained by the structural characteristics of arginine, particularly its polar guanidinium group. This group readily forms hydrogen bonds with polar amino acid residues.

Gln192 and Ser353 play an important role in stabilizing ligand binding through hydrogen bonding and contribute to the firm positioning of the ligand within the active site. Although Leu352 is predominantly hydrophobic, it contributes to the spatial orientation of the ligand through close-contact interactions. Met522, located within the hydrophobic channel of COX-2, is known to participate in substrate positioning. This suggests that arginine may occupy a catalytically significant region of the enzyme.

The unfavorable interaction observed with Arg513 is likely associated with electrostatic repulsion between positively charged groups present in both the ligand and the amino acid residue. However, the presence of several stabilizing hydrogen bonds may compensate for this unfavorable effect and contribute to an overall favorable binding energy.

From a functional perspective, the localization of arginine within the active site may partially block substrate access or disrupt the proper spatial orientation required for enzymatic catalysis. Considering that COX-2 is an enzyme responsible for the conversion of arachidonic acid into pro-inflammatory prostaglandins, such interactions may reduce enzymatic activity and contribute to the attenuation of inflammatory processes. This may be particularly important under hepatitis conditions, where COX-2 expression is elevated.

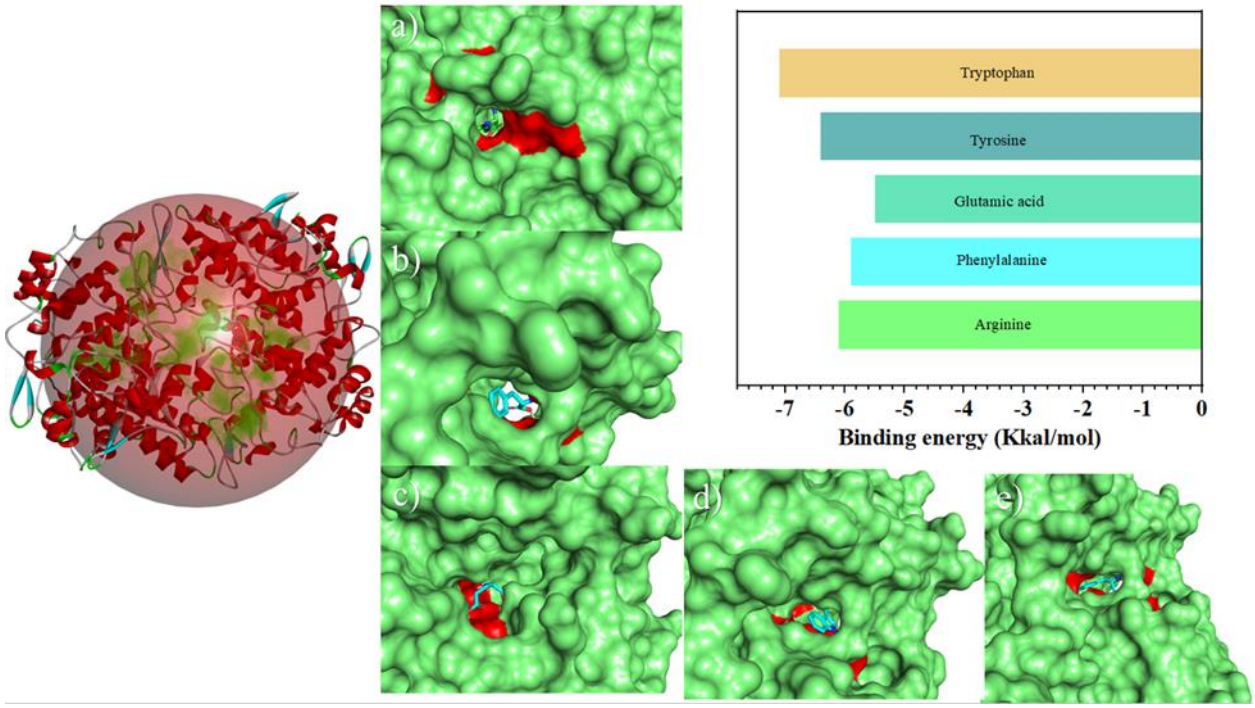


Figure 1. Integrated molecular docking analysis of selected amino acid ligands from the "As-Capsipol" complex with COX-2, illustrating their binding interactions and affinity profiles: (a) arginine, (b) phenylalanine, (c) glutamic acid, (d) tyrosine, and (e) tryptophan.

Phenylalanine exhibited a binding affinity of −5.9 kcal/mol toward COX-2 (Figure 1). This value corresponds to a Ki value of approximately 5.2×10^{-5} M, or about 52 μM. This result indicates that phenylalanine possesses a moderate inhibitory potential. Although this value is slightly weaker compared with that of arginine, it confirms that phenylalanine interacts significantly with the enzyme.

Interaction analysis showed that phenylalanine formed conventional hydrogen bonds with Cys36, Cys41, and Gln461. This indicates that the ligand is stably positioned within the binding pocket. These amino acid residues possess polar or semi-polar properties and are capable of stabilizing the ligand through hydrogen bonding. In particular, cysteine residues such as Cys36 and Cys41 may participate in hydrogen bonding through their thiol groups, thereby contributing to the spatial orientation and stabilization of the ligand. Gln461, as a polar amino acid residue, further enhances the specificity of binding through hydrogen bond formation.

In addition to hydrogen bonds, phenylalanine also exhibits π-related interactions due to its aromatic benzene ring. A π–sigma interaction was observed with Leu152, whereas a π–alkyl interaction was detected with Arg469. Such interactions are important because aromatic amino acids such as phenylalanine are characterized by their ability to form hydrophobic and π-mediated contacts within hydrophobic regions of proteins. This substantially increases the stability of the ligand within the protein binding pocket. These interactions help maintain the ligand in a favorable spatial orientation inside the binding pocket.

At the same time, an unfavorable donor–donor interaction was observed with His39 (Figure 2). This can be explained by competition between hydrogen bond donor groups of phenylalanine and the histidine residue, resulting in a repulsive interaction. However, as in the case of arginine, this unfavorable contact does not dominate the overall binding process, since it is compensated for by several stabilizing interactions.

From structural and functional perspectives, the binding of phenylalanine is mainly supported by hydrophobic and aromatic interactions rather than strong electrostatic forces. This suggests that phenylalanine occupies a relatively hydrophobic region within the COX-2 binding site. As a result, it may interfere with substrate positioning or stabilize an inactive conformation of the enzyme. Considering that COX-2 activity depends on the proper positioning of arachidonic acid within the hydrophobic channel, the localization of phenylalanine in this region may disrupt substrate binding and reduce enzymatic activity.

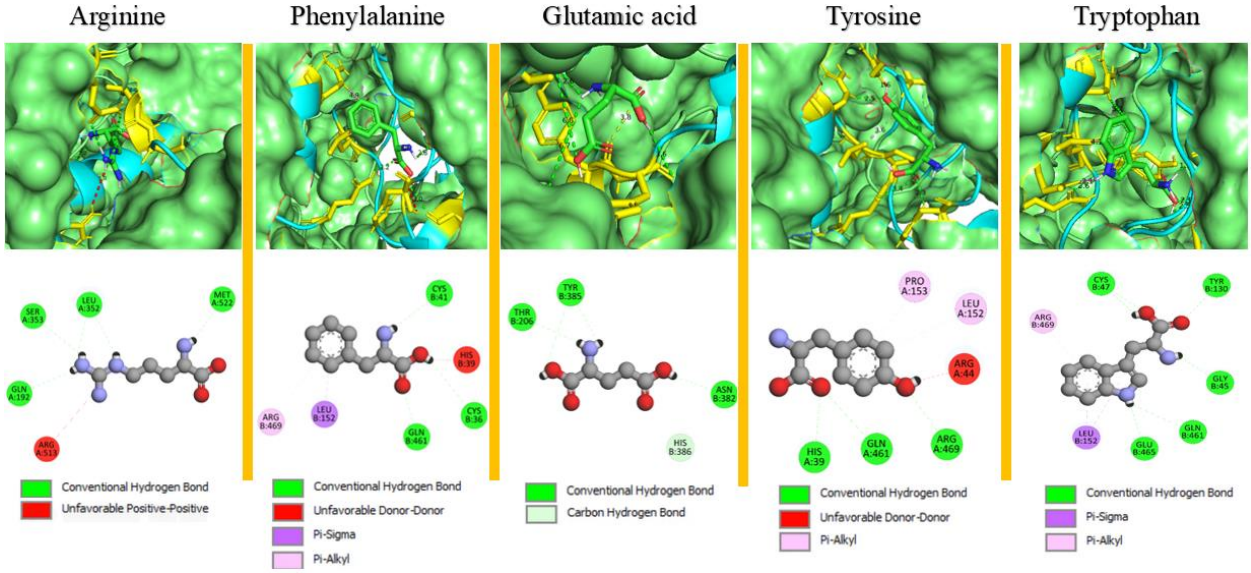

Figure 2. Molecular docking visualization of selected amino acid ligands from the "As-Capsipol" complex within the COX-2 active site, showing the binding modes, interaction networks, and structural conformations of arginine, phenylalanine, glutamic acid, tyrosine, and tryptophan.

Glutamic acid exhibited a binding affinity of −5.5 kcal/mol toward COX-2 (Figure 1). This value corresponds to an estimated Ki value of approximately 9.3×10^{-5} M, or about 93 μM, indicating the presence of moderate inhibitory activity. The docking simulation was performed using a grid box centered at the coordinates center_x = 36.323000, center_y = 26.465000, and center_z = 23.686000. This ensured the proper localization of the ligand within the active site region of the enzyme.

Interaction analysis showed that glutamic acid was stabilized within the binding pocket through several hydrogen bonds involving Thr206, Tyr385, and Asn382, as well as an additional carbon–hydrogen interaction with His386. These amino acid residues are located in the functional region of COX-2 and participate in processes associated with proper ligand positioning and enzymatic activity. In particular, Tyr385 plays an important role in the catalytic mechanism of COX-2 (Figure 2). Its involvement in interaction with the ligand suggests that glutamic acid may influence the functional activity of the enzyme.

Tyrosine showed a binding affinity of −6.4 kcal/mol toward COX-2. Its estimated Ki value was 2.0×10^{-5} M, or approximately 20 μM. This result indicates that tyrosine has a stronger inhibitory potential compared with the other amino

acids present in the "As-Capsipol" complex. The docking simulation was performed using a grid box centered at the coordinates center_x = 36.323000, center_y = 26.465000, and center_z = 23.686000. This allowed the ligand to be properly positioned within the active site of the enzyme (Figure 1).

Interaction analysis demonstrated that tyrosine formed conventional hydrogen bonds with His39, Gln461, and Arg469. These bonds contribute to the stable anchoring of the ligand within the binding pocket. In addition, hydrophobic π–alkyl interactions were observed with Pro153 and Leu152. This indicates that the aromatic ring of tyrosine is well positioned within the hydrophobic region of the active site. An unfavorable donor–donor interaction with Arg44 was also detected, which may be associated with repulsion between hydrogen bond donor groups. However, this unfavorable interaction does not substantially affect the overall stability of the complex.

The combined presence of hydrogen bonds and hydrophobic interactions indicates that tyrosine is effectively stabilized within the functional region of COX-2. While His39 and Gln461 play an important role in anchoring the ligand within the binding pocket, Arg469 provides an additional contribution to its spatial orientation (Figure 2). The involvement of Pro153 and Leu152 highlights the importance of hydrophobic contacts in maintaining the ligand in an appropriate orientation within the binding cavity.

From a functional perspective, the binding of tyrosine in this region may interfere with substrate entry into the active site or alter the spatial arrangement of catalytically important amino acid residues. Since COX-2 is responsible for converting arachidonic acid into pro-inflammatory prostaglandins, occupation of the active site by tyrosine may reduce enzymatic efficiency. Consequently, this interaction may contribute to the anti-inflammatory potential of the "As-Capsipol" complex, particularly under conditions such as hepatitis, where COX-2 expression is increased.

Tryptophan exhibited a binding affinity of −7.1 kcal/mol toward COX-2. Its estimated Ki value was 6.0×10^{-6} M, or approximately 6 μM. This result indicates that tryptophan has a stronger inhibitory potential than the other amino acids identified in the "As-Capsipol" complex. The docking analysis was performed using a grid box centered at the coordinates center_x = 36.323000, center_y = 26.465000, and center_z = 23.686000. This ensured precise positioning of the ligand within the active site of the enzyme (Figure 1).

The interaction profile showed that tryptophan was stabilized within the COX-2 binding pocket through several conventional hydrogen bonds involving Cys47, Tyr130, Gly45, Gln461, and Glu465 (Figure 1). These amino acid residues facilitate the anchoring of the ligand in the active site and support its proper spatial orientation. In addition to hydrogen bonds, π-related interactions, including π–sigma and π–alkyl contacts with Leu152 and Arg469, were also observed. This suggests that the aromatic indole ring of tryptophan plays an important role in stabilizing the ligand within the hydrophobic microenvironment.

The combined presence of polar and hydrophobic interactions indicates that tryptophan is well positioned within the functional region of COX-2. Gln461 and Glu465 contribute to stabilization through hydrogen bonding, whereas Tyr130 and Cys47 further strengthen ligand binding through polar contacts. The aromatic structure of tryptophan enables it to form strong interactions with hydrophobic amino acid residues. This may explain its relatively high binding affinity.

Functionally, the localization of tryptophan within the active site may significantly hinder substrate entry or disrupt the catalytic microenvironment required for prostaglandin synthesis. Since COX-2 is one of the key enzymes involved in the production of pro-inflammatory mediators, the strong binding of tryptophan may lead to reduced enzymatic activity. These findings suggest that tryptophan may play an important role in the anti-inflammatory effect of the "As-Capsipol" complex. This is particularly relevant for pathological conditions such as hepatitis, where COX-2 is highly expressed.

CONCLUSION

The molecular docking analyses demonstrated that the selected amino acids contained in the "As-Capsipol" dietary supplement are capable of forming stable interactions with the active site of the COX-2 enzyme. In particular, the relatively high binding affinities of tryptophan and tyrosine suggest that they may play an important role in modulating inflammatory processes at the molecular level. Arginine, phenylalanine, and glutamic acid were also found to interact with COX-2 through hydrogen bonds, hydrophobic interactions, and electrostatic interactions, thereby potentially contributing to the overall biological activity of the complex. The obtained results provide an in silico-based scientific rationale for the anti-inflammatory potential of the "As-Capsipol" complex and establish a theoretical basis for further experimental studies.

БИООРГАНИЧЕСКИЕ И ХИМИЧЕСКИЕ СВОЙСТВА ГИДРОФИЛЬНЫХ И ЛИПОФИЛЬНЫХ АНТИОКСИДАНТОВ В СОСТАВЕ HIPPOPHAE RHAMNOIDES L. И ИХ ФАРМАЦЕВТИЧЕСКИЕ ПЕРСПЕКТИВЫ

Аннотация: *Hippophae rhamnoides L. (облепиха) является лекарственным и пищевым растением, богатым витаминами, флавоноидами, фенольными кислотами, каротиноидами, токоферолами и другими биологически активными соединениями. Важной фитохимической особенностью облепихи является одновременное присутствие в её составе гидрофильных и липофильных антиоксидантных компонентов. В данной статье на основе данных современной научной литературы, индексированной в базе Scopus, систематизированы основные антиоксидантные компоненты H. rhamnoides. Флавоноиды, аскорбиновая кислота и фенольные кислоты рассмотрены как важнейшие компоненты гидрофильной антиоксидантной системы, а каротиноиды и токоферолы — липофильной антиоксидантной системы. Проведена сравнительная оценка их молекулярного строения, антиоксидантных свойств и распределения в различных органах растения. Научные данные показывают, что фитохимический состав облепихи изменяется в зависимости от генотипа, географического происхождения, органа растения, сроков сбора и условий переработки. Комплексное присутствие гидрофильных и липофильных антиоксидантов позволяет рассматривать H. rhamnoides как перспективный природный источник для производства антиоксидантных, нутрицевтических и фармацевтических продуктов.****

BIOORGANIC AND CHEMICAL PROPERTIES OF HYDROPHILIC AND LIPOPHILIC ANTIOXIDANTS IN HIPPOPHAE RHAMNOIDES L. AND THEIR PHARMACEUTICAL PROSPECTS

Abstract: Hippophae rhamnoides L. *(sea buckthorn) is a medicinal and food plant rich in vitamins, flavonoids, phenolic acids, carotenoids, tocopherols, and other biologically active compounds. An important phytochemical characteristic of sea buckthorn is the simultaneous presence of hydrophilic and lipophilic antioxidant components. This article systematizes the main antioxidant components of* H. rhamnoides *based on data from recent scientific literature indexed in the Scopus database. Flavonoids, ascorbic acid, and phenolic acids were analyzed as important components of the hydrophilic antioxidant system, while carotenoids and tocopherols were considered key components of the lipophilic antioxidant system. Their molecular structures, antioxidant properties, and*

distribution among different plant organs were comparatively evaluated. Scientific data indicate that the phytochemical composition of sea buckthorn varies depending on genotype, geographical origin, plant organ, harvesting time, and processing conditions. The combined presence of hydrophilic and lipophilic antioxidants makes H. rhamnoides *a promising natural source for antioxidant, nutraceutical, and pharmaceutical products.*

Keywords: Hippophae rhamnoides L., *sea buckthorn, flavonoids, carotenoids, tocopherols, ascorbic acid, antioxidants, bioorganic chemistry, pharmaceuticals.*

Kirish. Dorivor o‘ simliklar tarkibidagi tabiiy biologik faol birikmalar zamonaviy bioorganik, farmasevtik va oziq-ovqat kimyosining muhim tadqiqot ob’ektlaridan biri hisoblanadi. Ayniqsa, oksidlovchi stress jarayonlariga ta’sir ko‘ rsatuvchi tabiiy antioksidantlarni izlashda flavonoidlar, fenol kislotalari, vitaminlar, karotinoidlar va tokoferollarga boy o‘ simliklarga katta e’tibor qaratilmoqda [1].

Antioksidant moddalarning biologik xususiyatlari ularning faqat antiradikal faolligi bilan emas, balki molekular tuzilishi, qutbliligi, eruvchanligi va biologik muhitda taqsimlanishi bilan ham bog‘ liq. Shu nuqtai nazardan antioksidantlarni shartli ravishda gidrofil va lipofil komponentlarga ajratish mumkin. Askorbin kislotasi va ko‘ plab polifenollar suvli muhitda yaxshi eruvchan bo‘ lsa, karotinoidlar va tokoferollar lipid muhitlarida yuqori faollik namoyon etadi [2].

Hippophae rhamnoides L. Elaeagnaceae oilasiga mansub ko‘ p yillik o‘ simlik bo‘ lib, ushbu ikki xil antioksidant tizimni bir fitokompleksda birlashtirishi bilan alohida ahamiyatga ega. Zamonaviy ilmiy tadqiqotlarda chakanda mevalari, barglari, urug‘ lari va boshqa organlarida flavonoidlar, fenol kislotalari, askorbin kislotasi, karotinoidlar, tokoferollar, tanninlar va boshqa ikkilamchi metabolitlar aniqlangan [3].

Chakandaning fitokimyoviy tarkibi yuqori darajada murakkab. Zamonaviy tadqiqotlarda uning tarkibida vitaminlar, mineral elementlar, organik kislotalar, aminokislotalar, oqsillar, lignanlar, triterpenoidlar, uchuvchan birikmalar va boshqa biologik faol moddalar mavjudligi qayd etilgan.

2023 yilda *Journal of Agricultural and Food Chemistry* jurnalida chop etilgan keng qamrovli tahlilda *H. rhamnoides* tarkibida 99 ta flavonoid, 44 ta lignan, 64 ta uchuvchan komponent, 31 ta tannin va 30 ta terpenoyd kabi ko‘ p sonli tabiiy birikmalar tizimlashtirilgan. Bu ma’lumotlar chakandaning bioorganik kimyo nuqtai nazaridan murakkab va istiqbolli ob’ekt ekanini ko‘ rsatadi. Shu bilan birga, o‘ simlikning turli organlari kimyoviy tarkibi jihatidan bir-biridan farq qiladi. Meva va po‘ stloq karotinoidlar hamda ayrim flavonoidlarga boy bo‘ lsa, barglarda kversetin, kempferol va izoramnetin hosilalari kabi polifenollar ko‘ proq to‘ planishi mumkin [4].

Scopus bazasida indekslangan zamonaviy ilmiy adabiyotlar ma’lumotlari asosida *Hippophae rhamnoides L.* tarkibidagi gidrofil va lipofil antioksidant birikmalarni tizimlashtirish, ularning molekular va bioorganik xususiyatlarini tahlil qilish hamda farmasevtik qo‘ llanish istiqbollarini baholashdan iborat.

***H. rhamnoides* ning fitokimyoviy xususiyatlari.** Chakanda fitokimyoviy jihatdan ko‘ p komponentli tabiiy tizim hisoblanadi. Uning mevasi, po‘ stlog‘ i, urug‘ i, bargi va shoxlarida biologik faol moddalarning turli sinflari aniqlangan [5].

Zamonaviy adabiyotlarda *H. rhamnoides* tarkibida polifenollar, flavonoidlar, fenol kislotalari, vitaminlar, aminokislotalar, minerallar, karotinoidlar, organik kislotalar va terpen tabiatli moddalar mavjudligi ko‘ rsatilgan. Chakandaning farmakologik potensiali bitta alohida komponent bilan emas, balki turli fizik-kimyoviy xususiyatlarga ega moddalar kompleksi bilan bog‘ liq. Bu o‘ simlikni kompleks fitokimyoviy tizim sifatida tahlil qilish zaruratini keltirib chiqaradi. Bioorganik nuqtai nazardan chakandaning eng muhim xususiyatlaridan biri gidrofil va lipofil tabiatga ega antioksidant birikmalarning bir vaqtda mavjudligidir. Bu ularning turli biologik muhitlarda faollik ko‘ rsatish imkoniyatini oshiradi.

Gidrofil antioksidant komponentlar. Flavonoidlar. Flavonoidlar *H. rhamnoides* tarkibidagi asosiy fenol metabolitlaridan biri hisoblanadi. Adabiyotlarda ular orasida kversetin, kempferol, izoramnetin va ularning turli glikozid hosilalari ko‘ p uchrashi qayd etilgan.

2021 yilda *Journal of Food Composition and Analysis*da chop etilgan tadqiqotda chakanda barglari va meva po‘ stlog‘ ida flavonollar yuqori miqdorda uchrashi, ular tarkibida kversetin, izoramnetin va kempferol hosilalarining ustunligi ko‘ rsatilgan.

Kversetin flavonollar sinfiga mansub bo‘ lib, molekulasidagi fenol gidroksil guruhlarining ko‘ pligi uning antioksidant xususiyatlarini belgilaydi. U elektron yoki vodorod atomini berish orqali reaktiv radikallarni neytrallashda ishtirok etishi mumkin. Izoramnetin kversetinning metoksillangan hosilasi hisoblanadi. Molekulada metoksil guruhining mavjudligi uning qutbliligi, lipofilligi va biologik muhitda taqsimlanish xususiyatlariga ta’sir ko‘ rsatadi [5].

Kempferol ham polifenol tabiatli flavonol bo‘ lib, uning turli glikozid hosilalari chakanda tarkibida aniqlangan. Flavonoid molekulasiga uglevod fragmentining birikishi uning suvda eruvchanligi, transport xususiyatlari va biokiraolishligiga ta’sir qilishi mumkin. Shu sababli chakanda tarkibidagi flavonoidlarni o‘ rganishda faqat umumiy

flavonoidlar miqdorini emas, balki aglikon va glikozid shakllarini ham hisobga olish zarur. Chakanda barglarining kimyoviy tarkibini baholashda HPLC va UHPLC-ESI-QTOF-MS kabi zamonaviy analitik usullar qo‘llangan. Alohida flavonoidlarning taqsimlanishi asosida turli geografik kelib chiqishga ega namunalarni farqlash mumkinligi ko‘rsatilgan. Bu natijalar flavonoidlar nafaqat biologik faol komponentlar, balki chakanda xomashyosining kimyoviy xususiyatlarini tavsiflovchi muhim ko‘rsatkichlar ekanini ham ko‘rsatadi [6].

Askorbin kislotasi. Chakanda mevasi askorbin kislotasi -C vitaminining tabiiy manbalaridan biri hisoblanadi. Askorbin kislotasi suvda eruvchan redoks-faol birikma bo‘lib, reaktiv kislorod turlarini neytrallash jarayonlarida ishtirok etadi. Uning molekular strukturasi elektron berish va qayta oksidlanish-qaytarilish reaksiyalarida ishtirok etish qobiliyatini belgilaydi. Shu bois askorbin kislotasi gidrofil antioksidant tizimning muhim komponenti hisoblanadi.

Chakanda tarkibida askorbin kislotasining flavonoidlar va fenol kislotalari bilan birgalikda mavjudligi umumiy antioksidant potensialni shakllantirishda muhim ahamiyatga ega. Shu bilan birga, C vitamini miqdori o‘simlik navi, pishish darajasi, iqlim sharoiti, saqlash va qayta ishlash texnologiyasiga qarab o‘zgarishi mumkin. Bu chakanda mahsulotlarini tayyorlashda texnologik omillarni hisobga olish zarurligini ko‘rsatadi.

Lipofil antioksidant komponentlar. Karotinoidlar. Chakanda mevasining sariq, to‘q sariq va qizg‘ish ranglari asosan karotinoidlar mavjudligi bilan bog‘liq. Karotinoidlar molekulasida uzun kon’yugirlangan qo‘shbog‘lar tizimi mavjud bo‘lgan lipofil tabiatli birikmalardir. Ushbu kon’yugirlangan elektron tizim singlet kislorod va ayrim reaktiv kislorod turlarining energiyasini qabul qilish va tarqatish imkoniyatini beradi. Shu sababli karotinoidlar lipofil antioksidant himoya tizimining muhim tarkibiy qismi hisoblanadi.

Chakanda tarkibida β-karotin, lyutein, zeaksantin va boshqa karotinoidlar aniqlangan. β-karotin provitamin A xususiyatiga ega bo‘lib, organizmda retinoidlar hosil bo‘lishida prekursor vazifasini bajaradi. Karotinoidlarning miqdori va nisbati nav, geografik kelib chiqish, pishish bosqichi va o‘simlik qismiga bog‘liq ravishda sezilarli darajada farq qilishi mumkin. Ayrim tadqiqotlarda chakanda mevalarida umumiy karotinoidlar miqdori barglarga nisbatan bir necha marta yuqori ekani ko‘rsatilgan. Bu meva va meva po‘stlog‘ini karotinoidlar olish uchun istiqbolli xomashyo sifatida baholashga asos beradi.

Tokoferollar. Tokoferollar E vitamini faolligiga ega lipofil antioksidantlar hisoblanadi. Ular hujayra membranalari va boshqa lipid tizimlarida lipid peroksidlanish jarayonlarini cheklashda muhim ahamiyatga ega. Chakanda tarkibida α-, γ- va δ-tokoferollar kabi izomerlar uchraydi. Ular orasida α-tokoferol biologik faolligi yuqori shakllardan biri hisoblanadi.

Tokoferol molekulasidagi xromanol halqasi vodorod atomini berish orqali lipid radikallarini barqarorlashtirishda ishtirok etadi. Shu yo‘l bilan lipid peroksidlanishining zanjirli reaksiyasi susayishi mumkin. Chakandaning turli organlarida tokoferollar bir xil miqdorda taqsimlanmaydi. Adabiyotlarda urug‘ va meva qismlarida ularning miqdori genotip va texnologik qayta ishlash sharoitiga bog‘liq ekani qayd etilgan. Karotinoidlar va tokoferollarning bir fitokompleksda mavjudligi chakandaning lipofil antioksidant potensialini belgilaydi.

O‘simlik organlari bo‘yicha biologik faol moddalarning taqsimlanishi. Chakanda tarkibidagi biologik faol moddalar o‘simlik organlari bo‘yicha bir xil taqsimlanmagan.

1-jadval.

Hippophae rhamnoides L. o‘simligining turli qismlaridagi asosiy biologik faol komponentlar va ulardan foydalanishning istiqbolli yo‘nalishlari

O‘simlik qismi	Asosiy biologik faol komponentlar	Istiqbolli yo‘nalish
Meva va po‘stloq	karotinoidlar, askorbin kislotasi, flavonoidlar	antioksidant va nutritsevtik mahsulotlar
Barg	kversetin, kempferol, izoramnetin hosilalari	polifenol ekstraktlari
Urug’	tokoferollar va boshqa lipofil komponentlar	funksional mahsulotlar
Shox va endokarp	flavan-3-ollar, protsianidinlar	fenol birikmalari manbai

2021-yilgi kompleks tadqiqotlarda chakandaning meva po‘stlog‘i va barglarida kversetin, izoramnetin va kempferol hosilalari, shoxlar va urug‘ endokarpida esa flavan-3-ollar va polimer protsianidinlar ustun ekani ko‘rsatilgan. Bu ma’lumotlar chakanda xomashyosini baholashda qaysi o‘simlik qismi ishlatilayotganini albatta hisobga olish zarurligini ko‘rsatadi. Masalan, flavonoidlarga boy ekstrakt olish maqsad qilinganda barglar istiqbolli bo‘lishi mumkin, karotinoidlarga boy mahsulot olishda esa meva va uning po‘stlog‘i muhim xomashyo hisoblanadi. Demak, chakandaning farmatsevtik va nutritsevtik qiymati o‘simlikning muayyan organi bilan bevosita bog‘liq.

Geografik va texnologik omillarning ta’siri. Chakandaning fitokimyoviy tarkibi genetik omillar bilan bir qatorda geografik va ekologik sharoitlarga ham bog‘liq. Turli geografik hududlarda o‘sgan chakanda namunalarini qiyosiy o‘rganishda flavonoidlar, karotinoidlar, tokoferollar va boshqa metabolitlar tarkibida farqlar aniqlangan.

Bu farqlarga tuproq tarkibi, harorat, yorug‘ lik, suv ta’minoti, balandlik va boshqa ekologik omillar ta’sir qilishi mumkin. O‘ simlikning yig‘ ib olish vaqti ham muhim ahamiyatga ega. Pishish jarayoni davomida pigmentlar, organik kislotalar, vitaminlar va polifenollar miqdori o‘ zgarishi mumkin.

Quritish, saqlash va ekstraksiya texnologiyalari ham biologik faol moddalarning saqlanishiga ta’sir ko‘ rsatadi. Ayniqsa, askorbin kislotasi va ayrim karotinoidlar tashqi muhit omillariga sezgir bo‘ lishi mumkin. Shu sababli xalqaro adabiyotlarda keltirilgan aniq miqdoriy ko‘ rsatkichlarni O‘ zbekistonda o‘ sadigan yoki yetishtiriladigan *H. rhamnoides* xomashyosiga to‘ g‘ ridan-to‘ g‘ ri ko‘ chirish ilmiy jihatdan maqsadga muvofiq emas. Mahalliy xomashyoni alohida o‘ rganish, uning flavonoid, karotinoid, tokoferol va askorbin kislotasi tarkibini aniqlash kelgusida muhim tadqiqot yo‘ nalishi bo‘ lishi mumkin.

Gidrofil va lipofil antioksidantlarning bioorganik o‘ zaro bog‘ liqligi. Chakan daning asosiy ilmiy xususiyati alohida bir antioksidant moddaning yuqori miqdorida emas, balki turli fizik-kimyoviy xususiyatlarga ega antioksidant birikmalarning bir fitokompleksda mavjudligidadir.

Flavonoidlar va askorbin kislotasi kabi gidrofil komponentlar asosan suvli biologik muhitlarda redoks jarayonlarida ishtirok etadi. Tokoferollar va karotinoidlar esa lipofil xususiyatlari tufayli biologik membranalar va boshqa lipid muhitlarida muhim antioksidant vazifa bajarishi mumkin.

Ularning molekular ta’sir mexanizmlari ham bir-biridan farq qiladi. Flavonoidlarda fenol gidroksil guruhlarining elektron yoki vodorod berish qobiliyati muhim ahamiyatga ega. Hosil bo‘ lgan fenoksil radikal kon’yugirlangan elektron tizimida barqarorlashadi. Karotinoidlarda uzun kon’yugirlangan qo‘ shbog‘ lar tizimi reaktiv kislorod turlarining energiyasini qabul qilish va so‘ ndirish imkonini beradi.

Tokoferollarda esa xromanol halqasi lipid radikallariga vodorod berib, lipid peroksidlanishining zanjirli reaksiyalarini cheklashda ishtirok etadi.

Askorbin kislotasi esa suvli fazada redoks-faol modda sifatida ishlaydi. Shu jihatdan chakanda tarkibini «bitta antioksidant -bitta biologik ta’sir» modelida baholash yetarli emas. Uni gidrofil va lipofil komponentlardan tashkil topgan ko‘ p komponentli bioorganik antioksidant tizim sifatida qarash ilmiy jihatdan asosliroq hisoblanadi.

Farmakologik va farmasevtik ahamiyati. Zamonaviy ilmiy adabiyotlarda chakanda ekstraktlari va uning ayrim biologik faol komponentlari uchun antioksidant, yallig‘ lanishga qarshi, gepatoprotektor, kardioprotektor, neyroprotektor va antimikrob xususiyatlar haqida ma’lumotlar keltirilgan. Ushbu ta’sirlarning shakllanishida flavonoidlar, askorbin kislotasi, karotinoidlar va tokoferollar kabi antioksidant komponentlar muhim o‘ rin egallashi mumkin. Farmasevtik nuqtai nazardan eng muhim vazifa chakanda tarkibidagi biologik faol moddalarni sifat va miqdor jihatdan standartlashtirish hisoblanadi.

Chunki o‘ simlikning fitokimyoviy tarkibi genotip, organ, geografik hudud va qayta ishlash texnologiyasiga bog‘ liq ravishda o‘ zgarishi mumkin. Shu sababli chakanda asosida farmasevtik yoki nutritsevtik mahsulot ishlab chiqishda faqat umumiy antioksidant faollik ko‘ rsatkichidan foydalanish yetarli emas.

Flavonoid tarkibi, karotinoidlar tarkibi, tokoferollar va askorbin kislotasi kabi asosiy komponentlarni kompleks aniqlash mahsulot sifatini to‘ liqroq baholash imkonini beradi. Flavonoidlarni HPLC yoki LC-MS, karotinoidlarni HPLC-DAD, tokoferollarni esa yuqori samarali suyuqlik xromatografiyasi kabi analitik usullarda baholash mumkin. Bunday yondashuv chakanda xomashyosining bioorganik tarkibi bilan uning biologik va farmasevtik xususiyatlari o‘ rtasidagi bog‘ liqlikni aniqlash imkonini beradi.

Xulosa. Scopus bazasida indekslangan zamonaviy ilmiy ma’lumotlar tahlili *Hippophae rhamnoides L.* ni fitokimyoviy jihatdan murakkab va biologik faol birikmalarga boy dorivor o‘ simlik sifatida tavsiflash imkonini beradi. Chakandaning muhim xususiyati uning tarkibida gidrofil va lipofil antioksidant komponentlarning bir vaqtda mavjudligidir. Gidrofil tizim flavonoidlar, fenol kislotalari va askorbin kislotasi bilan, lipofil tizim esa asosan karotinoidlar va tokoferollar bilan ifodalanadi.

Flavonoidlar orasida kversetin, kempferol va izoramnetin hosilalari muhim o‘ rin egallaydi. Ularning molekular tuzilishi, gidroksil va metoksil guruhlarining mavjudligi hamda glikozidlanish xususiyatlari biologik faolligiga ta’sir ko‘ rsatadi. Karotinoid larning kon’yugirlangan qo‘ shbog‘ lar tizimi va tokoferollarning xromanol strukturasi ularning lipofil antioksidant xususiyatlarining molekular asosini tashkil etadi. Askorbin kislotasi esa suvli muhitda redoks jarayonlarida ishtirok etuvchi muhim gidrofil komponent hisoblanadi.

Adabiyot ma’lumotlari chakandaning fitokimyoviy taxlili o‘ simlik organi, genotip, geografik sharoit, yig‘ ish vaqti va qayta ishlash texnologiyasiga bog‘ liq ravishda o‘ zgarishini ko‘ rsatadi. Shu sababli *H. rhamnoides* xomashyosini standartlashtirishda kompleks fitokimyoviy yondashuv talab etiladi.

Shu nuqtai nazardan chakanda tarkibidagi flavonoidlar, karotinoidlar, tokoferollar va askorbin kislotasini birgalikda o‘ rganish «molekular tuzilish -fizik-kimyoviy xususiyat -antioksidant faollik -farmasevtik qo‘ llanish» o‘ rtasidagi bog‘ liqlikni tushuntirish uchun muhim ilmiy yo‘ nalish hisoblanadi. *Hippophae rhamnoides L.* ning gidrofil va lipofil

antioksidantlarga boyligi uni standartlashtirilgan o‘ simlik ekstraktlari, antioksidant komplekslar, nutritsevtik va farmatsevtik mahsulotlar yaratish uchun istiqbolli tabiiy xomashyo sifatida baholashga asos beradi.

FAOLLASHTIRILGAN VA METALL BIRIKMALARI BILAN MODIFIKATSIYALANGAN KO‘ MIRLARNI RENTGEN-DIFRAKSION TAHLIL QILISH USULLARI

Obidjon Olimjon o‘ g‘ li Ummatov
G‘ olibjon Mamayunusovich Ochilov
Qo‘ qon davlat universiteti

Annotatsiya: *Ushbu maqolada faollashtirilgan uglerodli materiallarni turli metall birikmalari (Fe, Cu, Zn, Mn, Al, Mg) bilan modifikatsiyalashning sirt arxitekturasi va faza tarkibiga ta’siri adabiyotlar tahlili hamda rentgen-difraksion tahlil (XRD) usullari yordamida ko‘ rib chiqilgan. Turli o‘ tish va ishqoriy-yer metallari oksidlarining uglerod matrisasida taqsimlanishi, yangi faol va katalitik markazlar hosil qilish mexanizmlari hamda ularning g‘ ovaklik tuzilishiga ta’siri tizimlashtirilgan. Modifikatsiyalash jarayonida metall miqdori va termik ishlov berish haroratini optimallashtirishning materialning yakuniy fizik-kimyoviy xossalarini belgilashdagi roli ko‘ rsatib o‘ tilgan.*

Kalit so‘ zlar: *faollashtirilgan ko‘ mir, metall birikmalari, modifikatsiyalash, rentgen-difraksion tahlil (XRD), faza tarkibi, adsorbsiya, sirt maydoni.*

X-RAY DIFFRACTION ANALYSIS METHODS FOR ACTIVATED AND METAL COMPOUND-MODIFIED CARBONS

Abstract: *In this paper, the effects of modifying activated carbon materials with various metal compounds (Fe, Cu, Zn, Mn, Al, Mg) on their surface architecture and phase composition are reviewed using literature analysis and X-ray diffraction (XRD) techniques. The distribution of various transition and alkaline-earth metal oxides within the carbon matrix, the mechanisms of generating new active and catalytic centers, and their overall impact on the porous structure are systematically classified. Furthermore, the role of optimizing metal loading and thermal treatment temperatures during the modification process in determining the final physicochemical properties of the materials is highlighted.*

Keywords: *activated carbon, metal compounds, modification, X-ray diffraction (XRD), phase composition, adsorption, surface area.*

МЕТОДЫ РЕНТГЕНОДИФРАКЦИОННОГО АНАЛИЗА АКТИВИРОВАННЫХ И МОДИФИЦИРОВАННЫХ СОЕДИНЕНИЯМИ МЕТАЛЛОВ УГЛЕЙ

Аннотация: *В данной статье с использованием анализа литературы и методов рентгеновской дифракции (РФА) рассмотрено влияние модификации активированных углеродных материалов различными металлическими соединениями (Fe, Cu, Zn, Mn, Al, Mg) на архитектуру поверхности и фазовый состав. Систематизированы распределение оксидов различных переходных и щёлочноземельных металлов в углеродной матрице, механизмы формирования новых активных и каталитических центров, а также их влияние на пористую структуру. Показана роль оптимизации количества металла и температуры термической обработки в процессе модификации при определении конечных физико-химических свойств материалов.*

Ключевые слова: *активированный уголь, металлические соединения, модификация, рентгеновская дифракция (РФА), фазовый состав, адсорбция, площадь поверхности.*

Kirish

Bugungi kunda oqova suvlarni sanoat chiqindilari, og‘ ir metallar, antibiotiklar va turli organik ekologik pollutantlardan tozalashda faollashtirilgan ko‘ mirlar eng samarali adsorbentlar hisoblanadi. Biroq, oddiy faollashtirilgan ko‘ mirlarning selektivligi va ma’lum turdagi qutbli yoki anionli birikmalarga nisbatan sig‘ imi cheklangan bo‘ lib, bu ularni kimyoviy va strukturaviy jihatdan modifikatsiyalash zaruriyatini tug‘ diradi. Uglerod sirtiga o‘ tish va ishqoriy-yer metallari birikmalarini kiritish materialning nafaqat adsorbsion, balki katalitik va magnit xossalarini ham sezilarli darajada oshirish imkonini beradi.

Adabiyotlar tahlili

Ilmiy manbalarning tahlili shuni ko‘ rsatadiki, ferrosen va temir saqlovchi birikmalar bilan modifikatsiyalangan faollashtirilgan ko‘ mirlar fenol kabi aromatik birikmalarni yutishda dastlabki ko‘ mirga qaraganda yuqoriroq sig‘ im namoyon etadi. Temir saqlovchi nanozarrachalar materialning sirt va g‘ ovak xossalarini o‘ zgartirib, qo‘ shimcha koordinatsion markazlar hosil qiladi [1]. Masalan, lignin asosidagi magnit faollashtirilgan ko‘ mir kompozitlari suv muhitidan atenolol, karbamazepin, diklofenak va sulfametoksazol kabi murakkab farmatsevtik moddalarni muvaffaqiyatli ajratishda yuqori samaradorlik ko‘ rsatgan. Xususan, Mqehe-Nedzivhe va hammualliflari mezoporoz ferrosen-modifikatsiyalangan faollashtirilgan ko‘ mirni maxsus fenolni yutish uchun moslashtirib, xuddi shunday natijani tasdiqlagan [2].

Mis birikmalari (CuO, Cu_2O yoki metall Cu fazalari shaklida) uglerod matrisasiga kiritilganda, tizimda oksidlanish-qaytarilish jarayonlari faollashadi. Mis ionlari organik adsorbentlar bilan barqaror komplekslar hosil qilish xususiyatiga ega bo‘ lganligi sababli, bunday materiallar antibiotiklar va aromatik bo‘ yoqlarni destruksiya qilishda qo‘ llaniladi. Xususan, Cu, Cu_2O va CuO faza aralashmalarini saqlovchi g‘ ovak uglerod siprofloksatsinni adsorbsiyalashda yuqori kinetik ko‘ rsatkichlar qayd etgan. Shuningdek, uglerod yuzasining oksidlanish darajasi hamda sirt funksional guruhlarining tabiati aromatik va organik moddalarning adsorbsiya mexanizmiga sezilarli ta’sir ko‘ rsatishi turli ilmiy izlanishlarda qayd etilgan [1, 3, 6].

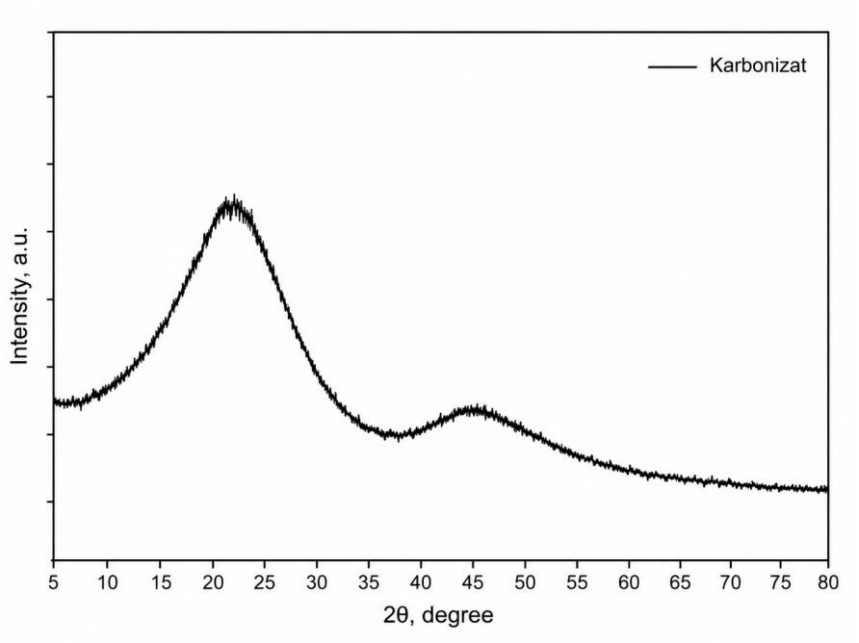
Rux oksidi (ZnO) kiritilgan tizimlarda esa sirtda bir vaqtning o‘ zida ham adsorbsion, ham fotokatalitik markazlar shakllanadi. ZnO ning gidroksillangan sirti qutbli organik molekulalar bilan kuchli dipol-dipol ta’sirlashuviga kirishadi. Masalan, magnitli Fe_3O_4 va ZnO nanozarrachalari bilan kompleks modifikatsiyalangan o‘ simlik asosidagi ko‘ mirlar siprofloksatsin adsorbsiyasida samarali bo‘ lib, magnitli komponent materialni sarflangan eritmadan magnit separatsiya yordamida oson ajratib olish imkonini beradi. Bu o‘ rinda, $ZnCl_2$ bilan faollashtirish jarayoni (bu yerda rux tuzi g‘ ovak hosil qiluvchi agent vazifasini baja-radi) va tayyor ko‘ mir sirtiga ZnO fazasini o‘ tirish to‘ liq farqli mexanizmlar ekanligini ta’kidlash lozim. Har ikki holatda ham yakuniy material tarkibidagi qoldiq rux miqdorini rentgen-difraksion tahlil yordamida nazorat qilish talab etiladi [7].

Marganes birikmalari (MnO_2 va aralash MnO_x oksidlari) uglerod sirtida Lyuis kislotali va faol kislorodli markazlarni hosil qiladi. Ular nafaqat adsorbsiyani, balki organik moddalarning katalitik oksidlanishini (geterogen Fenton-simon jarayonlar) ham tezlashtiradi [3]. Guruch somoni asosidagi faollashtirilgan ko‘ mirga Mn va Ce oksidlari kiritilganda fenolning adsorbsiyasi va keyingi termik oksidlanish orqali materialning yuqori darajada regeneratsiyalanishi isbotlangan. Biroq, metall oksidining miqdori kritik ahamiyatga ega: kam miqdordagi MnO_2 yangi faol markazlar hosil qilsa, uning ortiqcha miqdori (1 dan 50 % gacha bo‘ lgan kompozitlarda) uglerod sirtini to‘ liq qoplab, mikrog‘ ovaklarni bloklab qo‘ yadi.

Alyuminiy (Al_2O_3, $Al(OH)_3$ yoki Al-MOF) va magniy (MgO, $Mg(OH)_2$) birikmalari sirtning elektrostatik va kislota-asos tabiatini o‘ zgartiradi. Alyuminiy sirtidagi gidroksil guruhlari anionli tabiatga ega bo‘ yoqlar (masalan, Erioxrom qora T) va gerbitsidlar (paraquat) bilan vodorod bog‘ lari hamda kuchli elektrostatik bog‘ lanishlar hosil qiladi. Magniy oksidi (MgO) esa aksincha, sirtning asoslilik xossasini (pH_{pzc}) oshirib, kislotali funksional guruhli adsorbatlar bilan faol ta’sirlashadi. Garchi MgO bilan qoplash natijasida solishtirma sirt maydoni 1540 dan 1246 m2/g gacha kamaygan bo‘ lsa-da, kimyoviy markazlarning ortishi hisobiga metilen ko‘ kini yutish sig‘ imi yaxshilangan. Metall miqdorining ortishi har doim adsorbsiyani yaxshilamaydi, shu sababli xomashyoni kimyoviy-termik ishlash bosqichlarini mukammal boshqarish talab etiladi [5].

Tadqiqot metodologiyasi

Tadqiqot doirasida dastlabki xomashyo sifatida mahalliy yog‘ och chiqindilari tanlab olindi. Karbonizatsiya va keyingi kimyoviy hamda termik ishlov berish jarayonlari yog‘ och asosidagi uglerodli materialning makromolyukulyar karkasi va g‘ ovaklik tuzilishiga bevosita ta’sir ko‘ rsatadi. Tajribalarda faollashtirish jarayonidan so‘ ng uglerod qatlamlarining tartiblanish (kristallik va amorflik) darajasi o‘ zgarishi, shuningdek, metall tuzlari bilan modifikatsiyalash bosqichida uglerod matrisasi sirtida yangi mineral faza hamda faol kristall markazlarning hosil bo‘ lish qonuniyatlari o‘ rganildi.



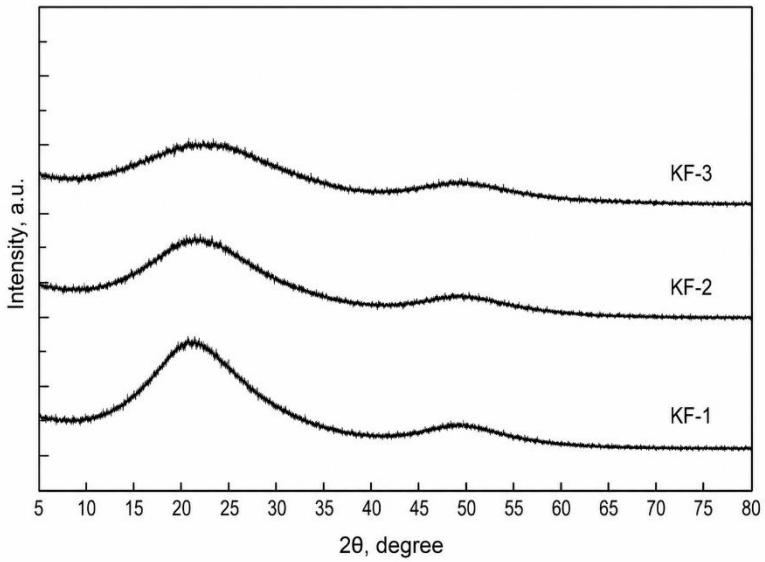
Shu maqsadda, dastlabki uglerodlangan material (karbonizat), kaliy gidroksidi (KOH) yordamida turli nisbatlarda kimyoviy faollashtirilgan ko‘ mirlar hamda temir (Fe), mis (Cu) va rux (Zn) birikmalari bilan modifikatsiyalangan kompozit namunalarining faza tarkibi rentgen-difraksion usulda tahlil qilindi. Olingan difraktogrammalar asosida uglerod fazasidagi strukturaviy o‘ zgarishlar va metall saqlovchi birikmalarning geterogen tabiati baholandi.

Rentgen-difraksion tadqiqotlar Rigaku MiniFlex 600 kukunli rentgen difraktometrida olib borildi. O‘ lchash jarayonlarida to‘ lqin uzunligi $\lambda = 1{,}5406$ Å bo‘ lgan Monoxromatik Cu-Kα nurlanishi qo‘ llanildi. Difraktogrammalar sintez qilingan namunalarning kristall va amorf fazalarini miqdoriy hamda sifat jihatidan aniqlash, shuningdek, faollashtirish va modifikatsiyalashdan keyingi panjara deformatsiyalarini baholash uchun keng burchaklar diapazonida (2θ burchagi 5°dan 80° gacha) qayd etildi.

Natijalar va ularning tahlili

Dastlabki karbonizatning strukturaviy holati

Sintez jarayonining birinchi bosqichida hosil bo‘ lgan va 500 °C haroratda olingan dastlabki karbonizat (C-500) namunasining rentgenogremmasi tahlil qilindi.



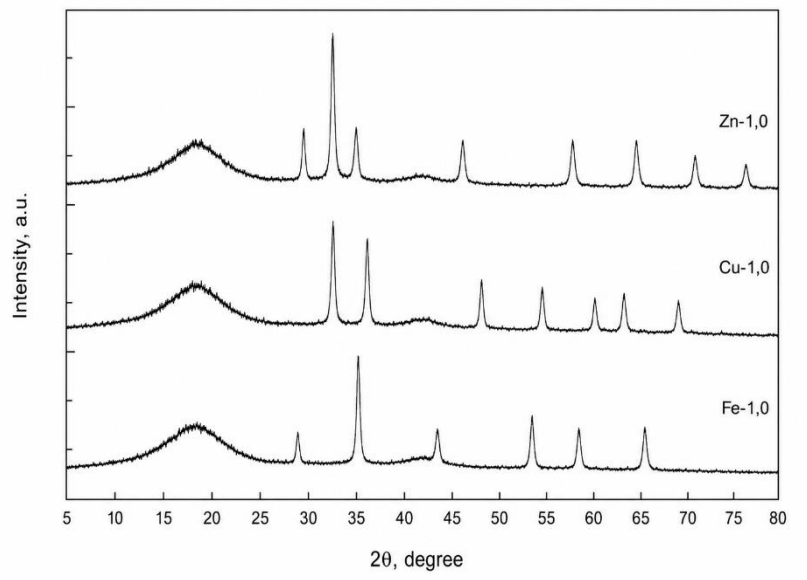
1-rasm. 500°C da olingan karbonizat (C-500) rentgenogremmasi.

1-rasmdagi C-500 karbonizat difraktogrammasida 2θ≈22–24° oralig‘ ida keng intensiv maksimum kuzatiladi. Ushbu maksimum tartibsiz joylashgan aromatik uglerod qatlamlariga xos bo‘ lib, odatda uglerodning (002) tekisligi bilan bog‘ lanadi. Maksimumning keng shaklda namoyon bo‘ lishi karbonizatda uzoq masofali kristall tartib mavjud emasligini, ya’ni material asosan amorf va turbostratik tuzilishga ega ekanligini ko‘ rsatadi.

2θ≈44–46° sohada ikkinchi, ancha kuchsiz va keng maksimum kuzatiladi. U uglerod tuzilishining (100)/(101) yo‘ nalishlariga tegishli bo‘ lib, aromatik qatlamlar ichidagi qisqa masofali tartiblanishni ifodalaydi. Ushbu refleksning past intensivligi 500 °C da karbonizatsiyalangan yog‘ och chiqindilarida uglerod karkasi hali yuqori darajada tartiblanmaganligini ko‘ rsatadi. Difraktogrammada grafitga xos tor va yuqori intensiv reflekslarning kuzatilmasligi ham C-500 namunasining grafitlashmagan, asosan tartibsiz uglerod tuzilishiga ega ekanligini tasdiqlaydi. Demak, 500 °C dagi termik ishlov yog‘ och tarkibidagi organik komponentlarning parchalanishi va aromatik uglerod karkasining shakllanishi uchun yetarli bo‘ lgan, biroq uglerod qatlamlarining yuqori darajada kristallanishiga olib kelmagan.

KOH bilan kimyoviy faollashtirishning strukturaga ta’siri

2-rasmda KOH bilan turli nisbatlarda faollashtirilgan KF-1, KF-2 va KF-3 namunalarining rentgenogrammalari keltirilgan.



2-rasm. Kimyoviy faollantirilgan ko‘ mir namunalarining rentgenogrammalari.

Barcha namunalarda 2θ≈21–24° oralig‘ ida keng maksimum va 45–50° sohada ancha kuchsiz keng maksimum saqlanib qolgan. Bu reflekslar uglerod materiallarining tartibsiz, turbostratik tuzilishiga xos bo‘ lib, mos ravishda (002) va (100)/(101) yo‘ nalishlari bilan bog‘ lanadi. KF-1 dan KF-3 ga o‘ tganda asosiy maksimumning kengayishi va nisbatan yassilanishi kuzatiladi. KOH:karbonizat nisbatining 1:1 dan 3:1 gacha oshishi uglerod qatlamlari orasidagi tartibning yanada buzilishiga olib kelgan. Bu holat faollashtirish jarayonida KOH ning uglerod karkasi bilan ta’siri kuchayishi, yopiq g‘ ovaklarning ochilishi va yangi g‘ ovaklarning hosil bo‘ lishi bilan bog‘ liq.

KF-2 namunasida asosiy maksimum KF-1 ga nisbatan kengroq, biroq KF-3 dagidek kuchli yassilanmagan. KF-3 da esa maksimumning yanada kengayishi yuqori KOH miqdorida uglerod karkasining chuqurroq yemirilganini ko‘ rsatadi. Shu sababli KF-2 namunasi uglerod tuzilishining yetarli darajada tartibsizlanishi va karkasning haddan tashqari buzilmasligi o‘ rtasidagi nisbatan maqbul holatni namoyon etadi. Difraktogrammalarda aniq va yuqori intensivlikdagi yangi kristall reflekslarning kuzatilmasligi faollashtirishdan keyin ham namunalarning asosiy qismi amorf uglerod holatida saqlanib qolganini ko‘ rsatadi. Olingan natijalar KOH miqdorini oshirish uglerod tuzilishining tartibsizlanishini kuchaytirishini tasdiqlaydi.

Metall birikmalari bilan modifikatsiyalangan ko‘ mirlarning faza tarkibi

3-rasmda Fe-1,0, Cu-1,0 va Zn-1,0 namunalarining rentgen-difraktogrammalari keltirilgan.

3-rasm. Fe, Cu va Zn birikmalari bilan modifikatsiyalangan faollashtirilgan ko‘ mirlarning rentgen-difraktogrammalari.

Dastlabki C-500 karbonizat va KOH bilan faollashtirilgan namunalarda asosan 2θ≈22–24° hamda 43–45° sohalardagi keng maksimumlar kuzatilgan bo‘ lsa, metall tuzlari bilan ishlov berilgandan keyin ushbu fon ustida bir qator aniq reflekslar paydo bo‘ lgan. Demak, modifikatsiyalash jarayonida uglerodning amorf-turbostratik tuzilishi saqlanib qolgan, shu bilan birga metall saqlovchi kristall fazalar hosil bo‘ lgan.

Fe-1,0 namunasida 2θ≈30,2; 35,5; 43,2; 53,6; 57,1 va 62,7° atrofida reflekslar kuzatiladi. Ularning joylashishi temir oksidlaridan, avvalo Fe_3O_4 tipidagi fazaga xos reflekslarga yaqin. Ayniqsa, 35–36° sohadagi intensiv refleks Fe saqlovchi kristall fazaning hosil bo‘ lganini ko‘ rsatadi. C-500 va KF namunalarida bunday tor reflekslar kuzatilmaganligi sababli ularning paydo bo‘ lishi aynan $FeCl_3 \cdot 6H_2O$ bilan modifikatsiyalash natijasi hisoblanadi.

Cu-1,0 difraktogrammasida 35,5 va 38,7° sohalardagi reflekslar ancha yaqqol, shuningdek 48,7; 53–54; 58–62° oralig‘ ida ham qo‘ shimcha reflekslar mavjud. Bu maksimumlar CuO tipidagi mis oksid fazasiga xos qiymatlarga mos keladi. Termik ishlov jarayonida boshlang‘ ich $CuCl_2$ saqlanib qolmaydi, balki uning bir qismi uglerod yuzasida mis saqlovchi oksid fazalariga aylanadi. Shu sababli ushbu namunadagi yangi reflekslarni mis birikmalarining uglerod materialida mavjudligining rentgen-difraksion belgisi sifatida qarash mumkin.

Zn-1,0 namunasida esa 31,8; 34,4; 36,3; 47,5; 56,6; 62,9 va 67,9° atrofidagi reflekslar kuzatiladi. Ularning majmuasi ZnO ning geksagonal tuzilishiga xos difraksion maksimumlarga mos keladi. Zn qatorida reflekslarning nisbatan aniq ko‘ rinishi Zn saqlovchi fazaning ma’lum darajada kristallangan holatda shakllanganini ko‘ rsatadi.

Shu bilan birga, barcha uch namunada 20–25° oralig‘ idagi keng uglerod maksimumi saqlanib qolgan. Bu muhim holat: metall birikmalarining kiritilishi uglerod karkasini to‘ liq kristall fazaga aylantirmagan. Asosiy matritsa avvalgidek tartibsiz ugleroddan iborat, metall saqlovchi fazalar esa uning yuzasi va g‘ ovaklarida alohida kristall zarrachalar ko‘ rinishida shakllangan deb qarash mumkin. Rentgenogrammalar Fe, Cu va Zn saqlovchi yangi kristall fazalarning hosil bo‘ lganini yaxshi ko‘ rsatadi, biroq faqat XRD natijasiga asoslanib Fe^{3+}, Cu^{2+} va Zn^{2+} kationlari uglerod panjarasiga bevosita

kirgan deb aytish to‘ g‘ ri emas. Termik ishlovdan keyin ularning kimyoviy holati o‘ zgaradi. Shu sababli metallarning namunada haqiqatan saqlanib qolganini EDS yoki XRF natijalari bilan tasdiqlash, ularning tarqalishini esa SEM-EDS tasvirlari bilan ko‘ rsatish maqsadga muvofiq. XRD natijasi esa modifikatsiyadan keyin Fe-, Cu- va Zn-saqlovchi kristall fazalar hosil bo‘ lganini tasdiqlaydi.

Xulosalar

Rentgen-difraksion tahlil natijalariga ko‘ ra, C-500 karbonizat va KOH bilan faollashtirilgan KF-1, KF-2 hamda KF-3 namunalarining asosiy qismi tartibsiz, amorf-turbostratik uglerod tuzilishiga ega ekanligi aniqlandi. KOH:karbonizat nisbatining ortishi bilan $2\theta \approx 21–24°$ sohadagi asosiy maksimumning kengayishi uglerod qatlamlarining tartibsizlanishi kuchayganini ko‘ rsatdi. KF-2 namunasida uglerod karkasining yetarli darajada rivojlanishi va uning haddan tashqari yemirilmasligi o‘ rtasida nisbatan maqbul holat kuzatildi.

Fe, Cu va Zn birikmalari bilan modifikatsiyalashdan keyin uglerodning amorf asosiy tuzilishi saqlanib qolgan holda yangi metall saqlovchi kristall fazalar hosil bo‘ ldi. Fe-1,0 namunasida Fe_3O_4 tipidagi, Cu-1,0 da CuO tipidagi, Zn-1,0 da esa geksagonal ZnO fazasiga mos reflekslar aniqlandi. Bu modifikatsiyalash jarayonida metall birikmalarining uglerod yuzasida termik jihatdan barqarorroq fazalarga aylanganini ko‘ rsatadi.

Abstract:*The textural properties of a three-dimensional copper(II) coordination framework built from ethylenediaminetetraacetate (Cu–EDTA–MOF) have been determined by nitrogen adsorption–desorption at 77.35 K and compared with the geometric parameters computed from its single-crystal structure. The isotherm is of type II with an H3 hysteresis loop. The specific surface area is 116.2 $m^2 \cdot g^{-1}$ (multipoint BET) and 120.7 $m^2 \cdot g^{-1}$ (de Boer t-plot slope), while the cumulative pore-wall areas are 64.1 (NLDFT), 64.2 (BJH) and 65.4 $m^2 \cdot g^{-1}$ (DH), so that about half of the accessible surface belongs to pore walls and the remainder to the external surface of the crystallites. The total pore volume is 0.5722 $cm^3 \cdot g^{-1}$ and no micropore volume is resolved. The NLDFT distribution is bimodal: 2.05–8.25 nm carries 38 % of the volume but 82 % of the surface, 27.5–35.9 nm carries 52 % of the volume and 13 % of the surface. Since the geometric pore-limiting diameter, 0.43 nm, exceeds the kinetic diameter of nitrogen by only a factor of 1.18, the intracrystalline channels are not accessible to nitrogen at 77 K, and the isotherm characterizes the textural porosity of the polycrystalline powder.*

ТЕКСТУРНАЯ ХАРАКТЕРИСТИКА ТРЁХМЕРНОГО КООРДИНАЦИОННОГО КАРКАСА Cu–EDTA МЕТОДОМ НИЗКОТЕМПЕРАТУРНОЙ АДСОРБЦИИ АЗОТА

Аннотация. *Методом низкотемпературной адсорбции–десорбции азота при 77,35 K определены текстурные характеристики трёхмерного координационного каркаса меди(II) на основе этилендиаминтетраацетата (Cu–EDTA–MOF) и проведено их сопоставление с геометрическими параметрами, рассчитанными по данным монокристального рентгеноструктурного анализа. Изотерма относится к типу II с петлёй гистерезиса H3. Удельная поверхность составляет 116,2 $м^2 \cdot г^{-1}$ (метод БЭТ) и 120,7 $м^2 \cdot г^{-1}$ (наклон t-графика де Бура), кумулятивные площади стенок пор — 64,1 (NLDFT), 64,2 (BJH) и 65,4 $м^2 \cdot г^{-1}$ (DH); таким образом, около половины доступной поверхности приходится на стенки пор, остальное — на внешнюю поверхность кристаллитов. Суммарный объём пор равен 0,5722 $см^3 \cdot г^{-1}$, микропористый объём не разрешается. Распределение NLDFT бимодально: 2,05–8,25 нм даёт 38 % объёма и 82 % поверхности, 27,5–35,9 нм — 52 % объёма и 13 % поверхности. Поскольку геометрический лимитирующий диаметр пор, 0,43 нм, превышает кинетический диаметр азота лишь в 1,18 раза, внутрикристаллические каналы недоступны для азота при 77 K, и изотерма характеризует текстурную пористость поликристаллического порошка.*

UCH O‘ LCHOVLI Cu–EDTA KOORDINATSION KARKASINING PAST HARORATLI AZOT SORBTSIYASI YORDAMIDA TEKSTURAVIY TAVSIFI

Annotatsiya. *Etilendiamintetraatsetat asosidagi uch o‘ lchovli mis(II) koordinatsion karkasining (Cu–EDTA–MOF) tekstura xossalari 77,35 K da azotning adsorbsiya–desorbsiya izotermasi yordamida aniqlandi va monokristall rentgenostruktura tahlilidan*

hisoblangan geometrik parametrlar bilan taqqoslandi. Izoterma H3 gisterezis halqasiga ega II tipga mansub. Solishtirma yuza BET usuli bo‘ yicha 116,2 $m^2 \cdot g^{-1}$, de Bur t-grafigining qiyaligi bo‘ yicha 120,7 $m^2 \cdot g^{-1}$; g‘ ovak devorlarining kumulyativ yuzasi 64,1 (NLDFT), 64,2 (BJH) va 65,4 $m^2 \cdot g^{-1}$ (DH), ya’ni ochiq yuzaning taxminan yarmi g‘ ovak devorlariga to‘ g‘ ri keladi. Umumiy g‘ ovak hajmi 0,5722 $sm^3 \cdot g^{-1}$, mikrog‘ ovak hajmi aniqlanmaydi. NLDFT taqsimoti bimodal: 2,05–8,25 nm hajmning 38 % ini, lekin yuzaning 82 % ini beradi; 27,5–35,9 nm hajmning 52 % ini va yuzaning 13 % ini beradi. Geometrik cheklovchi diametr 0,43 nm azotning kinetik diametridan atigi 1,18 marta katta bo‘ lgani uchun kristall ichidagi kanallar 77 K da azot uchun ochiq emas va izoterma polikristall kukunning tekstura g‘ ovakligini tavsiflaydi.

Kalit so‘ zlar: *metall-organik karkas, Cu–EDTA, azotning fizik adsorbsiyasi, solishtirma yuza, BET usuli, t-grafik, NLDFT, g‘ ovaklarning o‘ lcham bo‘ yicha taqsimoti, tor teshikli g‘ ovaklik*

Introduction

Most applications of metal–organic frameworks (MOFs) rest on their porosity, and low-temperature nitrogen physisorption is the routine method by which that porosity is quantified [1–3]. The method is not, however, universally applicable. When the apertures of a framework approach the kinetic diameter of the probe molecule, diffusion into the intracrystalline space at 77 K becomes strongly activated and does not reach equilibrium on the time scale of a volumetric measurement. The isotherm then describes the texture of the polycrystalline powder — the external surface of the crystallites and the voids between them — rather than the framework itself. Failure to distinguish these two situations is a common source of surface areas that are wrong by an order of magnitude, and the IUPAC recommendations therefore require that the applicability of each data reduction model be examined rather than assumed [2].

Ethylenediaminetetraacetic acid (EDTA) is a classical hexadentate chelating agent and is rarely employed as a framework linker, because complete chelation of a single metal centre leaves no donor atom available for bridging. A three-dimensional copper(II) framework in which EDTA acts as a μ_4-bridging linker is therefore of interest both structurally and texturally. The purpose of the present work is to characterize the porosity of this framework by nitrogen sorption at 77.35 K, to decompose the measured surface area into its pore-wall and external contributions, and to compare the result with the geometric parameters computed directly from the single-crystal structure.

Objects and methods of research

Sample. The synthesis process commenced with the utilization of a hydrothermal method for the sample. Initially, the first solution was meticulously prepared by dissolving 0.06 mmol of the disodium salt of ethylenediaminetetraacetic acid dihydrate (EDTA-$H_2Na_2.2H_2O$) ($C_{10}H_{14}N_2Na_2O_8.2H_2O$) in 0.3 mol of distilled water. Simultaneously, the second solution was created by dissolving 0.117 mmol of Copper (II) chloride dihydrate ($CuCl_2 \cdot 2H_2O$) in 0.3 mol of distilled water. Additionally, 0.145 mmol of p-nitroaniline ($C_6H_6N_2O_2$) was dissolved in 0.1 mol of ethyl alcohol (C_2H_6O).

The material crystallizes in the tetragonal space group $I4_1/a$ with a = b = 19.2145(4) Å, c = 14.3264(5) Å, V = 5289.3(3) $Å^3$ and Z = 16.

Nitrogen sorption. Measurements were carried out on an Autosorb iQ volumetric analyser (Quantachrome Instruments). The sample (0.0111 g) was ground to a fine powder and outgassed in situ at 110 °C under dynamic vacuum for 1.0 h, and the dead volume was determined by helium expansion. Adsorption–desorption isotherms were recorded at the bath temperature of liquid nitrogen, 77.35 K, over 20 adsorption and 20 desorption points in the range $p/p° = 0.0493$–0.9938. Non-ideality of the adsorptive was corrected with a second-virial coefficient of 6.58×10^{-5} $Torr^{-1}$ and thermal transpiration with an effective molecular diameter of 0.354 nm. Data were reduced with ASiQwin v5.21 using a nitrogen cross-sectional area $\sigma(N_2) = 0.162$ nm^2 and a liquid density of 0.808 $g \cdot cm^{-3}$. Amounts adsorbed are reported both as volumes at standard temperature and pressure (273.15 K, 101.325 kPa; $V_m = 22\,413.97$ $cm^3 \cdot mol^{-1}$) and as specific amounts of substance; surface areas are calculated with the SI value of the Avogadro constant, $N_A = 6.02214076 \times 10^{23}$ mol^{-1}.

Data reduction. The specific surface area was obtained by the multipoint BET method [1] over $p/p° = 0.05$–0.20 and, independently, from the slope of the de Boer t-plot [7, 8] over the thickness interval t = 0.4375–0.6464 nm. Pore-size distributions were computed by the BJH [5] and Dollimore–Heal [6] methods on both branches and by non-local density functional theory (NLDFT) [11] with a nitrogen-at-77 K carbon slit-pore equilibrium kernel. Micropore volumes were evaluated by the Horváth–Kawazoe [9] and Saito–Foley [10] treatments, and the total pore volume by the Gurvich rule at $p/p° = 0.9938$.

Geometric analysis. The framework atoms were generated from the crystallographic information file by applying the sixteen symmetry operations of $I4_1/a$, giving 288 atoms per unit cell. The solvent-accessible volume and the largest cavity diameter were obtained on a Cartesian grid of 0.12–0.15 Å spacing with Bondi van der Waals radii, and the pore-limiting diameter from a percolation analysis of the accessible region in a three-fold supercell along each crystallographic axis. The accessible surface area was computed by Monte-Carlo integration with 3000 sample points per atom [16]. The five-coordinate geometry of the metal centre was quantified by the τ_5 parameter [17].

Results and discussion

Isotherm and its classification. The nitrogen isotherm at 77.35 K (Figure 1) is of type II with an H3 hysteresis loop in the IUPAC classification [2]. Three features define the assignment. The adsorption branch rises smoothly and almost linearly between p/p° = 0.05 and 0.30, without the pronounced low-pressure knee that accompanies micropore filling. The uptake remains modest over the whole mesopore range and rises steeply only above p/p° ≈ 0.95, reaching 369.9 cm³(STP)·g⁻¹ (16.51 mmol·g⁻¹) at p/p° = 0.9938 without approaching a plateau, which is the signature of condensation in macropores and in the interparticle void of an aggregate. The loop does not close: at p/p° ≈ 0.50 the desorption branch lies at 54.81 cm³(STP)·g⁻¹ against 23.47 cm³(STP)·g⁻¹ on adsorption. Non-closure of an H3 loop is characteristic of non-rigid aggregates of plate-like particles, and the quantities derived from the desorption branch are accordingly treated below as upper bounds.

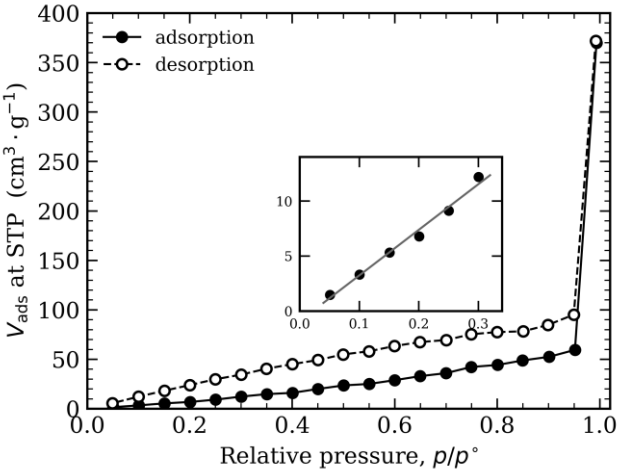

Figure 1. Nitrogen adsorption–desorption isotherm of Cu–EDTA–MOF at 77.35 K. Inset: the low-pressure region of the adsorption branch.

Specific surface area. Application of the BET equation over the monolayer–multilayer region p/p° = 0.05–0.20 (Figure 2a) gives a(BET) = 116.2 m²·g⁻¹ with a monolayer capacity of 1.192 mmol·g⁻¹. Following the recommendation that a BET area be corroborated by an independent determination [2], the same isotherm was analysed by the de Boer t-method (Figure 2b). Over t = 0.4375–0.6464 nm the adsorbed volume varies linearly with the statistical thickness, and the slope of 78.01 cm³(STP)·g⁻¹·nm⁻¹ converts to a total surface area of 120.7 m²·g⁻¹, in agreement with the BET value to within 3.8 %. Two independent treatments of the same isotherm therefore place the surface accessible to nitrogen at 116–121 m²·g⁻¹. The t-method resolves no separate micropore contribution, the external surface area returned by the data reduction being equal to the BET area (Table 2).

The cumulative surface areas obtained from the pore-size analyses are systematically lower: 64.07 m²·g⁻¹ (NLDFT), 64.20 m²·g⁻¹ (BJH, adsorption branch) and 65.38 m²·g⁻¹ (Dollimore–Heal, adsorption branch). This is not a discrepancy but a decomposition. The BJH, DH and NLDFT treatments integrate only the walls of those pores that the respective kernel resolves, whereas the BET and t-plot values additionally include the outer geometric envelope of the crystallites. Of the 116–121 m²·g⁻¹ accessible to nitrogen, therefore, 64–65 m²·g⁻¹ (53–56 %) is pore wall and the remaining 51–57 m²·g⁻¹ is external particle surface.

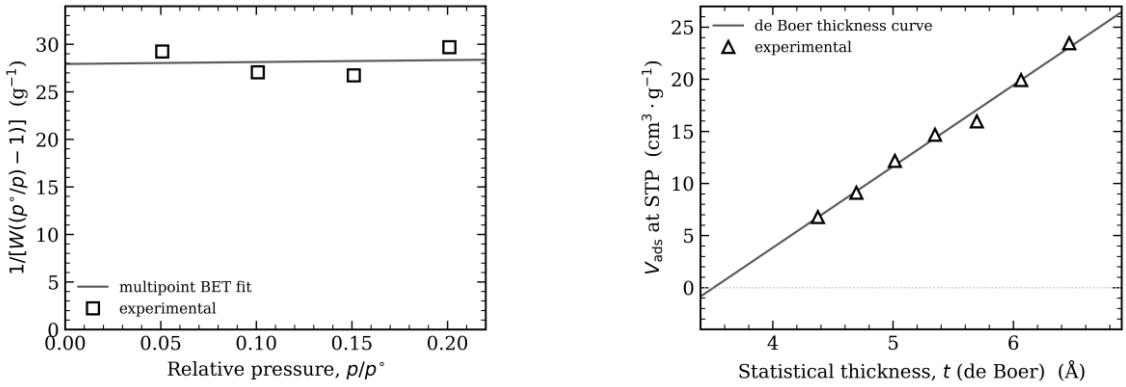

Figure 2. (a) Multipoint BET plot of Cu–EDTA–MOF over p/p° = 0.0507–0.2010; (b) de Boer t-plot of the same isotherm.

Pore volume. At p/p° = 0.9938 the Gurvich total pore volume for pores of radius below 156.19 nm is 0.5722 cm³·g⁻¹. Partitioning by BJH gives 0.5807 and 0.5458 cm³·g⁻¹ on the adsorption and desorption branches and the DH treatment 0.5627

and 0.5300 $cm^3 \cdot g^{-1}$. Micropore volumes returned by the Horváth–Kawazoe and Saito–Foley treatments are 0.008263 and 0.0006814 $cm^3 \cdot g^{-1}$, that is 1.4 % and 0.12 % of the total; together with the absence of a t-method micropore contribution these values show that no significant micropore volume is measurable with nitrogen at 77 K. The cumulative NLDFT volume, 0.2606 $cm^3 \cdot g^{-1}$, accounts for 46 % of the total, the balance residing in pores wider than the upper bound of the kernel. The mean pore radius, calculated as twice the pore volume divided by the specific surface area, is 9.85 nm, equivalent to a mean pore width of 19.69 nm.

Pore size distribution. The NLDFT analysis (Figure 3a), performed at a fitting error of 2.90 %, resolves a bimodal distribution. The principal mode lies at a pore width of 2.90 nm; the population between 2.05 and 8.25 nm carries 0.0985 $cm^3 \cdot g^{-1}$, only 38 % of the NLDFT volume, yet contributes 52.4 $m^2 \cdot g^{-1}$, fully 82 % of the NLDFT surface area. A second band between 27.5 and 35.9 nm carries 0.1344 $cm^3 \cdot g^{-1}$ (52 % of the volume) but merely 8.4 $m^2 \cdot g^{-1}$ (13 % of the area), the intervening interval from 10 to 27 nm being essentially flat. The porosity resolved by the kernel thus consists of a narrow-mesopore population that provides almost all of the internal surface and a wide-mesopore population that provides almost all of the volume. The BJH distributions (Figure 3b) place the mode at a pore radius of 1.707 nm on adsorption and 1.911 nm on desorption, in the same range as the primary NLDFT feature, and locate 86 % of the cumulative adsorption volume above a radius of 15.7 nm. It should be emphasized that the lower confidence limit of the NLDFT kernel corresponds to a pore width of 1.69 nm; the calculation is blind to anything narrower, so the absence of a micropore population in Figure 3a cannot by itself be read as evidence that micropores are absent from the solid.

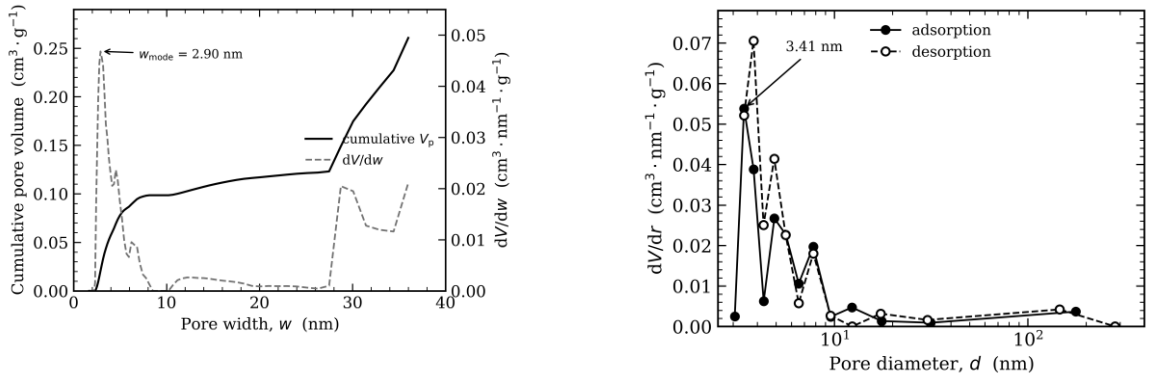

Figure 3. (a) NLDFT cumulative pore volume and differential pore-size distribution; (b) BJH pore-size distribution, adsorption and desorption branches.

Comparison with the crystal structure. Geometric analysis of the desolvated framework gives an accessible surface area of 1337 $m^2 \cdot g^{-1}$ for a probe of radius 0.186 nm matched to nitrogen, an intracrystalline pore volume of 0.169 $cm^3 \cdot g^{-1}$, a void fraction of 0.207 and a framework density of 1.221 $g \cdot cm^{-3}$; the channel system is three-dimensional, with a pore-limiting diameter of 0.43 nm and a largest cavity diameter of 0.68 nm. The measured surface area is therefore 11.5 times smaller than the geometric value, while the measured pore volume is 3.4 times larger than the crystallographic one. These two deviations point in opposite directions yet share a single origin. The ratio of the pore-limiting diameter to the kinetic diameter of nitrogen, 0.364 nm [13], is only 1.18, and diffusion through apertures this narrow is strongly activated and does not reach equilibrium on a volumetric time scale at 77 K; moreover, cavities of ≈0.7 nm are filled at $p/p^\circ \approx 10^{-5}$–$10^{-4}$, three to four orders of magnitude below the lowest relative pressure sampled here. Nitrogen at 77 K consequently did not enter the intracrystalline pore system. On this reading the excess volume, 0.5722 − 0.169 = 0.40 $cm^3 \cdot g^{-1}$, is interparticle in origin, in agreement with the H3 loop, with the wide-mesopore band at 27–36 nm and with the absence of a plateau near saturation. That the intracrystalline channels are nevertheless real and occupied is established by the structure itself, in which the solvent-accessible void amounts to 47.8 % of the unit-cell volume and accommodates 5.6 water molecules per copper atom.

Table 1

Conditions of the nitrogen sorption measurement

Parameter	Value	Parameter	Value
Adsorptive	Nitrogen	Sample mass	0.0111 g
Bath temperature	77.35 K	Outgassing	110 °C, 1.0 h
Analysis time	3 h 14 min	Cell type	9 mm, without rod
Dead volume	He expansion	Non-ideality	6.58×10^{-5} $Torr^{-1}$
Cold zone volume	2.05053 cm^3	Warm zone volume	14.9617 cm^3
$\sigma(N_2)$	0.162 nm^2	Liquid density	0.808 $g \cdot cm^{-3}$

Table 2

Textural characteristics of Cu–EDTA–MOF from nitrogen sorption at 77.35 K

Method	Surface area, $m^2 \cdot g^{-1}$	Pore volume, $cm^3 \cdot g^{-1}$	Mode pore radius, nm

* Half pore width in the slit geometry of the corresponding model; the pore widths are 2.90 nm (NLDFT) and 1.85 nm (HK). ** Mean pore radius, calculated as 2V/a(BET).

Conclusion

Nitrogen sorption at 77.35 K characterizes Cu–EDTA–MOF as a solid with a surface of 116–121 $m^2 \cdot g^{-1}$ accessible to nitrogen, of which slightly more than one half is pore wall and the remainder external crystallite surface; a total pore volume of 0.5722 $cm^3 \cdot g^{-1}$; a narrow-mesopore population centred at 2.90 nm that carries 82 % of the internal surface; a wide-mesopore and interparticle void that carries 52 % of the volume; and no micropore volume measurable with this adsorptive. Comparison with the geometric parameters computed from the single-crystal structure — a three-dimensional channel system of 0.43 nm limiting diameter and 0.169 $cm^3 \cdot g^{-1}$ intracrystalline volume — shows that nitrogen at 77 K does not enter the framework channels, the ratio of aperture to probe diameter being only 1.18. The isotherm therefore quantifies the textural porosity of the polycrystalline powder and neither confirms nor excludes the intracrystalline porosity established crystallographically. The result illustrates a point of general importance for narrow-aperture frameworks: a surface area measured with nitrogen at 77 K must be qualified by an explicit statement of what the probe was able to reach.

РАСПРОСТРАНЕНИЕ И МОРФОЛОГИЧЕСКИЕ ОСОБЕННОСТИ ВИДОВ MONILINIA (МЕДОВЫЕ) НА ПЛОДОВЫХ ДЕРЕВЬЯХ В УСЛОВИЯХ КАШКАДАРЬСКОЙ ОБЛАСТИ

Аннотация*. В данной статье анализируется история изучения, распространения и растений-хозяев фитопатогенных грибов рода Monilinia (Мед) в Узбекистане. Обобщены научные работы Н.Г. Запрометова, П.Н. Головина, Т. Каримова, М.Ш. Сагдуллаевой, Б.А. Хасанова и последующих исследователей видов Monilinia. Также представлены результаты полевых наблюдений, проведенных на плодовых деревьях в городе Карши в 2026 году. В образцах айвы были обнаружены макро- и микроморфологические признаки, характерные для Monilinia laxa, включая гиалиновые гифы, конидиеносцы и одноклеточные конидии, расположенные цепочками. Полученные результаты важны для изучения и мониторинга монилиоза в Кашкадарьинской области.*

DISTRIBUTION AND MORPHOLOGICAL FEATURES OF MONILINIA (HONEY) SPECIES ON FRUIT TREES IN THE KASHKADAR REGION

Abstract. *This article analyzes the history of the study, distribution, and host plants of phytopathogenic fungi of the genus Monilinia (Honey) in Uzbekistan. It summarizes the scientific works of N.G. Zaprometov, P.N. Golovin, T. Karimov, M.Sh. Sagdullaeva, B.A. Hasanov, and subsequent researchers of Monilinia species. The results of field observations conducted on fruit trees in the city of Karshi in 2026 are also presented. Macro- and micromorphological features characteristic of Monilinia laxa, including hyaline hyphae, conidiophores, and unicellular conidia arranged in chains, were detected in quince samples. The results obtained are important for the study and monitoring of moniliosis in the Kashkadarya region.*

Key words*: Monilinia, Monilinia laxa, Monilinia fructigena, moniliosis, phytopathogenic fungi, fruit trees, conidia, micromorphology, Kashkadarya.*

Kirish. *Monilinia* (Honey) turkumiga mansub fitopatogen zamburug‘ lar mevali daraxtlarda monilioz kasalligini keltirib chiqaruvchi eng muhim patogenlardan biri hisoblanadi. Ushbu turkum vakillari olma (*Malus domestica*), nok

(*Pyrus communis*), behi (*Cydonia oblonga*), o‘ rik (*Prunus armeniaca*), shaftoli (*Prunus persica*), olcha va gilos (*Prunus* spp.) kabi mevali daraxtlarni zararlab, gullarning kuyishi, yosh novdalarning qurishi hamda mevalarning qo‘ ng‘ ir chirishiga sabab bo‘ ladi. Kasallik natijasida hosildorlik va mahsulot sifati keskin pasayadi, mumiyolashgan mevalar esa keyingi vegetatsiya davrida infeksiya manbai bo‘ lib xizmat qiladi. Dunyo miqyosida ushbu kasallikni keltirib chiqaruvchi asosiy turlar sifatida *Monilinia laxa, Monilinia fructigena* va *Monilinia fructicola* qayd etilgan [11], [12].

O‘ zbekistonda *Monilinia* turkumiga mansub zamburug‘ larni o‘ rganish XX asrning 20-yillarida boshlangan. Dastlab N.G. Zaprometov (1926, 1928) [2], [3] tomonidan O‘ rta Osiyo mikoflorasini o‘ rganish jarayonida Monilinia fructigena va Monilinia laxa turlarining mevali daraxtlarda uchrashi qayd etilgan hamda ularning biologik va ekologik xususiyatlari haqida dastlabki ma’lumotlar berilgan. Keyinchalik P.N. Golovin (1949) [1] tomonidan Markaziy Osiyo mikoflorasi tizimli ravishda tadqiq qilinib, Monilinia vakillarining morfologik belgilari, ekologiyasi va tarqalish qonuniyatlari batafsil tavsiflangan.

O‘ zbekiston bog‘ larida monilioz kasalligining tarqalishi va rivojlanish xususiyatlari T. Karimov (1962) [5] tomonidan o‘ rganilib, kasallikning agroiqlim omillari bilan chambarchas bog‘ liqligi ilmiy asoslangan. Keyinchalik Moniliaceae oilasiga mansub turlar, jumladan *Monilinia* turkumining respublika hududidagi tarqalishi, xo‘ jayin o‘ simliklari va taksonomik holati bo‘ yicha muhim ilmiy ma’lumotlar umumlashtirilgan [7].

So‘ nggi yillarda B.A. Xasanov, M.A. Zuparov va N.M. Mamedov (2009) [9] tomonidan behida uchraydigan monilioz kasalligining biologiyasi va zarar keltirish xususiyatlari o‘ rganilgan. Shuningdek, B.A. Xasanov, R.O. Ochilov, E.A. Xolmurodov va R.A. Gulmurodov (2010) [10] tomonidan mevali hamda yong‘ oqmevali daraxtlar kasalliklari, ularning diagnostikasi va ularga qarshi kurash usullari keng yoritilgan. Keyinchalik A.U. Sag‘ dullayev, A. Marupov, A.A. Rahmatov va hammualliflar (2014) [8] tomonidan mevali daraxtlarni monilioz kasalligidan himoya qilish bo‘ yicha amaliy tavsiyalar ishlab chiqilgan.

So‘ nggi yillarda J. Jo‘ raqulov va hammualliflari (2024–2025) [4] tomonidan O‘ zbekiston hududida Monilinia turkumi vakillarining tarqalishi, xo‘ jayin o‘ simliklari hamda ekologik xususiyatlariga oid yangi ma’lumotlar e’lon qilinib, respublika mikobiotasiga oid ilmiy ma’lumotlar yanada boyitildi.

Shunga qaramay, Qashqadaryo viloyati sharoitida Monilinia turlarining tarqalishi, xo‘ jayin o‘ simliklari va vegetatsiya davridagi rivojlanish xususiyatlari bo‘ yicha ilmiy ma’lumotlar yetarli emas. Shu sababli ushbu tadqiqotning maqsadi O‘ zbekistonda Monilinia (Honey) turkumiga mansub turlarni o‘ rganish tarixini tahlil qilish hamda Qarshi shahri sharoitida mevali daraxtlarda uchraydigan monilioz kasalligining makromorfologik belgilari asosida olib borilgan dala kuzatuvlari natijalarini yoritishdan iborat.

Tadqiqot materiallari va usullari

Tadqiqotlar 2026-yil mart–iyul oylarida Qashqadaryo viloyati, Qarshi shahri, Bog‘ obod mahallasida joylashgan "Hosildor zamin" zamonaviy ko‘ chatchilik-ta’lim majmuasi hududida olib borildi. Tadqiqot obyekti sifatida olma (*Malus domestica* Borkh.), nok (*Pyrus communis* L.), daraxtlari tanlandi.

Dala kuzatuvlari vegetatsiya davrining turli bosqichlarida amalga oshirildi. Namunalar 2026-yil 23-mart va 5-aprel kunlari yig‘ ildi. Tadqiqot davomida daraxtlarning gullari, barglari, yosh novdalari hamda mevalarida uchraydigan monilioz kasalligiga xos tashqi simptomlar qayd etildi. Zararlangan mevalaridan gerbariy namunalar yig‘ ildi, qog‘ oz paketlarga joylashtirildi va laboratoriyaga olib kelindi.

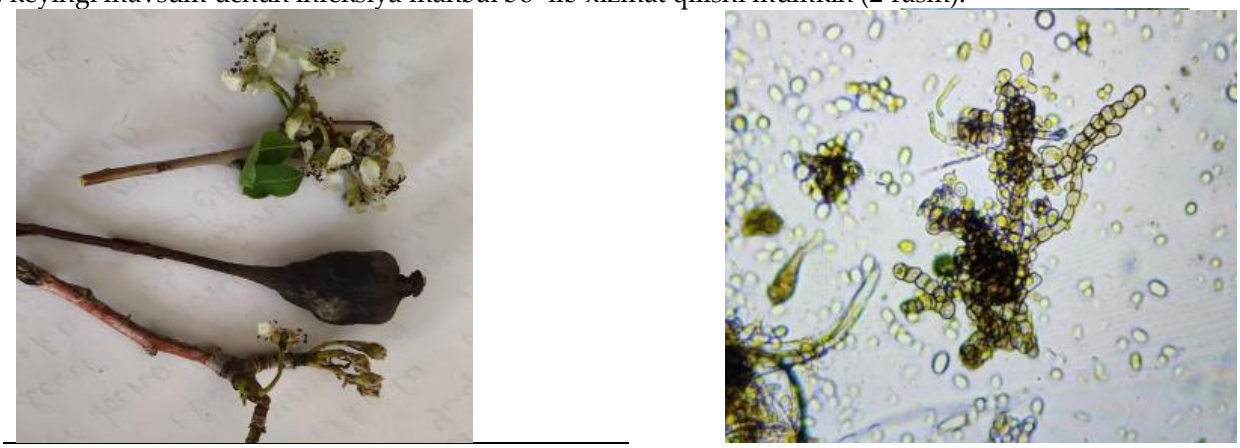
Gerbariy namunalari QarDU mikrobiologiya va biotexnologiya kafedrasining Mikrobiotexnologiya laboratoriyasida mikologik va mikrobiologik tahlil qilindi.

O‘ simliklarning mevasida uchraydigan zamburug‘ ni aniqlash, ularning morfologik belgilarini o‘ rganishda B-382PHiALC DC6V1000 mA raqamli mikroskop yordamida va aniqlagichlardan foydalanilgan holda amalga oshirildi [6]. Zamburug‘ larni xalqaro zamonaviy nomenklaturasi http://www.indexfungorum.org, bazasi asosida berildi.

Natijalar va ularning muhokamasi

Tadqiqotlarimiz natijasida *Monilinia* turkumining 2 ta turi uchrashi kuzatildi. Olmada (*Malus domestica*) *Monilinia fructigena,* nok (*Pyrus communis*) *Monilinia laxa* zamburug‘ turlari uchrashi aniqlandi.

Monilinia fructigena zamburug‘ i olma mevasida qo‘ ng‘ ir chirish kasalligini keltirib chiqardi. Zararlangan mevalar yuzasida qo‘ ng‘ ir rangli, asta-sekin kengayib boruvchi chirish o‘ choqlari hosil bo‘ ldi. Kasallik rivojlanishi davomida meva po‘ stida oqish-krem rangli mayda konidial yostiqchalar (sporodoxiyalar) paydo bo‘ lishi kuzatildi. Ushbu yostiqchalarda patogenning konidiyalari rivojlanib, kasallikning tarqalishini ta’minladi. Kuchli zararlangan mevalar yumshab chiridi va keyinchalik qurib, mumiyalandi (1- rasm).



b

1- rasm. Olma (*Malus domestica* Borkh.) mevasining *Monilinia fructigena* zamburug‘ i ta’sirida zararlanishi: a — kasallangan olma mevasi; b — *Monilinia fructigena* zamburug‘ ining mikroskopik konidiyalari.

Monilinia fructigena konidiyalari mikroskopik tekshiruvda gialin (rangsiz), bir hujayrali, tuxumsimon yoki limonsimon shaklda bo‘ lib, ko‘ pincha shoxlangan zanjirlar hosil qilishi kuzatildi. Konidiyalar o‘ lchami 7–14 × 14–16 μm, boshqa morfologik tavsiflarda esa 19–20 × 12,5–14 μm atrofida bo‘ lishi aniqlandi.

Monilinia laxa bilan zararlangan nok mevalar to‘ q qo‘ ng‘ ir rangga kirib, suvsizlanadi, kichrayadi va quruq mumiyalangan meva holida shoxda osilib qoladi. *M. laxa* bunday mumiyalangan mevalarda va zararlangan novdalarda qishlab, keyingi mavsum uchun infeksiya manbai bo‘ lib xizmat qilishi mumkin (2-rasm).

a b

2-rasm. *Monilinia laxa* keltirib chiqargan qo‘ ng‘ ir chirish kasalligining mevadagi simptomlari: a- zararlangan mevalarning qurishi va mumiyalanishi;. b — *Monilinia laxa* zamburug‘ ining mikroskopik konidiyalari.

Monilinia laxa konidiyalari mikroskopik tekshiruvda gialin, bir hujayrali, ovalsimon yoki ellipssimon shaklda bo‘ lib, zanjirsimon holda joylashganligi kuzatildi. Konidiyalar konidioforlarda hosil bo‘ lib, zich konidial tuzilmalarni shakllantiradi.

Olingan natijalar yuqorida keltirilgan ma’lumotlarni to‘ ldiradi. So‘ nggi yillarda Jo‘ raqulov va Mustafayev (2025) [4] tomonidan Monilinia turkumining respublikadagi tarqalishiga oid yangi ma’lumotlar e’lon qilingan bo‘ lib, bizning dala kuzatuvlarimiz Qashqadaryo viloyatida ham monilioz kasalligi uchrashini ko‘ rsatdi.

Olingan natijalar Qashqadaryo viloyati sharoitida mevali daraxtlarda monilioz kasalligining mavjudligini ko‘ rsatdi. Dala kuzatuvlarida kasallikning asosiy tashqi belgilari — mevalarda qo‘ ng‘ ir chirish, konidial tuzilmalar hosil bo‘ lishi, mevalarning qurishi va mumiyolanishi qayd etildi.

Ushbu belgilar *Monilinia* turkumiga xos bo‘ lgan simptomlar bilan mos keladi. Moniliozning muhim epidemiologik xususiyati shundaki, zararlangan mumiyolangan mevalar patogenning saqlanishi va keyingi vegetatsiya davrida yangi infeksiya manbai sifatida xizmat qilishi mumkin.

Bizning tadqiqotimizda olma mevalarida *M. fructigena* ga xos, nok mevalarida esa *M. laxa* ga mos keluvchi morfologik belgilar kuzatildi. Bu natija *Monilinia* turkumining ayrim vakillari olma va nok kabi urug‘ li mevalarda ham uchrashi mumkinligi haqidagi adabiyot ma’lumotlariga mos keladi.

Annotation. *The CRISPR/Cas9 system has revolutionized plant genome engineering by enabling precise, efficient, and programmable genetic modification. However, genome-editing efficiency is strongly influenced by vector design, particularly by regulatory elements such as promoters and terminators. These elements govern transcription, RNA stability, and protein expression. This article provides a comprehensive analysis of the promoter and terminator systems in plant CRISPR/Cas9 constructs, focusing on monocot–dicot differences, transcriptional regulation, and vector optimization strategies. In this review, we discuss recent advances in synthetic promoter engineering and transcriptional control. Understanding these regulatory components is essential for maximizing editing efficiency and expanding CRISPR applications in plant biotechnology.*

Key words: *CRISPR/Cas9, plant genome editing, promoter architecture, terminator sequences, vector optimization, transcriptional regulation, monocot-dicot differences, synthetic biology*

РЕГУЛЯТОРНЫЕ ЭЛЕМЕНТЫ, ОПРЕДЕЛЯЮЩИЕ ЭФФЕКТИВНОСТЬ CRISPR/CAS9 В БИОТЕХНОЛОГИИ РАСТЕНИЙ

Аннотация. *Система CRISPR/Cas9 произвела революцию в инженерии генома растений, обеспечив точные, эффективные и программируемые генетические модификации. Тем не менее, эффективность редактирования генома во многом определяется конструкцией вектора, в частности регуляторными элементами — промоторами и терминаторами. Эти элементы управляют транскрипцией, стабильностью РНК и уровнем экспрессии белков. В данной статье представлен комплексный анализ промоторных и терминаторных систем в конструкциях CRISPR/Cas9 для растений с акцентом на различия между однодольными и двудольными растениями, транскрипционную регуляцию и стратегии оптимизации векторов. Также рассматриваются последние достижения в области инженерии синтетических промоторов и транскрипционного контроля. Понимание этих регуляторных компонентов необходимо для максимизации эффективности редактирования и расширения возможностей применения CRISPR в биотехнологии растений.*

Introduction.

The advent of the CRISPR/Cas9 system has revolutionized genome engineering by offering unprecedented simplicity, high efficiency, and broad applicability across diverse biological systems, including plants. As a transformative tool in agricultural biotechnology, CRISPR/Cas9 holds immense potential to address global food security challenges by enabling the development of crop varieties with enhanced yields, superior quality, and robust resistance to biotic and abiotic stress [23, 24]. Mechanistically, the system relies on a Cas9 nuclease and guide RNA (gRNA), which assemble into a ribonucleoprotein (RNP) complex capable of inducing precise double-strand breaks (DSBs) at predefined genomic loci [6]. Following DSB formation, endogenous DNA repair pathways, predominantly non-homologous end joining (NHEJ) and homologous recombination (HR), are harnessed to introduce targeted genetic modifications into the genome.

While the meticulous design of single guide RNA (sgRNA) is paramount for ensuring target site specificity, emerging empirical evidence highlights the profound impact of overall vector architecture on genome-editing efficacy [1]. Specifically, the selection of regulatory elements, such as promoters and terminators, is critical for optimizing the expression of CRISPR machinery in vivo. In plant systems, the pronounced divergence in transcriptional machinery between monocotyledonous and dicotyledonous species necessitates the tailored selection and refinement of these regulatory elements. For instance, recent optimization studies have demonstrated that replacing ubiquitous promoters with species-specific endogenous ones, such as substituting the CaMV-35S promoter with the UBQ10 promoter in specific dicots or using endogenous U3/U6 promoters in target crops such as grape, can yield multiple-fold enhancements in targeted mutation frequencies [25,26]. Consequently, the strategic configuration and synergistic combination of optimal promoters and terminators are pivotal for maximizing CRISPR/Cas9-mediated editing outcomes across diverse plant platforms [2].

Promoter Systems in CRISPR/Cas9 Vectors. Promoters are regulatory DNA sequences located upstream of genes that control transcription initiation by recruiting RNA polymerases and transcription factors. They determine the timing, location, and intensity of gene expression [4]. In plant CRISPR/Cas9 vectors, promoters regulate two essential components: Cas9 nuclease expression and sgRNA transcription. The effectiveness of genome editing is therefore highly dependent on promoter strength and compatibility with host transcriptional machinery. Cas9 is a protein-coding gene transcribed by RNA polymerase II (Pol II), producing mRNA that is translated into functional Cas9 protein.

In dicot plants, the Cauliflower Mosaic Virus 35S (CaMV35S) promoter is widely used due to its strong constitutive activity (Odell et al., 1985). However, in monocots, promoters such as maize ubiquitin (ZmUbi) and rice actin are preferred because they exhibit higher transcriptional efficiency in cereal crops [3]. The selection of an appropriate promoter directly influences Cas9 expression levels and genome editing outcomes. Strong constitutive promoters typically result in higher mutation frequencies due to sustained Cas9 activity [16]. sgRNAs are short non-coding RNAs (~100–200 nucleotides) and are transcribed by RNA polymerase III (Pol III). These promoters are specialized for small RNA transcription and ensure precise transcript boundaries. Common sgRNA promoters include: arabidopsis U6/U3 promoters (dicots), rice U6/U3 promoters (monocots). Pol III promoters are essential for producing functional sgRNAs with correct 5′ and 3′ ends, which are critical for Cas9 targeting efficiency [21].

Promoters in CRISPR systems can be categorized based on expression patterns: **Constitutive promoters** drive continuous gene expression across tissues and developmental stages. They are widely used for high-efficiency genome editing [22]. **Tissue-specific promoters** enable targeted gene editing in specific organs, reducing unintended effects in

non-target tissues. **Inducible promoters** allow temporal control of gene expression in response to external stimuli such as chemicals or environmental conditions. **Synthetic promoters** engineered promoters designed to enhance expression strength, support multiplex sgRNA expression, and improve regulatory precision. These are increasingly used in advanced CRISPR applications [7].

Terminator Systems in CRISPR/Cas9 Vectors. Terminators are DNA sequences located downstream of genes that signal the end of transcription. They play a critical role in: mRNA cleavage and polyadenylation, transcript stability, prevention of transcriptional read-through. The combination of promoter and terminator sequences strongly influences gene expression levels [2]. Cas9 expression requires Pol II terminators to ensure proper mRNA processing and stability. Common terminators include: **NOS terminator** (widely used, stable across species), **OCS terminator** (reduces transcriptional read-through) **35S terminator** (often paired with CaMV35S promoter). Efficient terminators enhance mRNA stability, increase translation efficiency, and improve overall genome editing performance [8]. Pol III transcription terminates at short thymidine (poly-T) sequences, typically consisting of five consecutive thymidines (TTTTT). This mechanism ensures precise sgRNA termination and functionality. Typical sgRNA cassette: U6 promoter →sgRNA →poly-T terminator. This simple and efficient termination system is critical for accurate CRISPR activity [21].

Terminators influence genome editing efficiency through several mechanisms: **mRNA stability:** Strong terminators increase transcript half-life and protein production. **Polyadenylation efficiency:** Essential for nuclear export and translation. **Transcriptional isolation:** Prevents interference between adjacent expression cassettes. **Gene silencing reduction:** Particularly important in monocot plants. Optimized terminator selection can significantly enhance CRISPR efficiency [9].

Monocot vs Dicot Differences in CRISPR Vector Design. Promoter efficiency is highly species-dependent due to differences in transcriptional machinery. Dicots commonly use CaMV35S promoters, whereas monocots rely on ubiquitin-based promoters for optimal expression [3]. Although terminators are generally less species-specific, endogenous terminators may improve expression efficiency and reduce gene silencing in monocot systems [9]. CRISPR/Cas9 plasmid vectors are not limited to genome editing components (Cas9 and sgRNA) but also include a variety of auxiliary genetic elements that are essential for plasmid propagation, selection, expression, and intracellular targeting. These backbone components play a critical role in ensuring the stability, functionality, and efficiency of CRISPR systems in both bacterial and plant cells [12,16].

Before plant transformation, CRISPR vectors are typically constructed and amplified in bacterial systems, such as Escherichia coli. Therefore, plasmids must contain elements that allow their replication and selection in bacteria. Antibiotic resistance genes, such as the ampicillin resistance gene (AmpR), encode β-lactamase, an enzyme that degrades ampicillin and allows only transformed bacterial cells to survive in selective media. This selection system is essential for isolating plasmids carrying CRISPR constructs during cloning [17]. **Origin of Replication (Ori)** the origin of replication is a DNA sequence that enables autonomous plasmid replication within bacterial cells. Common origins such as ColE1 determine plasmid copy number, which influences DNA yield and cloning efficiency. High-copy origins produce large amounts of plasmid DNA, whereas low-copy origins improve stability for large CRISPR constructs [11]. **Rop (Repressor of Primer Protein)** the Rop protein regulates plasmid copy number by stabilizing RNA–RNA interactions involved in replication initiation. This regulation is particularly important in large CRISPR vectors, as excessive copy numbers may lead to recombination or instability [15].

Some CRISPR vectors include bacterial regulatory systems that allow the controlled expression of Cas9 or other proteins during cloning or protein production. Lac Operon Components (Lac Promoter, Lac Operator, LacI) The lac operon system provides inducible control of gene expression in bacterial cells. The lac promoter (Plac) drives transcription, whereas the lac operator (LacO) serves as a binding site for the LacI repressor protein. In the absence of an inducer, LacI binds to LacO and prevents transcription. Upon the addition of IPTG or lactose, LacI dissociates, allowing gene expression [13]. This system is useful for: Preventing toxic overexpression of Cas9 in bacteria and controlling recombinant protein production. **T7 Promoter System** the T7 promoter is a strong bacteriophage-derived promoter recognized by T7 RNA polymerase. It enables high-level transcription and is commonly used in *E. coli* strains such as BL21(DE3) for protein production [19]. Although not typically used for plant expression, the T7 system is valuable for: In vitro sgRNA synthesis, recombinant Cas9 protein purification. Efficient protein production requires proper translation initiation signals. **Ribosome Binding Site (RBS)** the RBS, also known as the Shine–Dalgarno sequence, is essential for initiating translation in prokaryotes. It aligns the ribosome with the start codon, ensuring proper translation of Cas9 or other proteins in bacterial systems [18]. Without an RBS, even correctly transcribed mRNA cannot be translated into protein, highlighting its importance in vector design. For CRISPR/Cas9 to function in plant cells, the Cas9 protein must be localized to the nucleus, where genomic DNA resides. **Nuclear Localization Signals (NLS)** nuclear localization signals, such as the SV40 NLS, are short peptide sequences rich in lysine and arginine residues that direct proteins to the nucleus via the nuclear import machinery. Cas9 is often engineered with one or two NLS sequences (NLS–Cas9–NLS) to ensure

efficient nuclear targeting [14]. Efficient nuclear localization is critical because: Genome editing occurs in the nucleus and reduced nuclear import decreases editing efficiency.

Certain CRISPR constructs include protein tags for biochemical applications. **6×His Tag (Hexahistidine Tag)** the 6×His tag is a short peptide sequence that binds to nickel or cobalt ions, allowing affinity purification of recombinant proteins. This tag is widely used for: Cas9 protein purification, western blot detection and structural and biochemical studies [10]. Although not required for genome editing in vivo, tagging is essential in experimental workflows involving protein characterization. The overall performance of CRISPR/Cas9 systems depends on the coordinated interaction between backbone elements and expression cassettes. While promoters and terminators control transcription, backbone components ensure plasmid stability, efficient cloning, and proper protein function. For example: A stable origin of replication ensures sufficient plasmid yield, antibiotic selection guarantees successful cloning, NLS sequences ensure Cas9 reaches the nucleus, regulatory systems prevent toxic expression in bacteria. Thus, backbone components indirectly but critically influence genome editing efficiency [12]. While designing CRISPR vectors, the following factors should be considered: plasmid size (larger constructs reduce transformation efficiency), copy number (must balance yield and stability), compatibility with the host system (bacterial vs. plant expression requirements), and recombination risk (minimized by controlled copy number and stable elements). Optimizing these parameters improves the cloning efficiency, vector stability, and ultimately, the genome editing performance. Successful CRISPR/Cas9 applications require careful optimization of vector components, including compatibility with plant species (monocots vs. dicots), promoter strength and specificity, sgRNA expression efficiency, target tissue specificity, multiplex editing requirements, and vector size limitations. Coordinated high-level expression of Cas9 and sgRNA is essential for achieving high mutation efficiency [7].

Conclusion. The efficiency of CRISPR/Cas9 genome editing in plants is strongly influenced by the promoter–terminator combinations. Advances in synthetic biology have enabled the development of engineered promoters and optimized terminators, which significantly improve gene expression control. Recent studies have highlighted the importance of fine-tuning transcriptional regulation to achieve precise and efficient genome editing. Future research should focus on developing species-specific regulatory elements and minimizing gene silencing effects to further enhance the performance of CRISPR. Promoters and terminators are fundamental components of CRISPR/Cas9 plant vectors that directly influence the efficiency of genome editing. Careful selection and optimization are essential for achieving reliable and high-performance gene editing. Continued advancements in regulatory element engineering will further expand the application of CRISPR technology in plant biotechnology

БИОГЕОХИМИЧЕСКАЯ И АГРОЭКОЛОГИЧЕСКАЯ ХАРАКТЕРИСТИКА ФИСТАШКИ НАСТОЯЩЕЙ (*Pistacia vera* L.), ПРОИЗРАСТАЮЩЕЙ В УСЛОВИЯХ ПЕСЧАНЫХ ПОЧВ

Аннотация. *Целью настоящего исследования является оценка агроэкологических и биогеохимических особенностей песчаных почв, распространённых на территории Шобердинского лесничества Кокандского государственного лесного хозяйства, а также определение их экологического значения для роста фисташки настоящей (Pistacia vera L.). В ходе исследования в почвенных образцах, отобранных по почвенному профилю, были определены механический состав, pH, объёмная масса, содержание гумуса, валовые и подвижные формы фосфора и калия, а также содержание карбонатов, гипса и солей. Кроме того, изучено вертикальное распределение натрия, калия, кальция и железа в почвенном профиле.*

По результатам исследования установлено, что почвы Шобердинского лесничества относятся к лёгким по механическому составу песчаным почвам со слабощелочной реакцией среды (pH 7,6–7,7), низким содержанием гумуса (0,76–0,92 %) и карбонатно-гипсовым типом. Вертикальное распределение элементов показало относительно более высокое содержание натрия и калия в верхних горизонтах, тогда как кальций и железо преимущественно накапливались в нижних слоях, что свидетельствует об их дифференцированном распределении под влиянием педогенетических процессов. Существенное снижение содержания подвижного фосфора в нижнем горизонте при относительно стабильном уровне обменного калия свидетельствует о том, что фосфор является одним из основных лимитирующих факторов питательного режима данных почв.

Полученные результаты могут служить научной основой для оценки агроэкологического и биогеохимического состояния песчаных почв Кокандского государственного лесного хозяйства, рационального управления элементами минерального питания в фисташковых насаждениях и совершенствования агротехнических мероприятий, направленных на сохранение плодородия почв.

Ключевые слова: *Pistacia vera L., фисташка настоящая, песчаные почвы, агроэкология, биогеохимия, макроэлементы, плодородие почв, Кокандское государственное лесное хозяйство.*

BIOGEOCHEMICAL AND AGROECOLOGICAL CHARACTERIZATION OF COMMON PISTACHIO (*Pistacia vera* L.) GROWING ON SANDY SOILS

Abstract. *The aim of this study was to evaluate the agroecological and biogeochemical characteristics of sandy soils distributed in the Shoberdi Forestry Division of the Kokand State Forestry and to determine their ecological significance for the growth of common pistachio (Pistacia vera L.). Soil samples collected from different profile horizons were analyzed for particle-size distribution, pH, bulk density, humus content, total and available phosphorus and potassium, as well as carbonate, gypsum, and salt contents. In addition, the vertical distribution of sodium, potassium, calcium, and iron within the soil profile was investigated.*

The results showed that the soils of the Shoberdi Forestry Division are light-textured sandy soils characterized by a slightly alkaline reaction (pH 7.6–7.7), low humus content (0.76–0.92%), and carbonate–gypsum composition. The vertical distribution of elements revealed relatively higher concentrations of sodium and potassium in the upper soil horizon, whereas calcium and iron were more abundant in the lower horizon, indicating differential distribution under the influence of pedogenetic processes. A marked decrease in available phosphorus in the lower horizon, together with a relatively stable level of exchangeable potassium, indicates that phosphorus is one of the principal limiting factors affecting the nutrient regime of these soils.

The obtained results provide a scientific basis for assessing the agroecological and biogeochemical status of sandy soils in the Kokand State Forestry, improving nutrient management in pistachio plantations, and optimizing agronomic practices aimed at maintaining soil fertility.

Keywords: *Pistacia vera L., common pistachio, sandy soil, agroecology, biogeochemistry, macroelements, soil fertility, Kokand State Forestry.*

Kirish. Global iqlim o‘ zgarishi, atmosfera haroratining ortishi, yog‘ in miqdorining kamayishi hamda suv resurslari tanqisligi arid va yarim arid hududlarda tuproq degradatsiyasi, cho‘ llanish va agroekotizimlar barqarorligining pasayishiga olib kelmoqda. Bunday sharoitda qurg‘ oqchilikka chidamli, ekologik moslashuvchan va yuqori xo‘ jalik ahamiyatiga ega daraxt turlarini ilmiy asosda o‘ rganish muhim ilmiy-amaliy ahamiyat kasb etadi [1].

Oddiy pista (*Pistacia vera* L.) qurg‘ oqchil iqlim sharoitlariga yaxshi moslashgan, chuqur ildiz tizimiga ega bo‘ lgan va qumli hamda toshloq tuproqlarda barqaror o‘ suvchi istiqbolli mevali daraxt hisoblanadi. Respublikamizda pistachilikni rivojlantirish, plantatsiyalar tashkil etish va ko‘ chat yetishtirish texnologiyalarini takomillashtirish bo‘ yicha qator tadqiqotlar amalga oshirilgan. Yuldashov va hammualliflar [1] hamda Yormatova va Xushvaqtova [5] pista agrotexnikasi va plantatsiyalarni barpo etish masalalarini yoritgan bo‘ lsa, Kuiliboev va hammualliflar [2] ko‘ chat yetishtirishning zamonaviy usullarini ishlab chiqqan. Mardonov va hammualliflar [3] pistaning kasalliklari, Mahmarasulova va Mamadiyeva [4] esa uning biologik xususiyatlari va amaliy ahamiyatini o‘ rgangan.

Xorijiy tadqiqotlar *Pistacia vera* ning kelib chiqishi va domestikatsiyasi Markaziy Osiyo bilan chambarchas bog‘ liqligini ko‘ rsatadi [10]. Shuningdek, pista mevasi oqsillar, to‘ yinmagan yog‘ kislotalari, fenol birikmalari va mineral elementlarga boyligi sababli oziq-ovqat hamda farmatsevtika sanoatida muhim xomashyo hisoblanadi [9].

Pista plantatsiyalarining o‘ sishi va mahsuldorligi ko‘ p jihatdan tuproqning agroekologik va biogeokimyoviy xususiyatlariga bog‘ liq. Qumli tuproqlar gumus miqdorining kamligi, nam sig‘ imining pastligi va oziqa elementlarining yuviluvchanligi bilan tavsiflanadi. Shu sababli bunday tuproqlarda pH, gumus, oziqa elementlari hamda Fe, Mn, Zn, Cu, Ni, Co, Cr, Sr va Ba kabi makro va mikroelementlarning miqdoriy tarkibini baholash tuproq unumdorligini aniqlash va o‘ simliklarning mineral oziqlanishini izohlashda muhim ahamiyatga ega [6, 8].

So‘ nggi yillarda tuproq salomatligini saqlash, degradatsiyaga uchragan yerlarni tiklash va agroekotizimlarning ekologik barqarorligini ta’minlash bo‘ yicha tadqiqotlar jadallashgan bo‘ lsa-da [11,12], Qo‘ qon davlat o‘ rmon xo‘ jaligi qumli tuproqlarida o‘ sayotgan *Pistacia vera* plantatsiyalarining agroekologik va biogeokimyoviy xususiyatlari yetarli darajada o‘ rganilmagan.

Shu munosabat bilan ushbu tadqiqotning maqsadi Qo‘ qon davlat o‘ rmon xo‘ jaligi qumli tuproqlarining agroekologik va biogeokimyoviy xususiyatlarini kompleks baholash, makro va mikroelementlarning miqdoriy tarkibini aniqlash hamda ularning oddiy pista (*Pistacia vera* L.) o‘ simligining o‘ sishi va rivojlanishidagi ekologik ahamiyatini ilmiy asoslashdan iborat.

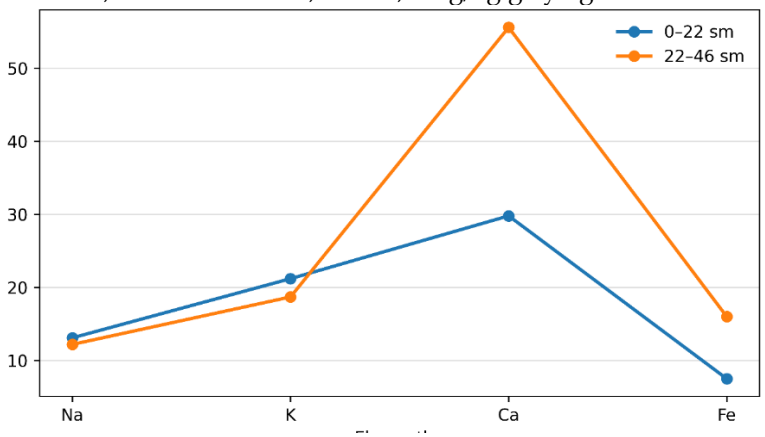
Tadqiqot obyekti va usullari. Tadqiqot obyekti sifatida Qo‘ qon davlat o‘ rmon xo‘ jaligining "Shoberdi" o‘ rmonchilik bo‘ limida tarqalgan oddiy pista (*Pistacia vera* L.) plantatsiyalari va qumli tuproqlar tanlandi. Tadqiqot hududi qurg‘ oqchil iqlimi, qumli mexanik tarkibga ega tuproqlari va pista plantatsiyalarining mavjudligi bilan tavsiflanadi. Mazkur hudud agroekologik va biogeokimyoviy tadqiqotlar olib borish uchun muhim ilmiy-amaliy ahamiyatga ega.

Tadqiqotning asosiy usuli tariqasida tuproqlardan kesmalar olishda V.V.Dokuchayevning kesma va morfogenetik usullaridan foydalanildi. Tuproq va anzur piyozni element tahlili neytron-aktivatsion usulda O‘ zFA Yadro fizikasi instituti Ekologiya va biotexnologiya laboratoriyasida olib borildi. Bunda namunalar atom reaktorida 5*1013 neytron/sm² sek. neytron oqimi bilan nurlantirilib, kimyoviy elementlarning yarim yemirilish davrlariga asoslanib ularning miqdorlari aniqlandi.

Tadqiqot natijalari. Tuproqning agroekologik va biogeokimyoviy xususiyatlari o‘ simliklarning o‘ sishi, rivojlanishi va mahsuldorligini belgilovchi asosiy omillardan biridir. Tuproq tarkibidagi makro va mikroelementlarning miqdori, ularning harakatchan shakllari hamda biologik o‘ zlashtirilish darajasi o‘ simliklarning mineral oziqlanishiga bevosita ta’sir ko‘ rsatadi. Ayniqsa, qumli tuproqlarda gumus miqdorining kamligi, nam sig‘ imining pastligi va oziqa elementlarining yuqori darajada yuvilishi mineral elementlar migratsiyasini jadallashtiradi hamda o‘ simliklarning oziqlanish rejimiga sezilarli ta’sir qiladi.

Biogeokimyoviy nuqtai nazardan tuproqdagi Na, K, Ca, Fe kabi elementlarning miqdori hamda vertikal taqsimlanishi tuproq unumdorligi va ekologik holatini tavsiflovchi muhim ko‘ rsatkichlar hisoblanadi. Ushbu elementlarning yetishmasligi yoki ortiqcha to‘ planishi o‘ simliklarning fiziologik jarayonlari, fermentativ faolligi, fotosintez intensivligi hamda stress omillariga moslashuvchanligiga ta’sir ko‘ rsatadi. Shu sababli pista plantatsiyalari joylashgan qumli tuproqlarning agroekologik va biogeokimyoviy tavsifini kompleks baholash ularning oziqlanish rejimini aniqlash hamda plantatsiyalar mahsuldorligini oshirishda muhim ilmiy-amaliy ahamiyatga ega.

Qo‘ qon davlat o‘ rmon xo‘ jaligining "Shoberdi" o‘ rmonchilik bo‘ limida o‘ tkazilgan tadqiqotlar natijasida qumli tuproqlarning asosiy agrokimyoviy ko‘ rsatkichlari hamda makro va mikroelementlar tarkibi aniqlandi va ularning oddiy pista (*Pistacia vera* L.) o‘ simligining o‘ sishi uchun ekologik ahamiyati baholandi.



Mazkur tadqiqotda asosiy e’tibor Qo‘ qon davlat o‘ rmon xo‘ jaligining qumli tuproqlarida o‘ sayotgan oddiy pista (*Pistacia vera* L.) plantatsiyalari ostidagi tuproqlarning agroekologik va biogeokimyoviy xususiyatlarini baholashga qaratildi. Tuproqdagi elementlarning miqdoriy tarkibi hamda ularning vertikal taqsimlanishi o‘ simliklarning mineral oziqlanishi va ekologik moslashuvchanligini tavsiflovchi muhim ko‘ rsatkich hisoblanadi. Shu sababli, dastlab qumli tuproqlarning makroelementlar bilan ta’minlanganlik darajasi tahlil qilindi. Tadqiqot natijalari Qo‘ qon davlat o‘ rmon xo‘ jaligi hududidagi qumli tuproqlarda aniqlangan makroelementlarning miqdoriy tarkibi va ularning profil bo‘ yicha taqsimlanishini tavsiflaydi (1-jadval).

1-jadval

Qumli tuproqlarda makroelementlar miqdori, mg/kg (n-2)

Hudud	Chuqurligi sm	Na	K	Ca	Fe
Shoberdi o‘ rmonchilik bo‘ limi	**0-22**	13,1	21,2	29,8	7,5
	22-46	12,2	18,7	55,6	16,0

Yuqoridagi jadval ma’lumotlariga ko‘ ra, Qo‘ qon davlat o‘ rmon xo‘ jaligi "Shoberdi" o‘ rmonchilik bo‘ limining qumli tuproqlarida makroelementlarning vertikal taqsimlanishi turlicha xarakterga ega. Tuproqning 0-22 sm qatlamida natriy (Na), kaliy (K) va temir (Fe) mos ravishda 13,1; 21,2 va 7,5 mg/kg ni tashkil etgan bo‘ lsa, kaltsiy (Ca) miqdori 29,8 mg/kg ni tashkil etdi. Pastki (22–46 sm) qatlamda Na va K miqdori mos ravishda 12,2 va 18,7 mg/kg gacha kamaygan, aksincha Ca va Fe miqdori sezilarli ortib, mos ravishda 55,6 va 16,0 mg/kg ga yetgan.

1-rasm. Shoberdi o‘ rmonchilik bo‘ limi qumli tuproqlarida elementlarning vertikal taqsimlanishi

Rasm ma’lumotlariga ko‘ ra, qumli tuproqlar profilida makroelementlarning vertikal taqsimlanishi turlicha ekanligi kuzatildi. Natriy (Na) va kaliy (K) miqdori ustki (0–22 sm) qatlamda mos ravishda 13,1 va 21,2 mg/kg ni tashkil etib, quyi (22–46 sm) qatlamda biroz kamaygan. Aksincha, kaltsiy (Ca) va temir (Fe) miqdori chuqurlik bo‘ yicha ortib, mos ravishda 55,6 va 16,0 mg/kg ga yetgan. Bu holat karbonatli qumli tuproqlarda elementlarning pedogenetik

jarayonlar ta’sirida vertikal differensial taqsimlanishini ko‘ rsatadi. Ayniqsa, kaltsiyning quyi qatlamda keskin ortishi karbonat va gips birikmalarining ushbu gorizontda ko‘ proq to‘ planganligi bilan izohlanadi. Umuman olganda, rasm natijalari Shoberdi o‘ rmonchilik bo‘ limi qumli tuproqlarida makroelementlarning profil bo‘ yicha migratsiyasi va taqsimlanish xususiyatlarini yaqqol aks ettiradi.

Kuzatilgan vertikal taqsimlanish qumli tuproqlarning yengil mexanik tarkibi va yuvilish jarayonlari bilan izohlanadi. Kaliy va natriyning yuqori qatlamda nisbatan ko‘ proq uchrashi ularning o‘ simlik ildizlari faol joylashgan qatlamda to‘ planishi bilan bog‘ liq bo‘ lsa, kaltsiy va temirning pastki gorizontda ortishi karbonatli birikmalar hamda temir oksidlarining quyi qatlamlarda akkumulatsiyalanishini ko‘ rsatadi. Ushbu holat qumli tuproqlarda elementlarning vertikal migratsiyasi faol kechishini hamda pista (*Pistacia vera* L.) ning mineral oziqlanishi ko‘ p jihatdan tuproq profilidagi elementlar taqsimlanishiga bog‘ liqligini ko‘ rsatadi.

2-jadval

Oddiy pista (*Pistacia vera* L.) organlarida makro va mikroelementlar miqdori mg/kg (n-2)

Elementlar	Barg	Urug	O‘ rtacha*
Na	188	89	182.5
K	5200	7230	6215
Ca	10120	2580	6341
Fe	309	65	187

Jadval ma’lumotlari oddiy pista (*Pistacia vera* L.) organlarida mineral elementlarning taqsimlanishi organlar kesimida sezilarli farqlanishini ko‘ rsatdi. Natriy (Na) miqdori barglarda 188 mg/kg, urug‘ larda esa 89 mg/kg ni tashkil etdi. Barglarda natriyning nisbatan yuqori miqdorda aniqlanishi vegetativ organlarda suv almashinuvi va ionlar transportining faol kechishi bilan bog‘ liq bo‘ lishi mumkin.

Kaliy (K) o‘ rganilgan elementlar ichida eng yuqori konsentratsiyada qayd etildi. Uning miqdori barglarda 5200 mg/kg bo‘ lgan bo‘ lsa, urug‘ larda 7230 mg/kg ga yetdi. Urug‘ larda kaliyning yuqori miqdorda to‘ planishi ushbu elementning uglevodlar transporti, fermentativ jarayonlar, osmotik muvozanatni saqlash hamda urug‘ ning shakllanishi va zahira moddalarining to‘ planishidagi muhim fiziologik vazifalari bilan izohlanadi.

Kalsiy (Ca) miqdori, aksincha, barglarda 10120 mg/kg ni tashkil etib, urug‘ lardagi miqdoridan (2580 mg/kg) qariyb to‘ rt baravar yuqori bo‘ ldi. Bu holat kalsiyning transpiratsiya oqimi orqali asosan vegetativ organlarga transport qilinishi va hujayra devori hamda membranalarning strukturaviy barqarorligini ta’minlashdagi funksiyasi bilan bog‘ liq.

Temir (Fe) esa barglarda 309 mg/kg, urug‘ larda 65 mg/kg miqdorda aniqlandi. Temir xloroplastlarda kechadigan oksidlanish-qaytarilish reaksiyalari, elektron tashish tizimi va fotosintez bilan bog‘ liq fermentlar tarkibiga kiruvchi muhim mikroelement bo‘ lganligi sababli uning fotosintetik faol barglarda yuqori konsentratsiyada uchrashi kuzatilgan.

Tadqiqot natijalari oddiy pista (*Pistacia vera* L.) organlarida mineral elementlarning taqsimlanishi ularning fiziologik vazifalariga mos ravishda differensial xarakterga ega ekanligini ko‘ rsatdi. Bunda kaliy asosan urug‘ larda, natriy, kalsiy va temir esa barglarda nisbatan ko‘ proq to‘ planganligi aniqlandi. Ushbu taqsimlanish oddiy pistaning mineral oziqlanish xususiyatlari va organlar o‘ rtasida elementlarning qayta taqsimlanish qonuniyatlarini tavsiflaydi.

3-jadval

Shoberdi o‘ rmonchilik bo‘ limi qumli tuproqlarining agrokimyoviy xususiyatlari (n=2, 2026-yil)

Ko‘ rsatkich	Birligi	0-22 sm	22-46 sm
Mexanik tarkibi			
Qum	%	81,5	89,1
Chang	%	5,8	3,9
Loyqa	%	2,6	1,4
Fizik loy (<0,01 mm)	%	8,4	5,3
pH(H_2O)	-	7,6	7,7
Hajmiy massa	g/sm³	1,31	1,45
Gumus	%	0,92	0,76
Yalpi			
P_2O_5	%	0,20	0,09
K_2O	%	0,77	0,68
Harakatchan			
P_2O_5	mg/kg	23,1	6,8
K_2O	mg/kg	71	66
Tuzlar			

Jami	%	0,88	1,00
Zaharli	%	0,03	0,05
Gips	%	1,20	6,98
Karbonatlar	%	16,8	18,1

Jadval ma'lumotlariga ko' ra, Qo' qon davlat o' rmon xo' jaligining Shoberdi o' rmonchilik bo' limida tarqalgan tuproqlar yengil mexanik tarkibli qumli tuproqlar guruhiga mansub ekanligi aniqlandi. Tuproq profilining ustki 0-22 sm qatlamida qum fraksiyasi 81,5 % ni tashkil etgan bo' lsa, quyi 22-46 sm qatlamda uning miqdori 89,1 % gacha ortgan. Aksincha, chang va loyqa fraksiyalarining chuqurlik bo' yicha kamayishi fizik loy miqdorining 8,4 % dan 5,3 % gacha pasayishiga olib kelgan. Mazkur holat tuproqning suvni ushlab qolish qobiliyati past, aeratsiyasi esa yuqori ekanligini ko' rsatadi.

Tuproq eritmasining reaksiyasi pH bo' yicha 7,6-7,7 ni tashkil etib, kuchsiz ishqoriy muhit shakllanganligi aniqlandi. Bunday muhit karbonatli qumli tuproqlar uchun xos bo' lib, ayrim mikroelementlar, xususan Fe, Zn va Mn ning harakatchan shakllari kamayishiga hamda o' simlik tomonidan o' zlashtirilish darajasiga ta'sir ko' rsatishi mumkin.

Hajmiy massa ustki qatlamda 1,31 g/sm³, quyi qatlamda esa 1,45 g/sm³ ni tashkil etdi. Chuqurlik bo' yicha hajmiy massaning ortishi tuproqning tabiiy zichlashuvi hamda mayda fraksiyalar va karbonatli birikmalarning quyi gorizontlarda to' planishi bilan bog' liq. Biroq ushbu qiymatlar qumli tuproqlar uchun me'yoriy diapazonda bo' lib, pista ildiz tizimining rivojlanishiga sezilarli cheklov tug' dirmaydi.

Gumus miqdori tuproq profilining ustki qatlamida 0,92 % bo' lib, quyi qatlamda 0,76 % gacha kamaygan. Bu organik moddalarning asosan biologik faol ustki gorizontda to' planishini ko' rsatadi. Gumus miqdorining pastligi qumli tuproqlar uchun xos bo' lib, ularning tabiiy unumdorligi nisbatan past ekanligini tavsiflaydi.

Tuproqning oziqa elementlari bilan ta'minlanganligi ham profil bo' yicha sezilarli farq qildi. Yalpi P_2O_5 va K_2O miqdorlari mos ravishda 0,20-0,09 % hamda 0,77-0,68 % oralig' ida o' zgargan bo' lsa, harakatchan fosfor miqdori 23,1 mg/kg dan 6,8 mg/kg gacha keskin kamaygan. Harakatchan kaliy miqdori esa 71-66 mg/kg oralig' ida bo' lib, profil bo' yicha nisbatan barqaror saqlangan. Bu holat fosforning biologik aylanishi asosan ustki gorizontda kechishini, kaliyning esa profil bo' yicha nisbatan bir tekis taqsimlanganligini ko' rsatadi.

Tuproq profilida karbonatlar va gips miqdorining ortishi yaqqol kuzatildi. Karbonatlar miqdori 16,8 % dan 18,1 % gacha, gips esa 1,20 % dan 6,98 % gacha ortgan. Ushbu ko' rsatkichlar tadqiqot hududi tuproqlarining karbonat-gipsli xususiyatga ega ekanligini tasdiqlaydi. Jami tuzlar miqdori 0,88-1,00 % oralig' ida, zaharli tuzlar esa 0,03-0,05 % ni tashkil etib, tuproqning kuchli sho' rlanmaganligini ko' rsatadi.

Shoberdi o' rmonchilik bo' limi tuproqlari **kam gumusli, karbonat-gipsli, kuchsiz ishqoriy reaksiyaga ega, yengil mexanik tarkibli qumli tuproqlar** sifatida tavsiflandi. Ushbu agroekologik sharoit oddiy pista (*Pistacia vera* L.) ning chuqur ildiz tizimini shakllantirish va quyi gorizontlardan namlik hamda oziqa elementlarini o' zlashtirishiga qulay bo' lsa-da, tuproq unumdorligini saqlash uchun organik modda zaxirasini ko' paytirish hamda, ayniqsa, fosforli o' g' itlardan ilmiy asosda foydalanishni talab etadi.

Xulosa. adqiqot natijalari Shoberdi o' rmonchilik bo' limida tarqalgan qumli tuproqlar yengil mexanik tarkibli, kuchsiz ishqoriy reaksiyali, kam gumusli va karbonat-gipsli tuproqlar ekanligini ko' rsatdi. Tuproq profilida makroelementlarning differensial taqsimlanishi natriy va kaliyning ustki, kaltsiy hamda temirning esa quyi qatlamlarda nisbatan ko' proq to' planishi bilan tavsiflandi. Bu holat elementlar migratsiyasi va ularning pedogenetik jarayonlar ta'sirida qayta taqsimlanishini aks ettiradi.

Qumli tuproqlarda gumus hamda harakatchan fosfor miqdorining pastligi oddiy pista (*Pistacia vera* L.) plantatsiyalarida oziqa rejimini cheklovchi asosiy agroekologik omillardan biri ekanligi aniqlandi. Shu bilan birga, tuproqning yengil mexanik tarkibi, past sho' rlanish darajasi va yaxshi aeratsiyasi pista ildiz tizimining rivojlanishi uchun qulay sharoit yaratadi.

Olingan natijalar Qo' qon davlat o' rmon xo' jaligi qumli tuproqlarining agroekologik va biogeokimyoviy bahosini aniqlash, oziqa elementlarini ilmiy asosda boshqarish hamda pista plantatsiyalarida organik modda zaxirasini oshirish va fosforli o' g' itlardan samarali foydalanish bo' yicha amaliy tavsiyalar ishlab chiqishga asos bo' lib xizmat qiladi.

Annatatsiya. *Physalis alkekengi L. dorivor va manzarali ahamiyatga ega istiqbolli turlardan biri hisoblanadi. Physalis alkekengi yoki maydalangan gilos yoki ”xitoycha chiroq” Markaziy Amerika va Shimoliy Amerikaning janubi-sharqida o‘ sadigan o‘ tsimon o‘ simlik. Keyinchalik u Janubiy Yevropaga olib kelingan va keyin sharqqa qarab Xitoy va Yaponiyaga tarqalgan. Maydalangan gilos boshqa maydalangan gilos turlariga qaraganda sovuqqa chidamliroq va mo‘ tadil iqlim sharoitida qishlay oladigan va har yili ildizpoyalaridan qayta o‘ sadigan yagona turdir. Mazkur o‘ simlikning laboratoriya sharoitda ununchanligi standart labaratoriya usullar asosida nazorat qilingan yorug‘ lik harorat va namlik sharoitda o‘ rganildi. Olib borilgan tadqiqot davomida urug‘ larning unuvchanlik foizi, unush energiyasi va o‘ rtacha unush mudati aniqlandi. Ph.alkekengi urug‘ larni biologik hususiyatlarni aniqlash, ularni ko‘ paytirish va intraduksiya qilish uchun amaliy ahamiyatga ega.*

Kalit so‘ zlar: *unuvchanlik, physalis alkekengi, harorat, unush energiyasi, urug‘ massasi,*

ПАХ-ПАХ — ОЦЕНКА ВСХОЖЕСТИ И ЭНЕРГИИ ПРОРАСТАНИЯ СЕМЯН PHYSALIS ALKEKENGI L. В ЛАБОРАТОРНЫХ УСЛОВИЯХ

Аннотация. *Physalis alkekengi L. является одним из перспективных видов, обладающих лекарственной и декоративной ценностью. Данный вид, известный также как физалис обыкновенный или «китайский фонарик», является травянистым растением, происходящим из юго-восточных районов Северной и Центральной Америки. Впоследствии он был интродуцирован в Южную Европу, а затем распространился в Китай и Японию. По сравнению с другими видами физалиса Ph.alkekengi отличается более высокой холодостойкостью, способен зимовать в условиях умеренного климата и ежегодно возобновляется благодаря корневищам. В лабораторных условиях семена данного вида были исследованы по стандартным методикам определения посевных качеств при контролируемых условиях освещённости, температуры и влажности. В ходе исследования определены лабораторная всхожесть семян, энергия прорастания и средняя продолжительность прорастания. Полученные результаты имеют практическое значение для изучения биологических особенностей семян Ph.alkekengi, а также для их размножения и интродукции.*

Ключевые слова: *Physalis alkekengi, лабораторная всхожесть, энергия прорастания, температура, масса семян.*

PAQ-PAQ — ASSESSMENT OF SEED GERMINATION AND GERMINATION ENERGY OF PHYSALIS ALKEKENGI L. UNDER LABORATORY CONDITIONS

Abstract. *Physalis alkekengi L. is one of the promising species valued for its medicinal and ornamental properties. Also known as the Chinese lantern plant, it is a herbaceous species native to the southeastern regions of North and Central America. Subsequently, it was introduced into Southern Europe and later spread to China and Japan. Compared with other Physalis species, P. alkekengi exhibits greater cold tolerance, is capable of overwintering under temperate climatic conditions, and regenerates annually from its rhizomes. Under laboratory conditions, seed germination was evaluated using standard seed-testing methods under controlled light, temperature, and humidity regimes. The study determined seed germination percentage, germination energy, and mean germination time. The obtained results are of practical importance for understanding the biological characteristics of Ph.*

alkekengi seeds and for their propagation and introduction.

Keywords: *Physalis alkekengi, seed germination, germination energy, temperature, seed weight.*

Kirish

Physalis alkekengi L.- Solanaceae oilasiga mansub *Physalis* turkumiga mansub ko‘ p yillik o‘ simlik. Poyasi yog‘ ochsimon, balandligi 50-80 sm. *Ph.* alkekengi gulkosalari va mevalari Yevropa va Osiyoda tarqalgan. Gulkosalari yashil. Gultoji barglari oq rangda, o‘ z-o‘ zidan changlanadi, asosi biroz botiq, uzunligi 2,5–5 sm, diametri 2,5–3,5 sm, yupqa po‘ stlog‘ iga ega va pishganda to‘ q sariq-qizil yoki olov qizil rangda bo‘ ladi. Mevalari sharsimon, to‘ q sariq-qizil va diametri 10–15 mm. *Ph. alkekenge* flavonoidlar, terpenoidlar, steroidlar va polisaxaridlar kabi turli xil bioaktiv komponentlarga boy va yallig‘ lanishga qarshi antibakterial va immunomodulyator kabi farmakologik ta’sirga ega.

Ph.alkekengi nafaqat ajoyib dorivor qiymatga ega, balki ajoyib yeyish mumkin bo‘ lgan qiymat va tabiiy ozuqaviy afzalliklarni ham namoyish etadi. Uning mevasi o‘ ziga xos, yoqimli shirin-nordon ta’mga va muvozanatli ta’mga ega va turli xil vitaminlar, minerallar va tabiiy funktsional moddalarga boy. O‘ zining o‘ ziga xos hissiy xususiyatlari va mo‘ l-ko‘ l ozuqaviy tarkibiy qismlari tufayli *P. alkekengi* mevasi yangi iste’mol qilishda, qayta ishlangan gazaklarda, funktsional ichimliklarda va pishirilgan mahsulotlarda keng qo‘ llanilishi mumkin. Bu xususiyatlar iste’molchilarning tabiiy, sog‘ lom va funktsional oziq-ovqatlarga bo‘ lgan hozirgi tendentsiyasiga mos keladi, bu esa oziq-ovqat tadqiqotlari va sanoat qo‘ llanilishi uchun istiqbolli istiqbollarni ko‘ rsatadi.

Hozirgi vaqtda *P. alkekengi* dan 530 dan ortiq birikmalar ajratib olingan, ular orasida asosan steroidlar, flavonoidlar, alkaloidlar, fenilpropanoidlar, saxaroza efirlari, piperazinlar, uchuvchan yog‘ lar, polisaxaridlar, turli aminokislotalar va mikroelementlar mavjud. Zamonaviy farmakologik tadqiqotlar shuni ko‘ rsatdiki, Ph. alkekengi yallig‘ lanishga qarshi, mikroblarga qarshi, antioksidant, gipoglikemik, og‘ riq qoldiruvchi, o‘ smalarga qarshi va immunitetni tartibga soluvchi ta’sirga ega va katta ozuqaviy va dorivor ahamiyatga ega. Klinik amaliyotda *Ph.alkekengi* ko‘ pincha yo‘ tal, ortiqcha balg‘ am, faringit, tomoq og‘ rig‘ i, ekzema va sariqlikni davolash uchun boshqa Xitoy Xalq Respublikasi dorilari bilan birgalikda qo‘ llaniladi.

Adabiyotlar tahlili.

Ph.alkekenge urug‘ larini unishi uchun asosiy omil harorat hisoblanadi ko‘ pchilik olimlarning tadqiqot natijalariga ko‘ ri Physalis urug‘ larini unuvchanligi 20-25 ℃ deb belgilangan. Haroratning past yoki yuqori bo‘ lishi o‘ simlik urug‘ lari uchun noqulay omil hisoblanadi. Urug‘ larni unish energiyasi haqida malumotlar ilmiy adabiyotlarda yertarli emas, shu sababli urug‘ biologiyasi o‘ rganish ilmiy - amaliy jihatdan dolzarb hisoblanadi.

Tadqiqot metodologiyasi

Ilmiy tadqiqot *Ph.alkekenge* urug‘ lari labaratoriya shoroitda amalga oshirildi. Tadqiqot uchun biologik jihatdan yetilgan urug‘ lar ajratib olindi. Tajriba uchun dastlab har variantda 100 tadan urug‘ lar sanab olindi. Urug‘ lar strillangan petri idishlarga filtr qog‘ ozga ekildi va namlik muntazam nazorat qilindi. Olingan natijalar qayt etib borildi. Unish eneriyasi standart sharoitda unib chiqgan urug‘ lar soniga nisbatan foizlarda hisoblandi.

Natija va ularning tahlili

Ph. alkekenge urug‘ larini laboratoriya unuvchanligini aniqlash uchun avvalo 1000 ta urug‘ ni vaznini o‘ lchab olindi. 1000 ta urug‘ ning o‘ rtacha vazni 1.546 gr tashkil etdi. O‘ tkazilgan tadqiqot natijalariga ko‘ ri saralab olingan urug‘ larimizda 0℃, 5℃ va 10℃ da unuvchanlik haroratga bog‘ liq ravishda o‘ zgarish kuzatilmaganligini ko‘ rishimiz mumkun. 15℃ haroratdan boshlab P.alkekenge urug‘ larida unuvchanlik kuzatilgan. 25℃ haroratda eng yuqori ko‘ rsatgichga yetgan. 30℃ boshlab urug‘ larning unuvchanligi biroz pasayganligi qayt etilgan. 35℃ da urug‘ larning unuvchanlik foizi 12% gacha pasaygan (1-jadval). 40℃ haroratda Physalis urug‘ larida unuvchanlik kuzatilmadi.

Tadqiqot natijalariga ko‘ ri Ph. alkekenge urug‘ larining unuvchanligi 10-20 kunlar oralig‘ ida yuqori ko‘ rsatgichga yetganligini kuzatishimiz mumkun (1-rasm)

1-jadval

Turli haroratda *Ph. alkekenge* urug‘ larning unuvchanligi

℃	Kunlar, % da											%
		3	6	9	11	14	17	20	23	26	30	
0		-	-	-	-	-	-	-	-	-	-	0%

Urug‘ larning unush energiyasi - bu belgilangan qisqa muddat ichida namuna tarkibidagi normal unib chiqgan urug‘ lar sonining umumiy urug‘ lar soniga nisbatan foizlarda ifodalangan ko‘ rsatgichidir. Urug‘ larni unish eneriyasi quidagi formula yordamida ifodalanadi.

$$E = \frac{n}{N} * 100\ \%$$

E - unish energiyasi

N - undirishga qo‘ yilgan jami urug‘ lar soni.

n - belgilangan muddatda ungan urug‘ lar soni.

1-rasm. *Ph. alkekenge* urug‘ larining turli haroratda unuvchanlik ko‘ rsatgichlari

Urug‘ larni unuvchanligi va unish energiyasi ISTA (International Rules for Seed Testing, 2024) hamda AOSA (Rules for Testing Seeds, 2023) metodikasi asosida baholandi.

Tadqiqot natijasiga ko‘ ri unish energiyasi quyidagicha baholandi. Unish energiyasi Physali ISTA qoidasiga ko‘ ri asosiy mezon qilib urug‘ larni undurishga qo‘ ygandan keyin 12 - kuni o‘ tkazilish tavsiya etiladi. Ammo bizda 1, 3, 6, 9, 11, 14, 17, 20, 23, 26 va 30-kunlarda olib borilganligi sababli

12- Kunga eng yaqin kuzatuv, 11- kun ma’lumotlari asosida baholandi.

$$E = \frac{12}{100} * 100$$

Tajribada unish energiyasining foiz ko‘ rsatgichi 12 % teng ekanligi aniqlandi.

Xulosa

Olib borilgan ilmiy tadqiqot ishimizda Urug‘ larning labaratoriya sharoitida unish jarayoni bevosita haroratga bog‘ liq ekanligi aniqlandi. Eng yuqori unuvchanlik 25 ℃ haroratda qayt etildi, bu natija urug‘ larning unishu uchun optimal harorat ekanligi malum bo‘ ldi. Urug‘ larni asosiy qismi dastlabki 17 kunda unib chiqganligini, ular uchun qulay sharoit yaratilganda yuqori fiziologik faollikga ega bo‘ lishi aniqlandi.

ОПРЕДЕЛЕНИЕ АМИНОКИСЛОТ В НАДЗЕМНОЙ ЧАСТИ ЛЕКАРСТВЕННОГО РАСТЕНИЯ MENTHA PIPERITA L. МЕТОДОМ ВЫСОКОЭФФЕКТИВНОЙ ЖИДКОСТНОЙ ХРОМАТОГРАФИИ (ВЭЖХ).

Аннотация: *Целью данного исследования было определение качественного и количественного состава аминокислот в надземной части лекарственного растения Mentha piperita L. (мята перечная), произрастающего в Сурхандарьинской области, с использованием метода высокоэффективной жидкостной хроматографии (ВЭЖХ). Образцы растений для исследования были собраны в Сурхандарьинской области в мае 2025 года. Анализы проводились с использованием высокоэффективной жидкостной хроматографии Agilent Technologies серии 1200. В результате в растении было идентифицировано в общей сложности 20 аминокислот, их суммарное количество составило 45,962 мг/г сухого растительного сырья. Среди идентифицированных аминокислот преобладали аспарагин (11,636 мг/г), аргинин (8,340 мг/г), глицин (5,164 мг/г), аланин (3,841 мг/г) и тирозин (3,575 мг/г). Также были обнаружены серин, треонин, глутамин, цистеин, фенилаланин, валин, гистидин и другие аминокислоты. Полученные результаты указывают на то, что Mentha piperita L. является богатым природным источником биологически активных аминокислот и может быть использована в качестве перспективного лекарственного сырья в производстве фармацевтических препаратов, нутрицевтиков и функциональных пищевых продуктов. Результаты исследования предоставляют новые научные данные об аминокислотном составе Mentha piperita L., произрастающей в Узбекистане, и служат научной основой для стандартизации и улучшения контроля качества лекарственного растительного сырья.*

DETERMINATION OF AMINO ACIDS IN THE ABOVE-GROUND PART OF THE MEDICINAL PLANT MENTHA PIPERITA L. BY HIGH-PERFORMANCE LIQUID CHROMATOGRAPHY (HPLC) METHOD

Abstract: *The aim of this study was to determine the qualitative and quantitative composition of amino acids in the above-ground part of the medicinal plant Mentha piperita L. (peppermint) growing in the Surkhandarya region using the high-performance liquid chromatography (HPLC) method. Plant samples for the study were collected from the Surkhandarya region in May 2025. The analyses were carried out using Agilent Technologies 1200 Series high-performance liquid chromatography. As a result, a total of 20 amino acids were identified in the plant, and their total amount was 45.962 mg/g of dry plant raw material. Among the identified amino acids, asparagine (11.636 mg/g), arginine (8.340 mg/g), glycine (5.164 mg/g), alanine (3.841 mg/g) and tyrosine (3.575 mg/g) prevailed. Serine, threonine, glutamine, cysteine, phenylalanine, valine, histidine and other amino acids were also detected. The results obtained indicate that Mentha piperita L. is a rich natural source of biologically active amino acids and can be used as a promising medicinal raw material in the production of pharmaceuticals, nutraceuticals and functional food products. The results of the study provide new scientific data on the amino acid composition of Mentha piperita L. growing in Uzbekistan and serve as a scientific basis for standardization and improvement of quality control of medicinal plant raw materials.*

Keywords: *Mentha piperita L.; mint; medicinal plant; amino acids; high-performance liquid chromatography (HPLC); Agilent Technologies 1200 Series; phytochemical analysis; biologically active substances; Surkhandarya region; pharmacognosy.*

KIRISH: Mentha piperita L. (yalpiz) Lamiaceae (Labguldoshlar) oilasiga mansub ko‘ p yillik dorivor o‘ simlik bo‘ lib, dunyoning ko‘ plab mamlakatlarida farmatsevtika, oziq-ovqat va kosmetika sanoatida keng qo‘ llaniladi. O‘ simlik tarkibida mentol, menton, flavonoidlar, fenolik birikmalar, organik kislotalar va boshqa biologik faol moddalar mavjud bo‘ lib, ular antioksidant, yallig‘ lanishga qarshi, antimikrob va spazmolitik xususiyatlarga ega ekanligi ilmiy jihatdan isbotlangan (McKay Blumberg, 2006; Singh et al., 2011; Mahendran & Rahman, 2020).

So‘ nggi yillarda dorivor o‘ simliklarning aminokislotalar tarkibini o‘ rganishga bo‘ lgan qiziqish ortib bormoqda. Aminokislotalar oqsillarning tarkibiy qismi bo‘ lish bilan birga, o‘ simliklarda azot almashinuvi, hujayra metabolizmi, fermentlar faolligi, osmotik muvozanat va stressga moslashuv jarayonlarida muhim rol o‘ ynaydi (Hildebrandt et al., 2015; Galili et al., 2016). Ayrim aminokislotalar antioksidant himoya tizimini kuchaytirishi hamda biologik faol ikkilamchi metabolitlar biosintezida ishtirok etishi aniqlangan (Noctor et al., 2012; Szabados Savouré, 2010).

Yalpiz o‘ simligi kimyoviy tarkibi bo‘ yicha ko‘ plab tadqiqotlar amalga oshirilgan bo‘ lsa-da, ularning asosiy qismi efir moylari va fenolik birikmalarni o‘ rganishga bag‘ ishlangan (Mimica-Dukić Božin, 2008; Kamatou et al., 2013). Erkin aminokislotalarning sifat va miqdor tarkibi, ayniqsa Markaziy Osiyo sharoitida o‘ suvchi Mentha piperita namunalari uchun yetarli darajada o‘ rganilmagan.

Dorivor o‘ simliklarning kimyoviy tarkibi o‘ sish hududi, tuproq tarkibi, iqlim sharoiti, vegetatsiya davri va agroekologik omillarga bevosita bog‘ liq bo‘ lib, bu omillar biologik faol moddalarning miqdoriga sezilarli ta’sir ko‘ rsatadi (Fiehn, 2002; Weckwerth, 2003; Obata & Fernie, 2012). Shu sababli O‘ zbekiston hududida o‘ suvchi dorivor o‘ simliklarning aminokislotalar tarkibini aniqlash farmakognoziya va fitokimyo sohalari uchun dolzarb ilmiy yo‘ nalish hisoblanadi.

Mazkur tadqiqotda Surxondaryo viloyatida 2025-yil may oyida yig‘ ilgan Mentha piperita L. o‘ simligining yer ustki qismi Agilent Technologies 1200 Series YuSSX tizimida tahlil qilindi. Tadqiqot natijasida 20 ta aminokislota aniqlanib, ularning umumiy miqdori 45,962 mg/g ni tashkil etdi. Eng yuqori konsentratsiyalar asparagin (11,636 mg/g), arginin (8,340 mg/g) va glisin (5,164 mg/g) uchun qayd etildi, bu esa mazkur o‘ simlikning biologik faol aminokislotalarga boy tabiiy manba ekanligini ko‘ rsatadi.

Tadqiqotning maqsadi Mentha piperita L. o‘ simligining yer ustki qismi tarkibidagi aminokislotalarning sifat va miqdor tarkibini YuSSX usulida aniqlash hamda olingan natijalarni dorivor o‘ simliklarni standartlashtirish va farmatsevtik amaliyotda qo‘ llash nuqtai nazaridan ilmiy baholashdan iborat.

Materiallar va usullar

Tadqiqot obyekti sifatida **Mentha piperita L.** (yalpiz) o‘ simligining yer ustki qismi ishlatildi. O‘ simlik namunalari O‘ zbekiston Respublikasi **Surxondaryo viloyatidan 2025-yil may oyida**, gullash davrida yig‘ ib olindi. Botanika identifikatsiyasi o‘ simlikning morfologik va sistematik belgilari asosida amalga oshirildi hamda amaldagi farmakognoziya va botanika adabiyotlari bilan taqqoslab tasdiqlandi (WHO, 2019; European Pharmacopoeia, 2023).

Yig‘ ilgan o‘ simlik xomashyosi begona aralashmalardan tozalandi va to‘ g‘ ridan-to‘ g‘ ri quyosh nurlaridan himoyalangan, yaxshi shamollatiladigan xonada **25–30 °C** haroratda doimiy massa hosil bo‘ lguncha quritildi. Quritilgan namuna laboratoriya tegirmonida maydalanib, **1 mm** o‘ lchamli elakdan o‘ tkazildi. Tayyorlangan kukun germetik yopiladigan polietilen idishlarda laboratoriya sharoitida saqlandi.

Reaktivlar va kimyoviy moddalar

Tahlil davomida **6 M xlorid kislota (HCl), YuSSX darajasidagi metanol, atsetonitril, natriy atsetat bufer eritmasi, ortoftalaldegid (OFA)** hamda aminokislotalarning standart aralashmalari **(Sigma-Aldrich, AQSH)** qo‘llanildi. Eritmalarni tayyorlashda **Milli-Q** ultra toza suv tizimidan olingan suv ishlatildi. Barcha reaktivlar analitik tozalikka ega bo‘lib, xalqaro laboratoriya talablariga javob berdi.

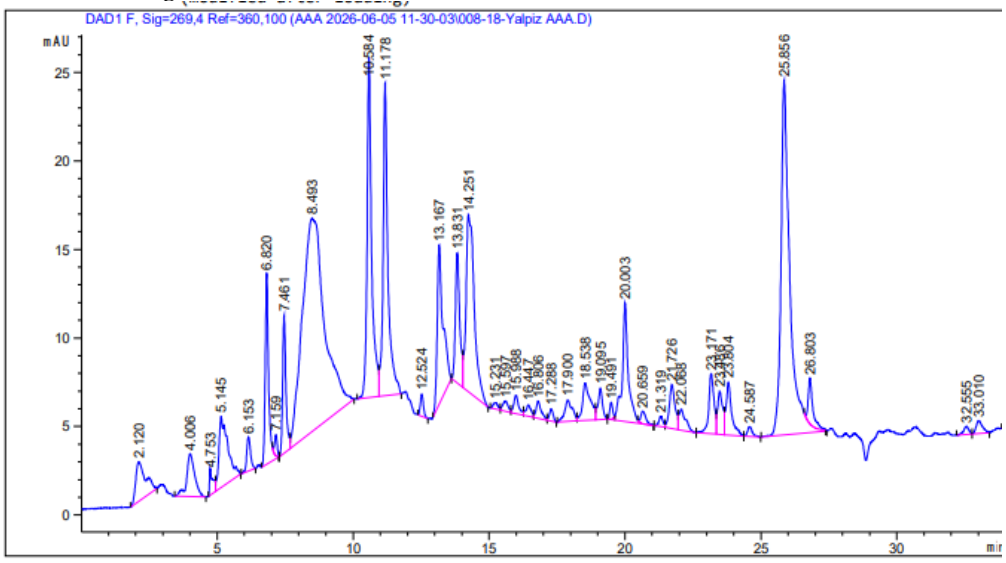
Namunalarni tayyorlash

Maydalangan o‘simlik kukunidan **0,5 g** aniq tortib olinib, gidroliz naychalariga joylashtirildi. Namunalar **6 M HCl** bilan **110°C** haroratda **24 soat** davomida azot atmosferasida gidroliz qilindi. Gidroliz yakunlangach, kislota vakuum ostida rotatsion bug‘latkich yordamida bug‘latib yuborildi. Hosil bo‘lgan qoldiq **pH 2,2** bo‘lgan natriy sitrat bufer eritmasida eritildi va **0,22 mkm** membranali filtr orqali filtrlanib, YuSSX vialalariga quyildi (Henderson et al., 2000).

Aminokislotalarni YuSSX usulida aniqlash

Aminokislotalarning sifat va miqdoriy tahlili **Agilent Technologies 1200 Series High Performance Liquid Chromatography (YuSSX)** tizimida amalga oshirildi. Qurilma kvaternar nasos, avtomatik namuna yuboruvchi (autosampler), kolonka termostati va flyuoressensiya detektori bilan jihozlangan.

Xromatografik ajratish **Zorbax Eclipse AAA C18** (4,6 × 150 mm; 5 μm) kolonkasida bajarildi. Tahlildan oldin aminokislotalar **ortoftalaldegid (OFA)** yordamida derivatizatsiya qilindi. Harakatlanuvchi faza sifatida natriy atsetat bufer eritmasi (A) va atsetonitril–metanol–suv aralashmasi (B) qo‘llanildi. Gradient elyutsiya rejimida oqim tezligi **1,0 ml/min**, kolonka harorati **40 °C**, namuna yuborish hajmi esa **10 μl** etib belgilandi.



Aminokislotalar standart eritmalar bilan ushlanish vaqtlari (retention time) taqqoslanib identifikatsiya qilindi. Miqdoriy hisoblash tashqi kalibrlash egri chiziqlari yordamida amalga oshirildi va natijalar **mg/g quruq o‘simlik xomashyosi** ko‘rinishida ifodalandi.

Statistik tahlil

Barcha tajribalar uch martadan takrorlandi va natijalar **o‘rtacha qiymat ± standart og‘ish (Mean ± SD)** ko‘rinishida ifodalandi. Statistik ishlov berish **OriginPro 2024** va **Microsoft Excel 2021** dasturlari yordamida amalga oshirildi. Statistik jihatdan ishonchli farq **$p < 0,05$** darajasida baholandi.

Natijalar va muhokama

Surxondaryo viloyatida o‘suvchi *Mentha piperita* L. o‘simligining yer ustki qismi tarkibidagi aminokislotalar **Agilent Technologies 1200 Series** yuqori samarali suyuqlik xromatografiyasi (YuSSX) usuli yordamida sifat va miqdor jihatdan tahlil qilindi. *Mentha piperita* L. o‘simligining yer ustki qismi tarkibidagi aminokislotalar ekstraktining YuSSX xromatogrammasi 1-rasmda keltirilgan.

1-rasm. *Mentha piperita* L. o‘simligining yer ustki qismi tarkibidagi aminokislotalar ekstraktining YuSSX xromatogrammasi.

Tahlil natijasida **20 ta aminokislota** aniqlandi va ularning umumiy miqdori **45,962 mg/g** quruq o‘simlik xomashyosini tashkil etdi. Aniqlangan aminokislotalar orasida **asparagin (11,636 mg/g)** eng yuqori miqdorda qayd etildi. Keyingi o‘rinlarda **arginin (8,340 mg/g), glisin (5,164 mg/g), alanin (3,841 mg/g), tirozin (3,575 mg/g), treonin (1,789 mg/g), glutamin (1,667 mg/g) va sistein (1,627 mg/g)** aniqlandi. Eng kam miqdor **triptofan (0,199 mg/g), aspartat kislotasi (0,214 mg/g), izoleysin (0,223 mg/g), leysin (0,238 mg/g)** va **metionin (0,419 mg/g)** uchun kuzatildi.Natijalar 1-jadvalda keltirilgan.

1-jadval

Surxondaryo viloyatida o‘ sgan *Mentha piperita* L. o‘ simligi yer ustki qismi tarkibidagi aminokislotalar miqdori

№	Aminokislotalar nomi	*Matricaria chamomilla L* Konsentratsiya mg/gr	№	Aminokislotalar nomi	*Matricaria chamomilla L* Konsentratsiya mg/gr
1	Aspartat kislotasi	0,214	11	Prolin	0,703
2	Glutamat kislotasi	0,554	12	Tirozin	3,575
3	Serin	1,100	13	Valin	1,294
4	Glisin	5,164	14	Metionin	0,419
5	Asparagin	11,636	15	Gistidin	1,279
6	Glutamin	1,667	16	Izoleysin	0,223
7	Sistein	1,627	17	Leysin	0,238
8	Treonin	1,789	18	Triptofan	0,199
9	Arginin	8,340	19	Fenilalanin	1,390
10	Alanin	3,841	20	Lizin	0,710
Jami					**46.912**

YuSSX tahlili natijasida *Mentha piperita* L. o‘ simligining yer ustki qismida 20 ta aminokislota aniqlandi. Eng yuqori miqdor asparagin (11,636 mg/g), arginin (8,340 mg/g) va glisin (5,164 mg/g) hissasiga to‘ g‘ ri keldi.

Tadqiqot natijalariga ko‘ ra, **asparagin** yalpiz tarkibida ustun aminokislota ekanligi aniqlandi. Asparagin o‘ simliklarda azotni saqlash va tashishning asosiy shakllaridan biri bo‘ lib, hujayralarda azot almashinuvini boshqarishda muhim rol o‘ ynaydi. Shuningdek, u oqsil biosintezi, hujayra bo‘ linishi va yangi to‘ qimalarning shakllanishida faol ishtirok etadi (Hildebrandt et al., 2015; Galili et al., 2016).

Asparaginning yuqori miqdorda aniqlanishi *Mentha piperita* o‘ simligida azot almashinuvining faol kechayotganligini hamda vegetativ organlarda oziqa moddalarining intensiv to‘ planishini ko‘ rsatadi.

Ikkinchi eng yuqori ko‘ rsatkich **arginin** hissasiga to‘ g‘ ri keldi. Arginin azotga eng boy aminokislotalardan biri bo‘ lib, poliaminlar, azot oksidi va boshqa biologik faol birikmalarning biosintezida muhim prekursor hisoblanadi. Bundan tashqari, arginin o‘ simliklarning qurg‘ oqchilik, sho‘ rlanish va oksidlovchi stressga moslashishida muhim ahamiyatga ega (Winter et al., 2015). Surxondaryo viloyatining issiq va quruq iqlim sharoiti argininning nisbatan yuqori miqdorda to‘ planishiga ta’sir ko‘ rsatgan bo‘ lishi mumkin.

Glisin uchinchi o‘ rinda qayd etildi. Ushbu aminokislota xlorofill biosintezi, fotorespiratsiya va antioksidant himoyada ishtirok etuvchi glutation sintezi uchun zarur komponentlardan biridir (Noctor et al., 2012). Glisinning yuqori miqdori yalpiz o‘ simligida fotosintetik faollik va metabolik jarayonlarning yuqori darajada ekanligini ko‘ rsatadi.

Shuningdek, **alanin** va **tirozin** ham nisbatan yuqori miqdorlarda aniqlandi. Alanin uglevod va energiya almashinuvining muhim metaboliti bo‘ lsa, tirozin fenol birikmalar, flavonoidlar va boshqa ikkilamchi metabolitlarning biosintezida ishtirok etadi (Fiehn, 2002; Obata & Fernie, 2012). Bu natijalar *Mentha piperita* o‘ simligining biologik faol moddalarni sintez qilish salohiyati yuqori ekanligini ko‘ rsatadi.

Tahlil davomida **valin, treonin, metionin, fenilalanin, leysin, izoleysin, lizin va triptofan** kabi almashinmaydigan (essensial) aminokislotalar ham aniqlandi. Ularning umumiy tarkibda mavjudligi yalpizning oziqaviy va farmakologik qiymatini oshiradi. Ushbu aminokislotalar inson organizmida sintez qilinmaydi va oziq-ovqat yoki dorivor o‘ simliklar orqali qabul qilinadi. Shu sababli *Mentha piperita* biologik faol qo‘ shimchalar va fitopreparatlar ishlab chiqarishda istiqbolli tabiiy xomashyo hisoblanadi.

Olingan natijalar boshqa mamlakatlarda **YuSSX** va **LC–MS** usullarida o‘ tkazilgan tadqiqotlar bilan umumiy jihatdan mos keladi. Biroq Surxondaryo viloyatida o‘ sgan yalpiz namunalarida **asparagin** va **arginin** miqdorining yuqoriligi hududning agroiqlim sharoiti, tuproq tarkibi, namlik darajasi va vegetatsiya davrining o‘ ziga xosligi bilan

izohlanishi mumkin. Ilmiy adabiyotlarda ham dorivor o‘ simliklarning aminokislotalar tarkibi ekologik omillar ta’sirida sezilarli darajada o‘ zgarishi qayd etilgan (Weckwerth, 2003; Fernie et al., 2011).

Qiyosiy tahlil natijalariga ko‘ ra, Surxondaryo viloyatida o‘ sgan *Mentha piperita* L. namunalarida 20 ta aminokislota aniqlanib, bu ayrim ilgari e’lon qilingan tadqiqotlar bilan bir xil yoki undan kengroq aminokislotalar profilini ko‘ rsatadi. O‘ simlik tarkibida asparagin va argininning yuqori miqdorda aniqlanishi hududning agroiqlim sharoiti hamda o‘ simlikning fiziologik holati bilan bog‘ liq bo‘ lishi mumkin. Turli tadqiqotlarda *Mentha piperita* L. o‘ simligining aminokislotalar tarkibi bo‘ yicha qiyosiy tahlili 2-jadvalda keltirilgan.

2-jadval

Turli tadqiqotlarda *Mentha piperita* L. o‘ simligining aminokislotalar tarkibi bo‘ yicha qiyosiy tahlil

Muallif(lar), yil	Tadqiqot o‘ tkazilgan mamlakat	Tahlil usuli	Aniqlangan aminokislotalar soni	Ustun aminokislotalar
Khorasani va boshqalar (2018)	Eron	HPLC	17	Asparagin, glisin, arginin
El-Sayed va boshqalar (2021)	Misr	LC–MS	18	Asparagin, alanin, tirozin
Mazkur tadqiqot	O‘ zbekiston (Surxondaryo viloyati)	Agilent Technologies 1200 HPLC	20	Asparagin, arginin, glisin, alanin, tirozin

Qiyosiy tahlil natijalariga ko‘ ra, Surxondaryo viloyatida o‘ sgan *Mentha piperita* L. namunalarida 20 ta aminokislota aniqlanib, bu ayrim ilgari e’lon qilingan tadqiqotlar bilan bir xil yoki undan kengroq aminokislotalar profilini ko‘ rsatadi. O‘ simlik tarkibida asparagin va argininning yuqori miqdorda aniqlanishi hududning agroiqlim sharoiti hamda o‘ simlikning fiziologik holati bilan bog‘ liq bo‘ lishi mumkin.

Umuman olganda, ushbu tadqiqot natijalari Surxondaryo viloyatida o‘ suvchi *Mentha piperita* L. o‘ simligining yer ustki qismi aminokislotalarning boy tabiiy manbai ekanligini tasdiqladi. Ayniqsa, asparagin, arginin va glisinning yuqori miqdorda aniqlanishi ushbu o‘ simlikning farmakologik, nutrasevtik va funksional oziq-ovqat mahsulotlari ishlab chiqarish uchun istiqbolli xomashyo ekanligini ko‘ rsatadi. Mazkur natijalar dorivor o‘ simliklarni standartlashtirish, sifat nazoratini takomillashtirish hamda ularning biologik faol moddalar tarkibini chuqur o‘ rganish bo‘ yicha kelgusidagi ilmiy tadqiqotlar uchun muhim ilmiy asos bo‘ lib xizmat qiladi.

Xulosa

Ushbu tadqiqotda Surxondaryo viloyatida 2025-yil may oyida yig‘ ilgan **Mentha piperita** L. o‘ simligining yer ustki qismi tarkibidagi aminokislotalar **Agilent Technologies 1200 Series** yuqori samarali suyuqlik xromatografiyasi (YUSSX) usuli yordamida sifat va miqdor jihatdan o‘ rganildi.

Tahlil natijasida **20 ta aminokislota** aniqlanib, ularning umumiy miqdori **45,962 mg/g** quruq o‘ simlik xomashyosini tashkil etdi. Aniqlangan aminokislotalar orasida **asparagin (11,636 mg/g), arginin (8,340 mg/g), glisin (5,164 mg/g), alanin (3,841 mg/g)** va **tirozin (3,575 mg/g)** eng yuqori miqdorlarda qayd etildi. Mazkur natijalar yalpiz o‘ simligining aminokislotalarga boy tabiiy dorivor xomashyo ekanligini tasdiqlaydi.

Asparagin va argininning yuqori konsentratsiyada aniqlanishi o‘ simlikda azot almashinuvi jarayonlari faol kechayotganini hamda ushbu aminokislotalar o‘ simlikning ekologik sharoitlarga moslashishida muhim ahamiyat kasb etishini ko‘ rsatadi. Shuningdek, glisin, alanin va tirozinning nisbatan yuqori miqdorda uchrashi *Mentha piperita* L. o‘ simligining biologik faol moddalarga boyligini va uning farmakologik salohiyatini yanada oshiradi.

Olingan natijalar O‘ zbekiston sharoitida o‘ suvchi **Mentha piperita** L. o‘ simligining aminokislotalar tarkibi bo‘ yicha yangi ilmiy ma’lumotlarni taqdim etadi. Ushbu ma’lumotlar dorivor o‘ simlik xomashyosini standartlashtirish, sifat nazoratini takomillashtirish, fitopreparatlar, biologik faol qo‘ shimchalar (nutrasevtik vositalar) hamda funksional oziq-ovqat mahsulotlarini ishlab chiqishda ilmiy asos bo‘ lib xizmat qilishi mumkin.

Kelgusida **Mentha piperita** L. o‘ simligining turli vegetatsiya bosqichlari, turli ekologik hududlarda o‘ suvchi namunalari va boshqa *Mentha* turlari bilan qiyosiy metabolomik tadqiqotlarni amalga oshirish maqsadga muvofiqdir. Bunday izlanishlar aminokislotalar biosinteziga ta’sir etuvchi ekologik va fiziologik omillarni chuqurroq o‘ rganish hamda ushbu dorivor o‘ simlikning farmatsevtik qiymatini yanada to‘ liq baholash imkonini beradi.

Annotatsiya: *Ushbu maqolada kuzgi yumshoq bug‘ doyning Chillaki va Fortuna navlari hamda ularning T-5 (Chillaki × Fortuna) kombinatsiyasidan olingan 9 ta F_5 duragay namunalarining boshoqlash davrida barg hujayra shirasidagi suvda eruvchan albumin oqsillarining ivish (koagulyatsiya) harorati P.A. Genkel uslubi yordamida o‘ rganildi. Tadqiqot natijalariga ko‘ ra, namunalar kesimida oqsillar koagulyatsiya harorati 55,3°C dan 62,5°C gacha oraliqda o‘ zgarib, eng yuqori ko‘ rsatkich T-5/4 duragayida (62,5°C) qayd etildi. Olingan natijalar duragaylarning issiqlik stressiga chidamlilik darajasi yuqori ekanligini ko‘ rsatadi.*

ТЕМПЕРАТУРА КОАГУЛЯЦИИ АЛЬБУМИНОВЫХ БЕЛКОВ У ГИБРИДНЫХ ПОКОЛЕНИЙ F_5 ОЗИМОЙ МЯГКОЙ ПШЕНИЦЫ

Аннотация: *В данной статье с использованием метода П.А. Генкеля изучена температура коагуляции водорастворимых белков альбумина в клеточном соке листьев в период колошения у сортов мягкой озимой пшеницы Chillaki и Fortuna, а также у 9 F_5 гибридных образцов (Chillaki × Fortuna). Согласно результатам исследования, температура коагуляции белков варьировала в пределах от 55,3°C до 62,5°C, при этом наивысший показатель был отмечен у гибрида T-5/4 (62,5°C). Полученные результаты свидетельствуют о высокой степени устойчивости гибридов к тепловому стрессу.*

Ключевые слова: *Озимая мягкая пшеница, сорт, белок альбумин, клеточный сок листа, температура коагуляции.*

COAGULATION TEMPERATURE OF ALBUMIN PROTEINS IN F_5 HYBRID PROGENIES OF BREAD WHEAT

Abstract: *This article investigates the coagulation temperature of water-soluble albumin proteins in the leaf cell sap during the heading period of bread wheat varieties Chillaki and Fortuna, as well as nine F_5 hybrid samples obtained from the T-5 (Chillaki × Fortuna) combination, using the P.A. Genkel method. According to the research results, the protein coagulation temperature ranged from 55.3°C to 62.5°C across the samples, with the highest value recorded in hybrid T-5/4 (62.5°C). The obtained results indicate a high level of heat stress tolerance in the studied hybrids.*

Key words: *Bread wheat, variety, albumin protein, leaf cell sap, coagulation temperature.*

Kirish

So‘ nggi yillarda global iqlim o‘ zgarishi hamda antropogen ta’sirlarning kuchayishi natijasida atrof-muhit holatining yomonlashuvi qishloq xo‘ jaligi ishlab chiqarishi va oziq-ovqat xavfsizligiga jiddiy xavf tug‘ dirmoqda. Ekinlarning o‘ sishi, rivojlanishi va hosildorligiga salbiy ta’sir etuvchi asosiy abiotik omillar qatoriga yuqori harorat, tuproq sho‘ rlanishi hamda qurg‘ oqchilik kiradi. Ushbu omillar ta’sirida o‘ simliklarda kechadigan fiziologik va biokimyoviy jarayonlar izdan chiqib, hosildorlik hamda mahsulot sifati pasayadi. Bug‘ doyning issiqlik stressiga

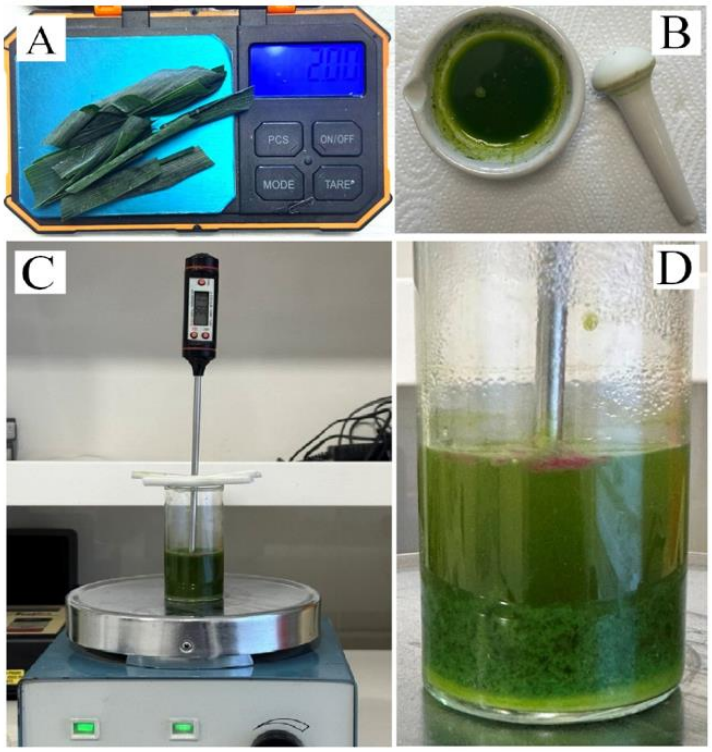
chidamliligini baholashda fiziologik ko‘ rsatkichlardan foydalanish muhim ahamiyatga ega. Xususan, barg hujayra shirasidagi suvda eruvchan albumin oqsillarining ivish (koagulyatsiya) harorati hujayra oqsillarining termik barqarorligini tavsiflovchi muhim ko‘ rsatkichlardan biri hisoblanadi. Ushbu ko‘ rsatkich asosida seleksiya jarayonida istiqbolli genotiplarni saralash va issiqlikka chidamli duragaylarni aniqlash imkoniyati yaratiladi. Mazkur tadqiqotda kuzgi yumshoq bug‘ doyning Chillaki va Fortuna navlari hamda ularning T-5 (Chillaki × Fortuna) kombinatsiyasidan olingan F_5 duragay avlodlarida boshoqlash davrida barg hujayra shirasidagi suvda eruvchan albumin oqsillarining ivish harorati aniqlanib, duragaylarning issiqlik stressiga chidamliligi qiyosiy baholandi.

Adabiyotlar tahlili

Issiqlik stressi o‘ simliklar o‘ zlarining optimal o‘ sish va rivojlanish haroratidan yuqori bo‘ lgan sharoitda uzoq muddat davomida qolishi natijasida yuzaga keladigan asosiy abiotik stress omillaridan biridir. Ushbu stressning kuchayishiga issiqxona gazlari va xlorftoruglerodlar emissiyasining ortishi, atmosfera tarkibida CO_2 konsentratsiyasining oshishi hamda inson faoliyati bilan bog‘ liq antropogen ta’sirlar sabab bo‘ lmoqda. Bunday o‘ zgarishlar global iqlim tizimining izchil isishiga olib kelib, qishloq xo‘ jaligi ekinlarining o‘ sishi, rivojlanishi va hosildorligiga salbiy ta’sir ko‘ rsatadi. Shu sababli iqlim o‘ zgarishining ekinlar mahsuldorligiga ta’sirini baholash, hosildorlikdagi ehtimoliy o‘ zgarishlarni oldindan prognoz qilish hamda moslashuv strategiyalarini ishlab chiqish maqsadida turli modellashtirish yondashuvlari va prognozlash modellari keng qo‘ llanilmoqda [**1**]. Yuqori harorat o‘ simliklarning generativ rivojlanish bosqichini jadallashtirib, fotosintez mahsulotlarining meva va urug‘ hosil bo‘ lishiga yo‘ naltirilishini cheklaydi. Shuningdek, tuproq haroratining me’yoridan ortishi urug‘ larning unib chiqish jarayoniga salbiy ta’sir ko‘ rsatib, maysalarning bir tekis rivojlanishiga to‘ sqinlik qilishi mumkin. Yuqori haroratning uzoq muddat davom etishi o‘ simliklarning o‘ sishi va rivojlanishini izdan chiqaradi, fiziologik jarayonlar muvozanatini buzadi hamda suv tanqisligini yanada kuchaytiradi. Natijada qurg‘ oqchilik stressi chuqurlashib, hosildorlikning keskin pasayishiga, ayrim hollarda esa o‘ simliklarning nobud bo‘ lishiga olib kelishi mumkin [**2**]. Yuqori harorat stressining salbiy ta’siri bug‘ doy, sholi, makkajo‘ xori, marvarid tariq, jo‘ xori, arpa, *Brachypodium*, *Arabidopsis*, no‘ xat va pomidor kabi ko‘ plab madaniy o‘ simliklarda kuzatiladi. Haroratning me’yoridan ortishi o‘ simliklarning o‘ sishi va rivojlanishiga salbiy ta’sir ko‘ rsatib, hosil shakllanish jarayonini izdan chiqaradi hamda hosil yig‘ imidan oldingi va keyingi yo‘ qotishlarning ortishiga sabab bo‘ ladi. Bunday o‘ zgarishlar barglarning quyosh ta’sirida kuyishi, barg, poya, novda va shoxchalarning qurishi, ildiz tizimi rivojlanishining susayishi hamda mevalar rangining o‘ zgarishi kabi morfologik belgilar bilan namoyon bo‘ ladi. Bundan tashqari, yuqori haroratning uzoq muddat davom etishi barglarning o‘ lchami, shakli va orientatsiyasiga ham ta’sir ko‘ rsatadi. Barglar fotosintezning asosiy organi bo‘ lganligi sababli, ular issiqlik stressiga eng tez javob qaytaruvchi va stressning dastlabki tashqi belgilarini namoyon etuvchi vegetativ organlardan biri hisoblanadi. Shu bois barglarda kuzatiladigan morfologik va fiziologik o‘ zgarishlar o‘ simliklarning issiqlikka chidamliligini baholashda muhim diagnostik mezon sifatida qaraladi [**3**].

Bug‘ doy dunyo miqyosida asosiy oziq-ovqat ekinlaridan biri sifatida oziq-ovqat xavfsizligi va oqsil ta’minotida muhim rol o‘ ynaydi hamda umumiy jahon don mahsulotlarining 11,1% ini va insoniyatning umumiy oqsil ehtiyojining 20,3% ini ta’minlaydi [4]. Bug‘ doy sifati, avvalo, uning oziqaviy qiymati hamda texnologik-qayta ishlash xususiyatlari bilan tavsiflanadi. Oziqaviy sifat albumin va globulin miqdori, aminokislotalar tarkibi, ayniqsa lizin kabi muhim aminokislotalar miqdori hamda boshqa oziq moddalar tarkibi bilan bog‘ liq [5]. Bug‘ doyning sifat ko‘ rsatkichlari genetik xususiyatlar, tashqi muhit omillari va ularning o‘ zaro ta’siri bilan belgilanadi [6]. Tuproqdagi namlik darajasi, yorug‘ lik intensivligi, tuproq xususiyatlari, harorat hamda atmosferadagi CO miqdorining ortishi kabi ko‘ plab ekologik omillar bug‘ doy sifatiga ta’sir ko‘ rsatishi aniqlangan [7]. Don hosil bo‘ lishi va to‘ lishi bosqichlaridagi haroratning o‘ zgaruvchanligi bug‘ doy doni sifatiga sezilarli ta’sir ko‘ rsatib, global qishloq xo‘ jaligi uchun muhim muammolardan biri hisoblanadi. 2035-yilga borib dunyo bo‘ yicha o‘ rtacha harorat taxminan 0,35-0,70°C ga oshishi taxmin qilinmoqda [8]. Issiqlik stressi don to‘ lish davrini qisqartiradi, bu bosqich oqsil va kraxmal to‘ planishi uchun muhim bo‘ lib, natijada umumiy oqsil miqdori kamayadi hamda uning tarkibi o‘ zgaradi [9]. Bug‘ doy vegetativ bosqichlarga nisbatan reproduktiv rivojlanish davrida yuqori harorat ta’siriga ko‘ proq sezgir hisoblanadi [10].

Barg haroratining oshishi natijasida issiqlik stressiga uchragan bug‘ doy o‘ simligida barglarning suv potensiali va nisbiy suv miqdori keskin kamayadi, oqibatda fotosintez samaradorligi pasayadi [11]. Don to‘ lish davrida kuzatiladigan issiqlik stressi oziq moddalarning o‘ simlik bo‘ ylab harakatlanishini susaytiradi [12]. Barg hujayralaridagi suvda eriydigan oqsillarning koagulyatsiya harorati bilan bug‘ doyning issiqlikka chidamlilik xususiyati o‘ zaro bog‘ liq hisoblanadi [13]. O‘ simliklarning yuqori haroratga moslashuvchi himoya reaksiyalaridan biri oqsillarning koagulyatsiya haroratining oshishidir [14]. Bug‘ doy barglarining suvni yuqori darajada saqlashi muhim ahamiyatga ega. Sut-mum pishish davrida barglarda suvning 60% va undan ortig‘ ining saqlanib qolishi qurg‘ oqchil hududga moslashgan navlarga xos belgi bo‘ lib, seleksiya uchun muhim ko‘ rsatkich hisoblanadi [15].

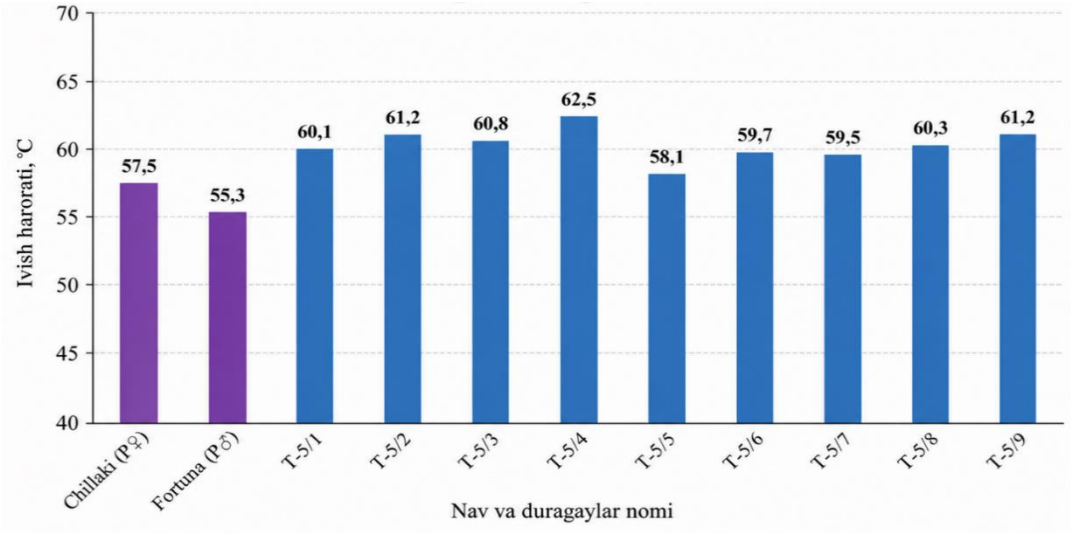


2025-2026-yillarda Xorazm viloyatida olib borilgan tadqiqotlarda ayrim navlarda bargdagi suvda eruvchan albumin oqsillarining ivish harorati aniqlangan. Unga ko‘ ra, 2025-yilda navlarning bargdagi suvda eruvchan albumin

oqsilining ivish harorati o‘ rtacha 57,9ºC dan 63,2ºC gacha oraliqda bo‘ lib, eng yuqori natija Bo‘ zqal’a (62,8ºC) va Yonbosh (63,2ºC) navlarida qayd qilingan. 2026-yilda navlarning oqsil koagulyatsiyasi aniqlanganda eng past natija Kate-A1 navida kuzatilib 56,6ºC ga teng bo‘ lgan. Qolgan navlarda Kate-A1 naviga nisbatan oqsil koagulyatsiyasi ±0,3 dan 6,9ºC gacha yuqori ko‘ rsatkichni qayd qilgan. 2026-yilda o‘ rganilgan navlar ichida eng yuqori natija Bo‘ zqal’a navida (63,5ºC) kuzatilgan [16].

Tadqiqot metodologiyasi

Tadqiqot obyekti sifatida kuzgi yumshoq bug‘ doyning Chillaki, Fortuna kabi ota-ona shakllari va T-5 (Chillaki x Fortuna) kombinatsiyasidan olingan 9 ta F_5 duragay namunalari olindi.



Tadqiqot uslublari. Navlar va duragaylarning boshoqlash davrida barg hujayra shirasi tarkibidagi suvda eruvchi albumin oqsillarining ivish (koagullanish) harorati P.A.Genkel uslubi yordamida o‘ rganildi. Ushbu uslub yordamida albuminlar koagulyatsiyasini aniqlash uchun 2,0 gramm barg namunasi olinib, olingan namuna ustiga 25 ml distillangan suv quyib chinni havonchada yaxshilab eziladi. Barg hujayra shirasi ajratib olinib, filtrlanadi. Filtrlangan eritma elektr plitka ustiga qo‘ yilib qizdiriladi (1-rasm). Albumin oqsillarining ivish (koagullanish) harorati aniqlanadi va natijalar qayd etiladi [17].

1-rasm. P.A.Genkel uslubi yordamida albumin oqsillarining koagullanish harorati aniqlash jarayoni. A) kerakli barg namunasini o‘ lchash, B) barg hujayra shirasi ajratib olish, C)barg shirasi ekstraktiga harorat ta’sir qildirish jarayoni, D)koagulyatsiyaga uchragan albumin oqsillari.

Natijalar va ularning tahlili

Laboratoriya sharoitida olib borilgan tadqiqotlarda Chillaki va Fortuna navlari hamda ular ishtirokida olingan duragaylarning barg hujayra shirasidagi suvda eruvchan albumin oqsillarining ivish harorati o‘ rganildi. Tadqiqot natijalariga ko‘ ra, namunalar kesimida oqsil koagulyatsiyasi harorati 55,3°C dan 62,5°C gacha oraliqda o‘ zgardi. Ota-ona shakllari orasida eng yuqori ko‘ rsatkich Chillaki navida kuzatilib, albumin oqsillarining ivish harorati 57,5°C ni tashkil etdi. Fortuna navida esa ushbu ko‘ rsatkich 55,3°C bo‘ lib, tadqiqotdagi eng past natija sifatida qayd etildi (2-rasm). Bu esa Fortuna naviga nisbatan Chillaki navining yuqori harorat ta’siriga nisbatan hujayra oqsillarini barqarorroq saqlash xususiyatiga ega ekanligini ko‘ rsatadi.

2-rasm. Navlar va duragaylar barg hujayra shirasidagi albumin oqsillarining ivish harorati, °C

Duragaylar orasida albumin oqsillarining ivish harorati ota-ona shakllariga nisbatan ancha yuqori bo‘ ldi. Eng yuqori natija T-5/4 duragayida kuzatilib, 62,5°C ni tashkil etdi. Shuningdek, T-5/2 va T-5/9 duragaylarida ham yuqori ko‘ rsatkichlar qayd etilib, bir xil ravishda 61,2°C ga teng bo‘ ldi. T-5/3 duragayida 60,8°C, T-5/8 duragayida 60,3°C va T-5/1 duragayida 60,1°C natijalar aniqlandi. Tajriba uchun olingan qolgan duragay namunalarida nisbatan pastroq ko‘ rsatkichlar kuzatilgan bo‘ lsa-da, ular ham ota-ona navlaridan yuqori natija qayd etdi.

Xulosa

Kuzgi yumshoq bug‘ doy navlari va duragaylarining barg hujayra shirasidagi albumin oqsillari koagulyatsiyasini aniqlash ularning yuqori harorat stressi hamda suv tanqisligi sharoitlariga bardoshliligini baholashda muhim fiziologik ko‘ rsatkichlardan biri hisoblanadi. Albumin oqsillarining ivish haroratining yuqori bo‘ lishi hujayra protoplazmasining termik barqarorligi yuqori ekanligini va o‘ simlikning noqulay muhit omillariga nisbatan chidamliligini tavsiflaydi.

Tadqiqot natijalariga ko‘ ra, ota-ona shakllari orasida eng yuqori ko‘ rsatkich Chillaki navida (57,5°C), eng past ko‘ rsatkich esa Fortuna navida (55,3°C) kuzatildi. Duragaylar orasida albumin oqsillarining ivish harorati 58,1–62,5°C oralig‘ ida o‘ zgarib, eng yuqori natija T-5/4 duragayida (62,5°C), undan keyingi yuqori ko‘ rsatkichlar T-5/2 va T-5/9 duragaylarida (61,2°C) qayd etildi. Mazkur duragaylarda oqsillarning yuqori haroratlarda koagulyatsiyaga uchrashi ularning issiqlik stressiga nisbatan yuqori chidamlilikka ega ekanligini ko‘ rsatadi. Shu sababli, T-5/4, T-5/2 va T-5/9 duragaylarini yuqori harorat va suv tanqisligi sharoitlariga moslashgan yangi navlarni yaratish jarayonida istiqbolli seleksiya materiali sifatida baholash mumkin.

Annotatsiya: *Ushbu tadqiqotda optimal dala sharoitida o‘ stirilgan 18 ta malina (Rubus idaeus L.) navlarining barglaridagi nisbiy suv miqdori (RWC) va xlorofill indeksi (SPAD) o‘ rtasidagi genotipik munosabatlar hamda navlararo farqlar tahlil qilingan. Bargning nisbiy suv miqdori Barrs va Weatherley uslubi, xlorofill miqdori esa SPAD-502Plus portativ xlorofill-metri yordamida aniqlandi. Natijalarga ko‘ ra, RWC ko‘ rsatkichi navlar kesimida 82,99% (Zyugana sariq) dan 89,69% (Enrosadira) gacha, SPAD ko‘ rsatkichi esa 35,79 (Tibetskiy) dan 46,75 (Sariq gigant) birlikgacha o‘ zgarishi aniqlandi. Tukey HSD testi har ikki ko‘ rsatkich bo‘ yicha navlararo statistik jihatdan ishonchli farqlar mavjudligini tasdiqladi. Pearson korrelyatsion tahlili normal o‘ sish sharoitida RWC va SPAD ko‘ rsatkichlari o‘ rtasida chiziqli bog‘ liqlik yo‘ qligini ko‘ rsatdi (r=−0,040, p>0,05). Bu esa optimal sharoitda suv rejimi va xlorofill to‘ planishi mustaqil genetik mexanizmlar orqali boshqarilishini anglatadi. Tadqiqot yakunida yuqori fiziologik va fotosintetik salohiyatga ega bo‘ lgan Enrosadira hamda Karamelka navlari seleksiyada boshlang‘ ich qimmatli donorlar sifatida tavsiya etildi.*

Kalit so‘zlar: *malina (Rubus idaeus L.), genotip, nisbiy suv miqdori (RWC), xlorofill indeksi (SPAD), korrelyatsiya, Tukey testi, seleksiya, donor.*

АНАЛИЗ ГЕНОТИПИЧЕСКОЙ ВЗАИМОСВЯЗИ МЕЖДУ ВОДОСБЕРЕГАЮЩИМ РЕЖИМОМ И ИНДЕКСОМ ХЛОРОФИЛЛА У ГЕНОТИПОВ МАЛИНЫ *(RUBUS IDAEUS L.)* В ОПТИМАЛЬНЫХ УСЛОВИЯХ

Аннотация: *В данной работе проведен анализ генотипических взаимосвязей и межсортовых различий между относительным содержанием воды (RWC) и индексом хлорофилла (SPAD) в листьях 18 сортов малины (Rubus idaeusL.), выращенных в оптимальных полевых условиях. Относительное содержание воды в листьях определяли по методу Баррса и Уэзерли, а содержание хлорофилла экспресс-методом с помощью портативного хлорофиллометра SPAD-502Plus. Согласно результатам, показатель RWC варьировал от 82,99% (сорт Зюгана желтая) до 89,69% (сорт Энросадира), а значения SPAD — от 35,79 (сорт Тибетский) до 46,75 единиц (сорт Сарыг гигант). Критерий Тьюки (Tukey HSD) подтвердил статистически достоверные различия между сортами по обоим параметрам. Корреляционный анализ Пирсона показал отсутствие линейной зависимости между RWC и SPAD в нормальных условиях выращивания (r=−0,040,p>0,05). Это свидетельствует о том, что при отсутствии водного стресса водный режим и накопление хлорофилла регулируются независимыми генетическими механизмами. В качестве ценных доноров для селекции рекомендованы сорта Энросадира и Карамелька, продемонстрировавшие высокий физиологический и фотосинтетический потенциал.*

Ключевые слова: *малина (Rubus idaeus L.), генотип, относительное содержание воды (RWC), индекс хлорофилла (SPAD), корреляция, тест Тьюки, селекция, донор.*

ANALYSIS OF THE GENOTYPIC CORRELATION BETWEEN WATER-USE EFFICIENCY AND CHLOROPHYLL INDEX IN RASPBERRY *(RUBUS IDAEUS L.)* GENOTYPES UNDER OPTIMAL CONDITIONS

Abstract: *This study analyzes the genotypic relationships and cultivar variations between relative water content (RWC) and chlorophyll index (SPAD) in the leaves of 18 raspberry (Rubus idaeus L.) cultivars grown under optimal field conditions. Leaf relative water content was determined using the Barrs and Weatherley method, and chlorophyll content was measured using a portable SPAD-502Plus chlorophyll meter. The results showed that RWC varied from 82.99% (Zyugana sariq) to 89.69% (Enrosadira), while SPAD values ranged from 35.79 (Tibetskiy) to 46.75 units (Sariq gigant). The Tukey HSD test confirmed statistically significant differences among the cultivars for both parameters. Pearson correlation analysis indicated no significant linear correlation between RWC and SPAD under optimal growth conditions ($r=-0.040, p>0.05$). This suggests that under non-stress conditions, water status and chlorophyll accumulation are regulated by independent genetic mechanisms. Conclusively, the cultivars Enrosadira and Karamelka, which exhibited high physiological and photosynthetic potential, are recommended as valuable starting donors for raspberry breeding programs.*

Keywords: *raspberry (Rubus idaeus L.), genotype, relative water content (RWC), chlorophyll index (SPAD), correlation, Tukey test, breeding, donor.*

Kirish

Malina (*Rubus idaeus* L.) Rosaceae oilasiga mansub ko‘p yillik rezavor meva ekini bo‘lib, yuqori biologik va oziqaviy qiymati bilan ajralib turadi. Rezavor meva tarkibidagi polifenollar, antotsianlar, fruktoza, glyukoza hamda hayotiy muhim vitaminlar (ayniqsa, C va E vitaminlari) inson organizmida antioksidantlik va immunomodulyatorlik xususiyatlarini namoyon qilishi ko‘plab tadqiqotlarda o‘z isbotini topgan [6]. So‘nggi yillarda malina seleksiyasida nafaqat hosildorlik va meva sifati, balki o‘simliklarning fiziologik xususiyatlarini baholash ham ustuvor yo‘nalishlardan biriga aylandi. Ayniqsa barglarning nisbiy suv miqdori (*Relative Water Content* – RWC) hamda xlorofill miqdorini ifodalovchi SPAD indeksi o‘simliklarning fiziologik holatini tavsiflovchi muhim indikatorlar sifatida keng qo‘llanilmoqda .

Bargning nisbiy suv miqdori - o‘simlik to‘qimalarining suv bilan ta’minlanganlik darajasini va hujayralardagi turgor bosimini xarakterlovchi asosiy gidrologik ko‘rsatkichdir [1]. Ilmiy adabiyotlarda keltirilishicha, optimal sharoitda RWC darajasi yuqori bo‘lgan genotiplar barg stomalarining o‘tkazuvchanligini yaxshiroq boshqaradi va hujayra metabolizmini barqaror ushlab turadi [3]. RWC ko‘rsatkichi nafaqat qurg‘oqchilik sharoitida o‘simlikning chidamliligini, balki normal agrotexnik sharoitda ham navlarning o‘ziga xos transpiratsiya samaradorligi va suvni tejash strategiyalarini ochib beruvchi ishonchli marker hisoblanadi [5].

Bargdagi pigmentlar tizimining faolligi va xlorofill miqdori bevosita fotosintez jarayonining jadalligi hamda birlamchi organik modda to‘planish tezligini belgilaydi. SPAD-502 portativ asbobi yordamida aniqlanadigan xlorofill indeksi barg to‘qimalariga shikast yetkazmasdan turib fotosintetik salohiyatni tezkor va aniq baholash imkonini beradi [7]. Tadqiqotlar shuni ko‘rsatadiki, xlorofill zichligi yuqori bo‘lgan genotiplar yorug‘lik energiyasidan samaraliroq foydalanadi va bu ko‘rsatkich o‘simlikning mineral oziqlanishni (ayniqsa, azotni) o‘zlashtirish darajasiga bevosita bog‘liqdir [2]. Normal o‘sish sharoitida SPAD qiymatining yuqoriligi navning yuqori biologik mahsuldorlik salohiyatiga ega ekanligidan dalolat beradi.

Material va metodlar

Ushbu tadqiqotda optimal sharoitida o‘stirilgan 18 ta malina navlarida barglarning nisbiy suv miqdori (RWC, %) ko‘rsatkichlari Barrs va Weatherley uslubi bo‘yicha aniqlandi [1]. Barglardagi xlorofill miqdorini ekspress baholash maqsadida esa Konica Minolta SPAD-502Plus (Yaponiya) portativ xlorofill-metri apparatidan foydalanildi. Shuningdek, ularning o‘zaro korrelyatsiyasi hamda navlararo farqlanish tabiati statistik tahlil qilindi.

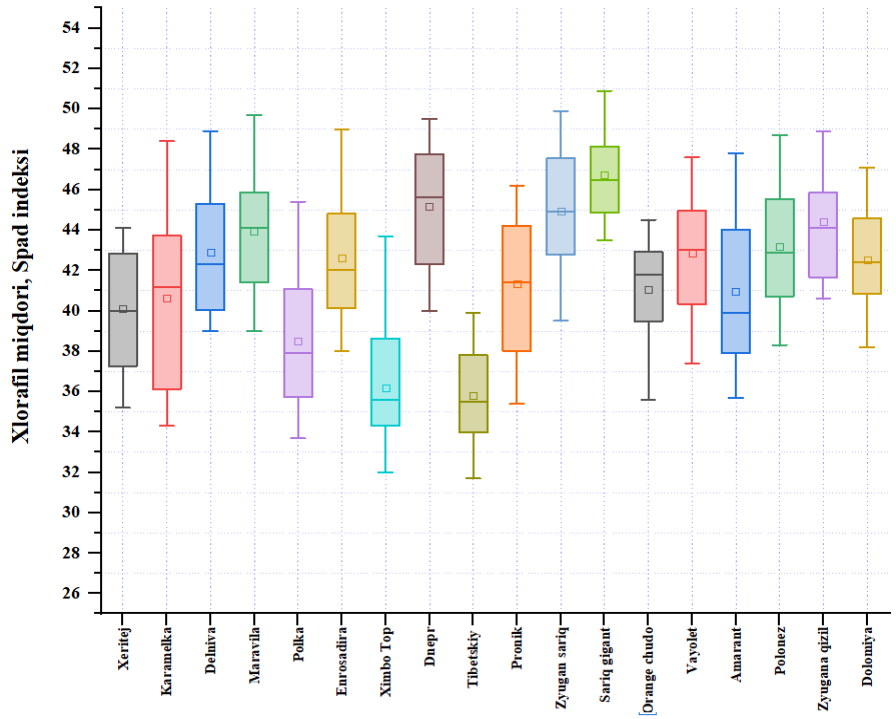
Natijalar va ularning tahlili

Optimal sharoitda o‘simlik barglarining suv bilan to‘yinganligi - ularning genetik jihatdan belgilangan suvni saqlash hamda transpiratsiyani muvofiqlashtirish xususiyatlarini aks ettiradi.

O‘rganilgan malina navlarida barglarning nisbiy suv miqdori (RWC) 82.99% dan 89.69% gacha bo‘lgan diapazonda o‘zgarishi aniqlandi. Bu barcha navlarda barglarning suv bilan yaxshi ta’minlanganligini ko‘rsatadi.

Eng yuqori suv saqlash darajasi Enrosadira (89.69 ± 0.4%, Tukey testi bo‘yicha “a” guruhi) va Karamelka (89.37 ±1.0%, “a” guruhi) navlarida qayd etildi. Shuningdek, *Polka* va *Polonez* (88.81%, “ab” guruhi) navlari ham turgor holatini yuqori darajada ushlab tura olish darajasi qayd etildi. Ushbu natijalar mazkur navlarning barg anatomiyasi, kutikula qalinligi, mezofill tuzilishi hamda suv almashinuvining genotipik xususiyatlari bilan izohlanishi mumkin.

Shuningdek, Zvugana sariq (82,99±0,2 %), Amarant (83,04±0,5 %), Delniva (83,17±0,3 %) va Tibetskiy (83,76±0,5 %) navlarida nisbiy suv miqdori eng past qiymatlarda qayd etildi. Biroq ushbu ko‘ rsatkichlar ham fiziologik me’yor doirasida bo‘ lib, navlarning suv bilan yetarli ta’minlanganligini ko‘ rsatadi.



1-jadval

Malina (*Rubus idaeus* L.) navlarining barglaridagi nisbiy suv miqdori ko‘ rsatkichlari va ularning statistik tahlili. (Tukey HSD testi, α=0.05).

Jadvalda keltirilgan Tukey HSD testi natijalari navlar o‘ rtasida suv miqdori bo‘ yicha ishonchli statistik farqlar mavjudligini tasdiqlaydi (α=0,05). Demak, barglarning suv bilan ta’minlanganlik darajasi asosan navlarning genetik xususiyatlariga bog‘ liq holda shakllanadi. Variatsiya koeffitsienti (CV) barcha navlarda 0,32–2,12 % oralig‘ ida bo‘ ldi. Bunday past qiymatlar tajriba natijalarining yuqori aniqlikda olinganligini hamda biologik takrorlar orasidagi tafovut juda kam ekanligini ko‘ rsatadi.

Barglardagi xlorofill (SPAD indeksi) ko‘ rsatkichlarining navlararo farqlanishiga ko‘ ra, optimal sharoitda xlorofill miqdori cheklovchi omillardan xoli bo‘ lib, to‘ g‘ ridan-to‘ g‘ ri navning fotosintetik salohiyatini, barg mezofilli tuzilishini va mineral oziqlanishni o‘ zlashtirish tezligini ko‘ rsatadi. 2-jadval ma’lumotlari malina navlari o‘ rtasida SPAD indeksining ko‘ rsatkichlari 35,79–46,75 birlik oralig‘ ida o‘ zgardi. Bu navlar fotosintetik apparatining rivojlanish darajasi bir xil emasligini ko‘ rsatadi.

1-rasm. Malina (*Rubus idaeus* L.) navlarining barglaridagi xlorafil (SPAD indeksi) miqdori ko‘ rsatkichlari va ularning statistik tahlili

Xlorofillning eng yuqori zichligi ya’ni SPAD qiymati Sariq gigant navida (46,75±0,4) qayd etildi. Undan keyingi o‘ rinlarni Dnepr (45,18±0,6), Zvugana sariq (44,92±0,7) va Zvugana qizil (44,42±0,6) navlarida tahlil qilindi. Mazkur navlarda barglarning to‘ q yashil rangi va xlorofill pigmentlarining nisbatan yuqori miqdori kuzatilgan bo‘ lib, bu fotosintetik salohiyatning yuqoriligini ko‘ rsatadi. Bu navlar fotosintezning birlamchi jarayonlarida yuqori quyosh energiyasini yutish xususiyatiga ega.

Aksincha, Tibetskiy (35,79±0,5), Ximbo Top (36,18±0,6) hamda Polka (38,49±0,7) navlarida SPAD qiymatlari eng past bo‘ ldi. Bu navlarda barg pigmentatsiyasi boshqa navlarga nisbatan sustroq ekanligini bildiradi. SPAD ko‘ rsatkichlari bo‘ yicha ham Tukey HSD testi navlar o‘ rtasida statistik jihatdan ishonchli farqlar mavjudligini ko‘ rsatdi (α=0,05). Bu esa xlorofill biosintezi va barg pigmentlarining to‘ planishi genotipga xos belgi ekanligini tasdiqlaydi. SPAD bo‘ yicha variatsiya koeffitsienti 4,62–10,70 % oralig‘ ida bo‘ ldi. Ushbu qiymatlar RWC ga nisbatan biroz yuqori bo‘ lib, fotosintetik pigmentlar miqdori suv miqdoriga qaraganda genotiplar orasida ko‘ proq farqlanishini ko‘ rsatadi.

Muhokama

O‘ simliklar fiziologiyasi qonuniyatlariga binoan, kuchli suvsizlik stressi paydo bo‘ lgandagina hujayra turgorining yo‘ qolishi (RWC pasayishi) oqibatida bargda xlorofill apparatining parchalanishi (SPAD pasayishi) yuz beradi va ular o‘ rtasida sun’iy ijobiy korrelyatsiya shakllanadi. Biroq, bizning tadqiqotimiz normal dala sharoitida (optimumda) o‘ tkazilganligi sababli, suv tanqisligi o‘ simliklar uchun cheklovchi omil hisoblanmaydi. Bunday optimal muhitda har bir genotip o‘ zining individual anatomik va adaptiv xususiyatlarini namoyon qiladi.

Enrosadira (RWC = 89.6, SPAD = 42.63) va Karamelka (RWC = 89.37%, SPAD = 40.62) navlari normal sharoitning o‘ zidayoq har ikki muhim parametr bo‘ yicha ham eng yuqori ko‘ rsatkichlarni namoyon qildi. Bu ularning genotipi ham suv balansini yuqori turgor darajasida ushlashni, ham fotosintez faolligini bir vaqtning o‘ zida muvofiqlashtirish xususiyatiga ega ekanligini anglatadi.

Normal dala sharoitida malina genotiplarining suv rejimi va xlorofill to‘ plash ko‘ rsatkichlari bir-biriga bog‘ liq bo‘ lmagan holda, mustaqil genetik mexanizmlar orqali boshqariladi. Normal agrotexnik sharoitda ham yuqori suv tejash qobiliyati, ham faol pigment tizimining optimal muvozanatiga ega bo‘ lgan Enrosadira va Karamelka navlari eng istiqbolli genotiplar deb belgilandi hamda ulardan seleksiyada boshlang‘ ich qimmatli donorlar sifatida foydalanish tavsiya etiladi.

Pearson korrelyatsion tahlili natijasida barglarning nisbiy suv miqdori bilan SPAD indeksi o‘ rtasida r = –0,040 (p>0,05) korrelyatsiya aniqlandi. Ushbu qiymat nolga juda yaqin bo‘ lib, ikki ko‘ rsatkich o‘ rtasida statistik jihatdan ishonchli chiziqli bog‘ liqlik mavjud emasligini ko‘ rsatadi. Mazkur natija shuni anglatadiki, normal dala sharoitida malina navlarida barglarning suv bilan ta’minlanganlik darajasi fotosintetik pigmentlarning to‘ planish darajasini bevosita belgilamaydi. Boshqacha aytganda, suv almashinuvi va xlorofill biosintezi turli fiziologik mexanizmlar orqali

boshqariladi. Bu holat bir necha omillar bilan izohlanishi mumkin. Birinchidan, barglarning nisbiy suv miqdori asosan hujayra turgori, osmotik bosim va suv almashinuvi jarayonlariga bog‘ liq. Ikkinchidan, SPAD ko‘ rsatkichi bargning anatomik tuzilishi, mezofill qalinligi, xloroplastlar soni, azot bilan ta’minlanganlik va genotipga xos pigment sintezi intensivligiga bog‘ liq. Shu sababli ushbu ikki fiziologik ko‘ rsatkichning o‘ zgarishi bir xil yo‘ nalishda kechmasligi tabiiy hol hisoblanadi.

Xulosa

Tadqiqot natijalari malina navlari barglarining suv bilan ta’minlanganligi va xlorofill miqdori bo‘ yicha sezilarli genotipik farqlarga ega ekanligini ko‘ rsatdi. Enrosadira navi barglarda suvni saqlash qobiliyati bo‘ yicha, Sariq gigant navida esa fotosintetik pigmentlar miqdori bo‘ yicha yuqori natijalar qayd etildi. Maravilla, Dnepr va Zvugana qizil navlari ikkala fiziologik ko‘ rsatkich bo‘ yicha ham yuqori ko‘ rsatkichlarga ega bo‘ lib, vegetativ rivojlanish va fotosintetik salohiyatning uyg‘ un shakllanganligi bilan ajralib turdi. Pearson korrelyatsion tahlili esa RWC va SPAD o‘ rtasida ishonchli bog‘ liqlik mavjud emasligini ko‘ rsatdi. Bu normal dala sharoitida ushbu belgilar malina genotiplarida nisbatan mustaqil shakllanishini va navlarning fiziologik tavsifini kompleks baholash zarurligini tasdiqlaydi.

РОСТОВЫЕ ПОКАЗАТЕЛИ СОРТОВ СОИ В УСЛОВИЯХ ВОДОСБЕРЕГАЮЩЕГО ОРОШЕНИЯ

Аннотация: *В данном исследовании изучена динамика суточного роста сортов сои «Нафис», «Мадад», «Орзу» и «Севинч, выращенных в условиях капельного и бороздкового орошения. В полевых опытах определяли среднюю высоту растений и абсолютную скорость роста (AGR) в фазы развития первого настоящего листа, бутонизации, цветения и формирования бобов. Результаты исследований показали, что у всех изученных сортов наиболее интенсивный рост растений наблюдался в фазу цветения, тогда как в фазу формирования бобов отмечалось снижение суточной скорости роста. В условиях капельного орошения у сортов «Нафис», «Мадад» и «Севинч» абсолютная скорость роста и средняя высота растений были несколько выше по сравнению с бороздковым орошением. Максимальная абсолютная скорость роста отмечена у сорта «Мадад» в фазу цветения и составила 1,52 см/сутки, тогда как минимальное значение (0,43 см/сутки) зарегистрировано у сорта «Орзу» в фазу первого настоящего листа. Полученные результаты свидетельствуют о том, что капельное орошение является более эффективным способом полива, обеспечивающим стабилизацию вегетативного роста, суточной динамики роста и формирование высоких морфобиологических показателей растений сои.*

Ключевые слова: *абсолютная скорость роста (AGR), сорта сои, «Нафис», «Мадад», «Орзу», «Севинч», капельное орошение, бороздковое орошение, динамика роста.*

GROWTH CHARACTERISTICS OF SOYBEAN CULTIVARS UNDER WATER-SAVING IRRIGATION

Abstract: *This study investigated the daily growth dynamics of the soybean cultivars Nafis, Madad, Orzu, and Sevinch grown under drip and furrow irrigation conditions. Field experiments were conducted to determine the average plant height and absolute growth rate (AGR) at the first trifoliate leaf, budding, flowering, and pod formation growth stages. The results showed that the highest plant growth rate in all cultivars was observed during the flowering stage, whereas the daily growth rate decreased during*

the pod formation stage. Under drip irrigation, the Nafis, Madad, and Sevinch cultivars exhibited slightly higher absolute growth rates and average plant heights than those grown under furrow irrigation. The highest absolute growth rate (1.52 cm day⁻¹) was recorded in the Madad cultivar during the flowering stage, while the lowest value (0.43 cm day⁻¹) was observed in the Orzu cultivar at the first trifoliate leaf stage. The obtained results indicate that drip irrigation is a more efficient irrigation method for promoting vegetative growth, stabilizing daily growth dynamics, and improving the morphobiological characteristics of soybean plants.

Keywords: *absolute growth rate (AGR), soybean cultivars, Nafis, Madad, Orzu, Sevinch, drip irrigation, furrow irrigation, growth dynamics.*

Kirish

Soya yuqori oqsil va yog‘ miqdoriga ega bo‘ lgan muhim dukkakli ekinlardan biri bo‘ lib, oziq-ovqat, yem-xashak va sanoat uchun qimmatli xomashyo hisoblanadi. Biroq global iqlim o‘ zgarishi va suv resurslarining cheklanishi soya yetishtirishda suvdan samarali foydalanishni taqozo etmoqda. Soya o‘ simligi suvga talabchan o‘ simlik bo‘ lib, soya yetishtirishda suv tejamkor sug‘ orish texnologiyalarini joriy etish va ularning o‘ simliklarning o‘ sishi hamda rivojlanishiga ta‘sirini baholash muhim ilmiy-amaliy ahamiyat kasb etadi. O‘ simlik bo‘ yining o‘ sish dinamikasi sug‘ orish sharoitlarining samaradorligini baholovchi muhim morfobiologik ko‘ rsatkichlardan biri hisoblanadi. Mazkur tadqiqotning maqsadi tomchilatib va egatlab sug‘ orish usullari orqali yetishtirilgan “Nafis”, “Madad”, “Orzu” va “Sevinch” soya navlarining o‘ sish dinamikasi hamda absolyut o‘ sish tezligini solishtirma tahlil qilishdan iborat.

O‘ simliklarning o‘ sish jarayonini miqdoriy baholashda absolyut o‘ sish tezligi (Absolute Growth Rate) muhim ko‘ rsatkich ekanligini qayd etilgan. Ketma-ket ikki kuzatuv oralig‘ idagi biomassa yoki o‘ simlik o‘ lchamining vaqtga nisbatan o‘ zgarishi orqali hisoblash metodikasini taklif etgan [1].

Dimov va hammualliflari sug‘ orish usuli soya o‘ simligining hosildorligi hamda sug‘ orish suvidan foydalanish samaradorligiga sezilarli ta‘sir ko‘ rsatishini aniqlagan. Mualliflar optimal sug‘ orish sharoitida o‘ simliklarning o‘ sishi va hosildorligi yaxshilanishini, turli sug‘ orish texnologiyalari esa hosil ko‘ rsatkichlarida sezilarli farqlarni yuzaga keltirishini qayd etganlar [2].

Song va boshqalar (2020) uch o‘ lchamli rekonstruksiya texnologiyasi yordamida soya o‘ simligining bo‘ yiga o‘ sish dinamikasini baholab, o‘ simlik bo‘ yi vegetatsiya davomida nav xususiyatlari va tashqi muhit omillariga bog‘ iq holda turlicha o‘ zgarishini aniqlagan. Mualliflar o‘ simlik bo‘ yining o‘ sish sur‘ati gullash davrida eng yuqori darajaga yetishini qayd etganlar [3].

Board va Kahlon (2011) soya o‘ simligining vegetativ va generativ rivojlanishi o‘ rtasidagi o‘ zaro bog‘ liqlikni tahlil qilib, gullash bosqichigacha poyaning intensiv o‘ sishi kuzatilishi, dukkak hosil bo‘ lishidan keyin esa assimilatlar asosan reproduktiv organlarga yo‘ naltirilishi sababli vegetativ o‘ sish sekinlashishini ta‘kidlaganlar [4].

Soya o‘ simligining o‘ sishi va rivojlanishi navning biologik xususiyatlari bilan bir qatorda tuproq-iqlim sharoiti hamda qo‘ llanilayotgan agrotexnik tadbirlarga bevosita bog‘ liqligi qayd etilgan. Vegetatsiya davrida o‘ simlikning morfologik ko‘ rsatkichlari, jumladan asosiy poya balandligi, barglar soni va rivojlanish bosqichlarining davomiyligi tashqi muhit omillariga qarab sezilarli darajada o‘ zgarishi aniqlangan [5]. Shu sababli soya navlarining o‘ sish dinamikasini turli yetishtirish texnologiyalari sharoitida kompleks baholash ilmiy va amaliy jihatdan muhim ahamiyatga ega.

Zhu va boshqalar (2020) soya o‘ simligining morfologik belgilarini butun vegetatsiya davri davomida tahlil qilib, V3–R3 rivojlanish bosqichlarida turli navlarning o‘ sish sur’atlari deyarli bir xil kechishini, R5 bosqichidan boshlab esa navlar o‘ rtasidagi fenotipik farqlar sezilarli ortishini aniqlagan. Mualliflarning ta’kidlashicha, aynan reproduktiv bosqichlarda o‘ simlik bo‘ yi va poya balandligi eng jadal o‘ zgaradi, bu esa sug‘ orish, oziqlantirish va boshqa agrotexnik tadbirlarni nav xususiyatlariga mos ravishda boshqarish uchun muhim ilmiy asos bo‘ lib xizmat qiladi [6].

Iminov va Bo‘ riboyev (2022) tadqiqotlarida mahalliy “Nafis” va xorijiy “Vilana” soya navlarining dukkaklash davridagi morfo-fiziologik ko‘ rsatkichlariga biostimulyatorlarning ta‘siri o‘ rganilgan. Tadqiqot natijalariga ko‘ ra, biostimulyatorlar qo‘ llanilishi o‘ simlik bo‘ yi, shoxlanish darajasi, barglar soni va dukkaklar sonining ortishiga ijobiy ta’sir ko‘ rsatgan. Mualliflar o‘ simlikning vegetativ o‘ sish ko‘ rsatkichlari yaxshilangani natijasida reproduktiv organlarning shakllanishi ham jadallashishini qayd etganlar [7].

Turli sug‘ orish usullarida yetishtirilgan soya navlarining o‘ sish dinamikasi va vegetativ rivojlanish xususiyatlarini qiyosiy baholash, o‘ simliklarning biologik salohiyatini to‘ liq namoyon etuvchi samarali sug‘ orish usullarini aniqlash hamda suv resurslaridan oqilona foydalanishning ilmiy asoslarini ishlab chiqish bugungi kunda dolzarb ilmiy-amaliy masalalardan biri hisoblanadi.

Tadqiqot materiali va uslublari

Mazkur tadqiqotlarimiz 2024–2026-yillarda Surxondaryo viloyati, Termiz tumanidagi “Ingichka tolali paxtachilik ilmiy-tadqiqot instituti” ning maydonida dala sharoitida amalga oshirildi. Soyaning mahalliy “Nafis”, “Madad”, “Orzu” va “Sevinch” navlari tomchilatib (suv tejamkor) va an’anaviy (egatlab) sug‘ orish usullarida yetishtirildi (1,2-rasmlar).

1-rasm. Egatlab sug‘ orish orqali yetishtirilayotgan soya navlari (chinbarg fazasi)

2-rasm. Tomchilatib sug‘ orish orqali yetishtirilayotgan soya navlari (chinbarg fazasi)

Soya navlarining vegetatsiya davrida fenologik kuzatuvlar olib borildi. Vegetativ o‘ sish ko‘ rsatkichlarini baholash maqsadida bo‘ yiga o‘ sish dinamikasi va barglar soni indeksi aniqlandi. O‘ simlik bo‘ yi tuproq yuzasidan asosiy poyaning o‘ sish nuqtasigacha o‘ lchandi. O‘ simliklarning bo‘ yiga o‘ sish dinamikasi – o‘ simlikning ma’lum vaqt (kun) oralig‘ ida qanchalik tez o‘ sayotganligini bildiradigan ko‘ rsatkichdir. Soya navlarining absolyut o‘ sish dinamikasini aniqlashda quyidagi formuladan foydalanildi [8,9].

$$O'sish\ tezligi = \frac{H2-H1}{T2-T1}(sm/kun)$$

Bu yerda: H_1 va H_2– mos ravishda t_1 va $t2$ vaqtidagi o‘ simlik bo‘ yi (sm), $t_2 - t_1$ – kuzatuvlar orasidagi vaqt oralig‘ i (kun).

O‘ simlikdagi barglar soni har bir kuzatuv muddatida to‘ liq shakllangan barglarni sanash orqali aniqlandi. Natijalar bitta o‘ simlikka to‘ g‘ ri keladigan barglar soni (dona/o‘ simlik) ko‘ rinishida ifodalandi.

Tadqiqot natijalari va tahlili

O‘ simlikning bo‘ yiga o‘ sish dinamikasi uning vegetativ rivojlanish darajasini tavsiflovchi asosiy morfologik ko‘ rsatkichlardan biri hisoblanadi. Turli sug‘ orish usullarida yetishtirilgan soya navlarining absolyut o‘ sish tezligini baholash natijalariga ko‘ ra, rivojalanish bosqichiga ko‘ ra o‘ sish jadalligi o‘ zgarib boradi. (1-jadval). O‘ sish jadalligi chinbarg hosil qilish bosqichida nisbatan sekin bo‘ lib, g‘ unchalash va ayniqsa gullash davrida keskin ortgan, dukkaklash bosqichida esa sekinlashishi kuzatilgan.

1-jadval

Soya navlarining kunlik o‘ sish dinamikasi (sm/kun)

Sug‘ orish usuli	Chinbarg	G‘ unchalash	Gullash	Dukkaklash
	Nafis			
Tomchilatib sug‘ orish	0,53	0,77	1,44	0,88
Egatlab sug‘ orish	0.51	0,79	1,41	0,84
Madad				
Tomchilatib sug‘ orish	0,51	0,84	1,52	0,97
Egatlab sug‘ orish	0.52	0,81	1,49	0,94
Orzu				
Tomchilatib sug‘ orish	0,43	0,62	1,24	0,71
Egatlab sug‘ orish	0,43	0,65	1,26	0,72
Sevich				
Tomchilatib sug‘ orish	0,49	0,71	1,39	0,82
Egatlab sug‘ orish	0,51	0,74	1,35	0,80

Barcha navlarda eng sekin o‘ sish tezligi chinbarg bosqichida (0,43–0,53 sm/kun^{-1}) kuzatilgan bo‘ lsa, g‘ unchalash bosqichida u 0,62–0,84 sm/kun^{-1} gacha ortdi. Absolyut o‘ sish tezligining eng yuqori qiymatlari gullash bosqichida qayd etilib, tomchilatib sug‘ orishda 1,24–1,52 sm/kun^{-1}, egatlab sug‘ orishda esa 1,26–1,49 sm/kun^{-1} oralig‘ ida o‘ zgardi. Dukkaklash bosqichida barcha navlarda o‘ sish sur’ati kamayib, mos ravishda 0,71–0,97 va 0,72–0,94 sm/kun^{-1} ni tashkil etdi.

Nafis, Madad va Sevinch navlarida tomchilatib sug‘ orish vegetatsiyaning faol bosqichlarida egatlab sug‘ orishga nisbatan yuqori absolyut o‘ sish tezligi kuzatildi. Orzu navida esa sug‘ orish usullariga bog‘ liq farq deyarli kuzatilmadi. Tadqiq etilgan navlar orasida Madad navi eng yuqori o‘ sish jadalligini namoyon etib, gullash bosqichida 1,52 sm/kun^{-1}, dukkaklash bosqichida 0,97 sm/kun^{-1} ni tashkil etdi. Eng past ko‘ rsatkichlar esa Orzu navida qayd etildi.

Soya o‘ simligida bo‘ yiga o‘ sish jadalligi vegetativ rivojlanishning dastlabki bosqichlarida asta-sekin ortib, gullash bosqichida eng yuqori darajaga yetishini, dukkaklarning shakllanish bosqichidan boshlab organik moddalar don shakllanihiga sarflanishi hisobiga o‘ sish sur’atining pasayishini aniqlandi. Shuningdek, tomchilatib sug‘ orish ko‘ pchilik navlarda vegetativ o‘ sish jarayonini faollashtirib, o‘ simliklarning chiziqli o‘ sishi uchun qulay sharoit yaratganligi aniqlandi.

Turli sug‘ orish usullarida yetishtirilgan soya navlarining o‘ rtacha bo‘ y uzunligi vegetatsiya davomida o‘ lchab borildi (2-jadval).

2-jadval

Soya navlarining o‘ rtacha bo‘ y uzunligi (smda)

Sug‘ orish usuli	Chinbarg	G‘ unchalash	Gullash	Dukkaklash
	Nafis			
Tomchilatib sug‘ orish	8,1	39,1	61,7	95,3
Egatlab sug‘ orish	9	38,4	58,5	92,6

Tomchilatib sug‘ orish	8,2	36,4	58,4	91,3
Egatlab sug‘ orish	8,5	36,7	58,8	89.6

Nafis, Madad va Sevinch navlarida tomchilatib sug‘ orishda o‘ simlik bo‘ yining uzunligi kam miqdorda yuqori bo‘ ldi. Dukkaklash bosqichida Madad navining bo‘ yi tomchilatib sug‘ orishda 102,3 sm, egatlab sug ‘orishda esa 98,5 sm ni tashkil etdi. Nafis navida ushbu ko‘ rsatkichlar mos ravishda 95,3 va 92,6 sm, Sevinch navida esa 91,3 va 89,6 sm bo‘ ldi.

Orzu navida dukkaklash bosqichida o‘ simlik bo‘ yi tomchilatib sug‘ orishda 74,2 sm, egatlab sug‘ orishda esa 73,5 sm ni tashkil etdi. Ushbu nav vegetatsiyaning barcha bosqichlarida boshqa navlarga nisbatan pastroq bo‘ y ko‘ rsatkichlariga ega bo‘ ldi.

Vegetatsiya davomida barcha navlarda o‘ simlik bo‘ yining bosqichma-bosqich ortishi kuzatildi. Eng baland o‘ simlik bo‘ yi Madad navida (102,3 sm), eng past ko‘ rsatkichlar esa Orzu navida (74,2 sm) qayd etildi. Ko‘ pchilik navlarda tomchilatib sug‘ orish egatlab sug‘ orishga nisbatan o‘ simlik bo‘ yining 1,7–3,8 % ga yuqori shakllanishini ta’minladi, bu esa o‘ simliklarning suv bilan ta‘minlanishning barqarorligi vegetativ o‘ sishga ijobiy ta‘sir etganligini ko‘ rsatadi.

Turli sug‘ orish usullarida yetishtirilgan soya navlarining o‘ sish ko‘ rsatkichlari rivojlanish bosqichlariga hamda navning biologik xususiyatlariga bog‘ liq holda o‘ zgarishini ko‘ rsatdi. Barcha navlarda o‘ simlik bo‘ yi vegetatsiya davomida doimiy ortib boradi. Absolyut o‘ sish tezligi esa gullash bosqichida yuqori bo‘ lishi kuzatildi. Tomchilatib sug‘ orish egatlab sug‘ orishga nisbatan vegetativ o‘ sishni jadallashtirib, o‘ simlik bo‘ yi va absolyut o‘ sish tezligini doimiy shakllanishini ta‘minladi.

Muhokama

Tadqiqot natijalariga ko‘ ra, soya navlarida absolyut o‘ sish tezligi rivojlanish bosqichlariga qarab o‘ zgarib, eng yuqori qiymat gullash bosqichida kuzatildi. Bu holat vegetativ o‘ sishning ushbu davrda eng faol kechishi va fotosintez

jarayoninng faol kechishi bilan izohlanadi. **Board va Kahlon (2011)** tadqiqotlarida [4] ham soya o‘ simligida gullash davrida vegetativ o‘ sishning jadal kechishini qayd etganlar.

Tadqiqotimizda tomchilatib sug‘ orish sharoitida **Nafis, Madad va Sevinch** navlarida o‘ simlik bo‘ yi hamda absolyut o‘ sish tezligi egatlab sug‘ orishga nisbatan kam bo‘ lsada jadalligi aniqlandi. Bu tomchilatib sug‘ orishda ildiz zonasida namlikning barqaror saqlanishi va suvning o‘ simlik tomonidan samaraliroq o‘ zlashtirilishi bilan bog‘ liq. Mazkur natijalar **Kaur va boshq. (2022)** tadqiqotlarida [10] ham qayd etilgan.

Xulosa

Turli sug‘ orish usullari soya navlarining vegetativ o‘ sishi va absolyut o‘ sish tezligiga sezilarli ta‘sir ko‘ rsatishi aniqlandi. Barcha navlarda absolyut o‘ sish tezligining eng yuqori qiymati gullash bosqichida kuzatildi. Tomchilatib sug‘ orish sharoitida Nafis, Madad va Sevinch navlarida o‘ simlik bo‘ yi hamda absolyut o‘ sish tezligi egatlab sug‘ orishga nisbatan yuqoriroq bo‘ ldi. Tadqiq etilgan navlar orasida Madad navi eng yuqori o‘ sish jadalligini va eng yuqori o‘ simlik bo‘ yini namoyon etdi. Olingan natijalar tomchilatib sug‘ orish usuli soya navlarining vegetativ rivojlanishini jadallashtirish va o‘ sish ko‘ rsatkichlarini yaxshilashda samaraliroq ekanligini ko‘ rsatdi.

Mualliflar hissasi, manfaatlar to‘ qnashuvi va moliyalashtirish

Mualliflar hissasi: barcha mualliflar tadqiqot konsepsiyasi, ma’lumotlarni tahlil qilish va maqola matnini tayyorlashda teng hissa qo‘ shgan. Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi yo‘ qligini bildiradi. Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

Annotatsiya. *Zamonaviy akvakulturada baliq mahsuloti tannarxi va ishlab chiqarish samaradorligini belgilaydigan asosiy omillardan biri yuqori sifatli kombikormlar bilan ta’minlanganlik hisoblanadi. Kamalakrang forel-Oncorhynchus mykiss (Walbaum, 1792) yuqori hazmlanuvchan protein, muhim aminokislotalar va energiyaga talabchanligi sababli uni intensiv usulda yetishtirishda maxsus kombikormlardan foydalanish talab etiladi. Mazkur tahliliy maqolada forel balig‘ i uchun import o‘ rnini bosuvchi mahalliy kombikormalar ishlab chiqarishning resurs, biologik va texnologik imkoniyatlari tahlil qilindi. Ushbu tadqiqotda kunjara, shrot, kepak, dukkakli va don mahsulotlari, shuningdek, veterinariya-sanitariya talablariga javob beradigan baliqchilik, parrandachilik va boshqa oziq-ovqat sanoati ikkilamchi mahsulotlaridan protein manbai sifatida foydalanish istiqbollari ko‘ rib chiqildi. O‘ simlik xomashyolaridan foydalanishni cheklovchi fitatlar, tanninlar, proteaza ingibitorlari, kletchatka hamda muhim aminokislotalar disbalansi kabi omillarga alohida e’tibor berildi. Ularning salbiy ta’sirini kamaytirish uchun fermentativ gidroliz, mikrobiologik fermentatsiya, termik ishlov va ekstruziyadan iborat kompleks biotexnologik yondashuv taklif etildi. Xorijiy tadqiqotlar tahlili forel rasionlarida baliq unining muayyan qismini soya, kungaboqar, raps, no‘ xat, paxta protein konsentratlari, parrandachilik, chorvachilik ikkilamchi mahsulotlari, pivo sanoati qoldiqlari, mikrosuvo‘ tlari va boshqa alternativ proteinlar bilan muvaffaqiyatli almashtirish mumkinligini ko‘ rsatdi. O‘ zbekiston sharoiti uchun «mahalliy ikkilamchi xomashyo → sanitariya va ozuqaviy skrining → biokonversiya → komplementar protein kompleksi → muvozanatlashtirilgan reseptura → ekstruziya → biologik va iqtisodiy baholash» texnologik modeli taklif qilinadi.*

Kalit so‘ zlar: *forel, Oncorhynchus mykiss, kombikorm, import o‘ rnini bosish, baliq uni, o‘ simlik proteini, hayvonot proteini, ikkilamchi xomashyo, biokonversiya, fermentatsiya, ekstruziya.*

TEXNOLOGICHYeSKIYe VOZMOJNOSTI SOZDANIYA MESTNЫX IMPORTOZAMEЩAYUЩIX KOMBIKORMOV DLYA FORELI

Annotatsiya. *V obzornoy statye proanalizirovanы resursnыye, biologicheskiye i texnologicheskiye vozmojnosti sozdaniya importozameщayuщix kombikormov dlya radujnoy foreli Oncorhynchus mykiss. Dlya usloviy Uzbekistana predlojena konseptualnaya texnologicheskaya sxema, ob’yedinyayuщaya skrining mestnogo sыrya, biokonversiyu, formirovaniye komplementarnogo proteinovogo kompleksa, balansirovaniye rasiona po perevarimomu proteinu i nezamenimым aminokislotam, ekstruziyu i biologicheskuyu osenku kormov.*

Klyuchevыye slova: *radujnaya forel, Oncorhynchus mykiss, kombikorm, importozameщyeniye, vtorichnoye sыryo, rastitelnыy belok, jivotnыy belok, biokonversiya, fermentatsiya, ekstruziya.*

TECHNOLOGICAL OPPORTUNITIES FOR DEVELOPING LOCAL IMPORT-SUBSTITUTING COMPOUND FEEDS FOR TROUT

Abstract. *This review analyses the resource, biological and technological potential for producing local import-substituting feeds for rainbow trout, Oncorhynchus mykiss, under the conditions of Uzbekistan. Particular attention is given to plant- and animal-derived agro-industrial by-products as potential sources of protein and energy. Major limitations associated with plant protein ingredients, including amino acid imbalance, dietary fibre, phytate, tannins and protease inhibitors, are discussed. Current evidence indicates that enzymatic hydrolysis, microbial fermentation, thermal processing and extrusion can substantially improve the nutritional value and digestibility of alternative feed ingredients. International studies demonstrate that fishmeal in rainbow trout diets can be partly and, under specific nutritional conditions, extensively replaced by soybean, rapeseed, sunflower, pea and cottonseed protein products, processed poultry by-products, brewery co-products, microalgal biomass and other alternative proteins. A technological model for Uzbekistan is proposed based on the sequence: local secondary raw materials → nutritional and sanitary screening → bioconversion → complementary protein complex → balanced formulation → extrusion → biological and economic evaluation. This approach may provide a scientific basis for reducing dependence on imported aquafeeds and developing a sustainable local feed industry for trout farming.*

Keywords: *rainbow trout, Oncorhynchus mykiss, aquafeed, fishmeal replacement, agro-industrial by-products, plant protein, animal protein, bioconversion, fermentation, extrusion.*

KIRISH

Akvakultura jahonda oziq-ovqat ishlab chiqarishning eng jadal rivojlanayotgan yo‘ nalishlaridan biri hisoblanadi. Akvakultura hajmining o‘ sishi baliqlar uchun yuqori sifatli ozuqaga bo‘ lgan talabning muttasil ortishi bilan kechmoqda. Rasion sifati nafaqat baliqning o‘ sish tezligi, balki yem konversiyasi, fiziologik holati, mahsulot sifati va ishlab chiqarishning ekologik samaradorligini ham belgilaydi [1–3].

Kamalakrang forel-*Oncorhynchus mykiss* (Walbaum, 1792) sanoat akvakulturasida muhim ob’yekt bo‘ lib, yuqori o‘ sish sur’ati, mahsulotining qimmatli ozuqaviy xususiyatlari va bozor talabining barqarorligi bilan ajralib turadi. Shu bilan birga, mazkur baliq turi protein va energiyaga boy yuqori sifatli rasion talab qiladi.

Forel kombikormlarida an’anaviy ravishda baliq uni muhim protein manbai sifatida xizmat qilgan. Uning afzalligi yuqori protein konsentratsiyasi, yaxshi hazmlanuvchanlik, muhim aminokislotalarning maqbul nisbati va ozuqaning yuqori iste’mol qilinishi bilan bog‘ liq [4]. Biroq baliq uni resurslarining cheklanganligi, uning narxi va akvakultura sanoatining o‘ sishi alternativ protein manbalarini izlashni dolzarb ilmiy masalaga aylantirdi [5].

Bugungi kundagi tadqiqotlarda alternativ protein manbalari sifatida o‘ simlik proteinlari, chorvachilik, parrandachilik mahsulotlari, mikrosuvo‘ tlar va bir hujayrali organizmlar, hasharotlar va turli agrosanoat korxonalariningikkilamchi mahsulotlari o‘ rganilmoqda [6–9].

O‘ zbekiston uchun mazkur masala ayniqsa juda ahamiyatli. Ayni paytda aytish o‘ rinliki. Respublikamizda forelchilik xo‘ jaliklarining rivojlanishi ko‘ p jihatdan ularni sifatli kombikorm bilan barqaror ta’minlashni talab etadi. Tayyor import kombikorm yoki ayrim yuqori proteinli ingrediyentlar narxining tashqi bozorga bog‘ liqligi mahalliy baliqchilik korxonalari iqtisodiy samaradorligini cheklashi mumkin.

Shu bilan birga, mamlakatda moyli va donli ekinlar, paxta, dukkakli o‘ simliklar, parrandachilik, chorvachilik, baliqchilik va oziq-ovqat sanoatining keng resurs bazasi mavjud. Ushbu tarmoqlarda hosil bo‘ ladigan ikkilamchi mahsulotlar tegishli qayta ishlash texnologiyalari qo‘ llanilganda baliqlar uchun qimmatli protein va sifatli ozuqa manbaiga aylantirilishi mumkin.

FAO ning mahalliy xomashyolar asosida forel ozuqalarini yaratishga bag‘ ishlangan tajribasida ham mahalliy qishloq xo‘ jaligi va sanoat mahsulotlarini inventarizatsiya qilish, ularning miqdori, sifati, mavsumiyligi va narxini baholash hamda mavjud mahalliy uskunalar asosida kombikorm ishlab chiqarish tavsiya etilgan [10]. FAO loyihasida forel rasioniga soya shroti, raps shroti, bug‘ doy kepagi, pivo sanoati mahsulotlari, qon uni, pat uni va go‘ sht-suyuk uni kabi turli manbalar kiritilgan.

Maqolaning maqsadi-zamonaviy ilmiy adabiyotlar va xalqaro tajribalar asosida O‘ zbekistonda forel balig‘ i uchun import o‘ rnini bosuvchi mahalliy kombikormlar ishlab chiqarishning mavjud imkoniyatlarini baholash hamda istiqbolli texnologik yechimlarni asoslashdan iborat.

Forel yirtqich oziqlanish tipiga moslashgan baliq bo‘ lib, tabiiy sharoitda hayvonot kelib chiqishidagi ozuqalarni iste’mol qiladi. Shu sababli sanoat rasionida proteinning nafaqat miqdori, balki sifati muhimdir.

FAO ma’lumotlarida forel uchun boshlang‘ ich rasionlarida protein darajasi taxminan 50%, mayda baliqlarda 47%, tovar baliqlarda esa taxminan 45% darajasidan past bo‘ lmasligi tavsiya etilgan [10]. Bundan tashqari, zamonaviy yuqori energiyali rasionlarda protein-energiya nisbati baliqning yoshi, suv harorati va ishlab chiqarish texnologiyasiga muvofiq optimallashtiriladi.

Forel organizmi proteindan samarali foydalanadi, ammo rasionda energiya yetarli bo‘ lmasa, qimmatli aminokislotalar energiya manbai sifatida sarflanadi. Shu sababli rasionda «oqsil o‘ rnini bosuvchi» effektini ta’minlaydigan yetarli darajadagi lipid va hazmlanuvchan energiya manbai bo‘ lishi juda muhim.

Zamonaviy rasion tarkibida xom proteindan ko‘ ra, yaxshi hazmlanuvchan protein, hazmlanuvchan energiya, muhim aminokislotalar nisbati muhimroq mezon sifatida qaralmoqda [1, 11].

Bugungi kunda baliq yemi tarkibidaga asosiy komponent baliq unini almashtirish bo‘ yicha ilmiy tadqiqotlar jadal olib berilmoqda (1-jadval). Xususan, o‘ simlik proteinlari bilan almashtirish bo‘ yicha eng muhim klassik ishlardan biri bu raps-no‘ xat kombinatsiyasi, soya mahsulotlari va makkajo‘ xori glyuteni kabi manbalar hisoblanadi. Masalan, baliq uni proteinining 66%ini o‘ simlik proteinlari bilan almashtirganda o‘ sish va maxsus o‘ sish tezligi nazoratdan sezilarli farq qilmaganini ko‘ rsatgan [12].

Kaushik va hammualliflar [13] 50% baliq uni proteinini soya va makkajo‘ xori proteinlari bilan almashtirish muayyan rasion sharoitlarida o‘ sish va yemdan foydalanishni yomonlashtirmaganini qayd etganlar.

Soya protein konsentratidan foydalanilgan boshqa tajribada esa 33-100% darajada baliq uni proteinini almashtirish o‘ sish va ozuqa moddalaridan foydalanishga sezilarli salbiy ta’sir ko‘ rsatmagan, ammo oddiy soya uni natijalari ancha past bo‘ lgan [14]. Bu holat xomashyoning nomi emas, balki uning qayta ishlanganlik darajasi ham muxim ekanligini ko‘ rsatadi.

Larsen va hammualliflar [15] no‘ xat, dala loviyasi va raps protein konsentratlaridan iborat aralashma baliq uni proteinining 47%ini almashtirganda forelning SGR va FCR ko‘ rsatkichlarida sezilarli yomonlashish kuzatilmaganini aniqlagan.

1-jadval

Dunyoda bo‘ yicha Forel rasionida baliq unini alternativ proteinlar bilan almashtirish bo‘ yicha o‘ tkazilgan ayrim tadqiqotlar tahlili

Alternativ manba	Baliq unini almashtirish foizi	Asosiy xulosa	Manba
Aralash o‘ simlik proteinlari	66% gacha	O‘ sishda sezilarli pasayish kuzatilmagan	[12]
Soya + makkajo‘ xori proteinlari	50%	Yemdan foydalanish saqlangan	[13]
Soya protein konsentrati	33–100%	Konsentrat oddiy soya unidan samaraliroq	[14]
No‘ xat + dala loviyasi + raps konsentrati	47%	SGR va FCR saqlangan	[15]
Kungaboqar shroti	40%	Proteindan foydalanish soyaga yaqin	[16]
Paxta protein konsentrati	75% gacha	O‘ sishga salbiy ta’sir kuzatilmagan; 100%da pasayish kuzatilgan	[17]
Parrandachilik ikkilamchi mahsuloti	yuqori darajada	Lizin va metionin balanslash talab etiladi	[18]
Pivo achitqisi va sarflangan don	20% va 15%	Forel uchun istiqbolli ikkilamchi resurs	[19]
Mikrosuvo‘ tlari ikkilamchi biomassasi	100%	Tajribada o‘ sish va FCR nazoratga yaqin	[20]

Kungaboqar shroti bo‘ yicha tadqiqotda u baliq uni proteinining 40%gacha qismini almashtirganda soya shrotiga yaqin natijalar bergan, ammo uglevod fraksiyasi sababli hazmlanuvchan energiya darajasi cheklovchi omil bo‘ lgan [16].

Farg‘ ona vodiysida mahalliy xomashyolarni tanlashda undan maksimal foydalanishda resursning faqat ozuqaviy qiymati emas, avvalo yillik hajmi, mavsumiyligi, barqaror foydalanish imkoniyati, narxi, saqlanuvchanligi; qayta ishlash imkoniyati, sanitariya-gigiyena xavfsizligi kabi ko‘ rsatkichlar ham baholanishi kerak.

O‘ zbekiston sharoitida istiqbolli komponentlar qatoriga paxta va kungaboqar kunjarasi va shroti, soya mahsulotlari, bug‘ doy kepagi, makkajo‘ xori mahsulotlari, dukkakli ekinlar, paxta sanoati proteinli mahsulotlari va boshqa mahalliy agrosanoat resurslarini kiritish mumkin (2-jadval).

Bizning mamlakatimizda paxtachilik sanoatining mavjudligi sababli paxta proteinlari alohida ilmiy qiziqish uyg‘ otadi. Oddiy paxta shroti bilan bog‘ liq asosiy cheklovlardan biri gossipol hisoblanadi. Shu sababli past gossipolli yoki chuqur qayta ishlangan paxta protein konsentratlaridan foydalanish afzal.

2022 yilda forelda o‘ tkazilgan tadqiqotda 46% xom protein va 16% lipidli rasionlarda baliq uni paxta protein konsentrati bilan 25, 50, 75 va 100% darajada almashtirilgan. 75%gacha almashtirish o‘ sish ko‘ rsatkichlarini sezilarli yomonlashtirmagan, ammo 100% variantda ozuqa iste’moli va o‘ sish pasaygan [17].

Bu natija O‘ zbekistonda paxta proteinini to‘ g‘ ridan-to‘ g‘ ri emas, balki detoksikatsiya, konsentrlash, fermentatsiya texnologiyalari asosida tadqiq qilish zarurligini ko‘ rsatadi.

O‘ simlik proteinlarining asosiy kamchiligi-muhim aminokislotalar nisbati va antinutritiv omillar bilan bog‘ liq bo‘ lsa, hayvonot proteinlarida aminokislota profili ko‘ p hollarda baliq talablariga yaqinroq bo‘ ladi.

Parrandachilik sanoati ikkilamchi mahsulotlari bunday resurslarning muhim misolidir. Fowler [18] parrandachilik ikkilamchi mahsulotlari uni forelda baliq unining qisman va yuqori darajadagi o‘ rinbosari bo‘ la olishini ko‘ rsatgan. To‘ liq almashtirishda, ayniqsa lizin va metionin bilan balanslash zarurligi ta’kidlangan.

2024 yilgi zamonaviy tadqiqotda parrandachilik ikkilamchi mahsuloti uni va gidrolizlangan pat unidan foydalanilgan rasion baliq unisiz sinovdan o‘ tkazilgan. O‘ sish, yemdan foydalanish va ichak salomatligida salbiy ta’sir qayd etilmagan [21].

2025 yilda Eronda forel uchun baliq unisiz rasionlarda parranda protein konsentrati, qon uni, past kulli parrandachilik mahsuloti uni, raps shroti va pat uni kombinatsiyalari tekshirilgan [22]. Bu natijalar yagona alternativ komponent emas, balki aralash protein tizimi istiqbolli ekanligini ko‘ rsatadi.

Mikrobiologiya sohasidagi ishlab chiqarishdan qoladigan achitqi va sarflangan don yuqori hajmda hosil bo‘ ladigan ikkilamchi resurslardan hisoblanadi. Estévez va hammualliflar [19] ushbu mahsulotlarni quritilgan va gidrolizlangan shaklda forel ozuqasida baholagan. Tadqiqot natijalari pivo sanoati ikkilamchi mahsulotlarini sirkulyar iqtisodiyot doirasida akvakultura uchun ozuqa manbaiga aylantirish mumkinligini ko‘ rsatgan.

Bu yondashuv O‘ zbekistonning oziq-ovqat sanoatidagi boshqa ikkilamchi biomassalar uchun ham qo‘ llanilishi mumkin.

O‘ simlik proteinlari arzon va keng tarqalgan bo‘ lsa-da, ularda o‘ simlik proteinlarini cheklovchi (foydalanishga to‘ sqinlik qiluvchi) antinutritiv omillar-fitatlar, tanninlar, tripsin va boshqa proteaza ingibitorlari, nokraxmal polisaxaridlar, yuqori molekulyar kletchatka, ayrim xomashyolarda gossipol yoki glikoalkaloidlar mavjud bo‘ lishi mumkin [5, 23].

Zamonaviy adabiyotlarda o‘ simlik xomashyosini termik ishlov, fermentatsiya, fermentativ qayta ishlash, ekstraksiya yoki funksional qo‘ shimchalar bilan boyitish orqali ushbu cheklovlarni sezilarli kamaytirish mumkinligini ko‘ rsatadi [5].

Kartoshka protein konsentrati misolida ham xomashyodagi glikoalkaloid miqdori uning forel uchun yaroqliligini belgilaydi. Past glikoalkaloidli komponent yuqori glikoalkaloidli variantga nisbatan xavfsizroq bo‘ lgan [24].

Shuning uchun O‘ zbekiston sharoitida mahalliy resurslardan yuqori sifatli forel ozuqasi yaratishning asosiy kaliti xomashyoni shunchaki aralashtirish emas, balki maqsadli biokonversiya qilish hisoblanadi.

Biokonversiya natijasida yirik protein molekulalari kichik peptidlar va erkin aminokislotalarga transformatsiya bo‘ lishi mumkin. Shu bilan birga o‘ simlik hujayra devori qisman parchalanadi, fitat (fitin kislotasining tuzlari) miqdori kamayadi, murakkab uglevodlar parchalanadi, proteinning fermentlarga bog‘ lanishi oshadi.

Fermentatsiya qilingan o‘ simlik proteinlari bo‘ yicha tizimli meta-tahlil bunday qayta ishlash baliqlarning o‘ sishi, hazm fermentlari faolligi va ozuqa moddalaridan foydalanishiga ijobiy ta’sir ko‘ rsatishi mumkinligini ko‘ rsatadi [25].

O‘ simliklarni fyermentativ qayta ishlashda xomashyolarning xususiyatiga qarab, masalan proteaza-proteinlarni gidroliz qilish, fitaza-fitatlarni parchalash, syellyulaza-kletchatkani qisman gidroliz qilish, ksilanaza-nokraxmal polisaxaridlarni parchalash uchun qo‘ llanilishi mumkin.

Ferment dozasi xomashyoga nisbatan belgilashda xar bir substrat uchun rN, harorat, namlik, ferment konsentratsiyasi va reaksiya davomiyligi eksperimental optimallashtirilishi zarur bo‘ ladi.

Mikrobiologik fermentatsiya natijasida xavfsiz mikroorganizmlar substrat tarkibidagi murakkab birikmalarni o‘ z fermentlari yordamida modifikatsiya qiladi. Fermentatsiya samaradorligi mikroorganizm shtammi, harorat, rN, namlik, kislorod rejimi, fermentatsiya vaqti bilan belgilanadi. Shu sababli «bir xil fermentatsiya texnologiyasi barcha xomashyolar uchun mos» degan yondashuv to‘ g‘ ri emas.

Forel uchun mahalliy kombikorm yaratishda eng istiqbolli strategiya- baliq yemi tarkibidagi bir komponent bilan baliq unini to‘ liq almashtirish emas, balki bir nechta manbaning kuchli jihatlarini komplementar birlashtirishdir. Masalan: o‘ simlik proteini, hayvonot proteini, aminokislota korreksiyasi, biokonversiya kombinatsiyasi bir manbaning aminokislota yetishmovchiligini boshqa manba hisobiga kompensatsiya qilishi mumkin.

2012 yilda alternativ protein aralashmalari bilan o‘ tkazilgan tadqiqot ham soya protein konsentrati asosidagi aralashmaning yuqori almashtirish darajalarida boshqa alternativ aralashmalardan samaraliroq bo‘ lganini ko‘ rsatgan [26].

O‘ simlik proteinlarini aralashma modeli asosida optimallashtirish bo‘ yicha tajribada no‘ xat, raps, kartoshka va soya protein konsentratlari aminokislotalar hamda taurin bilan muvozanatlashtirilib, baliq unisiz forel rasionlari ishlab chiqilgan [27].

2-jadval

Baliq yemi uchun istiqbolli mahalliy xomashyo turlari va ularni qayta ishlash

Xomashyo	Afzalligi	Asosiy cheklov	Taklif etiladigan qayta ishlash
Kungaboqar shroti/kunjarasi	Protein, mahalliy resurs	Kletchatka	Maydalash, fermentatsiya, fermentlar
Soya mahsulotlari	Yuqori protein	Ingibitorlar	Termik ishlov, fermentatsiya
Paxta proteini	Keng mahalliy baza	Gossipol	Detoksikatsiya, konsentrlash, fermentatsiya
Bug‘ doy kepagi	Arzon, keng mavjud	Kletchatka, past protein	Syellyulaza/ksilanaza, fermentatsiya
Dukkakli ekinlar	Protein va kraxmal	Antinutritiv moddalar	Termik/fermentativ ishlov
Parrandachilik mahsulotlari	Yuqori protein	Sanitariya, kul	Termik sanitarizatsiya, gidroliz
Pat	Keratinga boy protein	Past hazmlanuvchanlik	Gidroliz/fermentativ parchalash
Baliqni qayta ishlash mahsulotlari	Aminokislota va lipidlar	Oksidlanish, saqlash	Termik ishlov, gidroliz, antioksidant nazorati
Pivo achitqisi	Protein, funksional moddalar	Hujayra devori	Gidroliz
Sarflangan pivo doni	Arzon ikkilamchi resurs	Kletchatka	Fermentativ/mikrobiologik ishlov

Shuni alohida ta’kidlash kerakki, 2025 yilda *Nannochloropsis* sp. dan moy ajratilgandan keyin qolgan biomassa forelda 33, 66 va 100% baliq uni almashtirish darajasida variantida ham baliqlarda o‘ sish, FCR va tirik qolish nazorat variantidan sezilarli farq qilmagan [20]. Bu natija ikki muhim xulosani beradi. Birinchidan, «qoldiq» deb qaraladigan biomassa yuqori qiymatli ozuqa ingrediyentiga aylanishi mumkin. Ikkinchidan, xomashyoning dastlabki nomi emas, qayta ishlangan komponentning ozuqaviy sifati hal qiluvchi ahamiyatga ega.

2026 yilda o‘ tkazilgan gidrolizlangan yomg‘ ir chuvalchangi proteinini forel rasionida sinashda ham 10% almashtirish eng yaxshi o‘ sish ko‘ rsatkichlarini bergan va hazm fermentlari faolligini yaxshilagan [28].

Forel uchun yuqori sifatli kombikorm yaratishda ekstruziya muhim bosqich hisoblanadi. Ekstruziya, bu granula strukturasini shakllantiradi, kraxmal jelatinizatsiyasini ta’minlaydi, suvda barqarorlikni oshiradi, granulaning zichligi va suzish xususiyatini boshqaradi, ayrim mikroorganizmlarni kamaytiradi, moy bilan keyingi qoplash uchun qulay struktura yaratadi. Biroq ekstruziyada haroratning ortiqcha oshishi ayrim aminokislotalarning barqarorligini kamaytirishi mumkin.

Shu sababli mahalliy xomashyoga asoslangan har bir reseptura uchun namlik, harorat, bosim, vint tezligi, ushlab turish vaqti alohida optimallashtirilishi kerak.

Ilmiy adabiyotlarni o‘ rganish natijalariga asosan Namangan viloyati sharoitida boqilayotgan forel uchun mahalliy kombikorm yaratish quyidagi bosqichlarda amalga oshirilishi maqsadga muvofiq:

I- bosqich. Xomashyo resurslarini inventarizatsiya qilish

Har bir resurs uchun yillik hajm, narx, mavsumiylik, transport xarajatlari, saqlash va foydalanish imkoniyatlarini aniqlash.

II- bosqich. Kimyoviy skrining

Quyidagilar aniqlanishi lozim. Xususan, xom protein, lipid, kletchatka, kul, minerallar, aminokislotalar, antinutritiv moddalar va boshq.

III-bosqich. Xavfsizlik skriningi. Mikrobiologik va zarur toksikologik tekshiruvlarni amalga oshirish.

IV-bosqich. Biokonversiya. Fermentativ gidroliz va/yoki mikrobiologik fermentatsiyani amalga oshirish.

V bosqich. Qayta baholash

Biokonversiyadan so‘ ng protein hazmlanuvchanligi, peptidlar, erkin aminokislotalar, fitat, kletchatka, boshqa cheklovchi omillar qayta aniqlanadi.

VI-bosqich. Formulyasiya. Rasionlar xom protein bo‘ yicha emas, balki hazm bo‘ luvchi protein-muhim aminokislotalar va energiya tizimida hisoblanadi.

VII-bosqich. Ekstruziya. Granulaning texnologik va fizik ko‘ rsatkichlari optimallashtiriladi.

VIII- bosqich. Biologik sinov. Forel balig‘ idagi vazn ortishi, SGR, FCR, PER, tirik qolish va ADC aniqlanadi.

IX-bosqich. Iqtisodiy baholash

1 kg yem narxidan ko‘ ra, 1 kg baliq biomassasi o‘ sishiga sarflangan yem qiymati asosiy iqtisodiy mezon sifatida qaraladi.

3-jadval

Forel balig‘ i uchun mahalliy kombikormini ishlab chiqish bo‘ yicha taklif etilayotgan tajriba sxemasi

Guruh	Import proteinni mahalliy kompleks bilan almashtirish	Maqsad
K_0	0%	Nazorat
K_1	25%	Past almashtirish
K_2	50%	O‘ rta darajada almashtirish
K_3	75%	Yuqori almashtirish
K_4	100% yoki maksimal eksperimental	Almashtirish chegarasini aniqlash

3-jadvalda forel uchun import o‘ rnini bosuvchi mahalliy kombikormlarning samaradorligini eksperimental baholash sxemasi keltirilgan**.** Taklif etilayotgan yondashuvda nazorat rasioni (K_0) bilan bir qatorda import protein komponentining 25, 50, 75 va 100% yoki maksimal mumkin bo‘ lgan qismi mahalliy protein kompleksi bilan almashtirilgan tajriba rasionlari (K_1–K_4) ko‘ zda tutiladi. Bunday gradasion sxema mahalliy protein ulushining ortishi bilan forelning o‘ sishi, yemdan foydalanishi va fiziologik holatida yuz beradigan o‘ zgarishlarni aniqlash, shuningdek, import proteinini almashtirishning biologik va iqtisodiy jihatdan optimal chegarasini belgilash imkonini beradi.

Tajriba rasionlarini shakllantirishda ularning izoprotein va izoenergetik bo‘ lishi, shuningdek, lizin, metionin, treonin va boshqa muhim aminokislotalar bo‘ yicha imkon qadar tenglashtirilishi muhim hisoblanadi. Bu mahalliy protein kompleksining ta’sirini rasiondagi umumiy protein yoki energiya miqdori o‘ zgarishidan ajratgan holda ob’yektiv baholash imkonini beradi. Almashtirish samaradorligini baholashda baliqlarning vazn ortishi, maxsus o‘ sish tezligi (SGR), yem konversiya koeffisiyenti (FCR), protein samaradorligi koeffisiyenti (PER), tirik qolish darajasi va ozuqa moddalarining hazmlanuvchanligi asosiy mezonlar sifatida qo‘ llanilishi maqsadga muvofiq.

Bunda 100% almashtirish oldindan maqbul natija sifatida qabul qilinmasligi kerak. Aksincha, K_1-K_4 variantlarini nazorat bilan taqqoslash orqali mahalliy protein kompleksining qaysi darajasi forelning o‘ sishi va yem konversiyasini pasaytirmasdan import komponentini maksimal darajada almashtira olishi eksperimental ravishda aniqlanadi. Shu tariqa mazkur sxema import o‘ rnini bosishning nafaqat texnik imkoniyatini, balki uning biologik samarali va iqtisodiy maqbul darajasini belgilashga xizmat qiladi.

XULOSA

Adabiyotlar tahlili forel balig‘ i uchun import o‘ rnini bosuvchi mahalliy kombikormlar yaratishning yetarli ilmiy va texnologik asoslari mavjud ekanligini ko‘ rsatadi.

Birinchidan, forel rasionlarida baliq unini alternativ protein manbalari bilan sezilarli darajada almashtirish mumkinligi ko‘ plab tajribalarda isbotlangan. Ayrim o‘ simlik protein aralashmalarida 47–66% darajada almashtirish o‘ sish va yem konversiyasini jiddiy yomonlashtirmagan [12, 15]. Chuqur qayta ishlangan soya va paxta proteinlarida yana yuqori natijalarga erishilgan [14, 17].

Ikkinchidan, proteinning manbasi bilan bir qatorda uni qayta ishlash texnologiyasi hal qiluvchi ahamiyatga ega. Oddiy o‘ simlik shroti bilan protein konsentrati bir xil biologik natija bermaydi.

Uchinchidan, forel kombikormlarida mahalliy o‘ simlik va hayvonot proteinlarini komplementar birlashtirish muhim aminokislotalar disbalansini kamaytirish imkonini beradi.

To‘ rtinchidan, fermentativ gidroliz, mikrobiologik fermentatsiya va ekstruziya kabi texnologik usullar mahalliy xomashyoning protein hazmlanuvchanligi va biologik qiymatini oshirishning asosiy vositalari bo‘ lishi mumkin.

Beshinchidan, O‘ zbekistonda kungaboqar, paxtachilik, donchilik, dukkakli ekinlar, parrandachilik, baliqchilik va oziq-ovqat sanoati ikkilamchi mahsulotlaridan samarali foydalanish uchun resurs imkoniyatlari mavjud. Biroq har bir xomashyoning protein tarkibi, aminokislota profili, antinutritiv moddalari va xavfsizligi eksperimental baholanishi shart.

Shu asosda O‘ zbekiston sharoiti uchun eng maqbul ilmiy-texnologik model quyidagicha ifodalanishi mumkin: mahalliy o‘ simlik va hayvonot ikkilamchi xomashyolari →resurs va sanitariya skriningi →mexanik-termik qayta ishlash → fermentativ va/yoki mikrobiologik biokonversiya →yuqori hazmlanuvchan protein komponentlari →komplementar protein kompleksi →aminokislota va energiya bo‘ yicha muvozanatlashtirish →ekstruziya →forelda biologik sinov → iqtisodiy baholash →texnologik reglament →mahalliy sanoat ishlab chiqarishi.

Ushbu yondashuv forelchilikda import ozuqalarga qaramlikni bosqichma-bosqich kamaytirish, agrosanoat ikkilamchi resurslarini yuqori qo‘ shimcha qiymatli mahsulotga aylantirish, mahalliy kombikorm sanoatini rivojlantirish va respublikada intensiv forelchilikning barqaror ozuqa bazasini shakllantirish uchun ilmiy asos bo‘ lishi mumkin.

Maqola yakunida ta’kidlash mumkinki, O‘ zbekiston sharoitida birinchi marta mahalliy o‘ simlik va hayvon mahsulotidan bo‘ lgan ikkilamchi xomashyolarning komplementar protein potensiali kompleks baholanadi, ularni maqsadli fermentativ va mikrobiologik biokonversiya qilish asosida forel balig‘ i uchun import o‘ rnini bosuvchi yuqori hazmlanuvchan kombikormlar yaratishning ilmiy-texnologik asoslari ishlab chiqiladi va u amaliyotda, ya’ni forelchilik tarmog‘ ini barqaror rivojlantirishda muhim drayver vazifasini bajarishi mumkin.

Mazkur yondashuvda asosiy yangilik bu mahalliy xomashyo, o‘simlik va hayvonot proteinlarining komplementarligi, biokonversiya, yuqori hazmlanuvchan protein asosida formulyasiya, import o‘rnini almashtirish darajasining eksperimental aniqlash va ularni bir tizimda birlashtirilishidadir.

ULLISHO‘ RKO‘ LDA TARQALGAN CHIPOR DO‘ NGPESHONA *(HYPOPHTHALMICHTHYS NOBILIS)*NING YOSH, VAZN VA O‘ SISH XUSUSIYATLARI.

Z.O‘ .Narboyev
mustaqil izlanuvchi, Urganch davlat universiteti, Urganch

Annotatsiya. *Ushbu maqolada Ullisho‘ rko‘ lida tarqalgan chipor do‘ ngpeshona (Hypophthalmichthys nobilis) populyatsiyasining yosh tarkibi, tana uzunligi, vazni va o‘ sish xususiyatlari o‘ rganilgan. 1+ dan 4+ yoshgacha bo‘ lgan 30 ta baliq namunalari umumiy qabul qilingan ixtiologik metodlar asosida tahlil qilingan. Natijalarga ko‘ ra, baliqning yoshi ortishi bilan tana uzunligi va vazni izchil ravishda oshib borgan: uzunlik bo‘ yicha yillik o‘ sish sur’ati 1+/2+ yosh oralig‘ ida 242,4 mm, 2+/3+ da 172,1 mm, 3+/4+ da esa 143,9 mm ni tashkil etgan bo‘ lsa, vazn bo‘ yicha mos ravishda 1509,0 g, 2556,2 g va 4549,9 g ga teng bo‘ lgan.*

Kalit so‘ zlar. *Chipor do‘ ngpeshona, ovlanadigan tur, Hypophthalmichthys nobilis, Ullisho‘ rko‘ l, yosh tarkibi, uzunlik vazn, regressiya tahlili, o‘ sish sur’ati, Fulton koeffitsienti, ixtiologik tahlil.*

AGE, WEIGHT AND GROWTH CHARACTERISTICS OF THE BIGHEAD CARP (HYPOPHTHALMICHTHYS NOBILIS) DISTRIBUTED IN ULLISHORKOL

Abstract. *This article studies the age structure, body length, weight and growth characteristics of the bighead carp (Hypophthalmichthys nobilis) population distributed in Ullishorkol. Thirty fish samples aged from 1+ to 4+ were analysed using generally accepted ichthyological methods. According to the results, body length and weight increased consistently with age: the annual growth rate in length was 242.4 mm between ages 1+/2+, 172.1 mm between 2+/3+, and 143.9 mm between 3+/4+, while the corresponding weight increments were 1509.0 g, 2556.2 g and 4549.9 g, respectively.*

Keywords. *Bighead carp, commercial species, Hypophthalmichthys nobilis, Ullishorkol, age structure, length-weight, regression analysis, growth rate, Fulton’s condition factor, ichthyological analysis.*

ВОЗРАСТНЫЕ, ВЕСОВЫЕ И РОСТОВЫЕ ХАРАКТЕРИСТИКИ ПЕСТРОГО ТОЛСТОЛОБИКА (*HYPOPHTHALMICHTHYS NOBILIS*), ОБИТАЮЩЕГО В ОЗЕРЕ УЛЛИШОРКОЛЬ

Аннотация. *В данной статье изучены возрастной состав, длина тела, масса и особенности роста популяции пёстрого толстолобика (Hypophthalmichthys nobilis), распространённого в озере Уллишўркўл. 30 образцов рыб в возрасте от 1+ до 4+ лет проанализированы на основе общепринятых ихтиологических методов. Согласно результатам, с увеличением возраста рыбы длина тела и масса последовательно возрастали: годовой прирост по длине составил 242,4 мм в возрасте 1+/2+, 172,1 мм в 2+/3+ и 143,9 мм в 3+/4+, а по массе соответственно 1509,0 г, 2556,2 г и 4549,9 г.*

Ключевые слова. *Пёстрый толстолобик, промысловый вид, Hypophthalmichthys nobilis, Уллишўркўл, возрастной состав, длина-масса, регрессионный анализ, темп роста, коэффициент Фультона, ихтиологический анализ.*

Kirish. So‘ ngi yillarda O‘ zbekistonda baliqchilik sohasi davlat siyosatining ustuvor yo‘ nalishlaridan biriga aylanib bormoqda. Xususan, Respublikada baliqchilik tarmog‘ ini rivojlantirish, ozuqa bazasini mustahkamlash va baliq yetishtirish hajmini keskin oshirishga qaratilgan ustuvor yo‘ nalishlar belgilanmoqda. Hozirgi davrda baliqlarni ilmiy o‘ rganish, ularning biologiyasi, serpushtligi va ekologik moslashuvchanligini chuqur tadqiq qilish zarurati ortib bormoqda. Tabiiy suv havzalardagi baliq resurslarini zamonaviy usullar bilan aniqlash baliqchilikni ilmiy asosda boshqarish va barqaror rivojlanishga erishish uchun zarur ilmiy-amaliy ahamiyat kasb etadi. Shu jumladan, Ullisho‘ rko‘ lida keng tarqalgan chipor do‘ ngpeshona- *Hypophthalmichthys Nobilis*ning o‘ sish xususiyatlarini o‘ rganish muhim ahamiyatga ega hisoblanadi.

Chipor do‘ ngpeshona *(Hypophthalmichthys nobilis)* O‘ zbekistonning ko‘ plab sun‘iy va tabiiy suv havzalarida keng tarqalgan. Ushbu tur 1961 yilda respublikamiz suv havzalariga Xitoydan tasodifan keltirilgan tur hisoblanadi. (Мирабдуллаев И.М. va 2002). Chipor do‘ ngpeshona boshining yirik bo‘ lishi bilan oq do‘ ngpeshona baliq turidan

ajralib turadi. *Hypophthalmichthys nobilis* respublikamiz suv havzalarida keng tarqalgan, tez o‘ sishi va suvni filtrlab oziqlanish xususiyatiga ega bo‘ lgan, asosiy ovlanadigan tur hisoblanadi (Mirabdullayev I.M., Mirzayev U.T. va bosh. 2011). Ullisho‘ rko‘ l suv havzasida ilgari olib borilgan tadqiqotlarda ham chipor do‘ ngpeshona balig‘ i bo‘ yicha keng ma’lumotlar qayd etilgan (Б.Хакбердиев, 1983).

Material va metodika. Ushbu ilmiy tadqiqot ishida material sifatida Xorazm viloyati Yangiariq tumanida joylashgan Ullisho‘ rko‘ lidan 2026-yil iyun-iyul oylarida ovlangan chipor do‘ ngpeshona baliqlaridan foydalanildi. Ovlangan baliqlarning tur tarkibi (Mirabdullayev I.M., Mirzayev U.T. va bosh. 2011), (Mirabdullayev I.M. va bosh. 2020) qo‘ llanmalar bo‘ yicha aniqlandi. Materiallarni yig‘ ish, qayta ishlash va tahlil qilish umumiy qabul qilingan ixtiologik metodlar asosida amalga oshirildi (Правдин, 1966). Olib borilgan ilmiy tadqiqotlar natijasida ko‘ ldan ovlangan Chipor do‘ ngpeshona - (*Hypophthalmichthys nobilis)* baliq turidan 30 ta namuna yig‘ ildi.

Ushbu ilmiy tadqiqot doirasida yig‘ ilgan namunalar quyidagi aniq geografik koordinatalarga ega nuqtalardan ovlab olindi (1-jadval).

1-jadval

Chipor do‘ ngpeshona - (*Hypophthalmichthys nobilis*) baliqlarining namuna uchun ovlangan hudud koordinata nuqtalari

Turning nomi	Namuna olingan hudud	Koordinata nuqtalari
Hypophthalmichthys nobilis	Ullisho‘ rko‘ l	41°14′25.17″N 60°29′21.73″E
		41°14′35.55″N 60°29′40.39″E
		41°14′34.21″N 60°30′17.23″E
		41°14′15.76″N 60°30′11.07″E
		41°14′14.3″N 60°29′44.93″E

Bu nuqtalar bir-biriga nisbatan yaqin joylashgan bo‘ lib, ular bir xil ekologik sharoitga ega turg‘ un suv maydonini ifodalaydi. Ushbu koordinatalar asosida to‘ plangan ma’lumotlar tahlili, hududdagi ovlangan chipor do‘ ngpeshona baliqlarining yoshini aniqlash, tana uzunligi va vaznini aniqlashda muhim omil bo‘ lib xizmat qildi.

Natijalar va muhokamalar. Bizning olib bogan tadqiqot ishimizda asosan ko‘ lning turli nuqtalariudan chipor do‘ ngpeshona tiriga mansub jami 30 ta baliq namunasi o‘ rganildi. Ovlangan chipor do‘ ngpeshona balig‘ i 1+, 2+, 3+, 4+ yoshni tashkil etdi. Chipor do‘ ngpeshona (*Hypophthalmichthys nobilis*) baliqlarining (uzunlik, vazn va yosh ko‘ rsatkichlari) aiqlanadi , (2-jadval).

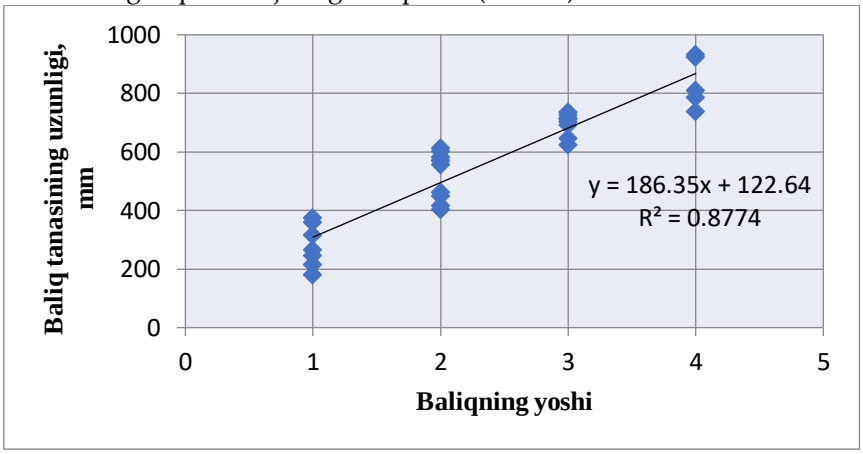
2-jadval

Ullisho‘ rko‘ l ko‘ lidagi *Hypophthalmichthys nobilis*ning uzunlik va og‘ irlik ko‘ rsatkichlari

Yoshi	*l, sm*	*W, gr*	*N*
1+	18-37,5	72-783	7
2+	40,2-61,2	910-2860	10
3+	62,3-73,5	2932-5324	8
4+	73,8-93,1	5402-12310	5

Har bir guruh bo‘ yicha tana uzunligi va vazniga oid statistik ko‘ rsatkichlar 3-jadvalda keltirilgan.

3-jadval

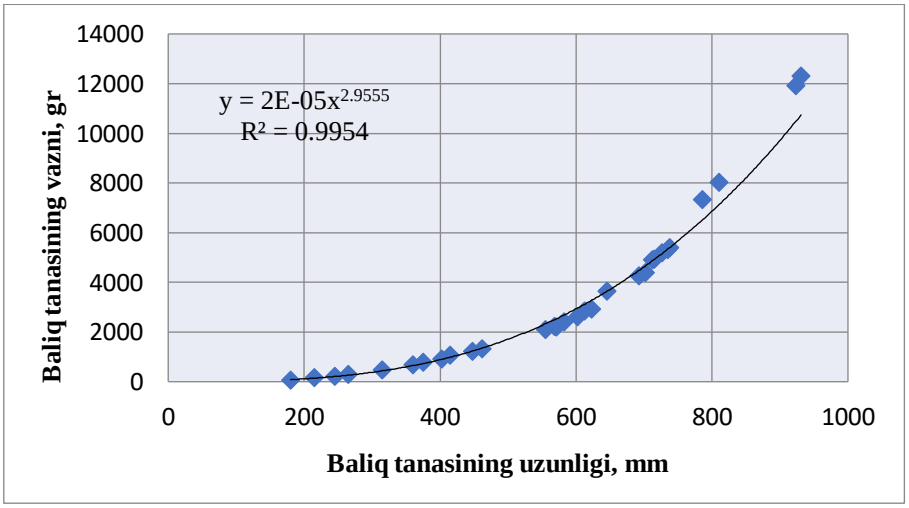


***Hypophthalmichthys nobilis*ning tana uzunligi va vazniga oid statistik ko‘ rsatkichlar**

Yosh guruhi	n	L, mm (o‘ rtacha ± SD)	L, mm (min–max)	W, g (o‘ rtacha ± SD)	W, g (min–max)	Fulton koeffitsienti (o‘ rtacha ± SD)
1+	7	279,3 ± 73,4	180–375	383,3 ± 273,1	72–783	1,48 ± 0,11
2+	10	521,7 ± 80,7	402–612	1892,3 ± 701,4	910–2860	1,29 ± 0,10
3+	8	693,8 ± 39,6	623–735	4448,5 ± 822,8	2932–5324	1,32 ± 0,06
4+	5	837,6 ± 85,7	738–931	8998,4 ± 3006,0	5402–12310	1,48 ± 0,08

Jadvaldan ko‘ rinib turibdiki, baliqning yoshi ortishi bilan tana uzunligi va vazni izchil ravishda ortib boradi. Umumiy tekshirilgan namunalarda tana uzunligi 180 mm dan 931 mm gacha, tana vazni esa 72 g dan 12310 g gacha o‘ zgarib turdi, bu esa bir yoshli yosh baliqlar bilan to‘ rt yoshli yetuk individlar o‘ rtasidagi sezilarli farqni ko‘ rsatadi.

Namunalarning yosh darajasi ko‘ rsatkichlari 1+ yoshdan 2+ yoshga o‘ tishda tana uzunligi o‘ rtacha 242,4 mm ga, 2+ dan 3+ ga o‘ tishda 172,1 mm ga, 3+ dan 4+ ga o‘ tishda esa 143,9 mm ga ortgan. Shunga mos ravishda tana vazni bo‘ yicha yillik o‘ rtacha 1+/2+ oralig‘ ida 1509,0 g ni, 2+/3+ oralig‘ ida 2556,2 g ni, 3+/4+ oralig‘ ida esa 4549,9 g ni tashkil qildi.



Shuningdek, ushbu ilmiy tadqiqotlar natijasida *Hypophthalmichthys nobilis* namunalarining yoshi va tanasining uzunligi o‘ rtasida o‘ zaro o‘ rtacha bog‘ liqlik mavjudligi aniqlandi (1-rasm).

1-rasm. Ullisho‘ rko‘ lida ovlangan *Hypophthalmichthys nobilis* baliqlarining yoshi va tana uzunligining o‘ zaro bog‘ liqligi.

Ushbu grafikda regressiya tenglamasi y=186.35x+122.64, R^2=0.8774 bo‘ lib, tahlil natijalariga ko‘ ra, baliq yoshi ortishi bilan tana uzunligi ham muntazam ravishda ortishi kuzatildi.

Hypophthalmichthys nobilis populyatsiyasida tana uzunligi va tana vazni o‘ rtasidagi bog‘ liqlik regressiya tahlili yordamida baholandi (2-rasm). Tahlil natijasida baliqlarning tana uzunligi va vazni o‘ rtasida kuchli musbat bog‘ liqlik mavjudligi aniqlandi.

2-rasm. Ullisho‘ rko‘ lida ovlangan *Hypophthalmichthys nobilis* baliqlarining tana uzunligi va tana vazni o‘ rtasidagi o‘ zaro bog‘ liqligi.

Ushbu grafikda regressiya tenglamasi quyidagicha keltirilgan y=2E-05$x^{2,9555}$. Bunda determinatsiya koeffitsienti R^2=0,9954 ni tashkil etdi, bu esa baliqlarning tana vaznidagi o‘ zgarishlarning 99,54 % i tana uzunligi bilan izohlanishini ko‘ rsatadi. Faqat 0,46 % o‘ zgarish boshqa biologik va ekologik omillar, jumladan oziqlanish sharoiti, individual rivojlanish xususiyatlari, va yashash muhiti ta’siri bilan bog‘ liq bo‘ lishii aniqnangan.

Bizning tadqiqotimizda olingan R^2 = 0,9954 qiymati populyatsiyada tana uzunligi va tana vazni o‘ rtasidagi bog‘ liqlik juda yuqori ekanligini ko‘ rsatadi hamda Ullisho‘ rko‘ l sharoitida *Hypophthalmichthys nobilis* populyatsiyasi barqaror o‘ sish sur’atiga ega ekanligini tasdiqlaydi.

Xulosa. Shunday qilib, Ullisho‘ rko‘ lda tarqalgan *Hypophthalmichthys nobilis* populyatsiyasining yosh tarkibi, morfometrik va uzunlik–vazn ko‘ rsatkichlari o‘ rganildi. Olib borilgan tadqiqotlar natijasida ushbu turning populyatsiyasi asosan 1+ dan 4+ yoshli bo‘ lgan individlardan tashkil topgani aniqlandi. Yosh va tana uzunligi

o‘ rtasidagi regressiya tahlili natijasida y = 186,35x + 122,64 regressiya tenglamasi hamda R^2 = 0,8774 determinatsiya koeffitsienti olindi. Bu tana uzunligidagi o‘ zgarishlarning 87,74 % i yosh omili bilan izohlanishini va yoshning ushbu turning chiziqli o‘ sishiga asosiy ta’sir etuvchi omillardan biri ekanligini ko‘ rsatadi.

Uzunlik–vazn munosabatining regressiya tahlili $W = 2\times10^{-5}L^{2.9555}$ tenglamasi bilan ifodalanib, R^2 = 0,9954 ga teng yuqori determinatsiya koeffitsienti aniqlandi. Bu natija tana uzunligi va vazni o‘ rtasida juda kuchli bog‘ liqlik mavjudligini tasdiqlaydi.

O‘ ZBEKISTON G‘ ARBIY VA JANUBI-G‘ ARBIY VOHALARIDA TARQALGAN CATOCALINI TRIBASI TURLARINING ZOOGEOGRAFIK XUSUSIYATLARI

Yavkachev Davronbek Azatovich
Urganch davlat pedagogika instituti
Tabiiy fanlar kafedrasi katta o‘ qituvchisi
ORCID- 0000-0002-1304-7284
e-mail: davron10@yandex.ru

Annotatsiya: *O‘ zbekistonning g‘ arbiy va janubi-g‘ arbiy vohalarida aniqlangan Catocalini tribasi vakillarining O.L. Kryzhanovskiy tasnifi bo‘ yicha 12 ta zoogeografik guruhga mansubligi aniqlandi. Tadqiqot natijasida jami 34 ta tur qayd etilgan bo‘ lib, ular quyidagicha taqsimlanadi: 9 ta tur — Turon-Markaziy Osiyo (26,5%), 2 ta tur — Turon-Qozog‘ iston (5,9%), 1 ta tur — Eron-Turon (2,9%), 3 ta tur — Turon (8,8%), 1 ta tur — Turkiston tog‘ (2,9%), 2 ta tur — Transpalearktik-transzonal (5,9%), 1 ta tur — Transzonal (2,9%), 3 ta tur — Qadimiy O‘ rta yer (8,8%), 3 ta tur — Yevropa-Skifiya-Turon (8,8%), 5 ta tur — Transpalearktika (14,7%), 2 ta tur — Palearktika (5,9%) va 2 ta tur — Turon-Markaziy Osiyo-Hind (5,9%). Shuningdek, 13 ta turning Markaziy Osiyo uchun endemik va avtoxton ekanligi ma’lum bo‘ ldi.*

Kalit so‘ zlar – *O‘ zbekiston, Xorazm, Buxoro, Qashqadaryo, tangachaqanotlilar, Catocalini, Catocala, zoogeografiya, provinsiya, Turon, transplaearktika, transzonal, endemik, avtoxton, fauna*

ЗООГЕОГРАФИЧЕСКИЕ ОСОБЕННОСТИ ВИДОВ ТРИБЫ CATOCALINI, РАСПРОСТРАНЕННЫХ В ЗАПАДНЫХ И ЮГО-ЗАПАДНЫХ ОАЗИСАХ УЗБЕКИСТАНА

Аннотация: *Представители трибы Catocalini, выявленные в западных и юго-западных оазисах Узбекистана, согласно классификации О.Л. Крыжановского, были распределены по 12 зоогеографическим группам. Исследование показало наличие 34 видов, которые распределяются следующим образом: 9 видов относятся к Туранско-Центральноазиатской группе (26,5%), 2 вида — к Туранско-Казахстанской (5,9%), 1 вид — к Ирано-Туранской (2,9%), 3 вида — к Туранской (8,8%), 1 вид — к Туркестанской горной (2,9%), 2 вида — к Транспалеарктическо-трансзональной (5,9%), 1 вид — к Трансзональной (2,9%), 3 вида — к Древнесредиземноморской (8,8%), 3 вида — к Европейско-Скифско-Туранской (8,8%), 5 видов — к Транспалеарктической (14,7%), 2 вида — к Палеарктической (5,9%) и 2 вида — к Туранско-Центральноазиатско-Индийской (5,9%). Установлено, что 13 видов являются эндемиками и автохтонами Центральной Азии.*

ZOOGEOGRAPHICAL CHARACTERISTICS OF THE SPECIES OF THE TRIBE CATOCALINI DISTRIBUTED IN THE WESTERN AND SOUTH-WESTERN OASES OF UZBEKISTAN

Abstract: *The members of the tribe Catocalini identified in the western and south-western oases of Uzbekistan were classified into 12 zoogeographical groups based on the O. Kryzhanovsky classification system. The analysis of 34 identified species is as follows: 9 species belong to the Turanian-Central Asian group (26.5%), 2 species to the Turanian-Kazakhstani (5.9%), 1 species to the Irano-Turanian (2.9%), 3 species to the Turanian (8.8%), 1 species to the Turkestanian mountain (2.9%), 2 species to the Transpalearctic-transzonal (5.9%), 1 species to the Transzonal (2.9%), 3 species to the Ancient Mediterranean (8.8%), 3 species to the European-Scythian-Turanian (8.8%), 5 species to the Transpalearctic (14.7%), 2 species to the Palearctic (5.9%), and 2 species to the Turanian-Central Asian-Indian (5.9%). Furthermore, 13 species were identified as endemic and autochthonous to Central Asia.*

Keywords**:** *Uzbekistan, Khorezm, Bukhara, Kashkadarya, Lepidoptera, Catocalini, Catocala, zoogeography, province, Turan, Transpalearctic, transzonal, endemic, autochthonous, fauna.*

Kirish

Hozirgi vaqtda Yer yuzini zoogeografik rayonlashtirishing yagona umumiy sxemasi mavjud emas, chunki hayvonlarning, shu jumladan hasharotlarning, ayniqsa tangachaqanotlilarni har bir guruhi tarqalishi bo‘ yicha o‘ ziga xos xususiyatlarga ega. Ushbu holatni tangachaqanotlilarning vakili hisoblangan Catocalini tribasi turlarida ham kuzatish mumkin. Ammo umurtqasiz hayvonlarning tarqalish xususiyatlari umurtqalilarnikidan farq qilganligi bois, ularning ayrim turlari arealini asos qilib olib yagona zoogeografik sxema yaratib bo‘ lmaydi. Shu munosabat bilan har bir taksonning tarqalish qonuniyatlarini hududlar kesimida alohida o‘ rganish talab etiladi[7;9].

Boshqa hasharotlar kabi Catocalini tribasi turlarining yer yuzi bo‘ ylab tarqalishi ko‘ p vaqtlardan buyon entomolog olimlar diqqat markazida bo‘ lib kelgan. Ma’lumotlarga ko‘ ra, Catocalini tribasining eng katta avlodi hisoblangan *Catocala* avlodiga mansub tangachaqanotlilarni dunyo bo‘ yicha 268 turi aniqlangan bo‘ lib, shulardan 103 turi Nearktikada, 165 turi Palearktikada tarqalgan, bular orasida Golarktik turlar uchramaydi. Ushbu avlodning bir nechta turlari Neotropika va Hindo-Malayya biogeografik viloyatlarida qayd qilingan [2;3;5;8;10].

Yuqoridagilardan kelib chiqqan holda biz O‘ zbekistonning Xorazm, Buxoro va Qashqadaryo vohalarida olib borgan tadqiqotlarimiz davomida aniqlangan Catocalini tribasiga mansub turlarning tarqalish areallarini biogeografik va zoogeografik jihatdan o‘ rganib chiqishni o‘ z oldimizga maqsad qilib oldik.

Material va metodika

Tangachaqanotlilarning tarqalgan areallarini aniqlashda entomolog olim O.L.Krijanovskiy tomonidan Yer yuzini zoogeografik rayonlashtirishga doir klassifikatsiyasini asos qilib oldik [9]. Bunga ko‘ ra Xorazm vohasi zoogeografik jihatdan Palearktika oblastining O‘ rta Yer dengizi kichik oblasti, Turon-Qozog‘ iston tekislik provinsiyasi, Amudaryo vodiy-voha okrugi, Quyi Amudaryo kichik okrugida joylashgan bo‘ lib, Xorazm faunasida to‘ qay landshaftlari va suv-botqoq komplekslari muhim o‘ rin tutadi.

Buxoro vohasi Qizilqum zoogeografik okrugining Markaziy Qizilqum, Janubiy Qizilqum, Mirzacho‘ l, Qashqadaryo kichik okruglari, shuningdek Amudaryo vodiy-voha okrugining Zarafshon-vodiy kichik okrugiga kiruvchi hududlarda joylashgan. Zarafshon daryosining quyi qismi va uning atrofidagi cho‘ l va chalacho‘ llar, vohalararo hududlarning mavjudligi psammofil faunani shakllanishida muhim rol o‘ ynagan. Shu bilan birga sun’iy sug‘ orish tizimlari tufayli antropogen landshaftlar faunasi ham shakllangan.

Qashqadaryo vohasi hududi esa Qizilqum zoogeografik okrugining Qashqadaryo kichik okrugida joylashgan bo‘ lib, bir tomondan Qashqadaryo havzasining tekislik qismini qamrab olsa, ikkinchi tomondan G‘ uzor, Hisor tizmalarining g‘ arbiy tarmoqlari va tog‘ oldi hududlari bilan tutashib ketadi. Shu bois bu yerda ham landshaftlar xilma-xilligi seziladi [4;6].

Natijalar

O‘ zbekistonning g‘ abiy va janubi-g‘ arbiy vohalarida aniqlangan Catocalini tribasi turlarini zoogeografik jihatdan tahlil qilish natijasida quyidagi guruhlar aniqlandi:

1) Turon-Markaziy Osiyo

Ushbu guruhni *Catocala optima, C.artobolevskiji, C.desiderata, C.aestimabilis, C.juncta, C.neglecta, C.repudiata, C.timur, C.remissa* kabi turlar tashkil qiladi. Bular asosan Palearktikaning arid hamda tog‘ oldi-tekislik landshaftlariga moslashgan, Turon provinsiyasi va Markaziy Osiyo ustprovinsiyasining cho‘ l va dasht biogeosenozlarida tarqalgan endemik turlar hisoblanadi. Mazkur turlar Markaziy Osiyo hududida shakllangan avtoxton entomofaunistik kompleksining komponentlari sifatida o‘ rganilayotgan hududning zoogeografik jihatdan o‘ ziga xosligini ko‘ rsatib beruvchi hasharotlar hisoblanadi.

2) Turon-Qozog‘ iston

Mazkur guruhga *Catocala orientalis, C.detrita* mansub bo‘ lib, asosan Markaziy Osiyoning cho‘ l-tekislik zonalari, Qozog‘ istonning keng cho‘ l, chala cho‘ l va janubiy dasht hududlarini, Sharqiy Yevropaning sharqiy chekkalaridagi (Uraloldi va Janubiy Ural) quruq dasht-cho‘ l landshaftlarida tarqalgan. Zoogeografik jihatdan bu turlarni areali arid iqlimli sharoitlarga ega Turon va Qozog‘ iston provinsiyalariga mos keladi. *Catocala orientalis, C.detrita* turlarining mavjudligi hudud entomofaunasining genezisida Turon va Qozog‘ iston provinsiyalari o‘ rtasida doimiy faunistik-migratsion aloqalar rivojlanganligini, shu aloqalar orqali har ikkala provinsiyada iqlim o‘ zgarishlari bo‘ lib o‘ tayotgan hozirgi kunda ham faol ravishda faunistik almashinuv amalga oshayotganini ko‘ rsatadi. To‘ plangan ma’lumotlar Turon-Qozog‘ iston turlarini o‘ rganilayotgan vohalar uchun alloxton xarakterga ega ekanligini bildiradi.

3) Eron-Turon

Mazkur guruh faqat *Catocala lesbia* turidan iborat bo‘ lib, Eron-Turon ustprovinsiyasining o‘ ziga xos va qadimgi turlaridan biri sifatida Eron tog‘ ligi arid landshaftlari hamda Turon pasttekisligining cho‘ l va to‘ qay biogeosenozlarida tarqalgan. *C.lesbia* iqlim xususiyatlari jihatdan keskin kontinental, quruq va issiq sharoitga, xususan, Old Osiyo va Markaziy Osiyo chegaralaridagi cho‘ l, chala cho‘ l hamda daryo bo‘ ylari to‘ qay ekotizimlariga ixtisoslashgan tur sanalanadi. Fikrimizga ko‘ ra *C.lesbia* o‘ rganilayotgan vohalar uchun avtoxton yoki endemik emas, balki Eron-Turon orqali kirib kelgan alloxton tur hisoblanadi. Ushbu turni tadqiqotlar davomida qayd qilinishi esa hududimiz

entomofaunasining genezisida mahalliy va shimoliy (Qozog‘ iston-Ural) faunistik aloqalar bilan bir qatorda janubi-g‘ arbiy yo‘ nalishdagi faunistik-migratsion aloqalar ham muhim rol o‘ ynaganini isbotlaydi.

4) Turon

Mazkur guruhga *Catocala fugitiva, C.kusnezovi, C.toropovi* kabi O‘ rta Osiyoning cho‘ l va cho‘ l-to‘ qay ekotizimlarining endemik turlari tashkil etadi. Bu turlarning tarqalish areallari Turon provinsiyasi (Turon pasttekisligining Qizilqum, Qoraqum sahrolari, Qashqadaryo, Amudaryo, Sirdaryo va Zarafshon daryolari vodiylari hamda ularga tutash cho‘ l-qumliklar) landshaftlari mos keladi. Turon turlari ekologik jihatdan hududning arid iqlimga ega sharoitlariga hamda daryo bo‘ ylaridagi to‘ qaylarda daraxt formatsiyalariga ixtisoslashgan guruh sanaladi. Ushbu guruhga mansub turlar evolyutsion jihatdan Turon provinsiyasi hududida shakllangan bo‘ lib, o‘ rganilayotgan g‘ arbiy va janubi-g‘ arbiy vohalar uchun alloxton emas, balki avtoxton turlardir. *Catocala fugitiva, C.kusnezovi, C.toropovi* turlarining mavjudligi Catocalini tibasining evolyutsion taraqqiyotida Turon provinsiyasining hal qiluvchi ahamiyat kasb etganini va mazkur faunistik markazlardan biri ekanligini yaqqol ko‘ rsatadi.

5) Turkiston tog’

Bu guruhga keskin kontinental tog‘ iqlimi sharoitlariga moslashgan oreofil (tog‘ li hududda yashovchi) va endemik sifatida *Catocala hariti* turi mansub bo‘ lib, Eron-Turon ustpovinsiyasining Turkiston tog‘ provinsiyasi bo‘ ylab tarqalgan. Boshqacha aytganda, mazkur turning tarqalish areali G‘ arbiy Tyan-Shan, Turkiston, Zarafshon, Hisor tog‘ tizmalarining o‘ rta va pastki qismlaridagi quruq tog‘ yonbag‘ irlari hamda tog‘ oldi daryo vodiylari fitosenozlaridan iborat. O‘ zbekistonning janubi-g‘ arbiy vohalarida bu turning qayd qilinishi esa tog‘ oldi va tog‘ larning pastki qismlaridan tekisliklarga, voha ekotizimlariga faunistik-migratsion jarayonlar bo‘ lib turganligini, bu esa hududimiz entomofaunasi, xususan Catocalini tribasi genezisida tog‘ va voha ekotizimlari o‘ rtasidagi vertikal va zonal, faunistik aloqalar bilan birga tog‘ oldi migratsion aloqalar ham muhim o‘ rin tutishini ko‘ rsatadi.

6) Transpalearktik-transzonal

Bu guruhni *Catocala nupta, C.neonympha* turlari tashkil etadi, ular keng ekologik valentlikka ega bo‘ lgan transpalearktik va transzonal hasharotlardir. Chunki mazkur turlarning tarqalish areallari faqat cho‘ l yoki tog‘ mintaqasi bilan chegaralanib qolmaydi, balki Yevrosiyoning g‘ arbiy hududlaridan tortib Tinch okeani havzasigacha bo‘ lgan geografik zonalarni – o‘ rmon-dasht, dasht, cho‘ l va arid landshaftlarni ham egallaydi. *Catocala nupta, C.neonympha* turlari turli xil iqlim va biosenoz sharoitlariga oson moslashuvchanligi bilan ajralib turadi, ayniqsa vohalarda mavjud to‘ qay ekotizimlarining Salicaceae oilasiga mansub daraxt va buta turlariga boyligi tufayli hamma joyda boshqa turlarga nisbatan barqaror populyatsiyalar hosil qilgan. O‘ rganilayotgan vohalar landshfatlarida *C.nupta, C.neonympha* turlari ham mahalliy to‘ qay ekotizimiga xos entomofaunaning tarkibiy qismi hisoblanadi. Ushbu turlarning qayd qilinishi esa respublikamiz entomofaunasining shakllanishida transpalearktik faunistik aloqalar ham muhim ahamiyat kasb etishini ko‘ rsatadi.

7) Transzonal

Tahlillar davomida *C.deducta* transzonal tur sifatida qayd qilindi. Ushbu tur tashqi muhitning ekologik omillarini keng diapazoniga va keng tarqalish xususiyatiga ega bo‘ lgan tangachaqanotli hasharot hisoblanadi. Mazkur tur tarqalish areali jihatdan bir necha zoogeografik oblast yoki zooxoronda uchraydi, xususan cho‘ l, chala cho‘ l, tog‘ , daryo vodiylari ekotizimlariga mansub xilma-xil landshaftlar tarqalganligi bilan boshqa guruhlardan farq qiladi. Shu tufayli hozirgi vaqtda ham tekislikdagi to‘ qaylar va tog‘ li hududlarning daryo bo‘ yi landshaftlarida barqaror populyatsiyalar shaklida saqlanib qolgan. *C. deducta* turining respublikamiz vohalaridagi tekisliklar, shuningdek tog‘ li hududlarda qayd qilinganligi uning boshqa hududlarga migratsiya qilish qobiliyatidan dalolat beradi. Bu holat o‘ rganilayotgan vohalarning Catocalini faunasi genezisida tekislik va tog‘ ekotizimlari o‘ rtasidagi faunistik aloqalar, bilan bir qatorda transzonal faunistik migratsiya muhim omil bo‘ lib xizmat qilganligini ko‘ rsatadi.

8) Qadimiy O‘ rta yer

Mazkur guruhga *C.hymenaea, C.nymphaea, C.conversa* turlari mansub bo‘ lib, ular Qadimiy O‘ rta yer dengizi oblastining kserofil, shuningdek, mezofil hasharotlari hisoblanadi. Bu turlar evolyutsion jihatdan relikt va tarqalish arealiga ko‘ ra Janubiy Yevropa, O‘ rta Yer dengizi havzasi, Kichik Osiyo va Old Osiyodan iborat hududlarni egallashgan. Ushbu turlarning evolyutsion shakllanishi va areal bo‘ ylab tarqalishi ularning lichinkalarining trofik munosabatlarida muhim o‘ rin tutuvchi o‘ simliklar tarqalishi bilan uzviy ravishda bo‘ lib o‘ tgan. Shunga ko‘ ra, O‘ rta Yer dengizi havzasi va unga tutash hududlar bu guruhdagi turlarning asosiy shakllanish markazi hisoblanadi. Markaziy Osiyo, qolaversa O‘ zbekiston vohalari sharoitida mazkur tangachaqanotlilarning qayd qilinishi ularning Qadimiy O‘ rta Yer markazidan sharqqa tomon daryo vodiylari va fitosenozlar orqali migratsiya qilganidan dalolat beradi.

9) Yevropa-Skifiya-Turon

Ushbu guruhni *Catocala sponsa, C.promissa, C.lupina* turlari tashkil qilib, ular zoogeografik jihatdan Boreal oblastning Skifiya kichik oblasti, Qadimiy O‘ rta Yer oblastining Gesperiya, Yevropa kichik oblastlari hamda Turon provinsiyasiga taalluqli mezofil va mezokserofil hasharotlar hisoblanadi. Mazkur turlarning kelib chiqishi va tarqalishida

Shimoliy Afrika, Yevropa, Kavkaz hamda G‘ arbiy Sibirning janubiy hududlari landshaftlari muhim ahamiyatga ega. Bu guruhning evolyutsion shakllanishi va tarqalishi mo‘ tadil iqlim mintaqasidagi keng bargli o‘ rmon biogeosenozlarining tarqalishi bilan birgalikda kechgan. Shu boisdan Yevropa va Skifiya *Catocala sponsa, C.promissa, C.lupina* turlarini tarqalish markazi hisoblanadi. Markaziy Osiyo va Turon pasttekisligi, shuningdek, g‘ arbiy va janubi-g‘ arbiy vohalarda bu turlarning uchrashi – nam mo‘ tadil iqlim hukm surgan qadimgi davrlarda nemoral hisoblangan mazkur turlarning Skifiya orqali Turon hududiga migratsiya qilganligidan dalolat beradi. Geologik davrlar almashinuvi jarayonida bo‘ lib o‘ tgan iqlim aridizatsiyasi va o‘ rmonlarning shimol tomonga surilishi natijasida bu turlar lichinkalarining ozuqa manbasi mavjud ekologik refugiumlarda geografik to‘ siqlar tufayli alohidalashgan holda saqlanib qolgan.

10) Transpalearktika

Bu guruh *C.adultera, C.electa, C.fraxini, C.fulminea, C.pacta* kabi turlardan iborat. Ular zoogeografik jihatdan Transpalearktika kompleksiga taalluqli keng arealga ega mezofil va mezokserofil tangachaqanotlilar hisoblanadi. Mazkur turlarning tarqalish areali Yevrosiyo qit’asining Atlantika okeani sohillaridan Tinch okeani havzasigacha (Uzoq Sharq, Yaponiya) bo‘ lgan mo‘ tadil mintaqaga to‘ g‘ ri keladi. Transpalearktik turlarning evolyutsion genezisi va tarqalish xususiyati ularning ekologik valentlik diapazoni hamda lichinkalarining ozuqaviy spektri kengligi (polifag yoki oligofag) ega ekanligi bilan xarakterlanadi. Shu munosabat bilan transpalearktik turlar Yevrosiyo bo‘ ylab g‘ arbdan sharqqa tomon butun qit’a bo‘ ylab erkin migratsiya qilishiga va keng areallarni egallashga muvaffaq bo‘ lishgan. O‘ zbekistonning g‘ arbiy va janubi-g‘ arbiy vohalarida transpalearktik guruhga mansub Catocalini vakillarining qayd qilinishi mazkur vohalardagi landshaftlarning bu guruh tangachaqnotlilari uchun har tomonlama qulay ekanligini bildiradi.

11)Palearktika

Ushbu guruhni *Catocala elocata, C.puerpera* kabi turlar tashkil qilib, ular o‘ zlarining keng areallari hamda turli landshaft-iqlim sharoitlariga adaptatsiyasi bilan ajralib turadi. Turlarning tarqalish areali – Shimoliy Afrika, Sinay yarim orolining bir qismi, Yevropa, Kichik Osiyo, Kavkaz, Markaziy Osiyo, Sibir, Oltoy, Uzoq Sharq, Xitoy kabi katta hududlardan iborat. Mazkur turlarning Shimoliy Afrikada ham tarqalishi ularning transkontinental xususiyatga ega ekanligini bildiradi. Palearktik turlar ekologik valentlik diapazoni kengligi tufayli biologik progressga yuz tutgan. Shuning uchun ham mo‘ tadil mintaqalardagi daraxt-butazor formatsiyalari va arid zonalarning daryo vodiylari (Amudaryo, Sirdaryo, Zarafshon, Qashqadaryo)ning mavjud biosenozlarida mazkur turlarning barqaror populyatsiyalari shakllangan.

12) Turon-Markaziy Osiyo-Hind

Ushbu guruhning vakillari bo‘ lgan *Catocala pudica, C. afghana* turlari zoogeografik jihatdan Turon provinsiyasi, Markaziy Osiyo ustprovinsiyasi hamda Paleotropika olami tarkibiga kiruvchi Hind kichik oblastida tarqalgan hamda keskin kontinental va arid sharoitga moslashgan.

Xulosa

Tadqiqot materiallarini tahlil qilish Markaziy Osiyo uchun *Catocala optima, C.artobolevskiji, C.desiderata, C.aestimabilis, C.juncta, C.neglecta, C.repudiata, C.timur, C.remissa, C.hariti, C.fugitiva, C.kusnezovi, C.toropovi* tangachaqanotlilari endemik turlar ekanligi, Turon provinsiyasi va Markaziy Osiyo ustpovinsiyasi bo‘ ylab tarqalganligini inobatga olsak, mazkur turlarni Markaziy Osiyo uchun avtoxton turlar deb ta’riflashimizga asos bo‘ ladi. O‘ zbekiston g‘ arbiy va janubi-g‘ arbiy vohalari Catocalini tribasi faunasini shakllanishida avtoxton turlardan tashqari Palearktikaning shimoliy-boreal, sharqiy-tog‘ va janubi-g‘ arbiy-arid kabi alloxton turlari ham muhim ahamiyat kasb etgan.

Аннотация. *Изучены особенности прорастания семян редкого вида Dorema microcarpum в лабораторных условиях. Целью исследования было определение всхожести семян, сроков начала и продолжительности прорастания, а также оценка влияния холодной стратификации, продолжительности хранения и температуры. Исследования проводили в лаборатории «Биотехнологии» Ташкентского ботанического сада имени академика Ф.Н. Русанова при Институте ботаники АН Республики Узбекистан Семена, хранившиеся 6 и 12 месяцев, после 45-дневной холодной стратификации проращивали при +4–+6 °C и +24–+26 °C. Наибольшая всхожесть отмечена при +4–+6 °C: 55% после 6 месяцев и 69% после 12 месяцев хранения. В контрольных вариантах показатели составили 12 и 18% соответственно. При +24–+26 °C всхожесть стратифицированных семян была значительно ниже — 4 и 6%. Установлено, что холодная стратификация и низкие положительные температуры способствуют повышению всхожести семян D. microcarpum. Полученные результаты могут быть использованы при разработке методов семенного размножения и сохранения данного редкого вида.*

Ключевые слова: *Dorema microcarpum, Apiaceae, семена, всхожесть, прорастание, холодная стратификация, температура, редкие виды.*

GERMINATION OF *DOREMA MICROCARPUM* SEEDS UNDER LABORATORY CONDITIONS

Abstract. *The germination characteristics of seeds of the rare species Dorema microcarpum were studied under laboratory conditions. The aim of the study was to determine seed germination capacity, the onset and duration of germination, and to assess the effects of cold stratification, storage duration, and temperature. Seeds stored for 6 and 12 months were subjected to 45 days of cold stratification and subsequently germinated at +4–+6 °C and +24–+26 °C. The highest germination rates were recorded at +4–+6 °C, reaching 55% after 6 months and 69% after 12 months of storage. In the control treatments, germination rates were 12% and 18%, respectively. At +24–+26 °C, the germination rates of stratified seeds were considerably lower, at 4% and 6%, respectively. The results showed that cold stratification and low positive temperatures promote seed germination in D. microcarpum. These findings can be used to develop methods for seed propagation and conservation of this rare species.*

Keywords: *Dorema microcarpum, Apiaceae, seeds, germination capacity, germination, cold stratification, temperature, rare species.*

DOREMA MICROCARPUM URUG‘ LARINING LABORATORIYA SHAROITIDA UNIB CHIQISHI

Annotatsiya. *Dorema microcarpum noyob turining urug‘ larining laboratoriya sharoitidagi unib chiqish xususiyatlari o‘ rganildi. Tadqiqotning maqsadi urug‘ larning unuvchanligini, unib chiqish boshlanishi va davomiyligini aniqlash, shuningdek, sovuq stratifikatsiya, saqlash muddati va haroratning ta’sirini baholashdan iborat bo‘ ldi. 6 va 12 oy davomida saqlangan urug‘ lar 45 kunlik sovuq stratifikatsiyadan so‘ ng +4–+6 °C va +24–+26 °C haroratlarda undirildi. Eng yuqori unuvchanlik +4–+6 °C haroratda qayd etilib, 6 oylik saqlashdan so‘ ng 55%, 12 oylik saqlashdan so‘ ng esa 69% ni tashkil etdi. Nazorat variantlarida ushbu ko‘ rsatkichlar mos ravishda 12% va 18% bo‘ ldi. +24–+26 °C haroratda stratifikatsiyalangan urug‘ larning unuvchanligi sezilarli darajada past bo‘ lib, mos ravishda 4% va 6% ni tashkil etdi. Tadqiqot natijalari sovuq stratifikatsiya va past musbat haroratlar D. microcarpum urug‘ larining unuvchanligini oshirishini ko‘ rsatdi. Olingan natijalardan ushbu turning urug‘ orqali ko‘ paytirish va saqlash usullarini ishlab chiqishda foydalanish mumkin.*

Kalit so‘ zlar: *Dorema microcarpum, Apiaceae, urug‘ lar, unuvchanlik, unib chiqish, sovuq stratifikatsiya, harorat, noyob turlar.*

Введение. Сохранение редких и исчезающих видов растений является одной из приоритетных задач современной ботаники. Особое значение при этом имеют исследования, направленные на изучение репродуктивной биологии видов, поскольку способность к семенному размножению определяет возможности их естественного восстановления и сохранения в культуре.

Изучение всхожести семян позволяет определить их репродуктивный потенциал, выявить оптимальные условия прорастания и разработать эффективные методы получения жизнеспособных проростков. Всхожесть семян определяется как их способность в течение определенного периода формировать нормальные проростки при благоприятных условиях проращивания.

Прорастание семян зависит от комплекса внутренних и внешних факторов. К ним относятся температура, влажность, световой режим, физиологическое состояние семян, наличие ингибирующих веществ, морфологические особенности плодов и продолжительность периода покоя. Существенное влияние может оказывать также положение семян на материнском растении, поскольку распределение питательных ресурсов между семенами неоднородно [4, с. 1039–1044]. Кроме того, семена могут формироваться в разные периоды, вследствие чего подвергаются воздействию различных погодных условий. При этом физиологическое и биохимическое состояние материнского растения изменяется, что может отражаться на метаболизме и последующей жизнеспособности семян [1, с. 666].

У ряда растений прорастание семян задерживается вследствие наличия физиологического покоя, ингибиторов прорастания, вторичных метаболитов и других биологически активных веществ. Период покоя представляет собой состояние, при котором семена не прорастают даже при наличии внешних условий, благоприятных для их прорастания. Глубокий покой семян связан с комплексом физиологических и биохимических механизмов, регулирующих переход семян к активному росту [5, с. 204].

Одним из методов преодоления физиологического покоя является холодная стратификация, которая широко применяется для стимуляции прорастания семян различных видов растений. Эффективность данного метода зависит от продолжительности воздействия низких температур, состояния семян и их физиологических особенностей [1, 5].

К основным показателям, характеризующим процесс прорастания, относятся время появления первых проростков и продолжительность периода прорастания [2, с. 77; 3, с. 9–22; 6, с. 230].

Род *Dorema* D.Don (Apiaceae) объединяет виды, преимущественно связанные с аридными и субаридными местообитаниями. Представители рода встречаются в сухих предгорьях, на холмистых территориях и в пустынных экосистемах; отдельные виды характеризуются выраженной экологической специализацией к определённым типам субстрата [6, 8].

D. microcarpum связан преимущественно с горными и предгорными территориями Центрального и юго-западного Тянь-Шаня, а также северо-западной частью Алайского хребта. Вид отмечается на щебнистых и гипсовых склонах гор и холмов. *D. sabulosum*, напротив, характерен преимущественно для аридных территорий Туранской провинции и связан с пустынными и полупустынными местообитаниями [7].

Несмотря на наличие исследований, посвященных сбору и хранению семян растений, сведения о лабораторной всхожести и особенностях прорастания семян *D. microcarpum* остаются ограниченными. В связи с этим изучение влияния холодной стратификации, продолжительности хранения и температурного режима на прорастание данного вида является актуальным.

Цель исследования — изучить особенности прорастания семян *D. microcarpum* в лабораторных условиях и определить наиболее благоприятные температурные условия для их прорастания.

Для достижения поставленной цели были определены следующие задачи:

1. определить лабораторную всхожесть семян *D. microcarpum*;
2. установить сроки начала прорастания после закладки семян;
3. определить продолжительность периода прорастания;
4. оценить влияние холодной стратификации на всхожесть семян;
5. изучить зависимость всхожести от продолжительности хранения семян;
6. сравнить эффективность прорастания при различных температурных режимах.

Материалы и методы

Объект исследования и место проведения работ. Объектом исследования являлись семена *Dorema microcarpum* (Apiaceae), собранные в июне в период полного созревания.

Эксперименты по изучению всхожести семян проводили в лаборатории «Биотехнологии» Ташкентского ботанического сада имени академика Ф.Н. Русанова при Институте ботаники Академии наук Республики Узбекистан, а также в лабораториях кафедры биологии Наманганского государственного университета.

Собранные семена хранили в бумажных пакетах при комнатной температуре. Для оценки влияния продолжительности хранения были сформированы две экспериментальные серии: семена после 6 месяцев хранения и семена после 12 месяцев хранения.

Подготовка семян и условия проращивания

Семена размещали в чашках Петри в трех повторностях на предварительно увлажненную фильтровальную бумагу в соответствии с общепринятой методикой. Все используемые материалы перед проведением эксперимента стерилизовали в автоклаве.

Для изучения влияния холодной стратификации семена выдерживали при низкой положительной температуре в течение 45 суток. После завершения стратификации семена помещали для дальнейшего проращивания в два температурных режима:

- +4–+6 °C — в холодильной камере;
- +24–+26 °C — в термостате.

В каждом варианте использовали стратифицированные семена и контрольный вариант без предварительной обработки.

Прорастание семян контролировали ежедневно. Датой начала прорастания считали день появления первого проросшего семени, а окончанием эксперимента — день появления последнего проросшего семени. Продолжительность прорастания определяли как период от появления первых до последних проростков.

Лабораторную всхожесть определяли как отношение количества проросших семян к общему количеству семян, заложенных на проращивание, выраженное в процентах.

Результаты и обсуждение.

Прорастание семян после 6 месяцев хранения. Первый эксперимент проводили с семенами, хранившимися в течение 6 месяцев. После хранения семена подвергали холодной стратификации продолжительностью 45 суток, после чего помещали в холодильную камеру и термостат.

В холодильной камере при температуре +4–+6 °C стратифицированные семена начали прорастать на 35-е сутки после закладки. Процесс прорастания продолжался до 50-х суток, а конечная всхожесть достигла 55% (рис. 1).

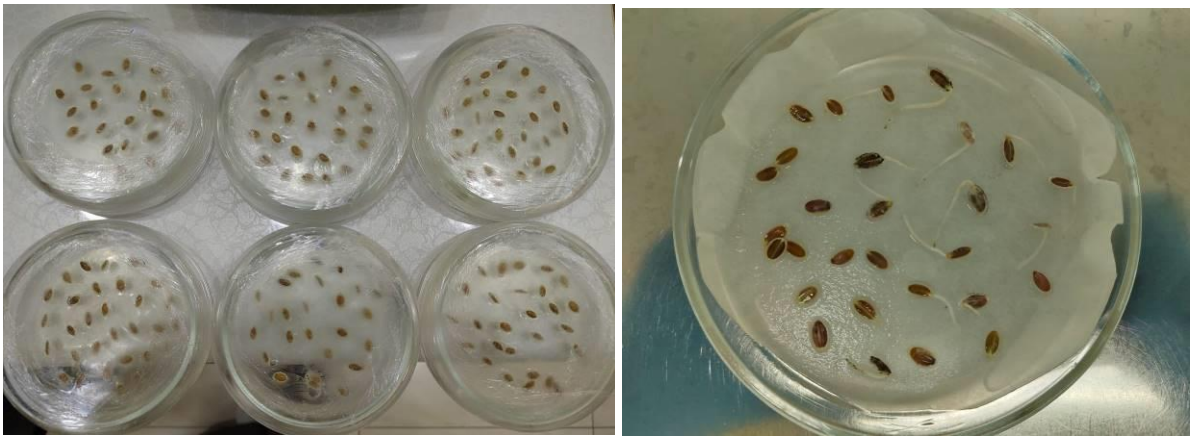

Рисунок 5.9 Всхожесть семян в холодильнике +4 - +6°C

В контрольном варианте первые проростки появились на 30-е сутки, а процесс прорастания завершился на 35-е сутки. При этом всхожесть составила лишь 12%.

Таким образом, холодная стратификация существенно повысила всхожесть семян *D. microcarpum* по сравнению с контрольным вариантом.

При температуре +24–+26 °C стратифицированные семена начали прорастать значительно раньше — на 12-е сутки. Однако конечная всхожесть оказалась очень низкой и составила всего 4%. В контрольном варианте при данной температуре прорастания не наблюдалось (рис. 2)

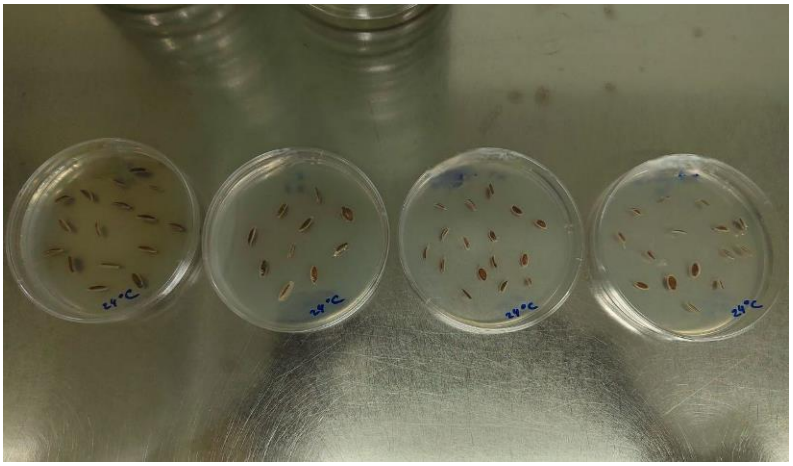

Рисунок 5.10 Всхожесть семян в термостате +24 – +26°C

Таблица 1.

***Лабораторная всхожесть семян D. microcarpum* после 6 месяцев хранения**

D. microcarpum	Вариант опыта	Всхожесть семян (%)	Длительность в днях
В холодильнике +4–+6°C	Обработанные семена	55%	35-50
	Контроль	12%	30-35
В термостате +24–+26°C	Обработанные семена	4%	12-15
	Контроль	–	–

Полученные результаты показывают, что более высокая температура ускоряла появление первых проростков у обработанных семян, однако не обеспечивала высокой конечной всхожести. Напротив, при +4–+6 °C процесс начинался позднее, но процент проросших семян был существенно выше.

Прорастание семян после 12 месяцев хранения

Второй эксперимент проводили с семенами после 12 месяцев хранения. После холодной стратификации продолжительностью 45 суток семена также проращивали при температурах +4–+6 °C и +24–+26 °C.

При температуре +4–+6 °C стратифицированные семена начали прорастать на 30-е сутки. Процесс прорастания продолжался до 45-х суток, а конечная всхожесть достигла 69%.

В контрольном варианте первые проростки появились на 25-е сутки, а процесс прорастания завершился на 30-е сутки. Всхожесть контрольных семян достигла 18%.

Таким образом, после 12 месяцев хранения показатель всхожести стратифицированных семян оказался выше, чем после 6 месяцев хранения: 69% против 55%.

При температуре +24–+26 °C стратифицированные семена начали прорастать на 10-е сутки, однако конечная всхожесть составила только 6%. В контрольном варианте прорастания не наблюдалось.

Таблица 2.

***Лабораторная всхожесть семян D. microcarpum* после 12 месяцев хранения.**

D. microcarpum	Вариант опыта	Всхожесть семян (%)	Длительность в днях
В холодильнике +4–+6°C	Обработанные семена	69%	30–45
	Контроль	18%	25–30
В термостате +24–+26°C	Обработанные семена	6%	10–12
	Контроль	–	–

Сравнение двух серий экспериментов показывает, что увеличение продолжительности хранения с 6 до 12 месяцев сопровождалось повышением всхожести семян как в стратифицированном, так и в контрольном варианте при температуре +4–+6 °C. У стратифицированных семян показатель увеличился с 55 до 69%, то есть на 14 процентных пунктов, а у контрольных — с 12 до 18%, то есть на 6 процентных пунктов.

Одновременно при температуре +24–+26 °C всхожесть оставалась крайне низкой и составляла 4–6% только у стратифицированных семян.

Влияние температурного режима и холодной стратификации

Полученные результаты свидетельствуют о выраженном влиянии температурного режима на процесс прорастания семян *D. microcarpum*. Наиболее благоприятными условиями в проведенном эксперименте оказались низкие положительные температуры +4–+6 °C.

При данном температурном режиме всхожесть стратифицированных семян составила 55% после 6 месяцев хранения и 69% после 12 месяцев хранения. В то же время при температуре +24–+26 °C эти показатели составили соответственно 4 и 6%.

Таким образом, различия между температурными режимами были значительными. В условиях низкой положительной температуры семена не только успешно прорастали, но и демонстрировали значительно более высокую конечную всхожесть.

Важную роль также сыграла холодная стратификация. В обоих экспериментах стратифицированные семена имели более высокую всхожесть по сравнению с контролем. После 6 месяцев хранения при +4–+6 °C разница составила 43 процентных пункта (55% против 12%), а после 12 месяцев — 51 процентный пункт (69% против 18%).

Это указывает на то, что холодная стратификация способствует выходу семян *D. microcarpum* из состояния покоя и повышает вероятность формирования проростков. Подобная зависимость согласуется с общими представлениями о физиологии покоя семян и значении низких температур для его преодоления [1, 5].

Низкие показатели всхожести при +24–+26 °C, вероятно, связаны не только с температурным воздействием, но и с развитием плесневых грибов на поверхности семян. В процессе эксперимента наблюдалось образование колоний плесени, после чего часть семян подвергалась загниванию. В связи с этим эксперимент при повышенной температуре был прекращен.

Следовательно, повышение температуры не всегда приводит к увеличению эффективности прорастания. Несмотря на более раннее появление первых проростков при +24–+26 °C, конечная всхожесть семян была значительно ниже, чем при +4–+6 °C.

Влияние продолжительности хранения семян

Одним из интересных результатов исследования стало повышение всхожести семян после более длительного хранения.

После 6 месяцев хранения всхожесть стратифицированных семян при +4–+6 °C составила 55%, тогда как после 12 месяцев — 69%. Аналогичная тенденция наблюдалась и в контрольном варианте: показатель увеличился с 12 до 18%.

Полученные данные позволяют предположить, что семенам *D. microcarpum* может быть свойственен определенный период физиологического покоя, продолжительность которого влияет на последующую способность к прорастанию. Возможно, длительное хранение в сочетании с последующей холодной стратификацией способствует снижению уровня физиологического покоя семян [1, 5].

Вместе с тем для подтверждения данной закономерности необходимы дополнительные эксперименты с более широким диапазоном сроков хранения, количеством повторностей и контролем влажности семян в период хранения.

Заключение. В результате проведенного исследования были изучены особенности прорастания семян *Dorema microcarpum* при различных температурных режимах, после разной продолжительности хранения и холодной стратификации.

Установлено, что наиболее благоприятным температурным режимом для прорастания семян *D. microcarpum* в условиях проведенного эксперимента является +4–+6 °C. При этих условиях всхожесть стратифицированных семян составила 55% после 6 месяцев хранения и 69% после 12 месяцев хранения.

Холодная стратификация продолжительностью 45 суток оказала положительное влияние на всхожесть семян. При +4–+6 °C она повысилась с 12 до 55% после 6 месяцев хранения и с 18 до 69% после 12 месяцев хранения по сравнению с контрольными вариантами.

При температуре +24–+26 °C, несмотря на более раннее появление первых проростков, конечная всхожесть была крайне низкой — 4% после 6 месяцев и 6% после 12 месяцев хранения. В контрольных вариантах при этой температуре прорастания не наблюдалось. Низкие показатели, вероятно, были связаны с развитием плесневых грибов и последующим загниванием семян.

Продолжительность хранения также оказала положительное влияние на показатели всхожести: после 12 месяцев хранения всхожесть стратифицированных семян при +4–+6 °C увеличилась на 14 процентных пунктов по сравнению с семенами после 6 месяцев хранения.

Таким образом, сочетание длительного хранения, холодной стратификации и последующего проращивания при +4–+6 °C может рассматриваться как перспективный подход к повышению всхожести

семян *D. microcarpum*. Полученные результаты имеют практическое значение для разработки методов семенного размножения и ex situ-сохранения данного редкого вида.

В дальнейшем целесообразно изучить влияние различных сроков холодной стратификации, влажности, светового режима, различных субстратов и продолжительности хранения, а также провести оценку жизнеспособности полученных проростков.

Annotatsiya. *Ushbu maqolada dorivor Ferula foetidissima Regel & Schmalh. turining bargi morfo-anatomik jihatdan o‘ rganildi. Aniqlanishicha, mazkur turning bargi kseromorf tuzilishga ega bo‘ lib, bir qatorli, tashqi devori qalinlashgan va kutikula bilan qoplangan epiderma, izolateral tipli mezofill, yaxshi rivojlangan ustunsimon va asosiy parenxima, kollateral o‘ tkazuvchi to‘ plamlar, mexanik to‘ qimalar hamda ajratma kanallar bilan tavsiflanadi. Sekretor tizim va himoya to‘ qimalarining rivojlanganligi turning qurg‘ oqchil muhitga moslashuvi bilan birga, uning dorivorlik xususiyatlari bilan ham bog‘ liq ekani ko‘ rsatildi. Aniqlangan belgilar dorivor xom-ashyoni diagnostika qilishda va turning adaptiv imkoniyatlarini baholashda qo‘ llanishi mumkin.*

Tayanch so‘ zlar: *Ferula foetidissima, adaptatsiya, ajratma kanallar, barg anatomiyasi, dorivor o‘ simlik, kseromorf belgi.*

МОРФОЛОГО-АНАТОМИЧЕСКОЕ СТРОЕНИЕ ЛИСТА *FERULA FOETIDISSIMA* REGEL & SCHMALH., ЕГО ЛЕКАРСТВЕННОЕ ЗНАЧЕНИЕ И КСЕРОМОРФНЫЕ ПРИЗНАКИ АДАПТАЦИИ

Аннотация. *В статье приведены данные по изучению морфолого-анатомического строения листа Ferula foetidissima Regel & Schmalh. — лекарственного вида рода Ferula L. Установлено, что лист данного вида характеризуется ксероморфным строением: однослойной эпидермой с утолщенной наружной стенкой, покрытой кутикулой, изолатеральным мезофиллом, хорошо развитыми палисадной и основной паренхимой, коллатеральными проводящими пучками, механическими тканями и секреторными вместилищами. Показано, что развитие секреторной системы и защитных тканей связано как с адаптацией к засушливым условиям, так и с лекарственной ценностью растения. Выявленные анатомические признаки могут быть использованы в диагностике сырья и при изучении адаптивного потенциала вида.*

Ключевые слова: *Ferula foetidissima, адаптация, анатомия листа, ксероморфность,лекарственное растение, секреторные вместилища.*

MORPHO-ANATOMICAL STRUCTURE OF THE LEAF OF *FERULA FOETIDISSIMA* REGEL & SCHMALH., ITS MEDICINAL SIGNIFICANCE AND XEROMORPHIC ADAPTIVE TRAITS

Abstract. *This article presents data on the morpho-anatomical structure of the leaf of Ferula foetidissima Regel & Schmalh., a medicinal species of the genus Ferula L. The leaf was found to possess a xeromorphic structure characterized by a single-layered epidermis with thickened outer walls covered by cuticle, isolateral mesophyll, well-developed palisade and ground parenchyma, collateral vascular bundles, mechanical tissues, and secretory ducts. It is shown that the development of the secretory system and protective tissues is related both to adaptation to arid environments and to the medicinal value of the species. The revealed anatomical characters can be used for raw material diagnostics and for assessing the adaptive potential of the species.*

Keywords: *Ferula foetidissima, adaptation, leaf anatomy, medicinal plant, secretory ducts, xeromorphy.*

Kirish.

Apiaceae Lindl. oilasi vakillari oziq-ovqat, ziravor, efir-moyli va dorivor o‘ simliklar sifatida katta ilmiy hamda amaliy ahamiyatga ega. Ushbu oilaga mansub turlarda efir moylari, smolali moddalar, flavonoidlar, kumarinlar va boshqa biologik faol birikmalar to‘ planishi ularning farmakologik qiymatini belgilaydi [4, 5, 8].

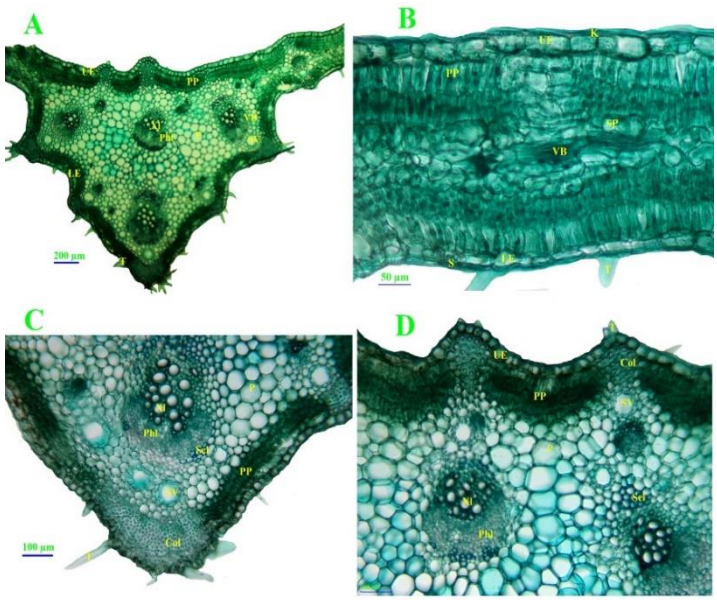
Shu jihatdan *Ferula* L. turkumi alohida o‘ rin tutadi. Mazkur turkum vakillari Sharq tabobatida qadimdan qo‘ llanib kelinib, yallig‘ lanishga qarshi, gijja haydovchi, yara bitiruvchi, hazmni yaxshilovchi hamda umumiy quvvat beruvchi vosita sifatida ishlatilgan [4, 5, 8].

Markaziy Osiyo *Ferula* turkumi vakillarining muhim tarqalish va xilma-xillik markazlaridan hisoblanadi [6, 8]. O‘ zbekiston florasida ham ushbu turkumga mansub ko‘ plab turlar uchraydi. Ular orasida dorivor va ekologik jihatdan ixtisoslashgan turlar mavjud [6]. Biroq turkum doirasida dorivor xom-ashyoni to‘ g‘ ri identifikatsiya qilish, anatomik-diagnostik belgilarini aniqlash va ayrim turlarning ekologik moslanish mexanizmlarini yoritish bilan bog‘ liq masalalar hanuz dolzarbdir [1-3].

Ma’lumki, barg o‘ simlikning asosiy assimilatsion organi bo‘ lishi bilan birga, uning ekologik moslanish strategiyalarini aks ettiruvchi muhim strukturaviy tizim hamdir. Barg anatomiyasida epiderma va kutikulaning qalinligi, trixomalarning rivojlanishi, mezofill tipi, ustunsimon va g‘ ovak parenxima nisbatlari, o‘ tkazuvchi to‘ plamlar, mexanik to‘ qimalar hamda ajratma kanallarning joylashuvi o‘ simlikning muhit omillariga moslashganlik darajasini ko‘ rsatadi [1-3]. Qurg‘ oqchil va tog‘ oldi-tog‘ li sharoitlarda o‘ suvchi turlarda ayniqsa qalin kutikula, bo‘ lingan barg plastinkasi, kuchli rivojlangan mezofill, sekretor tizim va mexanik elementlarning yaxshi ifodalanganligi kuzatiladi [2, 3].

Ferula foetidissima Regel & Schmalh. Markaziy Osiyo va unga tutash hududlarda tarqalgan dorivor tur bo‘ lib, O‘ zbekistonda Qashqadaryo, Surxondaryo va Farg‘ ona viloyatlarida uchraydi. Tur tog‘ larning quyi va o‘ rta mintaqalarida, 1200-2300 m, ayrim hollarda 2800 m gacha bo‘ lgan balandliklarda shag‘ alli-toshloq yonbag‘ irlar, surilmalar, siyrak butazorlar va archa jamoalarida o‘ sadi [6]. Bunday ekologik sharoitlar o‘ simlikda kuchli kseromorf va himoya belgilarining shakllanishini taqozo etadi. Shu bilan birga, bu tur dorivor xususiyatlari bilan ham qiziqish uyg‘ otadi. Demak, uning barg anatomiyasini o‘ rganish bir vaqtning o‘ zida ham ekologik moslanish mexanizmlarini, ham farmakognozik diagnostika uchun muhim bo‘ lgan strukturaviy belgilarni aniqlash imkonini beradi.

Adabiyotlarda *Ferula* turkumining ayrim vakillarida barg anatomiyasi va sekretor tizimi o‘ rganilgan bo‘ lsada, *Ferula foetidissima* bargining morfo-anatomik tuzilishi, ayniqsa uning dorivor ahamiyati va kseromorf moslanish belgilari bilan bog‘ liq holdagi tavsifi yetarli darajada yoritilmagan [4, 5, 7]. Shu sababli mazkur ishning maqsadi *Ferula foetidissima* bargining morfo-anatomik tuzilishini o‘ rganish, undagi sekretor tizim va himoya to‘ qimalarining rivojlanish xususiyatlarini aniqlash hamda ularni turning dorivor ahamiyati va qurg‘ oqchil muhitga adaptatsiyasi bilan bog‘ liq holda talqin qilishdan iborat.



Tadqiqot metodlari. Tadqiqot obyekti sifatida *Ferula foetidissima* Regel & Schmalh. turi olindi. O‘ simlik materiali tabiiy yashash joyidan yig‘ ilib, barg namunalari 70% li etanolda fiksatsiya qilindi. Barglarning anatomik tadqiqotlari umumqabul qilingan metodika bo‘ yicha olib borildi [1]. Kesmalar qo‘ lda ustara yordamida tayyorlandi. Preparatlar metilen ko‘ k bilan bo‘ yalib, glitserin-jelatin bilan mustahkamlandi. Mikrofotosuratlar KERN OBN 1327241 axromatik mikroskop va SZM45NT-2L trinokulyar mikroskop yordamida olindi. Mikrofotolarda masshtab chiziqlari bo‘ yicha kalibrlash asosida o‘ lchovlar bajarildi. Morfometrik ko‘ rsatkichlar mikrofotolardan o‘ lchandi va natijalar o‘ rtacha qiymat ± standart og‘ ish ko‘ rinishida ifodalandi. Anatomik tavsiflashda klassik botanik terminologiyadan foydalanildi [1, 3].

Natijalar va muhokama. *Ferula foetidissima* monokarp tur bo‘ lib, areali Xitoy (Shinjon), Pamir-Oloy (Qirg‘ iziston, Tojikiston, O‘ zbekiston) hududlarini qamrab oladi. O‘ zbekistonda Qashqadaryo, Surxondaryo va Farg‘ ona viloyatlarida tarqalgan. Tog‘ larning quyi va o‘ rta mintaqalarida, asosan shag‘ alli-toshloq yonbag‘ irlar, surilmalar, siyrak butazorlar va archa jamoalarida o‘ sadi. May-iyun oylarida gullab, iyun-iyul oylarida mevalaydi [6]. Tur dorivor xususiyatlari bilan ajralib turadi va *Ferula* turkumi vakillari orasida biologik faol moddalarga boy tur sifatida qaraladi [4, 5, 8].

O‘ simlik bo‘ yi 1-1,5 m bo‘ lib, turpsimon yo‘ g‘ onlashgan ildizga ega. Barglari asosan ildizoldi to‘ pbarglaridan iborat, yirik va baquvvat. Barg plastinkasi keng, uch tomonlama bo‘ lingan, bo‘ laklari butun, uzunligi 14-16 sm, eni 3-4,5 sm ni tashkil etadi. Bargning yuza tomoni deyarli tuksiz, ostki tomoni esa bir hujayrali yumshoq tukli trixomalar bilan qoplangan. Bunday tuklanish barg sathida havo qatlamini ushlab turish, transpiratsiyani kamaytirish va bargni ortiqcha qizib ketishdan saqlashga xizmat qiladi [2, 5].

Bargning ko‘ ndalang kesimida ustki va ostki epiderma yaxshi shakllangan bo‘ lib, epiderma hujayralari tashqi tomondan qalin kutikula bilan qoplangan (1-rasm). Epiderma tashqi devori qalinligi 9,5±0,21 mkm, epiderma balandligi 33,5±0,31 mkm ni tashkil etdi. Bu ko‘ rsatkichlar bargda himoya apparati kuchli rivojlanganini ko‘ rsatadi. Qalin kutikula suv yetishmovchiligi, yuqori insolyatsiya va shamol sharoitida suv yo‘ qotilishini kamaytirishga xizmat qiluvchi tipik kseromorf belgi hisoblanadi. Demak, *F. foetidissima*da kseromorf moslanishlar avvalo epidermal himoya apparati orqali yaqqol namoyon bo‘ ladi.

Barg mezofilli yaxshi differensiyalashgan va izolateral tipda tuzilgan. Uning ikki tomonida ham ustunsimon parenxima 2-3 qatordan joylashgan. Mezofill qalinligi 305,5±2,81 mkm, ustunsimon parenxima balandligi 36,6±0,42 mkm, eni esa 14,5±0,28 mkm ni tashkil etdi. Mezofillning markaziy qismida asosiy hamda qisman g‘ ovaksimon parenxima kuzatildi, g‘ ovak parenxima diametri 20,1±0,25 mkm ga teng bo‘ ldi. Izolateral mezofill bargning har ikki tomonida ham faol fotosintez olib borishga moslashganligini ko‘ rsatadi, bu esa kuchli yorug‘ lik tushadigan ochiq tog‘ oldi va tog‘ yonbag‘ irlarida muhim ekologik ustunlik beradi [2, 3, 5].

1-rasm – *Ferula foetidissima* bargining strukturaviy tuzilishi: A, C, D – bargning asosiy o‘ tkazuvchi qismi (glavnaya jilka); B – barg mezofilli.
Shartli belgilar: Col – kollenxima, K – kutikula, LE – ostki epiderma, P – parenxima, Phl – floema, PP – ustunsimon parenxima, Scl – sklerenxima, St – barg og‘ izchasi, SV – ajratma kanal, T – trixoma, UE – ustki epiderma, VB – o‘ tkazuvchi to‘ plam, Xl – ksilema.

Bargning markaziy tomir sohasi yaxshi rivojlangan. O‘ tkazuvchi to‘ plamlar kollateral tipda bo‘ lib, ksilema va floema aniq farqlanadi. Ksilema elementlari soni 10-12 ta, diametri esa 29,2±0,21 mkm ni tashkil etdi. Yirikroq ksilema elementlari suvni nisbatan tez va hajmli o‘ tkazishga moslashgan bo‘ lib, qisqa muddatli namlik sharoitidan samarali foydalanishga xizmat qilishi mumkin. O‘ tkazuvchi to‘ plamlar atrofida sklerenxima elementlarining rivojlanganligi bargning mexanik barqarorligini oshiradi va shamolli, ochiq stansiyalarda uning strukturaviy chidamliligini ta’minlaydi.

Ferula foetidissima bargida ajratma kanallar yaxshi rivojlangan. Ular butun barg bo‘ lagi bo‘ ylab o‘ tkazuvchi to‘ plamlarning tepasida va ostida joylashgan bo‘ lib, bo‘ shlig‘ i diametri 75,7±0,81 mkm ni tashkil etdi. Ajratma kanallar ustida va epiderma ostida kollenxima hujayralari guruhlari joylashgan. *Ferula* turlarida sekretor tizimning bunday rivojlanganligi smola, efir moylari va boshqa biologik faol moddalarning sintezi hamda to‘ planishi bilan bog‘ liq bo‘ lib, turning dorivor qiymatini belgilovchi muhim anatomik asos hisoblanadi. Demak, sekretor tizimning kuchli ifodalanishi *F. foetidissima* bargida nafaqat taksonomik va anatomik, balki farmakognozik ahamiyatga ham ega.

Barg anatomiyasining kompleks tahlili *Ferula foetidissima*da adaptiv va farmakognozik jihatdan ahamiyatli belgilar majmuasi shakllanganini ko‘ rsatadi. Qalin kutikula va trixomalar bargni qurg‘ oqchil muhitda suv yo‘ qotilishidan himoya qiladi. Izolateral mezofill yuqori yorug‘ lik sharoitida fotosintez samaradorligini oshiradi. Yaxshi rivojlangan o‘ tkazuvchi va mexanik tizim suv transporti hamda strukturaviy mustahkamlikni ta’minlaydi. Ayniqsa, yirik ajratma kanallar turning dorivorlik xususiyatlari bilan bevosita bog‘ liq bo‘ lib, ular efir-moyli va smolali moddalarning to‘ planish joyi sifatida farmakognozik ahamiyatga ega. Shu bois *F. foetidissima* bargining anatomik diagnostikasi dorivor xomashyoni identifikatsiya qilishda muhim mezon bo‘ lib xizmat qilishi mumkin.

Xulosa. *Ferula foetidissima* bargining morfo-anatomik tuzilishi kseromorf xususiyatlarni yaqqol namoyon etadi. Bargning asosiy diagnostik belgilari sifatida qalin kutikulali epiderma, izolateral mezofill, 2-3 qator ustunsimon parenxima, yaxshi rivojlangan kollateral o‘ tkazuvchi to‘ plamlar, mexanik to‘ qimalar va yirik ajratma kanallar aniqlandi. Ushbu belgilar turning qurg‘ oqchil tog‘ oldi va tog‘ li muhitga moslashganligini ko‘ rsatadi. Shu bilan birga, sekretor tizimning rivojlanganligi turning dorivorlik xususiyatlari bilan chambarchas bog‘ liq bo‘ lib, bargni farmakognozik nuqtayi nazardan ham qimmatli organ sifatida tavsiflaydi. Olingan natijalar *Ferula foetidissima* dorivor xom-ashyosini

anatomik diagnostika qilish va turning ekologik moslanish strategiyalarini tushunishda muhim ilmiy asos bo‘ lib xizmat qiladi.

Mazkur tadqiqot O‘ zbekiston Respublikasi Fanlar akademiyasi Botanika institutining FL-9524115063-sonli “Respublikaning dorivor o‘ simliklari resurs salohiyatini bioiqlim va geofazoviy tahlili, moslashish va tarqalish qonuniyatlari (Ferula L. turkumi misolida)” mavzusidagi fundamental loyiha doirasida hamda 2025-2029 yillarga mo‘ ljallangan “Raqamli tabiat: Markaziy O‘ zbekiston florasining raqamli platformasini ishlab chiqish” mavzusidagi davlat dasturi doirasida amalga oshirildi.

Abstract: *This article discusses the negative effects of the use of synthetic pesticides in agriculture on the environment, soil microflora, and human health, as well as the potential use of biopesticides and bionanopesticides as environmentally safe alternatives. Along with the main advantages of biopesticides, their sensitivity to ultraviolet radiation, temperature, humidity, and precipitation, slow onset of action, high specificity, and limitations associated with storage and transportation are analyzed. The article also examines the history of the development of bionanopesticides, their evolution through the integration of biotechnology and nanotechnology, and the possibilities of nanoencapsulation of biologically active substances. The importance of nanotechnology in improving the stability, bioavailability, and controlled release of active substances is highlighted. Alongside the prospects of bionanopesticides, the need to assess the environmental and toxicological safety of nanomaterials is also emphasized. This approach may contribute to improving the efficiency of pesticide use in agriculture and reducing the environmental burden.*

Keywords: *bionanopesticides, biopesticides, nanotechnology, nanoencapsulation, environmental safety, biological control, green synthesis.*

КЛАССИФИКАТСИЯ И СВОЙСТВА БИОНАНОПЕСТИТСИДОВ

Аннотация*: В данной статье освещены негативные последствия использования синтетических пестицидов в сельском хозяйстве для окружающей среды, почвенной микрофлоры и здоровья человека, а также рассмотрены возможности применения биопестицидов и бионанопестицидов в качестве экологически безопасной альтернативы. Наряду с основными преимуществами биопестицидов проанализированы их чувствительность к ультрафиолетовому излучению, температуре, влажности и осадкам, медленное проявление действия, высокая специфичность, а также ограничения, связанные с их хранением и транспортировкой. Кроме того, рассмотрены история формирования бионанопестицидов, их развитие на основе интеграции биотехнологии и нанотехнологий, а также возможности наноинкапсуляции биологически активных веществ. Показано значение нанотехнологий в повышении стабильности, биодоступности и контролируемого высвобождения активных веществ. Наряду с перспективами применения бионанопестицидов подчёркивается необходимость оценки экологической и токсикологической безопасности наноматериалов. Данный подход может способствовать повышению эффективности использования пестицидов в сельском хозяйстве и снижению экологической нагрузки.*

Ключевые слова: *бионанопестициды, биопестициды, нанотехнологии, наноинкапсуляция, экологическая безопасность, биологическая защита, зелёный синтез.*

BIONANOPESTITSIDLARNING KLASSIFIKATSIYASI VA XUSUSIYATLARI

Annotatsiya: *Mazkur maqolada qishloq xo‘ jaligida sintetik pestitsidlardan foydalanishning atrof-muhit, tuproq mikroflorasi va inson salomatligiga salbiy ta’siri hamda ularga ekologik xavfsiz muqobil sifatida biopestitsid va bionanopestitsidlardan foydalanish imkoniyatlari yoritilgan. Biopestitsidlarning asosiy afzalliklari bilan bir qatorda, ularning ultrabinafsha nurlanish, harorat, namlik va yog‘ ingarchilikka sezgirligi, ta’sirining sekin namoyon bo‘ lishi, yuqori spesifikligi hamda saqlash va tashishdagi cheklovlari tahlil qilib chiqilgan. Shuningdek, bionanopestitsidlarning shakllanish tarixi, biotexnologiya va nanotexnologiyalar integratsiyasi asosida rivojlanishi hamda biologik faol moddalarni nanoenkapsulyatsiya qilish imkoniyatlari ko‘ rib chiqilgan. Nanotexnologiyalarning faol moddalarning barqarorligi, biologik o‘ zlashtirilishi va nazorat qilinadigan ajralib chiqishini yaxshilashdagi ahamiyati ko‘ rsatib berilgan. Bionanopestitsidlarning istiqbollari bilan bir qatorda, nanomateriallarning ekologik va toksikologik xavfsizligini baholash*

zarurligi ham ta'kidlangan. Mazkur yondashuv qishloq xo' jaligida pestitsidlardan foydalanish samaradorligini oshirish va ekologik yuklamani kamaytirishga xizmat qilishi mumkin.

Kalit so' zlar: *bionanopestitsidlar, biopestitsidlar, nanotexnologiya, nanoenkapsulyatsiya, ekologik xavfsizlik, biologik himoya, yashil sintez.*

KIRISH

Ko' p yillar mobaynida kimyoviy pestitsidlar qishloq xo' jaligida hosildorlikni ta'minlash va ko' plab zararkunandalar hamda kasalliklarga qarshi kurashishda muhim o' rin tutib kelgan.

Sintetik pestitsidlarga algitsidlar, gerbitsidlar, feromonlar va boshqa turdagi pestitsidlar kiradi. Biroq pestitsidlarning me'yoridan ortiq qo' llanilishi va yomg' ir suvlari orqali ularning suv havzalariga yuvilib tushishi natijasida suv ekotizimida yashovchi ko' plab organizmlar nobud bo' lishi mumkin. Hatto bunday ta'sir organizmlarning o' limiga olib kelmagan taqdirda ham, pestitsid qoldiqlarini o' zida to' plagan suv organizmlarini iste'mol qilish insonlarda saraton, qandli diabet, jigar faoliyatining buzilishi, ekzema, shuningdek, asab va yurak-qon tomir tizimi kasalliklari kabi jiddiy xastaliklarning rivojlanishiga sabab bo' lishi mumkin.

Bundan tashqari, sintetik pestitsidlar tuproq mikroflorasi va undagi foydali mikroorganizmlarga ham katta zarar yetkazadi. Sintetik pestitsidlardan foydalanish bilan bog' liq xavf-xatarlar ularga muqobil sifatida biopestitsidlardan foydalanishga bo' lgan qiziqishni oshirdi. Biopestitsidlar nisbatan arzon, ekologik xavfsiz va atrof-muhitga kamroq zarar yetkazuvchi vositalar hisoblanadi. Ular mikroorganizmlar, o' simliklar, shuningdek, bionanozarrachalar asosida olinishi mumkin.

Nanobiopestitsidlarning oddiy biopestitsidlarga nisbatan yuqori pestitsid faolligiga ega bo' lib, faol moddaning maqsadli yoki nazorat qilinadigan tarzda ajralib chiqishini ta'minlaydi. Ular yuqori darajadagi biomoslik yani biokompatibillik va biologik parchalanish xususiyatlari bilan ajralib turadi.

Ko' plab afzalliklariga qaramay, biopestitsidlar har doim ham qishloq xo' jaligi ishlab chiqarishi sharoitida barqaror samaradorlikni ta'minlay olmaydi. Ularning amaliy qo' llanilishini cheklovchi asosiy omillardan biri biologik faol komponentlarning atrof-muhit omillari ta'siriga yuqori darajada sezgirligidir. Ultrabinafsha nurlanish, yuqori harorat, namlikning keskin o' zgarishi hamda yog' ingarchilik mikroorganizmlarning hayotchanligini pasaytirishi va tabiiy biologik faol moddalarning tez parchalanishiga olib kelishi mumkin. Natijada preparatlarning himoya samaradorligi kamayadi.

Yana shuni nazarda tutish kerakki, biopestitsidlarning samaradorligi ko' p jihatdan ularni qo' llash sharoitlariga bog' liq. Laboratoriya tajribalarida ular odatda yuqori biologik faollikni namoyon etsa-da, dala sharoitida ularning ta'siri harorat, namlik, tuproqning kislotalilik darajasi (pH), mikrob hamjamiyatining tarkibi hamda boshqa ekologik omillar ta'sirida sezilarli darajada o' zgarishi mumkin. Bu esa turli agroekotizimlarda biopestitsidlardan foydalanishda barqaror natijalarga erishishni qiyinlashtiradi.

Yana bir cheklovchi omil biopestitsidlarning biologik ta'siri nisbatan sekin rivojlanishidir. Kimyoviy pestitsidlar ko' pincha zararkunandalarning tez nobud bo' lishiga sabab bo' lsa, aksariyat biopestitsidlarning ta'siri mikroorganizmlarning ko' payishi, zararkunanda organizmiga kirib borishi yoki biologik faol metabolitlarning asta-sekin to' planishi bilan bog' liq. Shu sababli ularning himoya ta'siri darhol emas, balki ma'lum vaqt o' tgach namoyon bo' ladi.

Shuningdek, ko' plab biopestitsidlar yuqori darajadagi spesifiklikka ega bo' lib, faqat ma'lum bir guruh zararkunanda organizmlarga qarshi samarali hisoblanadi. Bir tomondan, bu foydali organizmlar va atrof-muhitga salbiy ta'sirni kamaytiradi, ikkinchi tomondan esa ularni qishloq xo' jaligida universal qo' llash imkoniyatlarini cheklaydi.

Biopestitsidlarning keng miqyosda joriy etilishiga to' sqinlik qiluvchi qo' shimcha omillar qatoriga ularning saqlash muddati nisbatan qisqaligi, tashish va saqlashda maxsus sharoitlarga rioya qilish zarurligi hamda ayrim biologik preparatlarni ishlab chiqarish xarajatlarining yuqoriligi kiradi.

Ushbu cheklovlar sababli so' nggi yillarda tadqiqotchilar e'tibori bionanopestitsidlarni yaratishga qaratilmoqda. Nanotexnologiyalarni qo' llash biologik faol moddalarning atrof-muhitning noqulay omillaridan himoyalanishini ta'minlaydi, ularning nazorat qilinadigan tarzda ajralib chiqishiga imkon yaratadi, preparatlarning barqarorligi va biologik o' zlashtirilishini oshiradi, ta'sir davomiyligini uzaytiradi hamda natijada ekologik yuklamani kamaytirgan holda qishloq xo' jaligi ekinlarini himoya qilish samaradorligini sezilarli darajada oshiradi.

ADABIYOTLAR TAXLILI

Bionanopestitsidlarning paydo bo' lish tarixi. Bionanopestitsidlar XXI asr boshlarida biotexnologiya va nanotexnologiyaning kesishgan nuqtasida an'anaviy sintetik pestitsidlarning uzoq muddat qo' llanilishi natijasida yuzaga kelgan ekologik inqirozga evolyutsion javob sifatida paydo bo' ldi. Ular o' simliklarni himoya qilish vositalarining eng yangi, to' rtinchi avlodi bo' lib, biologik faol moddalar (o' simlik ekstraktlari, mikroorganizmlar va ularning metabolitlari)ni nanostrukturali yetkazib berish tizimlari bilan uyg' unlashtiradi.

Ushbu yo‘ nalishning shakllanish tarixi to‘ rtta asosiy bosqichda rivojlandi.

1. Dastlabki bosqich: Sof biologiya davri (XIX asr – XX asr o‘ rtalari)

Kelajakdagi bionanopestitsidlar uchun asos klassik biopestitsidlar hisoblanadi. **1835-yil** – italiyalik olim **Agostino Bassi** birinchi bo‘ lib *Beauveria bassiana* zamburug‘ idan zararkunandalarga qarshi biologik kurash vositasi sifatida foydalanish mumkinligini ilmiy jihatdan isbotladi. **1901-yil** – yapon biologi **Shigetane Ishiwata** *Bacillus thuringiensis* (Bt) bakteriyasini ajratib oldi. Bugungi kunda ushbu bakteriya dunyodagi eng keng qo‘ llaniladigan biologik insektitsidlarning asosini tashkil etadi.

2. Kimyoviy rivojlanish va ekologik inqiroz davri (1940–1980-yillar)

1939-yilda **Paul Müller** tomonidan DDTning insektitsid xususiyatlari kashf etilgach, qishloq xo‘ jaligida e’tibor arzon va samarali sintetik pestitsidlarga qaratildi. Biroq 1970–1980-yillarga kelib ularning salbiy oqibatlari yaqqol namoyon bo‘ ldi. Tuproqda toksik moddalarning to‘ planishi, foydali hasharotlarning kamayishi hamda zararkunandalarning kimyoviy preparatlarga nisbatan chidamlilik (rezistentlik) hosil qilishi ekologik muammolarni keskinlashtirdi. Shu sababli ilmiy tadqiqotlar yana ekologik xavfsiz biologik himoya usullarini yaratishga yo‘ naltirildi.

3. Klassik biopreparatlarning texnologik cheklovlari (1990-yillar)

XX asr oxiriga kelib efir moylari, bakteriyalar, viruslar va zamburug‘ larga asoslangan ko‘ plab samarali biologik pestitsidlar ishlab chiqildi. Ammo ularning amaliy qo‘ llanishida muhim muammo yuzaga keldi. Tabiiy biologik faol moddalar quyoshning ultrabinafsha nurlanishi ta’sirida tez parchalanar, yog‘ ingarchilik natijasida yuvilib ketar hamda qisqa muddat ta’sir qilgani sababli tez-tez qayta qo‘ llashni talab etardi. Bu esa yirik fermer xo‘ jaliklari uchun iqtisodiy jihatdan samarasiz edi.

4. Nanotexnologik inqilob va bionanopestitsidlar konsepsiyasining shakllanishi (2000-yillar – hozirgi davr)

2000-yillarning boshlarida qishloq xo‘ jaligida nanotexnologiyalarning rivojlanishi biologik preparatlarning barqarorlik muammosini hal qilish imkonini berdi. Olimlar biologik faol moddalarni nanoo‘ lchamli tashuvchilar bilan birlashtirdilar. Natijada quyidagi afzalliklarga erishildi:

Biologik faol moddalarni nanoenkapsulyatsiya qilish. Neem (Azadirachta indica) moyi, zamburug‘ sporalari va boshqa bioaktiv moddalar xitozan, zein kabi tabiiy polimerlardan tayyorlangan nanokapsulalarga joylashtirildi. Bu ularni ultrabinafsha nurlanishidan himoya qildi hamda faol moddalarning nazorat qilinadigan va asta-sekin ajralib chiqishini ta’minladi.

Yashil sintez texnologiyasidan foydalanish. Kumush, mis va rux oksidi nanokristallari kimyoviy usullar o‘ rniga o‘ simlik ekstraktlari va mikroorganizmlar yordamida sintez qilina boshlandi. Natijada nanomateriallar ekologik jihatdan xavfsizroq va biologik mos bo‘ lib qoldi.

Hozirgi holati (2026-yil holatiga ko‘ ra). Bugungi kunda bionanopestitsidlar laboratoriya tadqiqotlari bosqichidan bosqichma-bosqich tijorat miqyosidagi ishlab chiqarishga o‘ tmoqda. Ular aniq va ekologik xavfsiz dehqonchilikning muhim tarkibiy qismi sifatida e’tirof etilmoqda. Chunki bionanopestitsidlar qo‘ llaniladigan kimyoviy pestitsidlar miqdorini bir necha o‘ n baravar kamaytirish bilan birga, zararkunandalar va kasalliklarga qarshi yuqori samaradorlikni saqlab qolish imkonini beradi.

Mazkur yo‘ nalishda olib borilayotgan tadqiqotlar nanokapsulalarning ta’sir mexanizmlarini takomillashtirish, "yashil sintez" uchun yangi biomateriallarni yaratish hamda nanomateriallarning atrof-muhitga uzoq muddatli ta’sirini baholashga qaratilgan.

Bionanopestitsidlar Yevropa Komissiyasi nanomaterialni "tabiiy, tasodifiy yoki ishlab chiqarilgan material bo‘ lib, unda zarrachalar bog‘ lanmagan holatda, agregat yoki aglomerat shaklida bo‘ lib, raqam o‘ lchami taqsimotidagi zarrachalarning 50 % yoki undan ko‘ prog‘ i uchun bir yoki bir nechta tashqi o‘ lchamlar 1 nm - 100 nm o‘ lchamda bo‘ ladi deb ta’riflagan (Nanomaterial ta’rifi bo‘ yicha tavsiya 2011/696/EU). Aniqrog‘ i, tabiat yoki tabiiy asosdagi nanopestitsidlar organik (masalan, polimerlar) yoki noorganik elementlardan iborat.

Nanotizimlar o‘ z hujayra o‘ lchami tufayli faol moddalarning biofaolligini oshirishi mumkin bo‘ lgan (yoki ba’zan faol modda sifatida ham ishlashi mumkin (Badawy va Rabea, 2016) sifatida ishlashi mumkin bo‘ lgan agentlarni tashiydi, kamaytiradi va qoplaydi, bu esa yuqori kirib borish va hujayra assimilyatsiyasini osonlashtirish hamda yanada maqsadli faoliyatni ta’minlaydi. Bundan tashqari, ular maqsadli joyda faol moddalar tarqalishini nazorat qiladi va modulyatsiya qiladi (Pavoni va boshq., 2020).

Nanopestitsidlar nanomateriallarda ishlab chiqilgan pestitsidlar bo‘ lib, qishloq xo‘ jaligi sohasida qo‘ llanilishi mumkin, maxsus gibrid substratga mahkamlangan, matritsada kapsullangan yoki tashqi stimullar yoki ferment orqali triggerlar uchun funksionallashtirilgan nanokaryerlar bo‘ lsin. Nanoo‘ lchamdagi zarralar, ularning shakli va maxsus xususiyatlari bilan birga, silika, lipidlar, polimerlar, kopolimerlar, keramika, metall, uglerod va boshqa materiallarga asoslangan nanotashuvchi innovatsion formulalarda pestitsid faoliyatini o‘ rganishi mumkin deb hisoblanadi [3].

Nanopestitsid formulalari suvda eriydiganligini, bioavailability va agrokimyoviy moddalarni atrof-muhitning buzilishidan himoya qilishi, ekinlardagi patogenlar, begona o‘ tlar va hasharotlarni nazorat qilishda inqilobiy o‘ zgarish qilishi mumkin [4]. Biroq, nanomaterial xususiyatlari sitotoksiklik va genotoksiklik chegarasida ham mavjud.

Pestitsidlarning befarq va mantiqsiz qo‘ llanilishi ekotizim muvozanatiga ta’sir qiladi va har bir inson sog‘ lig‘ ini xavf ostiga qo‘ yadi. Oziq-ovqatdan pestitsid qoldiqlarini kasbiy yoki tasodifan iste’mol qilish natijasida qisqa muddatli (keskin) va uzoq muddatli salbiy ta’sirlar — bu o‘ limga olib keladi yoki nogironlikka moslashtirilgan umr yili (DALY). Bolalar pestitsidlar ta’siriga ko‘ proq moyil bo‘ lib, doimiy to‘ qima va organlarga zarar yetkazadi. Ularning birgalikda, centra va periferik neyrotoksiklik hamda qon ivish qobiliyatining yo‘ qolishiga ta’siri xavotir uchun muhim sabablardir [5]. Darhaqiqat, nanopestitsidlarning faoliyati va toksikligiga ta’sir qiluvchi ijobiy va salbiy tomonlarni batafsil baholash qishloq xo‘ jaligida allaqachon tasdiqlangan nanopartikullardan foydalanish xavfsiz va barqaror rivojlanishi uchun juda muhimdir.

Formulalarning nanopestitsidlarning atrof-muhit, ekotizimlar, fermer ishchilari, iste’molchilar va qishloq xo‘ jaligi zanjiridagi barcha ishlab chiqarish sohalarida xatti-harakatlariga ta’siri to‘ liq ma’lum emas [4]. Biroq, nanoformulalarning faol moddaning parchalanishini kamaytirish, suvda eruvchanlik muvozanatini yaxshilash va faol moddalar biologik mavjudligini oshirishdagi muhim roli ma’lum. Xususan, zararkunandalarning endemik zararlanishi, o‘ simliklarga zarar yetkazilishi va qishloq xo‘ jaligi mahsulotlari hamda oziq-ovqatlarning sifat va miqdorini kamaytirish orqali iqtisodiy yo‘ qotishlarning oldini olish [6].

XULOSA

Xulosa qilib aytganda, bionanopestitsidlar sintetik pestitsidlarning atrof-muhit va inson salomatligiga salbiy ta’sirini kamaytirishga qaratilgan istiqbolli ekologik xavfsiz vositalardan biridir. Ular biopestitsidlarning biologik faolligini nanotexnologiyalar imkoniyatlari bilan uyg‘ unlashtirib, faol moddalarning barqarorligi, bio o‘ zlashtirilishi va maqsadli ta’sirini oshirish imkonini beradi. Ayniqsa, nanoenkapsulyatsiya va nazorat qilinadigan ajralish texnologiyalari biologik faol komponentlarni ultrabinafsha nurlanish, yuqori harorat va yog‘ ingarchilik kabi noqulay omillardan himoyalashda muhim ahamiyatga ega.

Shu bilan birga, bionanopestitsidlarning ekologik va toksikologik xavfsizligi, organizmlarga ta’siri hamda uzoq muddatli ekologik oqibatlarini chuqur o‘ rganish zarur. Kelgusidagi tadqiqotlar samaradorligi yuqori, biologik parchalanadigan va atrof-muhit uchun xavfsiz nanoformulyatsiyalarni ishlab chiqishga qaratilishi lozim.

Umuman olganda, bionanopestitsidlar barqaror qishloq xo‘ jaligi va integratsiyalashgan o‘ simliklarni himoya qilish tizimining istiqbolli yo‘ nalishlaridan biri hisoblanadi.

mukotaba uchun mas’ul muallif.

Annotatsiya: *Gepatit B virusi (HBV) DNKsini real vaqt polimeraza zanjir reaksiyasi (PZR) yordamida aniqlashda natijaning ishonchliligi butun preanalitik zanjirga bog‘ liq: nuklein kislotalarning ekstraksiya jarayonida yo‘ qolishi yoki reaksiyaning ingibirlanishi, ayniqsa past virus yuklamasida, yolg‘ on manfiy xulosaga olib kelishi mumkin. Ishning maqsadi — dupleks real vaqt PZR tizimi uchun plazmidaga asoslangan ekzogen ichki nazoratni (IN) tanlash, uning ishchi darajasini absolyut nusxa soniga keltirish va analitik parametrlarga ta’sirini baholash. HBV markerlari bo‘ yicha manfiy sog‘ lom donorlar (n = 10) va HBV infeksiyasi tasdiqlangan bemorlar (n = 350) plazmasi namunalari tahlil qilindi. IN sifatida Saccharomyces cerevisiae α-factor prepro sekretor signal hududidan kelib chiqqan geterologik ketma-ketlikni saqlovchi rekombinant pPICZα-asosli plazmida qo‘ llanildi; u lizis eritmasi qo‘ shilganidan so‘ ng, ekstraksiyadan oldin kiritilib, klinik DNK bilan birga «SOREX-DNA» to‘ plami yordamida ajratib olindi. HBV mahsuloti FAM, IN mahsuloti JOE kanalida QuantStudio 5 platformasida qayd etildi. IN ning ishchi darajasi taxminan 100 nusxa/reaksiyani tashkil etdi; valid klinik ekstraktlarda uning o‘ rtacha Cq qiymati 29,0 ± 0,4 (diapazon 28,1–29,8), validlik ko‘ rsatkichi esa 355/360 (98,6%) bo‘ ldi. HBV uchun aniqlash chegarasi IN bilan ham, INsiz ham 5,15 nusxa/reaksiya (≈ 257,5 nusxa/ml) darajasida saqlanib qoldi (ΔCq = 0,12 ± 0,08; p > 0,05). Yuqori virus yuklamasida (10^8 MB/ml) IN signali 1,1–1,8 siklga kechikdi, biroq bu HBV ning miqdoriy hisob-kitobiga ta’sir ko‘ rsatmadi. Shunday qilib, ekstraksiyadan oldin kiritilgan geterologik plazmida IN, nusxa soni to‘ g‘ ri tanlanganda, jarayon darajasidagi sifat nazoratini ta’minlaydi va asosiy nishonning analitik sezgirligini pasaytirmaydi.*

Kalit so‘ zlar: gepatit B virusi, HBV DNK, real vaqt PZR, qPCR, ichki nazorat, ekzogen nazorat, plazmida, PZR ingibitsiyasi, nuklein kislota ekstraksiyasi, molekulyar diagnostika.

ВЫБОР И ОЦЕНКА ЭКЗОГЕННОГО ВНУТРЕННЕГО КОНТРОЛЯ НА ОСНОВЕ ПЛАЗМИДЫ ДЛЯ ПЦР-ДИАГНОСТИКИ ИНФЕКЦИИ HBV В РЕАЛЬНОМ ВРЕМЕНИ

Аннотация: *Надёжность выявления ДНК вируса гепатита B (HBV) методом ПЦР в реальном времени определяется всей преаналитической цепочкой, а не только стадией амплификации: потери нуклеиновых кислот при экстракции и ингибирование реакции могут приводить к ложноотрицательным результатам, особенно при низкой вирусной нагрузке. Целью работы был подбор и оценка экзогенного внутреннего контроля (ВК) на основе плазмиды для*

дуплексной ПЦР-системы реального времени, предназначенной для выявления ДНК HBV. Исследованы образцы плазмы здоровых доноров, отрицательных по маркёрам HBV (n = 10), и пациентов с клинически и серологически подтверждённой HBV-инфекцией (n = 350). В качестве ВК использована рекомбинантная плазмида на основе pPICZα, несущая гетерологичную последовательность из области препро-секреторного сигнала α-фактора Saccharomyces cerevisiae; ВК вносили в каждый образец сразу после добавления лизирующего буфера, до стадии экстракции, и выделяли совместно с клинической ДНК с помощью сорбционного набора «SOREX-DNA» . Продукт HBV регистрировали по каналу FAM, ВК — по каналу JOE на платформе QuantStudio 5. Перевод рабочего разведения в абсолютные единицы дал уровень ВК около 100 копий на реакцию. В валидных клинических экстрактах среднее значение Cq для ВК составило 29.0 ± 0.4 (диапазон 28.1–29.8), доля валидных сигналов ВК — 355/360 (98,6%). Предел обнаружения HBV сохранялся на уровне 5,15 копий/реакцию (≈ 257,5 копий/мл) как с ВК, так и без него; различие Cq при низкоположительных концентрациях было статистически незначимым (ΔCq = 0.12 ± 0.08; p > 0.05). При высокой вирусной нагрузке (10^8 МЕ/мл) Cq для ВК запаздывал на 1.1–1.8 цикла без ущерба для количественной оценки HBV и чувствительности канала FAM.

Ключевые слова: *вирус гепатита В, ДНК HBV, ПЦР в реальном времени, qPCR, внутренний контроль, экзогенный контроль, плазмида, ингибирование ПЦР, экстракция нуклеиновых кислот, молекулярная диагностика.*

SELECTION AND EVALUATION OF A PLASMID-BASED EXOGENOUS INTERNAL CONTROL FOR REAL-TIME PCR DIAGNOSIS OF HBV INFECTION

Annotation: *Reliable detection of hepatitis B virus (HBV) DNA by real-time PCR depends on the entire pre-analytical chain: nucleic acid loss during extraction or reaction inhibition may produce false-negative results, particularly at low viral loads. This study aimed to select a plasmid-based exogenous internal control (IC) for a duplex real-time PCR assay detecting HBV DNA and to convert its working level into absolute copy numbers. Plasma samples from HBV-negative healthy donors (n = 10) and from patients with confirmed HBV infection (n = 350) were analysed. A recombinant pPICZα-based plasmid carrying a heterologous sequence derived from the Saccharomyces cerevisiae α-factor prepro secretory signal region was added to each sample immediately after the lysis solution, before extraction, and co-extracted with clinical DNA using the silica-sorption «SOREX-DNA» kit. HBV product was recorded in the FAM channel and the IC in the JOE channel on a QuantStudio 5 platform. The IC input was approximately 100 copies per reaction; in valid extracts the mean IC Cq was 29.0 ± 0.4 (range 28.1–29.8) and IC validity reached 355/360 (98.6%). The HBV limit of detection remained 5.15 copies/reaction (≈ 257.5 copies/mL) both with and without the IC (ΔCq = 0.12 ± 0.08; p > 0.05). At high viral loads (10^8 IU/mL) the IC Cq was delayed by 1.1–1.8 cycles without compromising HBV quantification. A heterologous plasmid IC added before extraction therefore provides process-level quality control without degrading analytical sensitivity.*

Key words: *hepatitis B virus, HBV DNA, real-time PCR, qPCR, internal control, exogenous control, plasmid, PCR inhibition, nucleic acid extraction, molecular diagnostics.*

Kirish

Molekulyar diagnostikada natijaning ishonchliligi ko‘ pincha amplifikatsiya bosqichining texnik sifati bilan tenglashtiriladi. Amalda esa yolg‘ on manfiy xulosaning asosiy manbalari analitik zanjirning undan oldingi bo‘ g‘ inlarida — namunani saqlash, lizis, sorbsiya va elyusiya bosqichlarida — shakllanadi. Nuklein kislotalarning qisman yo‘ qolishi yoki ajratib olish reagentlarining reaksiya aralashmasiga o‘ tishi ko‘ p hollarda hech qanday tashqi belgi bermaydi: reaksiya rasman «bajarilgan», ammo nishon signali yo‘ q. Aynan shu holat diagnostik xatoning eng xavfli ko‘ rinishidir.

Gepatit B virusi infeksiyasi bunday xatoning oqibatlari ayniqsa og‘ ir bo‘ ladigan sohalardan biridir. Jahon sog‘ liqni saqlash tashkilotining baholashiga ko‘ ra, 2022 yil holatiga dunyo bo‘ yicha 254 million kishi surunkali HBV infeksiyasi bilan yashagan; virusli gepatitlar sababli o‘ lim 2019-yildagi 1,1 milliondan 2022-yilda 1,3 millionga ko‘ tarilgan va bu o‘ limlarning 83% i aynan gepatit B hissasiga to‘ g‘ ri keladi [1, 2]. HBV DNK yuklamasi davolashni boshlash to‘ g‘ risidagi qarorda, terapiya samaradorligini kuzatishda va transmissiya xavfini baholashda markaziy laborator marker hisoblanadi [1, 3]. O‘ zbekiston tarixan HBV bo‘ yicha endemik mamlakat hisoblanadi: 2016 yil uchun surunkali HBV (HBsAg-musbat) tarqalishi 8,3% — taxminan 2,5 million kishi deb baholangan, ammo ularning atigi ~10% i tashxis olgan [15]. 2022–2024 yillarda o‘ tkazilgan milliy skrining doirasida bir milliondan ortiq kishi tekshirilib, umumiy HBsAg tarqalishi 2,89% ni tashkil etgan; vaksinatsiya dasturi qamrab olgan tug‘ ilish kogortalarida ko‘ rsatkich sezilarli pasaygan [16]. Donor qonini skrining qilishda esa bitta aniqlanmagan musbat namuna transfuziya orqali yuqish xavfini yuzaga keltiradi.

Ushbu muammoning uslubiy yechimi — namuna ichiga kiritiladigan ichki nazorat (IN). Agar nazorat ekstraksiyadan oldin qo‘ shilsa va asosiy nishon bilan birga ajratib olinib amplifikatsiya qilinsa, u faqat PZR bosqichini emas, balki lizis, nuklein kislota tiklanishi va ingibitsiyani ham qamrab oladi. Bunday nazorat mavjud bo‘ lgandagina HBV signali qayd etilmagan namuna asosli ravishda haqiqiy manfiy deb talqin qilinishi mumkin.

Shu bilan birga, ichki nazoratni dupleks formatga kiritish o‘ z-o‘ zidan yechim emas. Nazorat nishoni reaksiya komponentlari uchun asosiy nishon bilan raqobatlashadi va uning miqdori noto‘ g‘ ri tanlansa, past nusxadagi HBV DNKsining amplifikatsiyasini bostirishi mumkin. Demak, IN ni loyihalashdagi asosiy vazifa — signalni maksimal darajaga chiqarish emas, balki nazoratning barqarorligi bilan asosiy nishonning sezgirligi o‘ rtasida muvozanat topishdir.

Mazkur ishning maqsadi — HBV DNKsini aniqlashga mo‘ ljallangan dupleks real vaqt PZR tizimi uchun plazmidaga asoslangan ekzogen IN ni tanlash, uning ishchi darajasini nisbiy suyultirmadan absolyut nusxa soniga keltirish hamda ekstraksiya nazorati, ingibitsiyani aniqlash, multipleks raqobat va analitik sezgirlik nuqtai nazaridan baholashdan iborat.

Adabiyotlar tahlili

qPCR sifat standartlari va nazoratlar tizimi

qPCR natijalarining qayta ishlab chiqarilishi test dizayni, validatsiya hajmi va hisobotning shaffofligi bilan bevosita bog‘ liq. MIQE tavsiyalari va ularning 2025 yilda qayta ko‘ rib chiqilgan MIQE 2.0 tahriri namuna bilan ishlash tartibi, nuklein kislota ajratish usuli, praymer va zond ketma-ketliklari, reaksiya sharoitlari, amplifikatsiya samaradorligi, aniqlash va miqdoriy aniqlash chegaralari, shuningdek musbat, manfiy va ichki nazoratlarning to‘ liq bayonini talab qiladi [4, 5]. MIQE 2.0 klinik multipleks qPCR uchun ichki nazorat asosiy nishon bilan bir turdagi nuklein kislota (DNK nishoni uchun — DNK, RNK nishoni uchun — RNK) bo‘ lishini hamda infeksion diagnostikada imkon qadar namuna tayyorlashdan oldin kiritilishini ma’qullaydi — bu ekstraksiyadan amplifikatsiyagacha bo‘ lgan butun zanjirni qamrab olish imkonini beradi [4].

PZR ingibitsiyasi analitik xato manbai sifatida

Qon va uning komponentlarida amplifikatsiyani susaytiruvchi moddalarning mavjudligi ko‘ p yillar davomida hujjatlashtirilgan: gemoglobin va laktoferrin bevosita ingibitor xususiyatiga ega [8], kengroq sharhlarda esa geparin, immunoglobulinlar, tuzlar, spirtlar va sorbsion reagentlarning qoldiqlari ham muhim omillar sifatida qayd etiladi [7, 9]. Ingibitsiya amplifikatsiya samaradorligini pasaytiradi va Cq qiymatini kechiktiradi; aniqlash chegarasiga yaqin konsentratsiyalarda esa natijani manfiy tomonga siljitishi mumkin. Shu sababli diagnostik amplifikatsiya tizimlarida faqat tashqi seriya nazoratlari bilan cheklanish yetarli emas — namuna ichidagi jarayon nazorati zarur [6].

Endogen va ekzogen ichki nazoratlar

Ichki nazoratlar kelib chiqishiga ko‘ ra ikki turga bo‘ linadi. Endogen nazorat sifatida inson genlaridan foydalanish qo‘ shimcha shablon talab qilmaydi va namunaning hujayraviy tarkibi haqida ma’lumot beradi. Biroq plazma va zardob kabi asosan hujayrasiz matritsalarda inson genom DNKsining miqdori past va namunadan namunaga sezilarli darajada o‘ zgaruvchan bo‘ ladi, bu esa nazoratning me’yoriy diapazonini belgilashni qiyinlashtiradi. Ma’lum konsentratsiyada tashqaridan kiritiladigan ekzogen DNK nishoni bu cheklovdan xoli bo‘ lib, ekstraksiya samaradorligi va ingibitsiyani standartlashtirilgan tarzda nazorat qilish imkonini beradi [6].

Multipleks raqobat va xalqaro kalibrlash

Ekzogen IN dizaynidagi markaziy masala — dupleks reaksiyadagi raqobat. Nazorat darajasi juda past bo‘ lsa, u stoxastik tarzda aniqlanmasligi yoki qisman ingibitsiyani ishonchli ko‘ rsatmasligi mumkin; haddan tashqari yuqori bo‘ lsa, past nusxadagi HBV DNKsi bilan praymer, zond va polimeraza uchun raqobatga kirishadi. Ilgari ishlab chiqilgan HBV real vaqt PZR tizimlarida ko-ekstraksiya qilinadigan (klinik namuna bilan birga ajratib olinadigan) geterologik nazorat DNKlari ekstraksiya va amplifikatsiya nosozligini aniqlash uchun muvaffaqiyatli qo‘ llanilgan [10, 11]. Shuningdek, juda yuqori HBV yuklamasida asosiy nishonning kuchli amplifikatsiyasi IN signalini susaytirishi mumkin; bu holat aniq HBV-musbat natijani bekor qilmaydi, ammo tegishli talqin qoidasi validatsiya bosqichida oldindan belgilanishi shart [4, 10].

Miqdoriy HBV diagnostikasida metrologik izchillik ham muhim ahamiyatga ega. JSSTning HBV DNK xalqaro standartlari natijalarni MB/ml (IU/mL) da yagona shkalada ifodalash uchun asos yaratadi [14], ko‘ p markazli baholashlar esa testlarning aniqlash chegarasi, chiziqli diapazoni, takrorlanuvchanligi va laboratoriyalararo mosligini alohida ko‘ rsatish zarurligini tasdiqlaydi [12, 13]. Shunga ko‘ ra, yangi ichki nazoratni baholash uning o‘ z amplifikatsiyasi bilan cheklanmasligi, balki HBV aniqlash chegarasi va past-musbat namunalarning Cq qiymatlariga sezilarli ta’sir ko‘ rsatmasligi bilan ham isbotlanishi kerak.

Tadqiqot metodologiyasi

Tadqiqot dizayni va klinik namunalar

Ichki nazoratni baholash uchun ikki mustaqil namuna guruhi shakllantirildi. Birinchi guruh — HBV markerlari bo‘ yicha manfiy deb tasdiqlangan sog‘ lom donorlarning plazma namunalari (n =10); ular ekstraksiya jarayonining fon barqarorligini va IN signalining bazaviy taqsimotini aniqlash uchun xizmat qildi. Ikkinchi guruh — klinik va serologik jihatdan HBV infeksiyasi tasdiqlangan bemorlarning namunalari (n = 350); ular dupleks sharoitda IN va HBV signallari o‘ rtasidagi o‘ zaro ta’sirni tekshirish imkonini berdi. Namunalar tanlashda gemolizga uchragan hamda lipemik alikvotlar hisobga olinmadi.

HBV holati tijorat reaktiv to‘ plami AmpliSens® HBV-Monitor-FRT (Moskva, Rossiya) va QuantStudio 5 (Applied Biosystems, AQSh) real vaqt PZR tizimi yordamida mustaqil ravishda qayta tasdiqlandi. Plazma alikvotalari nuklein kislotalar ajratib olingunga qadar −80 °C haroratda saqlandi. Nuklein kislota degradatsiyasining oldini olish maqsadida takroriy muzlatish-eritish sikllariga yo‘ l qo‘ yilmadi (har bir alikvota uchun bir martadan oshmadi).

Barcha namunalar shaxsni identifikatsiya qiluvchi ma’lumotlarsiz, anonimlashtirilgan holda tahlil qilindi; ish Xelsinki deklaratsiyasining amaldagi tahririga va muassasa etika komissiyasi tasdiqlagan tartibga rioya qilgan holda bajarildi.

Ekzogen ichki nazorat konstruksiyasi va ishchi darajasi

Ekzogen ichki nazorat (IN)

Ekzogen ichki nazorat (IN) sifatida laboratoriya sharoitida tayyorlangan, pPICZα A vektori (umumiy uzunligi 3593 juft asos) asosida konstruksiya qilingan rekombinant plazmida qo‘ llanildi. Nishon ketma-ketlik pPICZα turidagi ekspressiya vektorlari tarkibiga kiruvchi *Saccharomyces cerevisiae* α-factor prepro sekretor signal hududidan kelib chiqqan geterologik DNK qismidan iborat. Ushbu hudud vektorning 941–1207 nukleotidlari oralig‘ ida, ya’ni 5′ *AOX1* promotori va ko‘ p sonli klonlash sayti (MCS) orasida joylashgan bo‘ lib, uzunligi 267 juft asosni, GC-tarkibi esa 42% ni tashkil etadi.

Nishon hududning HBV genomi bilan gomologiyaga ega emasligi *in silico* tekshirildi. 267 j.a. li α-factor ketma-ketligi NCBI BLASTn dasturi yordamida (megablast va blastn algoritmlari, nr/nt ma’lumotlar bazasi, qidiruv *Hepatitis B virus* [taxid:10407] bo‘ yicha cheklangan holda, tekshiruv sanasi — 2025-yil 15-yanvar solishtirildi. E-value chegarasi 10 ga teng bo‘ lganda ham ahamiyatli o‘ xshashlik aniqlanmadi ("No significant similarity found"). Bundan tashqari, tanlangan IN praymer-zond tizimi HBV-pozitiv namunalarda nospetsifik signal bermasligi, HBV praymerlari esa IN plazmidasida signal bermasligi eksperimental yo‘ l bilan tasdiqlandi.

Rekombinant plazmida *Escherichia coli* TOP10 shtammiga elektro-transformatsiya usulida kiritildi. Transformatsiya qilingan hujayralar 25 mkg/ml Zeocin™ tutgan past tuzli LB-agarda (pH 7,5) tarkibli selektiv muhitda ekilib, 37 °C haroratda 14-16 soat davomida inkubatsiya qilindi va hosil bo‘ lgan klonlarning seleksiyasi amalga oshirildi.

Plazmida DNKsi *E. coli* hujayralaridan ishqoriy lizis usuli bilan ajratib olinib, keyinchalik fenol-xloroform aralashmasi yordamida tozalandi. Olingan preparatning tozaligi va konsentratsiyasi spektrofotometrik usulda baholandi: A260/A280 nisbati 1,88 ni tashkil etdi, bu 1,8–2,0 oralig‘ idagi maqbul ko‘ rsatkichga mos keladi. Preparatning butunligi 0,7% li agaroza gelida elektroforez qilish orqali tasdiqlandi.

Tanlangan klonlarning autentikligi ikki mustaqil usulda tasdiqlandi. Birinchidan, ajratib olingan plazmida DNKsi α-factor hududiga xos praymerlar yordamida PZR da tekshirildi; kutilgan o‘ lchamdagi 200 j.a. mahsulotning hosil bo‘ lishi nishon ketma-ketlikning mavjudligini ko‘ rsatdi. Ikkinchidan, plazmidaning umumiy o‘ lchami restriksion tahlil orqali baholandi. Halqasimon plazmida agaroza gelida o‘ zining haqiqiy molekulyar o‘ lchamiga muvofiq migratsiyalanmaydi: superо‘ ralgan, bo‘ shashgan halqasimon va bir zanjiri kesilgan shakllar turlicha tezlikda harakatlanadi, shu sababli molekulyar-og‘ irlik markeriga nisbatan o‘ lchamni baholab bo‘ lmaydi. Faqat chiziqli DNK o‘ zining haqiqiy uzunligiga mos ravishda yuradi.

Shu maqsadda 1 mkg plazmidaga FastDigest EcoRI va FastDigest KpnI restriktazalari (Thermo Scientific, AQSh) bilan 37 °C haroratda 15 daqiqa davomida ishlov berildi va mahsulot 0,8% li agaroza gelida elektroforez qilindi. Asosiy fragment 3556 j.a. o‘ lchamda, ya’ni pPICZα A vektorining kutilgan uzunligiga mos holatda qayd etildi (marker: 1 kbp DNA Ladder Plus) [10]. Har ikkala restriksiya sayti MCS tarkibida joylashgani sababli nishon α-factor hududi (941–1207 n.) butunligicha saqlanadi. Shu tariqa klonlarning aynan pPICZα A asosidagi rekombinant plazmidani tutishi ham nishon ketma-ketlik darajasida (PZR), ham butun vektor o‘ lchami darajasida (restriksion tahlil) tasdiqlandi. Chiziqli shakl bir vaqtning o‘ zida ikkinchi vazifani ham bajaradi: u nusxalar sonini massadan hisoblashda barcha molekulalarning bir xil topologik shaklda bo‘ lishini ta’minlaydi va turli halqasimon shakllarning amplifikatsiyaga har xil ta’sirini bartaraf etadi. Shuning uchun keyingi barcha ishlarda aynan chiziqli preparat qo‘ llanildi — u geldan elektroelyutsiya usuli bilan ajratib olindi.

Geldan ajratib olingan chiziqli DNK preparatining konsentratsiyasi spektrofotometrik usulda o‘ lchanib, 350 ng/mkl ni tashkil etdi. Nusxalar soni quyidagi formula asosida hisoblandi:

$$\text{nusxa/mkl} = (C\ [\text{ng/mkl}] \times 6{,}022\times10^{23}) / (N\ [\text{j.a.}] \times 660 \times 10^{9}),$$

bu yerda C — DNK konsentratsiyasi, N — chiziqli molekulaning uzunligi (3556 j.a.). Hisob natijasida preparatdagi konsentratsiya $8{,}98\times10^{10}$ nusxa/mkl ga teng bo‘ ldi. Undan ketma-ket suyultirish yo‘ li bilan avval taxminan 1 : 18 000 nisbatda oraliq stok eritma ($5{,}01\times10^{6}$ nusxa/mkl, ya’ni $5{,}01\times10^{9}$ nusxa/ml) tayyorlandi, so‘ ngra undan 1 : 100 000 suyultirish yo‘ li bilan 50 nusxa/mkl konsentratsiyali ishchi eritma olindi. Eritmalar ishlatilgunga qadar –20 °C haroratda, bir martalik aliqvotlar holida saqlandi.

IN har bir namunaga nukleinlar kislotalarini ajratib olish bosqichida, lizis eritmasi qo‘ shilganidan so‘ ng darhol 10 mkl hajmda qo‘ shildi, ya’ni har bir namunaga ~500 nusxa IN to‘ g‘ ri keldi. Ekstraksiya 50 mkl elyuat hajmida yakunlanganini hisobga olganda, elyuatdagi nazariy konsentratsiya ~10 nusxa/mkl ni, PZR reaksiyasiga 10 mkl elyuat

kiritilganda esa ~100 nusxa/reaksiyani tashkil etadi (100% chiqish samaradorligi shartida). IN ni ekstraksiya bosqichida kiritish uni bir vaqtning o‘ zida ham nukleinlar kislotalarini ajratib olish samaradorligining, ham amplifikatsiya ingibirlanishining nazorati sifatida ishlatish imkonini berdi.

Validatsiyani qayta ishlab chiqarish mumkin bo‘ lishi uchun nisbiy suyultirma absolyut miqdorga keltirildi. Oraliq stok eritmaning 1 : 100 000 nisbatdagi suyultirmasidan har bir klinik namunaga lizis eritmasi qo‘ shilganidan so‘ ng 10 μL qo‘ shildi; hisob-kitob zanjiri 1-jadvalda keltirilgan. Tanlangan daraja IN ning o‘ z aniqlash chegarasidan yetarlicha yuqori, ammo HBV ning past nusxali amplifikatsiyasiga sezilarli raqobat tug‘ dirmaydigan oraliqda joylashgan.

Jadval 1

Ichki nazoratning ishchi darajasini absolyut nusxa soniga keltirish

Bosqich	Qiymat	Izoh
Chiziqli DNK preparati (o‘ lchangan)	350 ng/μL ≈ $8{,}98\times10^{10}$ nusxa/μL	Spektrofotometrik o‘ lchash; N = 3556 j.a.
Oraliq stok eritma	5.01×10^{6} nusxa/μL (5.01×10^{9} nusxa/mL)	Preparatdan ~1 : 18 000 suyultirish
Ishchi suyultirma	1 : 100 000	Nuklein kislotasiz buferda
Suyultirilgan preparat	≈ 50 nusxa/μL	—
Har bir namunaga qo‘ shilgan hajm	10 μL	Lizis eritmasidan so‘ ng
Namunaga kiritilgan umumiy nusxa	≈ 5.0×10^{2} nusxa	—
Kirish plazma hajmi / elyusiya hajmi	100 μL / 50 μL	«SOREX-DNA» to‘ plami
Elyuatdagi nazariy konsentratsiya	≈ 10 nusxa/μL	100% tiklanish sharoitida
Reaksiyaga kiritilgan elyuat hajmi	10 μL	—
Reaksiyadagi nusxalar soni	≈ 100 nusxa/reaksiya	Yakuniy ishchi daraja

Izoh: hisob-kitob 100% tiklanish sharoitiga asoslangan nazariy qiymatlarni beradi; haqiqiy nusxalar soni raqamli PZR yoki kalibrlash egri chizig‘ i yordamida tasdiqlanishi lozim.

DNK ajratib olish

Ichki nazorat qo‘ shilgan plazma namunalaridan DNK O‘ zR FA S.Yu.Yunusov nomidagi O‘ simlik moddalari kimyosi institutida ishlab chiqilgan, sorbsiya usuliga asoslangan «SOREX-DNA» tijorat to‘ plami yordamida ishlab chiqaruvchi yo‘ riqnomasiga muvofiq ajratib olindi. Kirish plazma hajmi 100 μL, elyusiya hajmi 50 μL ni tashkil etdi. Har bir ekstraksiya seriyasida ikkita musbat jarayon nazorati (PKO1, PKO2) va bitta manfiy nazorat (OKO — nuklein kislotasiz matritsa + IN) parallel ravishda olib borildi; ushbu nazorat kontaminatsiyani aniqlash bilan bir qatorda ekstraksiya samaradorligining yuqori chegarasini belgilash imkonini berdi.

Dupleks real vaqt PZR

Amplifikatsiya va fluoressent signalni qayd etish QuantStudio 5 Real-Time PCR System (Thermo Fisher Scientific, AQSh) platformasida bajarildi. HBV ga xos mahsulot FAM kanalida, ichki nazorat mahsuloti esa JOE kanalida ro‘ yxatga olindi. HBV uchun nishon sifatida Core (C) genining yuqori darajada konservativ hududi (HBV genomining 1777–2473 nukleotidlari) tanlandi. Ichki nazoratga xos praymerlar va JOE/BHQ-1 belgili zond mualliflar tomonidan loyihalangan; ular bo‘ yicha intellektual mulk hujjatlari rasmiylashtirilish bosqichida bo‘ lgani sababli ketma-ketliklar ushbu maqolada keltirilmaydi va asosli so‘ rov asosida mas’ul muallifdan olinishi mumkin. Har bir reaksiyaning umumiy hajmi 25 μL bo‘ lib, tarkibida 1× PZR buferi, 2,5–4 mM $MgCl_2$, 0,8 mM dNTP aralashmasi, har bir praymerdan 0,2–0,8 μM, zonddan 0,2 μM, 2,5 U SynTaq DNK-polimeraza, 10 μL ajratib olingan DNK va yakuniy hajmgacha nukleazasiz suv bo‘ ldi. Ichki nazorat praymerlari va zondining reaksiyadagi yakuniy konsentratsiyasi: har bir praymerdan 0,4 μM, zond 0,1 μM ni tashkil etdi. Har bir tajribada kalibrlash standartlari (KR1, KR2) va shablonsiz nazorat parallel ravishda qo‘ yildi.

Jadval 2

Dupleks real vaqt PZR termosikllash dasturi

Bosqich	Harorat, °C	Vaqt	Fluoressensiyani o‘ lchash	Sikllar soni
1. Dastlabki denaturatsiya	95	5 daqiqa	–	1
2. Dastlabki amplifikatsiya	95	10 soniya	–	5
	60	20 soniya	–	

Bosqich	Harorat, °C	Vaqt	Fluoressensiyani o‘ lchash	Sikllar soni
	72	15 soniya	–	
3. Asosiy amplifikatsiya	95	10 soniya	–	40
	60	20 soniya	Signal o‘ qiladi (FAM, JOE)	
	72	15 soniya	–	

Izoh: fluoressensiya 40 siklli asosiy bosqichning 60 °C qismida ikkala kanal bo‘ yicha o‘ qildi.

Nazoratlar va natijalarni talqin qilish

Har bir seriyada kamida to‘ rt turdagi nazorat qo‘ llanildi: shablonsiz nazorat (NTC), manfiy ekstraksiya nazorati, HBV-musbat nazorat va ichki nazorat saqlovchi matritsa nazorati. Talqin qoidasi quyidagicha belgilandi: FAM kanalida belgilangan chegaradan kechikmagan valid Cq qayd etilsa, namuna HBV-musbat; FAM signali qayd etilmasa yoki belgilangan chegaradan yuqori bo‘ lsa, ammo JOE kanalidagi IN valid diapazonda aniqlansa, namuna HBV-manfiy deb baholandi. IN signali ham, HBV signali ham qayd etilmagan namuna invalid deb hisoblanib, qayta ekstraksiyaga yuborildi. Cq chegaralari quyidagicha belgilandi: FAM kanali uchun Cq ≤ 38,0), JOE kanali (IN) uchun Cq 27,5–30,5. Atipik amplifikatsiya egri chiziqlari bazaviy chiziq va chegara qo‘ lda qayta belgilanib, natija ikki mustaqil operator tomonidan ko‘ rib chiqildi tartibida baholandi. Takrorlar qoidasi: chegaraviy natijalar Cq 36,0–38,0 oralig‘ ida ikki takrorda qayta tekshirildi va kamida bitta takrorda signal qayd etilganda musbat deb baholandi.

Analitik baholash

Ichki nazoratni baholash o‘ zaro bog‘ liq uch yo‘ nalishda amalga oshirildi: (i) turli klinik namunalarda IN Cq qiymatlari taqsimoti orqali jarayon nazoratining barqarorligi va takrorlanuvchanligi; (ii) keng HBV DNK diapazonida multipleks raqobat; (iii) bir xil matritsa va ekstraksiya sharoitida IN bilan va INsiz HBV analitik sezgirligining taqqoslanishi.

Cq qiymatlari o‘ rtacha ± standart og‘ ish ko‘ rinishida keltirildi. Takrorlanuvchanlik standart og‘ ish va variatsiya koeffitsienti (CV%) orqali ifodalandi. IN bilan va INsiz olingan juft Cq qiymatlari taqsimotga qarab juft (Shapiro–Wilk) t-test yoki Wilcoxon belgili rangli testi bilan taqqoslandi; ahamiyatlilik darajasi $\alpha = 0,05$ (ikki tomonlama) qilib belgilandi. HBV aniqlash chegarasi takrorlarning kamida 95% ida aniqlanadigan konsentratsiya sifatida belgilandi: C_{95} va uning 95% ishonch oralig‘ i probit-regressiya yordamida hisoblanib, har bir konsentratsiya darajasi uchun 20 takror qo‘ llanildi. Kalibrlash egri chizig‘ i parametrlari (R^2, qiyalik) va amplifikatsiya samaradorligi MIQE tavsiyalariga muvofiq E = 10^(−1/qiyalik) − 1 formulasi bo‘ yicha aniqlandi. Statistik tahlil Python 3.10 dasturlash tilida scipy.stats kutubxonasi yordamida bajarildi.

Natijalar va ularning tahlili

Klinik namunalar va test validligi

Jami 360 ta plazma namunasi tahlil qilindi, jumladan 10 ta sog‘ lom donor va 350 ta HBV-musbat bemor namunasi. Oldindan belgilangan seriya va namuna validligi mezonlari qo‘ llanganda birlamchi tekshiruvda 355/360 (98,6%) namuna valid natija berdi. 5 ta namuna dastlab IN signalining yo‘ qligi tufayli invalid deb baholandi; qayta ekstraksiyadan so‘ ng ham ularning barchasida IN signali tiklanmadi va namunalar yakuniy invalid deb hisobdan chiqarildi.

Ichki nazorat signalining barqarorligi va takrorlanuvchanligi

Tanlangan ishchi darajada (≈ 100 nusxa/reaksiya) valid klinik ekstraktlarda IN ning o‘ rtacha Cq qiymati 29.0 ± 0.4 ni tashkil etdi; umumiy diapazon 28.1–29.8 oralig‘ ida bo‘ ldi. Bu 1.7 siklga teng tor oraliq bo‘ lib, ekstraksiya samaradorligining namunadan namunaga sezilarli o‘ zgarmaganini ko‘ rsatadi. IN validligi 355/360 (98,6%) ni tashkil etdi. HBV-manfiy va HBV-musbat guruhlar bo‘ yicha alohida ko‘ rsatkichlar hamda seriya ichidagi va seriyalararo o‘ zgaruvchanlik 3-jadvalda keltirilgan. IN ning qabul diapazoni natijalar olingandan keyin emas, balki validatsiya rejasida oldindan belgilangan mezon asosida talqin qilindi.

Jadval 3

Ichki nazoratning validatsiya ko‘ rsatkichlari

Ko‘ rsatkich	Olingan qiymat	Qabul mezoni
IN ishchi darajasi	≈ 100 nusxa/reaksiya	IN LoD dan ≥ 10 marta yuqori
Klinik namunalarda IN Cq (o‘ rtacha ± SD)	29.0 ± 0.4	Cq 27.5–30.5
IN Cq diapazoni (min–maks)	28.1–29.8	—
Valid IN signali ulushi	355/360 (98,6%)	≥ 95%

Ko‘ rsatkich	Olingan qiymat	Qabul mezoni
HBV LoD (INsiz)	5,15 nusxa/reaksiya ≈ 257,5 nusxa/ml)	—
HBV LoD (IN bilan)	5,15 nusxa/reaksiya ≈ 257,5 nusxa/ml)	INsiz LoD dan ≤ 2 marta farq
Past-musbat namunalarda ΔCq (IN bilan − INsiz)	0.12 ± 0.08 ($p > 0.05$)	$\lvert\Delta Cq\rvert \le 0.5$
Yuqori HBV yuklamasida (10^8 MB/ml) IN Cq siljishi	1.1–1.8 sikl	IN signali yo‘ qolmasligi

Yuqori HBV DNK konsentratsiyasida multipleks raqobat

Raqobat 10^2 dan 10^8 MB/ml gacha bo‘ lgan HBV konsentratsiyalari diapazonida baholandi. Yuqori virus yuklamasida (10^8 MB/ml) IN signalining Cq ko‘ rsatkichi 1.1–1.8 siklga kechikdi, biroq signalning to‘ liq yo‘ qolishi kuzatilmadi va HBV DNKsining miqdoriy hisob-kitobiga hamda FAM kanalining analitik sezgirligiga salbiy ta’sir qayd etilmadi. Multipleks qPCR tamoyillariga muvofiq, juda yuqori nishon yuklamasida IN signalining susayishi kutiladigan hodisa bo‘ lib, aniq HBV-musbat natijani bekor qilmaydi; shunga qaramay, ushbu test uchun qabul qilinadigan qoida validatsiya natijalari asosida oldindan belgilanishi lozim [4, 10].

Ichki nazoratning HBV analitik sezgirligiga ta’siri

HBV aniqlash chegarasi ichki nazoratsiz ham, tanlangan IN darajasi bilan ham 5,15 nusxa/reaksiya (≈ 257,5 nusxa/ml) darajasida saqlanib qoldi. 10 MB/ml past-musbat darajada aniqlanish ulushi INsiz 19/20 — 95% va IN bilan 19/20 — 95% ni tashkil etdi. Past-musbat namunalarda HBV Cq qiymatlari o‘ rtasidagi farq statistik jihatdan ahamiyatsiz bo‘ ldi ($\Delta Cq = 0.12 \pm 0.08$; $p > 0.05$). Bu natijalar tanlangan IN konsentratsiyasi HBV ning klinik ahamiyatli analitik sezgirligini saqlab qolishini ko‘ rsatadi va 5.4-bo‘ limda bayon etilgan raqobat cheklovining amalda bartaraf etilganini tasdiqlaydi.

Natijalarning muhokamasi

Ekstraksiyadan oldin, lizis bosqichida kiritilgan jarayon nazorati faqat amplifikatsiyani nazorat qiluvchi yondashuvga qaraganda sezilarli darajada kuchliroq sifat kafolatini beradi, chunki u nuklein kislotalarni sorbsiya, yuvish va elyusiya bosqichlaridagi yo‘ qotishlarni ham, keyingi PZR ingibitsiyasini ham bir vaqtda qamrab oladi. Olingan natijalar zamonaviy qPCR sifat tamoyillariga hamda ilgari ichki nazorat bilan ishlab chiqilgan HBV testlarining natijalariga mos keladi [4, 10, 11]. Plazma kabi hujayrasiz matritsada standartlashtirilgan ekzogen DNK nazorati endogen inson DNKsining tabiiy o‘ zgaruvchanligidan kamroq ta’sirlanadi, bu esa qabul diapazonini torroq belgilash imkonini beradi.

Optimallashtirishning maqsadi IN signalini maksimal kuchaytirish emas, balki nazoratning barqarorligi bilan asosiy nishonning sezgirligi o‘ rtasida muvozanat yaratishdir. MIQE 2.0 namuna ichidagi nazorat miqdorini uning aniqlash chegarasidan yuqorida, biroq imkon qadar past darajada saqlashni va multipleks natijalarni tegishli singleks reaksiyalar bilan taqqoslab validatsiya qilishni tavsiya etadi [4]. Shu nuqtai nazardan, 1 : 100 000 suyultirma faqat absolyut nusxa soniga keltirilgandan va HBV aniqlash chegarasiga ta’siri amalda tekshirilgandan so‘ ng ilmiy asoslangan deb hisoblanishi mumkin — aynan shu bosqich mazkur ishda bajarildi (1- va 3-jadvallar).

pPICZα dan kelib chiqqan geterologik DNK ning amaliy afzalligi — uni ko‘ p miqdorda tayyorlash, standart tarzda suyultirish va HBV dan alohida fluoressent kanal orqali farqlash mumkinligidir. Shu bilan birga, muhim uslubiy cheklovni ochiq qayd etish zarur: plazmida DNKsi kapsidlangan HBV virionining lizis xususiyatlarini to‘ liq takrorlamaydi. Demak, mazkur nazorat plazmida namunaga kiritilgan nuqtadan boshlab nuklein kislotani ajratib olish samaradorligini (recovery) va amplifikatsiya ingibitsiyasini nazorat qiladi; alohida tajriba bilan isbotlanmagan holda uni virus zarrachasining barcha biologik parchalanish bosqichlarini nazorat qiladi deb talqin qilish *to‘ g‘ ri emas*.

HBV DNK ning klinik ahamiyati yuqoriligicha qolmoqda: JSST va EASL ning amaldagi tavsiyalarida virus yuklamasi davolashga ko‘ rsatma, monitoring va transmissiya xavfini baholashda markaziy marker hisoblanadi [1, 3]. Mahalliy diagnostik to‘ plamga validatsiyalangan jarayon nazoratini kiritish invalid va yolg‘ on manfiy natijalar ulushini kamaytiradi. Biroq diagnostik mahsulotga joriy etishdan oldin to‘ liq analitik validatsiya, JSST xalqaro standartiga metrologik izchillik, lotlararo baholash, kontaminatsiya xavfi tahlili, barqarorlik tadqiqotlari va tegishli reglament talablari bo‘ yicha sinovlar o‘ tkazilishi lozim [12–14].

Xulosalar

Plazmaga ekstraksiyadan oldin kiritiladigan geterologik plazmida ichki nazorati dupleks HBV real vaqt PZR tahlilida ekstraksiya va amplifikatsiya sifatini bir vaqtda nazorat qilish uchun ilmiy jihatdan asoslangan yondashuv hisoblanadi. Nisbiy suyultirmani absolyut miqdorga keltirish natijasida ichki nazoratning ishchi darajasi taxminan 100

nusxa/reaksiyani tashkil etdi; ushbu daraja valid klinik ekstraktlarda tor Cq oralig‘ ini (29.0 ± 0.4; 28.1–29.8) ta’minladi. Tanlangan ichki nazorat HBV ning analitik sezgirligini pasaytirmadi: aniqlash chegarasi: 5,15 nusxa/reaksiya (≈ 257,5 nusxa/ml) darajasida saqlanib qoldi, past-musbat namunalardagi Cq farqi esa statistik jihatdan ahamiyatsiz bo‘ ldi ($\Delta Cq = 0.12 \pm 0.08$; $p > 0.05$). Yuqori virus yuklamasida (10^8 MB/ml) ichki nazorat signalining 1.1–1.8 siklga kechikishi kuzatildi; bu multipleks raqobatning kutilgan ko‘ rinishi bo‘ lib, HBV natijasining ishonchliligiga ta’sir qilmadi. Mahalliy diagnostik to‘ plamga joriy etish uchun quyidagilar tavsiya etiladi: (i) ishchi suyultirmani raqamli PZR yoki kalibrlash egri chizig‘ i bilan tasdiqlash; (ii) ichki nazorat Cq ning qabul diapazonini oldindan belgilash; (iii) JSST xalqaro standartiga izchil material yordamida ichki nazorat bilan va usiz HBV aniqlash chegarasi hamda aniqligini validatsiya qilish; (iv) yuqori virus yuklamasida ichki nazorat signalini talqin qilish qoidasini rasmiylashtirish; (v) klinik ahamiyatli interferentlar va preanalitik sharoitlarni tekshirish; (vi) barcha reaksiya komponentlari va talqin qoidalarini MIQE 2.0 talablariga muvofiq hujjatlashtirish.

Mualliflar hissasi, manfaatlar to‘ qnashuvi va moliyalashtirish

Mualliflarning hissasi: O.B.Alimuhamedova — tadqiqot konsepsiyasi, ichki nazorat konstruksiyasini tayyorlash, qPCR tajribalari, qo‘ lyozmani yozish; J.M.Abduraxmonov — tadqiqot dizayni va natijalarni talqin qilish; A.B.Baymirzayev — namunalar bilan ishlash va DNK ajratib olish; S.A.Ikramov — statistik tahlil; E.G.Yusupova — qo‘ lyozmani tahrirlash; Sh.S.Azimova — umumiy ilmiy rahbarlik.

Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi yo‘ qligini bildiradi.

Moliyalashtirish: O‘ zbekiston Respublikasi Fanlar akademiyasi O‘ MKIning A-FA-2021-418-raqamli amaliy granti doirasida amalga oshirildi.

AEGILOPS L. TURLARINING GULLASH DINAMIKASI.

M.Z.Kurbonova
Andijon davlat pedagogika instituti, o‘ qituvchi (PhD)
mehrioy4@gmail.com

Annotatsiya. *Maqolada Aegilops L. turlarining gullash dinamikasi tasvirlangan. Aegilops turkumi turlarini xalq xo‘ jaligida intensiv foydalanish uchun tavsiya qilishda, turlarning gullash biologiyasini ilmiy asosda o‘ rganish muhim ahamiyatga ega. Tajriba davomida turlarning gullash jarayoniga ayrim ekologik omillar (havo harorati va nisbiy namlik) ta’siri qayd etildi.*

Kalit so‘ zlar: *Aegilops triunicalis L., Aegilops cylindrica Host., Aegilops tauschii Coss., Aegilops crassa Boiss, gullash dinamikasi, ekologik omillar.*

ДИНАМИКА ЦВЕТЕНИЯ ВИДОВ *AEGILOPS* L.

Аннотация. *В статье описана динамика цветения видов рода* Aegilops *L. Научное изучение биологии цветения видов рода* Aegilops *имеет важное значение при рекомендации видов данного рода для интенсивного использования в народном хозяйстве. В ходе эксперимента было отмечено влияние некоторых экологических факторов (температуры воздуха и относительной влажности) на процесс цветения видов.*

Ключевые слова: Aegilops triunicalis *L.*, Aegilops cylindrica *Host.*, Aegilops tauschii *Coss.*, Aegilops crassa *Boiss.*, *динамика цветения, экологические факторы.*

FLOWERING DYNAMICS OF *AEGILOPS* L. SPECIES.

Annatation. *The article describes the flowering dynamics of species of the genus* Aegilops *L. The scientific study of the flowering biology of* Aegilops *species is of great importance when recommending species of this genus for intensive use in the national economy. During the experiment, the influence of certain environmental factors (air temperature and relative humidity) on the flowering process of the species was recorded.*

Keywords: Aegilops triunicalis *L.*, Aegilops cylindrica *Host.*, Aegilops tauschii *Coss.*, Aegilops crassa *Boiss.*, *flowering dynamics, environmental factors.*

Kirish. O‘ simliklarning gullash jarayonini, changlanishini o‘ rganish o‘ rganilayotgan turlarni ekologik va biologik tavsiflashga imkon beradi.

O‘ simliklarning hayotiy siklida gullash jarayoni alohida o‘ rin tutadi. Gullashning boshlanishi, davomiyligi va jadalligi o‘ simlikning biologik xususiyatlari bilan bir qatorda tashqi muhit omillariga ham bog‘ liq. Harorat, namlik, yorug‘ lik davomiyligi, tuproq sharoiti hamda agrotexnik tadbirlar gullash muddatlari va uning dinamikasiga sezilarli ta’sir ko‘ rsatishi mumkin. Shu sababli bug‘ doydoshlar oilasiga mansub o‘ simliklarda gullash jarayonining kechishi va uning o‘ zgaruvchanligini o‘ rganish o‘ simliklarning rivojlanish qonuniyatlarini aniqlashda muhim ahamiyatga ega.

R.Ye. Levina ilmiy asarlarida o‘ simliklarning gullash jarayonini changdon va urug‘ chilar yetilishi bilan boshlanishini va tugashini esa urug‘ lanish jarayoni bilan borishini asoslagan [4; 1-95-b.]. M.A. Pavlova o‘ zining ishlarida o‘ simlik turlarida gullash davomiyligi uning lateral generativ kurtaklar soniga bog‘ liq ekanligini va ular o‘ z navbatida o‘ simliklarning joylashish zichligi bilan ham belgilanishini qayd etgan [6; 1-12-b.].

Aegilops turkumi turlarini xalq xo‘ jaligida intensiv foydalanish uchun tavsiya qilishda, turlarning gullash biologiyasini ilmiy asosda o‘ rganish muhim ahamiyatga ega. Turkum vakillarini introduksiya sharoitida gullash biologiyasini o‘ rganish asosiy tadqiqot maqsadlarimizdan biridir.

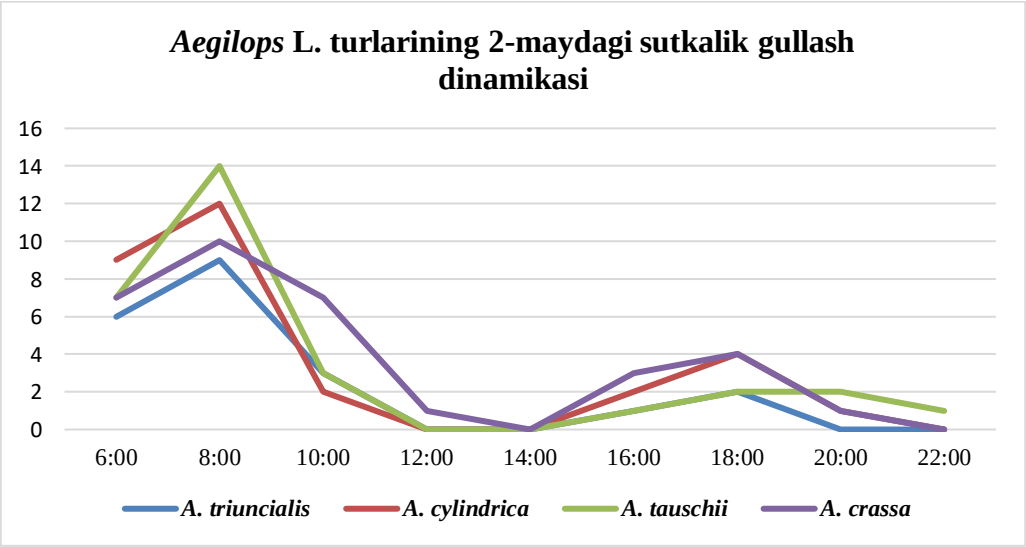
O‘ simlik gullarining umr ko‘ rish muddati har xil bo‘ lib, bir necha o‘ n daqiqadan bir necha haftagacha o‘ zgarishi mumkin [8; 1-43-b.].

Tadqiqot ob’yektlari va usullari. Turlarning mavsumiy rivojlanish maromi I.V. Borisova [2; 619 - 626-b.] va I.N. Beydeman [1; 1-154-b.] usullaridan foydalanib o‘ rganildi. Bunda vegetativ (unib chiqishi, uchinchi bargning shakllanishi, tuplanish va naychalash), boshoqlanish, gullash, donning yetilishi (sut pishish, mum pishish, to‘ la pishsish) fazalari

davomiyligi o‘rganildi. O‘simliklarning gullash biologiyasi hamda ularning mavsumiy dinamikasini o‘rganishda A.N. Ponomaryov [7;115-179-b, 61;1440-b.] usullari, X.Q. Qarshiboyevning metodik tavsiyalaridan [5; 1-84 -b] foydalanildi. O‘ simliklarning urug‘ mahsuldorligi I.V. Vaynagiy tavsiyalari asosida o‘ rganildi [3; 826-831-b].

1-jadval

Introduksiya sharoitida *Aegilops* L. turlarining mavsumiy gullash davri (2022-2023 yy.) n=100.

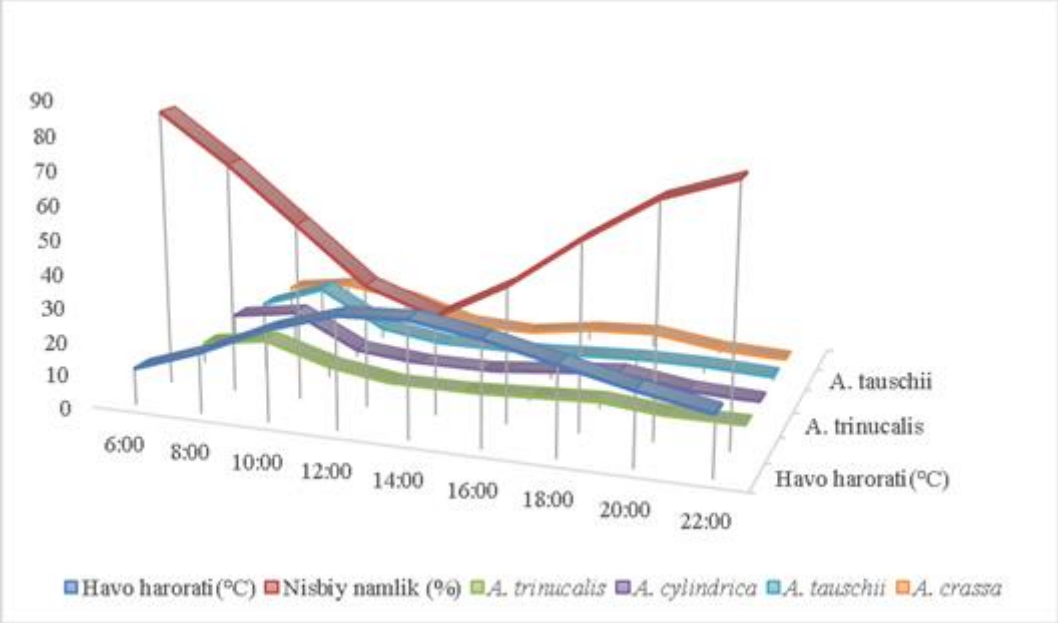


Turlarning nomi	Gullash jarayoni, kun			Gullash davomiyligi, kun
	gullashning boshlanishi	yalpi gullash	yakuniy gullash	
A. triuncialis	01.05	04.05	07.05	7
	28.04	03.05	08.05	10
A. cylindrica	30.04	04.05	08.05	9
	28.04	03.05	11.05	13
A. tauschii	25.04	01.05	06.05	11
	23.04	26.04	04.05	11
A. crassa	26.04	01.05	07.05	11
	24.04	29.04	05.05	11

Aegilops L. turkumi turlarining gullash jarayonini 2022-20223-yillar davomida introduksiya sharoitida kuzatildi. Yilning metrologik sharoitiga qarab turlarda gullash turli vaqtlarda amalga oshdi (1-jadval).

2022-2023-yillarda turlarning gullash jarayoni aprel oyining uchinchi may oyining birinchi dekadalarida amalga oshdi (1-jadvalga qarang). Yilning metrologik ko‘ rsatkichlariga qarab turlarda gullash davri bir necha kungacha o‘ zgarishi mumkin. O‘ rganilgan turlarda gullash davomiyligi 2022-yili 7 kundan (*A. triuncialis*) 11 kungacha (*A. tauschii, A. crassa*), 2023-yilda esa 10 kundan (*A. triuncialis*) 13 kunga (*A. cylindrica*) qadar davom etdi.

Tajriba davomida ayrim turlarda gullash boshoqning pastki qismidan boshlandi (*A. triuncialis*). Ba’zilarida 2-3-boshoqchalarda dastlabki gullash kuzatildi (*A. cylindrica, A. tauschii, A. crassa)*. Keyin esa yuqori qismidagi boshoqchalar gulladi. Gullashdan oldin boshoqcha qipiqlari ochildi, keyin changchi iplari tashqariga osilib chiqdi (3-rasm).



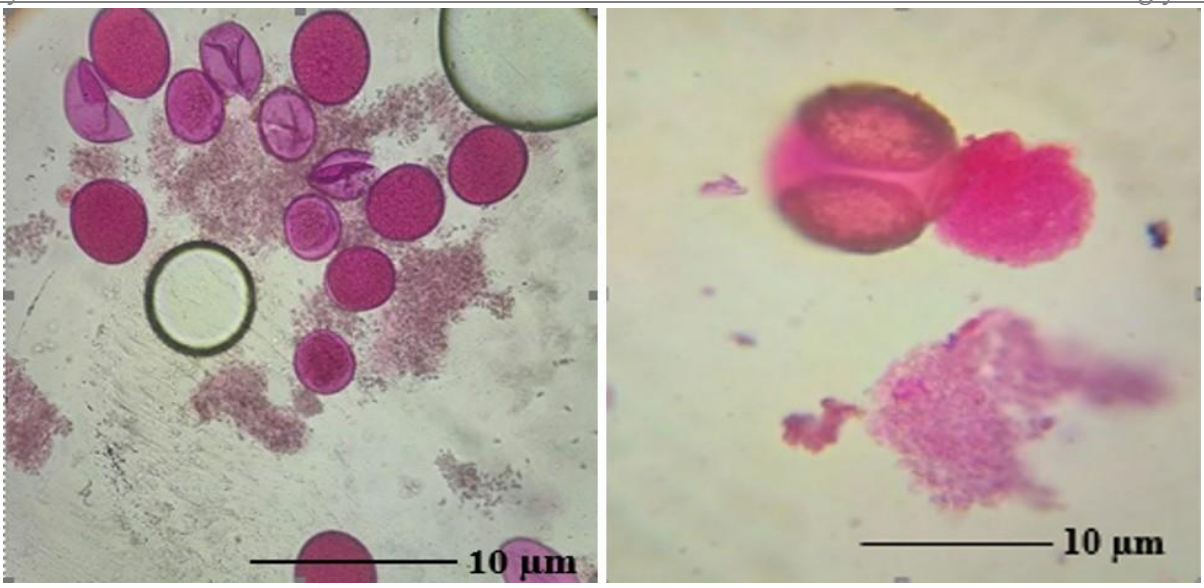
Olib borilgan tadqiqotlar davomida gullash jarayoni turlarda havo namligi yuqori, harorat past bo‘ lganda amalga oshdi (1-rasm).

1-rasm. *Aegilops* L. turlarining sutkalik gullash dinamikasi.

Sutka davomida ochilgan gullarning asosiy vaqti soat 6^{00}-10^{00} ga to‘ g‘ ri keldi (2.05.2022). Kunning o‘ rta qismida deyarli o‘ rganilgan turlarda gullash jarayoni qayd etilmadi. Soat 16:00-18:00 da ochilgan gular soni kamaydi, soat 20:00 dan boshlab ochilgan gular qayd etilmadi.

Tajriba davomida turlarning gullash jarayoniga ayrim ekologik omillar (havo harorati va nisbiy namlik) ta’siri qayd etildi (2-rasm).

2-rasm. *Aegilops* L. turlarining gullashiga havo harorati va namlikning ta'siri.



O‘ simliklarning gullash jarayoni ko‘ plab atrof-muhit omillariga ya'ni harorat, yorug‘ lik, havo namligiga, mineral moddalar bilan oziqlanish jarayonlariga chambarchas bog‘ liq [9; 7-204-b.]. Biz kuzatgan turlarning gullash jarayonida umumiy xususiyatlar mavjud bo‘ lib, ularning gullash vaqtlari boshoqdagi boshoqchalar soni bilan uzviy bog‘ liq.

3-rasm. *Aegilops* L. turlarining gullash jarayoni.

O‘ simliklarda urug‘ mahsuldorligi asosan gulchanglarning miqdori va sifati bilan bog‘ liqdir. O‘ simliklarning gullashi va changlanish jarayonlari muhim biologik jarayon bo‘ lib, katta amaliy ahamiyatga ega va o‘ simlik evolyusiyasida bir qator muammolarni hal qilishga katta xissa qo‘ shadi [8; 1-43-b.].

Anemofil o‘ simliklar odatda ko‘ p miqdorda gulchang ishlab chiqarsada, biz o‘ rganayotgan turkum vakillarining (*Aegilops* L.) chang donachalarining fertilligi haqida ma'lumotlar yetarli emas (chang donachalari 4 - rasmda berilgan). O‘ simliklarning chang fertilligi taksonomik jihatdan va nasilchilik dasturlarida muhim ahamiyatga ega.

4-rasm. *Aegilops* L. turlarining chang donachalarining ko‘ rinishi. x400. Scale bar=10 µm.

Shunigdek, chang donachalarining unumdorligi o‘ simliklar populyatsiyasida ma’lum bir turning omon qolishini ta‘minlash uchun jinsiy ko‘ payish orqali yetarli darajada regeneratsiya bo‘ ladimi yoki yo‘ qmi aniq belgilab beruvchi omil hisoblanadi [10; 30-33-b.]

2-jadval

***Aegilops* L. gullari chang donachalarining fertilligi (n=100).**

№	Tur	Chang yig‘ ilgan vaqt	Fertillik hisobida (%)
1	***Aegilops tauschii***	2022 2023	94,0 92,5
2	***Aegilops cylindrica***	2022 2023	96,6 93,4
3	***Aegilops crassa***	2022 2023	96,4 92,1
4	***Aegilops triuncialis***	2022 2023	99,1 95,2

Tadqiqotimiz davomida *Aegilops* L. turkum vakillarining chang fertilligi foizlarda ifodalandi. 2022-2023 yillar davomida kuzatilgan natijalarga ko‘ ra turkum vakillarining (*Aegilops crassa*) chang fertilligi 92,1 % dan yuqori bo‘ lib, bu turlarning umumiy barqarorligi yuqori ekanligi bilan izohlanadi (2-jadval).

SUG‘ ORILADIGAN TIPIK BO‘ Z TUPROQLARDA TURLI O‘ SIMLIK BIOMASSALARINING GUMUSNING FRAKSION-GURUH TARKIBIGA TA’SIRI

Yunusova Sayyoraxon Odiljon qizi
Toshkent davlat transport universiteti assistenti
ORCID: 0009-0004-4497-4904
E-mail: yunusovasayyora77@gmail.com

Annotatsiya: *Maqolada sug‘ oriladigan tipik bo‘ z tuproqlarda turli o‘ simlik biomassalarining gumusning fraksion-guruh tarkibiga ta’siri o‘ rganildi. Tuproqdagi umumiy uglerod, gumin va fulvo kislotalar, ularning nisbati hamda gidrolizlanadigan va gidrolizlanmaydigan moddalar tarkibidagi o‘ zgarishlar tahlil qilindi. Turli o‘ simlik biomassalarining tuproq organik moddasi shakllanishiga ta’siri qiyosiy baholandi. Olingan natijalar biomassaning turi gumusning guruh va fraksion tarkibiga sezilarli ta’sir ko‘ rsatishini ko‘ rsatdi.*

Kalit so‘ zlar: *sug‘ oriladigan tipik bo‘ z tuproq, o‘ simlik biomassasi, gumus, gumin kislotalar, fulvo kislotalar, organik uglerod, Cgk:Cfk, GM:GUM, gumifikatsiya.*

ВЛИЯНИЕ РАЗЛИЧНЫХ РАСТИТЕЛЬНЫХ БИОМАСС НА ФРАКЦИОННО-ГРУППОВОЙ СОСТАВ ГУМУСА ОРОШАЕМЫХ ТИПИЧНЫХ СЕРОЗЁМОВ

Аннотация *В статье изучено влияние различных растительных биомасс на фракционно-групповой состав гумуса орошаемых типичных серозёмов. Проанализированы изменения общего углерода, гуминовых и фульвокислот, их соотношения, а также гидролизуемых и негидролизуемых веществ. Проведена сравнительная оценка влияния различных видов растительной биомассы на формирование органического вещества почвы. Полученные результаты показывают, что вид растительной биомассы существенно влияет на групповое и фракционное строение гумуса.*

Ключевые слова: *орошаемый типичный серозём, растительная биомасса, гумус, гуминовые кислоты, фульвокислоты, органический углерод, Cgk:Cfk, GM:GUM.*

EFFECT OF DIFFERENT PLANT BIOMASSES ON THE FRACTIONAL-GROUP COMPOSITION OF HUMUS IN IRRIGATED TYPICAL SEROZEMS

Annotation: *The article examines the effect of different plant biomasses on the fractional-group composition of humus in irrigated typical serozems. Changes in total carbon, humic and fulvic acids, their ratio, and hydrolysable and non-hydrolysable substances were analyzed. The effects of different plant biomass types on soil organic matter formation were comparatively assessed. The results show that the type of plant biomass has a significant effect on the group and fractional composition of soil humus.*

Key words*: irrigated typical serozem, plant biomass, humus, humic acids, fulvic acids, organic carbon, Cgk:Cfk, GM:GUM.*

Kirish

Tuproq unumdorigini belgilovchi ko‘ rsatkichlardan biri bu - tuproqlarning gumusli holati bo‘ lib, tuproqlarning deyarlik barcha xossa va xususiyatlari bevosita gumus miqdori bilan bog‘ liqdir. Bugungi kunda sug‘ oriladigan tuproqlarda organik moddalar taqchilligini hisobga olgan holda, tuproq tarkibidagi organik moddalarni agrobiologik usullar yordamida oshirish muhim ahamiyat kasb etadi. Qishloq xo‘ jaligi ekinlarining vegetatsiya davri oxirida tuproqda qoldiradigan biomassalari tuproqni organik moddaga boyitishda katta ahamiyatga ega bo‘ lgan tabiiy resurslar hisoblanadi.

Xorijiy va mamlakatimiz olimlari tomonidan olib borilgan ilmiy-tadqiqot ishlarining natijalariga ko‘ ra tuproqqa qo‘ shiladigan turli organik qoldiqlarlarni, jumladan o‘ simliklar biomassasi (bargi, poyasi, ildizi) ni tuproq tarkibidagi mikroorganizmlar hamda fermentlar ta’sirida parchalanishi natijasida gumus moddalari hosil bo‘ ladi, tuproqlarning biologik faolligi ortib, fizik-kimyoviy xossa-xususiyatlari yaxshilanadi [1, 6, 11, 12, 2].

O‘ simlik qoldiqlari tarkibida asosan sellyuloza, lignin, gemitsellyuloza uglerod (C) va azot (N), fosfor (P) hamda kaliy (K) kabi muhim oziq elementlar bo‘ lib, tuproqni organik moddaga boyitishda asosiy manba bo‘ lib xizmat qiladi. O‘ simlik qoldiqlaridan tayyorlangan kompostlar tuproqda uchraydigan patogenlarni yo‘ q qilib, tuproqning strukturasini, oziq moddalar aylanishini yaxshilaydi, tuproqda mikroorganizmlar xilma-xilligini oshirib, hosildorlik oshishiga olib keladi [8].

Shu sababli turli o‘ simlik biomassalarining sug‘ oriladigan tipik bo‘ z tuproqlarda gumusning gumin va fulvo kislotalari hamda boshqa guruh tarkibiy qismlariga ta’sirini aniqlash ilmiy va amaliy jihatdan muhim hisoblanadi.

Tadqiqotning maqsadi - sug‘ oriladigan tipik bo‘ z tuproqlarga turli o‘ simlik biomassalarini qo‘ shish natijasida umumiy uglerod, gumin va fulvo kislotalar, Cgk:Cfk nisbati hamda gumusning guruh tarkibidagi o‘ zgarishlarni aniqlash.

Adabiyotlar tahlili

Dunyo bo‘ yicha oziq ovqat mahsulotlariga talab ortib borayotgan bir vaqtda intensiv dehqonchilik amaliyoti bilan o‘ simlik qoldiqlaridan foydalanish yildan-yilga ortib bormoqda. Jumladan 1960-61 yillarda ularning miqdori 1589 million tonnadan 2020-21 yillarda 5280 million tonnagacha ya’ni 3 barobarga ortgan [10].

FAO ma’lumotlariga ko‘ ra, o‘ simlik qoldiqlari va ildiz ajratmalari tuproqqa tushgach, mikroorganizmlar ishtirokida mineralizatsiyaga uchrab, yangi organik birikmalar hosil qiladi. Ushbu jarayon gumifikatsiya deb yuritiladi. Natijada hosil bo‘ lgan barqaror organik moddalar tuproq minerallari bilan birikadi yoki agregatlar tarkibida saqlanadi. Bu mexanizm tuproq organik uglerodining uzoq muddat saqlanishini ta’minlab, gumifikatsiyaning asosiy jarayoni hisoblanadi. Ushbu tashkilot hisobotiga ko‘ ra, gumifikatsiya koeffitsiyenti organik modda turiga bog‘ liq bo‘ lib, kompost uchun 0,6-0,9, go‘ ng uchun 0,3-0,5, yangi o‘ simlik qoldiqlari uchun esa 0,1-0,2 ni tashkil etadi. Tuproq agregatlari va mineral zarrachalar bilan bog‘ langan organik uglerod fraksiyalari uning uzoq muddat barqaror saqlanishini ta’minlaydi **[**3, **4, 5]**.

L.Beata va b. Karkoanze tog‘ larida gumusning fraksiyaviy guruh tarkibini o‘ rgangan bo‘ lib, subalp o‘ tloqi tuproqlarda fulvo kislotalar tuproq profilining barcha gorizontlarida gumin kislotalardan ustunlik qilishi, tuproqdagi gumus miqdoriga o‘ simliklar qoplamini ta’siri yuqori ekanligi to‘ g‘ risida ma’lumotlar bergan [1].

Y.Zheng, R.Sharma ma’lumotlariga ko‘ ra, o‘ simlik turiga qarab moddalar tarkibi sezilarli darajada o‘ zgaradi, bu esa o‘ z navbatida mineralizatsiya jarayoni tezligiga, organik moddalar hosil bo‘ lish dinamikasiga ta’sir qiladi. Misol uchun, makkajo‘ xori va bug‘ doyda sellyuloza miqdori 42,6 % va 30-39,2 % ni tashkil etsa, lignin miqdori esa 8,2 va 14-21 %ni tashkil etadi. Guruch qoldiqlarida esa lignin miqdori 18,2 %ni tashkil etadi, o‘ simlik tarkibida qanchalik sellyuloza va lignin ko‘ proq miqdorda bo‘ lsa, mineralizatsiya jarayonlari sekinroq ketadi [13, 7, 9].

Tadqiqot metodologiyasi

Tadqiqot O‘ zbekiston Milliy universitetining Botanika o‘ quv-ilmiy markazidagi Tuproqshunoslik kafedrasining statsionar dala tajriba maydonida tarqalgan sug‘ oriladigan tipik bo‘ z tuproq asosida olib borilgan. Dissertatsiyada ushbu maydon Toshkent shahrining shimoli-g‘ arbiy qismida, Chirchiq daryosining yuqori qismida joylashgani ko‘ rsatilgan. Vegetatsion tajriba aynan shu hududdagi dala tajribasidan olingan tuproq bilan tashkil etilgan.

O‘ simlik qoldiqlarining gumifikatsiya jarayonini o‘ rganish uchun 3 kg quruq tuproq sig‘ imiga ega idishlarda vegetatsion tajriba o‘ tkazilgan. Tuproq maydalangan o‘ simlik qoldiqlari bilan aralashtirilgan va ularning miqdori dala o‘ lchovlari asosida belgilangan. Tajriba 9 ta variantdan iborat bo‘ lib, nazorat bilan bir qatorda g‘ o‘ za bargi, ildizi, poyasi, bargi+ildizi, bargi+ildizi+poyasi, beda ildizi, bug‘ doy somoni va efemer o‘ simlik biomassasi qo‘ llanilgan.

Tuproqdagi gumus miqdori Tyurin usulining Nikitin modifikatsiyasi bo‘ yicha, gumusning fraksion-guruh tarkibi esa Ponomareva-Plotnikova usuli bo‘ yicha aniqlangan. Tadqiqotda tuproqshunoslikda qabul qilingan dala, laboratoriya va kameral usullar, shuningdek tegishli uslubiy qo‘ llanmalardan foydalanilgan.

Natijalar va ularning tahlili

Tadqiqotda turli o‘ simlik biomassalarining qo‘ llanilishi tuproqdagi umumiy uglerod va gumusning alohida guruh tarkibiy qismlariga turlicha ta’sir qilgani aniqlandi. Barcha biomassali variantlarda nazoratga nisbatan umumiy uglerodning oshishi kuzatildi. Gumin va fulvo kislotalar, Cgk:Cfk nisbati hamd gidrolizlanadigan moddalar miqdorida ham variantlar bo‘ yicha farqlar mavjud bo‘ ldi.

Gumus miqdoridagi bunday o‘ zgarishlar, avvalo, tuproqqa tushgan o‘ simlik biomassasining parchalanishi va mikroorganizmlar ishtirokida transformatsiyalanishi bilan bog‘ liq. O‘ simlik qoldiqlarining tuproqqa qo‘ shilishi natijasida organik uglerodning yangi manbai hosil bo‘ lib, uning bir qismi mineralizatsiyaga uchrasa, boshqa qismi murakkab organik birikmalar tarkibiga o‘ tadi. Shu jihatdan tajribada umumiy uglerod miqdorining ham barcha biomassali variantlarda nazoratga nisbatan ortishi kuzatildi. Nazorat variantida umumiy uglerod 0,644 % bo‘ lgan bo‘ lsa, g‘ o‘ za organlari qo‘ llanilgan variantlarda ushbu ko‘ rsatkich 0,651-0,673 % oralig‘ ida bo‘ ldi. G‘ o‘ zaning bargi, ildizi va poyasi birgalikda qo‘ llanilgan 6-variantda umumiy uglerod 0,673 % ga yetib, nazoratga nisbatan 0,029 foizga oshdi. Gidrolizlanadigan moddalar miqdorida ham variantlar bo‘ yicha farqlar mavjud bo‘ ldi.

1-jadval

Tajriba oxirida gumusning fraksiyon-guruh tarkibi, tuproqning umumiy uglerodiga nisbatan %

№	Variant	C, %	Gumin kislotalar				Fulvo kislotalar					$C_{gk}:C_{fk}$	Gidrolizlanadigan moddalar	GM : GUM
			1	2	3	Summa	1a	1	2	3	Summa			
1	Tuproq (nazorat)	0,644	2,18	0,94	8,21	11,33	3,88	0,47	5,89	14,10	24,34	0,47	35,67	0,56
2	tuproq+g'o'za bargi	0,655	1,05	2,84	7,61	11,50	4,18	1,20	5,23	12,83	23,44	0,49	34,94	0,54
3	tuproq+g'o'za ildizi	0,651	2,00	1,46	8,95	12,41	4,29	1,08	5,60	11,10	22,07	0,56	34,48	0,53

5	tuproq+g'o'za bargi+ g'o'za ildizi	0,659	2,35	0,60	7,18	10,13	4,11	0,16	7,04	11,72	23,03	0,44	33,16	0,50
6	tuproq+ g'o'za bargi+ g'o'za ildizi+ g'o'za poyasi	0,673	2,53	2,42	8,82	13,76	4,15	0,15	6,08	11,80	22,18	0,62	35,94	0,56
7	tuproq+beda ildizi	0,665	1,64	2,08	8,59	12,31	3,41	1,64	4,60	11,70	21,34	0,58	33,65	0,51
8	tuproq+bug'doy somoni	0,661	1,60	2,00	8,54	12,14	3,37	1,60	4,55	11,66	21,18	0,57	33,32	0,50
9	tuproq+efemer o'simlik	0,729	0,83	3,17	11,99	16,69	4,27	01,83	8,02	13,88	27,00	0,62	43,69	0,78

G‘ o‘ za organlarining alohida va kompleks qo‘ llanilishi gumusning fraksion-guruh tarkibida ham turlicha o‘ zgarishlarni yuzaga keltirdi. Nazorat variantida umumiy uglerodga nisbatan gumin kislotalar 11,33 %, fulvo kislotalar esa 24,34 % ni tashkil etgan. G‘ o‘ za bargi qo‘ llanilganda gumin kislotalar 11,50 %, g‘ o‘ za ildizida 12,41 %, poyasida 11,90 %, bargi va ildizi birgalikda qo‘ llanilganda 10,13 % ni tashkil etdi. G‘ o‘ zaning bargi, ildizi va poyasi kompleks qo‘ llanilgan 6-variantda esa gumin kislotalar 13,76 % ga yetdi. Shu bilan birga, ushbu variantda fulvo kislotalar 22,18 % ni tashkil etdi. Natijada gumin kislotalar ulushining ortishi va fulvo kislotalar ulushining nisbatan kamayishi Cgk:Cfk nisbatining 0,47 dan 0,62 gacha oshishiga olib keld

Izoh: Cgk:Cfk — gumin kislota uglerodining fulvo kislota uglerodiga nisbati; GM:GUM — gidrolizlanadigan moddalarning gidrolizlanmaydigan moddalarga nisbati

Olingan natijalar g‘ o‘ za organlarining tarkibi va ularning parchalanish xususiyatlari gumusning shakllanish yo‘ nalishiga ta’sir qilishini ko‘ rsatadi. Ayniqsa, ildiz va poya tarkibida lignin hamda murakkab uglerodli birikmalarning mavjudligi ularning nisbatan sekin parchalanishiga va gumusning barqarorroq komponentlari shakllanishiga sharoit yaratishi mumkin. Tajribada g‘ o‘ za organlari kompleks qo‘ llanilgan variantda gumin kislotalarning 13,77 % ga yetishi va Cgk:Cfk nisbatining 0,62 bo‘ lishi ham ushbu jarayonning nisbatan faol kechganligini ko‘ rsatadi.

Biroq turli o‘ simlik biomassalari orasida eng yuqori natijalar efemer o‘ simlik qoldiqlari qo‘ llanilgan variantda kuzatildi. Mazkur variantda umumiy uglerod miqdori 0,729 % ni tashkil etib, nazoratga nisbatan 0,085 foizga oshgan. Umumiy uglerodga nisbatan gumin kislotalar 11,33 % dan 16,99 % gacha, fulvo kislotalar esa 24,34 % dan 27,00 % gacha ortgan. Bunday natijani efemer o‘ simlik biomassasi tarkibida oson parchalanadigan uglevodlar, oqsil va azotli birikmalarning mavjudligi bilan izohlash mumkin. Mazkur organik moddalar mikroorganizmlar uchun nisbatan oson o‘ zlashtiriladigan substrat bo‘ lib, ularning parchalanishi va keyingi gumifikatsiya jarayonlarini jadallashtirishi mumkin.

Beda ildizi va bug‘ doy somoni qo‘ llanilgan variantlarda ham nazoratga nisbatan umumiy uglerod hamda gumin kislotalar miqdorining ortishi kuzatildi. Beda ildizi qo‘ llanilganda umumiy uglerod 0,665%, gumin kislotalar 12,31%, fulvo kislotalar 21,35% va Cgk:Cfk nisbati 0,58 ni tashkil etdi. Bug‘ doy somoni qo‘ llanilgan variantda esa umumiy uglerod 0,661%, gumin kislotalar 12,14%, fulvo kislotalar 21,34% va Cgk:Cfk nisbati 0,58 bo‘ ldi. Bu variantlarda gumin kislotalar ulushining fulvo kislotalarga nisbatan ortishi organik qoldiqlarning parchalanishi jarayonida nisbatan barqaror gumus komponentlari shakllanganligini ko‘ rsatadi.

Shu bilan birga, efemer o‘ simlik biomassasi qo‘ llanilgan variantning natijalari boshqa biomassalardan farq qildi. Ushbu variantda gumin va fulvo kislotalarning har ikkala fraksiyasi ham ortgan bo‘ lib, gumin kislotalar 16,99%, fulvo kislotalar 27,00% ni tashkil etdi. Cgk:Cfk nisbati esa 0,62 ga teng bo‘ ldi. Demak, efemer biomassasi tuproqdagi organik uglerodning umumiy miqdorini oshirish bilan birga, gumusning ham gumin, ham fulvo fraksiyalarining shakllanishini rag‘ batlantirgan. Bunda efemer o‘ simlik qoldiqlarining tez parchalanishi natijasida mikroorganizmlar uchun mavjud bo‘ lgan organik substratlar miqdorining ortishi muhim omil bo‘ lishi mumkin. Tadqiqotning umumiy natijalarida ham

aynan 9-variantda gumin kislotalar 11,33% dan 16,99% gacha, fulvo kislotalar 24,34% dan 27,00% gacha, Cgk:Cfk esa 0,47 dan 0,62 gacha oshgani qayd etilgan.

Gumusning gidrolizlanadigan va gidrolizlanmaydigan qismlari bo‘ yicha olingan ma’lumotlar ham o‘ simlik biomassalarining organik modda tarkibiga ta’siri turlicha ekanligini ko‘ rsatdi. Nazorat variantida gidrolizlanadigan moddalar ulushi 35,67%, gidrolizlanmaydigan moddalar ulushi esa 64,33% bo‘ lgan. G‘ o‘ za bargi, ildizi va poyasi birgalikda qo‘ llanilgan variantda ushbu ko‘ rsatkichlar mos ravishda 35,94 va 64,06% ni tashkil etdi. Beda ildizida 33,65 va 66,35%, bug‘ doy somonida 33,32 va 66,68% qayd etilgan. Eng yuqori gidrolizlanadigan moddalar miqdori efemer o‘ simlik biomassasi qo‘ llanilgan 9-variantda kuzatilib, 43,69% ga yetgan, gidrolizlanmaydigan moddalar esa 59,31% ni tashkil etgan.

Mazkur o‘ zgarishlar GM:GUM nisbatida ham o‘ z aksini topdi. Ushbu ko‘ rsatkich nazorat variantida 0,56 bo‘ lgan bo‘ lsa, g‘ o‘ za organlari qo‘ llanilgan variantlarda 0,50–0,56, beda ildizi va bug‘ doy somonida mos ravishda 0,51 va 0,50 ni tashkil etdi. Efemer o‘ simlik biomassasi qo‘ llanilgan variantda esa GM:GUM nisbati 0,78 gacha oshdi. Tajriba ma’lumotlariga ko‘ ra, 9-variantda umumiy uglerod, gumin va fulvo kislotalar, shuningdek gidrolizlanadigan moddalar miqdorining bir vaqtda yuqori bo‘ lishi ushbu biomassaning tuproq organik moddasining shakllanishiga kuchliroq ta’sir ko‘ rsatganini ko‘ rsatadi.

Umuman olganda, tajriba natijalari o‘ simlik biomassasining turi va kimyoviy tarkibi tuproq gumusining nafaqat umumiy miqdoriga, balki uning fraksion-guruh tarkibiga ham sezilarli ta’sir ko‘ rsatishini ko‘ rsatdi. G‘ o‘ zaning bargi, ildizi va poyasi kompleks qo‘ llanilganda gumin kislotalar ulushi va Cgk:Cfk nisbati eng yuqori qiymatga yetgan bo‘ lsa, efemer o‘ simlik biomassasi qo‘ llanilganda umumiy uglerod, gumin va fulvo kislotalar hamda gidrolizlanadigan moddalar miqdori eng yuqori bo‘ ldi. Bu holat turli o‘ simlik qoldiqlarining parchalanish tezligi, uglerodning shakllari va mikroorganizmlar tomonidan o‘ zlashtirilish darajasi bir xil emasligi bilan izohlanadi. Shu nuqtai nazardan, o‘ simlik biomassalarini tuproqqa qaytarish sug‘ oriladigan tipik bo‘ z tuproqlarda organik modda zaxirasini ko‘ paytirish va gumusning sifat tarkibini yaxshilashga yo‘ naltirilgan samarali agrobiologik tadbirlardan biri sifatida baholanishi mumkin. Tajriba natijalarida o‘ simlik biomassasi qo‘ llanilishi tuproqning boshqa biologik ko‘ rsatkichlariga ham ijobiy ta’sir ko‘ rsatgan: masalan, turli biomassalar bilan kompostlashda ammonifikatorlar, oligotroflar va aktinomisetlar miqdorining ortishi qayd etilgan.

XULOSALAR

1. Umumiy uglerodning eng yuqori miqdori efemer o‘ simlik biomassasi qo‘ llanilgan 9-variantda 0,729 % bo‘ lib, nazoratga nisbatan 0,085 % ga yuqori bo‘ ldi. Shu variantda gumin kislotalar 16,99 % ga, fulvo kislotalar 27,00 % ga va gidrolizlanadigan moddalar 43,69% ga yetdi.

3. G‘ o‘ za bargi, ildizi va poyasi kompleks qo‘ llanilgan 6-variantda gumin kislotalar 13,76 % ni, Cgk:Cfk nisbati esa 0,62 ni tashkil etdi. Bu variantda gumus tarkibida nisbatan barqaror fraksiyalar ulushining ortishi kuzatildi.

4. O‘ simlik biomassasining turi va kimyoviy tarkibi gumifikatsiya yo‘ nalishiga ta’sir qilishi sababli sug‘ oriladigan tipik bo‘ z tuproqlarda organik qoldiqlarni tuproqqa qaytarish gumus miqdori va sifat tarkibini yaxshilashga yo‘ naltirilgan istiqbolli agrobiologik tadbir sifatida baholanishi mumkin.

MUALLIFLAR BAYONOTLARI

Muallif hissasi: tadqiqot konsepsiyasi, tajriba ma’lumotlarini tahlil qilish, natijalarni talqin qilish va maqola matnini tayyorlash muallif tomonidan amalga oshirildi.

Manfaatlar to‘ qnashuvi: muallif manfaatlar to‘ qnashuvi mavjud emasligini bildiradi.

Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

Annotatsiya. *Ushbu tadqiqotda Andijon shahriga introduksiya qilingan Tunberg zirki (*Berberis thunbergii *DC.) o‘ simligida yashovchi* Parlatoria oleae *(Colvée, 1880) – zaytun qalqondorining uchrash ko‘ rsatkichlari va o‘ simlik bilan trofik aloqalari hamda ekologik nisha munosabatlari o‘ rganildi. Vizual tekshirilgan 65 tup Tunberg zirki o‘ simligining 25 tupida* P.oleae turi*ga xos yosh individlari aniqlandi (Andijon sh., 2026.08). Kuzatuvlar davomida zararlangan o‘ simliklar ulushi 38,5%ni tashkil etdi. Yosh qalqondorlar barglarning ustki (adaksial) yuzasida qayd etilib, bitta bargda urg‘ ochilarning kuzatilgan eng yuqori soni 2–3 tani tashkil etdi. Olingan natijalar* P. oleae turi*ning* B. thunbergii *bilan trofik aloqalarini Andijon sharoitida miqdoriy jihatdan tavsiflaydi hamda turning hududdagi ozuqa o‘ simliklari doirasiga oid ma’lumotlarni to‘ ldiradi.*

Kalit so‘ zlar: *Berberis thunbergii, Parlatoria oleae, Diaspididae, Tunberg zirki, ozuqa o‘ simligi, Andijon.*

РОЛЬ МАСЛИННОЙ ЩИТОВКИ (*PARLATORIA OLEAE* (COLVÉE, 1880)) В ЭНТОМОФАУНЕ ИНТРОДУЦИРОВАННОГО *BERBERIS THUNBERGII* DC.

Аннотация. *В настоящем исследовании изучены показатели встречаемости маслинной щитовки Parlatoria oleae (Colvée, 1880), её трофические связи с интродуцированным в г. Андижан барбарисом Тунберга (Berberis thunbergii DC.), а также особенности экологической ниши вида. В результате визуального обследования 65 кустов B. thunbergii молодые особи, характерные для P. oleae, были обнаружены на 25 растениях (г. Андижан, август 2026 г.). Доля заселённых растений составила 38,5%. Молодые особи щитовки отмечались на верхней (адаксиальной) поверхности листьев, при этом максимальное наблюдаемое количество самок на одном листе составляло 2–3 особи. Полученные результаты количественно характеризуют трофическую связь P. oleae с B. thunbergii в условиях Андижана и дополняют сведения о спектре кормовых растений этого вида в регионе.*

Ключевые слова: *Berberis thunbergii, Parlatoria oleae, Diaspididae, барбарис Тунберга, кормовое растение, Андижан.*

THE ROLE OF THE OLIVE SCALE (*PARLATORIA OLEAE* (COLVÉE, 1880)) IN THE ENTOMOFAUNA OF INTRODUCED *BERBERIS THUNBERGII* DC.

Abstract. *This study investigated the occurrence of the olive scale, Parlatoria oleae (Colvée, 1880), its trophic association with the introduced Japanese barberry (Berberis thunbergii DC.) in Andijan, and aspects of its ecological niche. Visual examination of 65 B. thunbergii shrubs revealed juvenile individuals of P. oleae on 25 plants (Andijan, August 2026). The proportion of infested plants was 38.5%. Juvenile scale insects were recorded on the upper (adaxial) surface of the leaves, with a maximum observed density of 2–3 females per leaf. The obtained results provide a quantitative characterization of the trophic association between P. oleae and B. thunbergii under the conditions of Andijan and supplement existing information on the host-plant range of this species in the region.*

Keywords: *Berberis thunbergii, Parlatoria oleae, Diaspididae, Japanese barberry, host plant, Andijan.*

KIRISH

Manzarali o‘ simliklarning xalqaro savdosi va yangi hududlarga introduksiya qilinishi fitofag hasharotlarning hududlararo tarqalishida muhim o‘ rin tutadi. Tirik ko‘ chatlar va vegetativ ko‘ paytirish materiallari o‘ simlik

organlarida yashirin rivojlanuvchi zararkunandalarni uzoq masofalarga olib o‘tishi mumkin [11]. Diaspididae vakillarining kichik o‘lchami, urg‘ochilarining o‘simlikka harakatsiz birikib yashashi va tanasining himoya qalqoni bilan qoplanganligi ularning novda, po‘stloq, barg yoki mevada sezilmay qolishiga imkon beradi [8, 15].

Berberis thunbergii DC. Markaziy va Janubiy Yaponiyada tabiiy tarqalgan buta bo‘lib, O‘zbekistonda introduksiya qilingan o‘simlik sifatida qayd etiladi [13]. Shu jihatdan uning fitofag entomofaunasini o‘rganish introduksiya qilingan manzarali o‘simliklarda shakllangan trofik aloqalarni tavsiflashda muhim ahamiyatga ega.

Parlatoria oleae (Colvée, 1880) zamonaviy tasnifda Hemiptera: Sternorrhyncha: Coccomorpha: Diaspididae tarkibiga kiruvchi polifag turdir. U mevali, manzarali va o‘rmon o‘simliklarining novda, shox, barg hamda mevalarida oziqlanadi. Diaspididlarning oziqlanish joyida uzoq vaqt harakatsiz saqlanishi ularni oddiy ko‘zdan kechirishda o‘simlik po‘stlog‘i yoki barg rangidan ajratishni qiyinlashtiradi, shu sababli manzarali ko‘chatlardagi kam zichlikdagi zararlanish ham fitosanitar jihatdan e’tibor talab qiladi. Kuchli zararlanish o‘simlikning zaiflashishi, barglarning sarg‘ayishi, novdalarning qurishi va mevalar rangining o‘zgarishiga olib kelishi, natijada mahsulotning tovar sifatini pasaytirishi mumkin [5, 15]. ScaleNetda tur keng ozuqa doirasiga ega kosmopolit qalqondor sifatida qayd etilgan [8].

Colvée turni 1880-yilda Ispaniyadan olingan *Olea* sp. materiali asosida *Diaspis oleae* nomi bilan tavsiflagan [7, 8]. Ispaniya turning tip joyi bo‘lsa-da, bu holat uning tabiiy vatani aynan shu hudud ekanini anglatmaydi. Turning kelib chiqishi uzil-kesil aniqlanmagan. Huffaker va boshqalar ehtimoliy tabiiy areal sifatida Shimoliy Hindiston, Pokiston va Yaqin Sharqni ko‘rsatgan [9]. Watson esa uni Sharqiy O‘rta Yer dengizidan Hindistongacha cho‘zilgan hudud bilan bog‘laydi [15]. Hozirgi areal Janubiy va G‘arbiy Osiyo, O‘rta Yer dengizi mamlakatlari, Shimoliy Afrika, Yevropaning ayrim qismlari, Shimoliy va Janubiy Amerika hamda Avstraliyani qamrab oladi [5, 8, 15].

Turning ozuqa o‘simliklari doirasiga Berberidaceae oilasining ayrim vakillari ham kiradi. ScaleNet ma’lumotlarida *Parlatoria oleae Berberis thunbergii*, *B. vulgaris*, *B. veitchii* va *B. vernae* turlarida qayd etilgan [8]. Xususan, Çalışkan Keçe va Ulusoy (2017) Turkiyaning Adana shahridagi park va manzarali o‘simliklarda Diaspididae turlarini o‘rganib, 2012-yil 11-martda Çoban Dede hududidagi *B. thunbergii* turidan olingan to‘qqizta urg‘ochi *P. oleae* namunasini qayd etgan. Ushbu ma’lumot *B. thunbergii* turining *P. oleae* uchun avvaldan ma’lum ozuqa o‘simligi ekanini ko‘rsatadi [6].

Markaziy Osiyoda koksidlarni o‘rganish XX asrning birinchi yarmida boshlangan. A.D. Arxangelskaya (1937) mintaqa koksidlari faunasi va tarqalishini umumlashtirgan, Z.S. Sinelnikova (1937) esa *P. oleae*ni Markaziy Osiyo mevali o‘simliklarining zararkunandasi sifatida maxsus tadqiq etgan [2, 14]. Keyinchalik V.N. Lashin (1956) Turkmaniston, R.A. Alimjanov va T.G. Bronshtein (1956) Zarafshon havzasi koksidlarini o‘rgangan [1, 10]. G.I. Matesova, I.D. Mitiaev va L.A. Yuxnevich (1962) Qozog‘iston meva-rezavor o‘simliklari zararkunandalari to‘g‘risidagi ma’lumotlarni umumlashtirgan [12]. B.B. Bazarov (1962) hamda Bazarov va Shmelev (1971) Tojikiston va unga tutash Markaziy Osiyo hududlaridagi qalqondorlar faunasi bo‘yicha tadqiqotlarni davom ettirgan [3, 4].

Zokirov va hammualliflari (2021) keltirgan tarixiy ma’lumotga ko‘ra, *P. oleae* 1933–1935-yillardagi karantin tekshiruvlarida O‘zbekistonning deyarli barcha hududlarida aniqlangan [19]. Mazkur mualliflarning 2015–2020-yillarda Andijon, Namangan va Farg‘ona viloyatlarida olib borgan kuzatuvlarida tur bog‘lar, tomorqalar, o‘rmonlar va ko‘cha daraxtzorlarida qayd etilib, mahalliy sharoitda yiliga ikki avlod bilan rivojlanishi ko‘rsatilgan [19]. Yakhyoev va hammualliflari (2021) turni Toshkent viloyati Diaspididae faunasi tarkibida keltirgan [18]. Xusanov va boshqalar (2023) *P. oleae* turini Andijon dendroparki va istirohat bog‘laridagi ayrim manzarali daraxtlarda qayd etgan, Xafizddinov va boshqalar (2024) esa turning Andijon viloyatida keng tarqalganini hamda Rosaceae oilasi vakillarida oziqlanishini ko‘rsatgan [16, 17].

Mavjud va foydalanilgan mahalliy manbalarda *P. oleae* turining aynan *B. thunbergii* bilan trofik aloqasiga oid ma’lumot uchramadi. Shu bois Andijon shahrida introduksiya qilingan Tunberg zirkida turning uchrash ko‘rsatkichlari, o‘simlik organlari va barg yuzalari bo‘yicha joylashishini tavsiflash uning mazkur o‘simlik entomofaunasidagi o‘rni hamda ekologik nishasining ayrim jihatlarini baholash uchun muhimdir. Tadqiqotning maqsadi *P.* oleae turini *B. thunbergii* bilan trofik aloqasi, o‘simliklar bo‘yicha uchrash ulushi va o‘simlikdagi joylashish xususiyatlarini aniqlash orqali turning ekologik nishasining trofik va joylashuvga oid jihatlarini tavsiflashdan iborat.

MATERIAL VA USLUBLAR

Tadqiqot obyekti introduksiya qilingan manzarali Tunberg zirki (*Berberis thunbergii* DC.) va unda uchragan *Parlatoria oleae* (Colvée, 1880) bo‘ldi. Tekshiruv 2026-yil 28-avgustda Andijon davlat universiteti hududida (40°47′22.7″N, 72°22′19.1″E; dengiz sathidan taxminan 510 m balandlikda) o‘tkazildi. Tekshiruv vaqtida havo harorati 28 °C, nisbiy namlik 35% ni tashkil etdi.

Hududdagi 65 tup *B. thunbergii* vizual tekshirildi. Barglarning adaksial va abaksial yuzalari, barg bandlari hamda shoxlarda tur individlarining mavjudligi ko‘zdan kechirildi. Tur uchragan tuplarda individlarning shoxlar va barg plastinkasi bo‘yicha joylashishi, ko‘zdan kechirilgan barglardagi urg‘ochilarning eng yuqori soni hamda ular joylashgan nuqtalardagi rang o‘zgarishlari qayd etildi. Yaqin atrofda o‘sayotgan *Lagerstroemia indica*, *Hibiscus syriacus*, *Euonymus japonicus* va *Photinia* sp. o‘simlik turlari ham tekshirildi.

O‘ simliklar bo‘ yicha uchrash ulushi tur aniqlangan tuplar sonining tekshirilgan tuplar umumiy soniga nisbati asosida foizda hisoblandi. Turning ekologik nisha xususiyatlari uning *B. thunbergii* bilan trofik aloqasi, o‘ simlik organlari va barg yuzalari bo‘ yicha joylashishi asosida baholandi. Kuzatilgan individlarning tashqi morfologik belgilari Watson (2002) tavsifi bilan qiyoslandi [15]. Turning taksonomik holati va ozuqa o‘ simliklari doirasi ScaleNet ma’lumotlari asosida tekshirildi [8]. *B. thunbergii* bilan ilgari qayd etilgan trofik aloqa esa Çalışkan Keçe va Ulusoy (2017) ma’lumotlari bilan taqqoslandi [6].

NATIJALAR VA MUHOKAMA

Tekshirilgan 65 tup *Berberis thunbergii* o‘ simligining 25 tupida *Parlatoria oleae* aniqlandi. O‘ simliklar bo‘ yicha turning uchrash ulushi 38,5% ni tashkil etdi. Tur aniqlangan tuplarda individlar asosan 2–3 ta shoxda kuzatilib, ushbu shoxlardagi ko‘ zdan kechirilgan barcha barglarda uchradi. Barglarning har ikki yuzasi tekshirilganda individlar faqat ustki — adaksial yuzada qayd etildi, abaksial yuzada, barg bandlari va shoxlarda esa aniqlanmadi. Ular barg plastinkasining turli qismlarida bir-biridan ajralgan holda joylashgan bo‘ lib, bitta bargda ko‘ pi bilan 2–3 ta urg‘ ochi kuzatildi. Shunday qilib, turning o‘ simlikdagi tarqalishi ayrim shoxlarda jamlangan, barg plastinkasidagi urg‘ ochi individlar esa tarqoq va kam sonli bo‘ lgan. Bunda 38,5% ko‘ rsatkich o‘ simliklar bo‘ yicha uchrash ulushini ifodalaydi.

Urg‘ ochilarga xos qalqonlar oqish–och kulrang, yumaloq yoki keng oval shaklda bo‘ lib, markazdan biroz chetroqda joylashgan to‘ q rangli ekzuviy aniq ajralib turdi. Shu barglarda oqish va cho‘ ziq, bir uchida sarg‘ ish-jigarrang ekzuviy joylashgan qalqonlar ham kuzatildi. Tashqi ko‘ rinishiga ko‘ ra, ular *P. oleae* erkaklarining preimaginal bosqichlariga xos qalqonlarga mos keldi (1-rasm). Kuzatilgan belgilar Watson (2002) tomonidan keltirilgan tavsifga, ya’ni urg‘ ochi qalqonining yumaloq yoki elliptik, erkak qalqonining esa cho‘ ziq va terminal ekzuviyli bo‘ lishiga muvofiq keldi [15].

P. oleae individlari joylashgan nuqtalar atrofida barg to‘ qimasining qizg‘ ish-binafsha tusga kirishi kuzatildi. Hasharot aniqlanmagan barglarda bunday rang o‘ zgarishi qayd etilmadi. Shu sababli qalqondor atrofidagi qizg‘ ish-binafsha dog‘ lar turning oziqlanishi bilan bog‘ liq mahalliy zararlanish belgisi sifatida baholandi. Watson (2002) *P. oleae* bilan zararlangan zaytun mevalarida binafsha rang o‘ zgarishi, ayrim boshqa mevalarda esa oziqlanish nuqtasi atrofida to‘ q qizil dog‘ lar hosil bo‘ lishini ko‘ rsatgan [15]. Mazkur tadqiqotda shunga o‘ xshash rang o‘ zgarishi *B. thunbergii* barglarida kuzatildi.

1-rasm. *Berberis thunbergii* bargining adaksial yuzasidagi *Parlatoria oleae*

Yaqin atrofda o‘ sayotgan *Lagerstroemia indica*, *Hibiscus syriacus*, *Euonymus japonicus* va *Photinia* sp. o‘ simlik turlari ko‘ zdan kechirilganda ularda *P. oleae* aniqlanmadi. Demak, mazkur joy va tekshiruv vaqtida ko‘ zdan kechirilgan manzarali o‘ simliklar orasida tur faqat *B.* thunbergii turida qayd etildi. Biroq bu natija sanab o‘ tilgan o‘ simliklarni turning ozuqa doirasidan chiqarish uchun asos bo‘ lmaydi. Jumladan, *P.* oleae turining *L.* indica turida uchrashi Turkiyada qayd etilgan [6].

Çalışkan Keçe va Ulusoy (2017) 2011–2013-yillarda Adana shahridagi park va manzarali o‘ simliklardan yig‘ ilgan 180 ta namunani o‘ rganib, Diaspididae oilasiga mansub 23 turni aniqlagan [6]. Mualliflar 2012-yil mart oylarida Çoban Dede hududidagi *B. thunbergii* turidan to‘ qqizta urg‘ ochi *P. oleae*, 2012-yil avgustda esa Pınar 2 parkidagi *L.* indica turidan to‘ rtta urg‘ ochi namuna qayd etgan [6]. Mazkur maqolada *B. thunbergii* turining tekshirilgan tuplari soni, tur aniqlangan o‘ simliklar ulushi, bargdagi individlar soni va ularning barg yuzalari bo‘ yicha joylashuvi berilmagan [6]. Shu sababli ikki tadqiqot natijalarini bevosita miqdoriy taqqoslash mumkin emas. Andijonda aniqlangan 38,5% uchrash ulushi va bitta bargda ko‘ pi bilan 2–3 ta urg‘ ochining qayd etilishi mazkur trofik aloqaning mahalliy miqdoriy xususiyatlarini ifodalaydi.

ScaleNetda *B. thunbergii P. oleae* turining ozuqa o‘ simliklaridan biri sifatida keltirilgan [8]. Shu bois Andijondagi topilma dunyo miqyosida yangi ozuqa o‘ simligi qaydi hisoblanmaydi. Biroq mavjud va foydalanilgan mahalliy manbalarda mazkur trofik aloqaga oid ma’lumot uchramadi. Olingan natijalar *P. oleae* turining *B. thunbergii* entomofaunasidagi fitofag tarkibiy qismlardan biri ekanini ko‘ rsatdi. Turning ushbu o‘ simlikdagi ekologik nishasi barglar bilan trofik bog‘ liqligi, faqat adaksial yuzada uchrashi, ayrim shoxlarda jamlanishi va barg plastinkasida tarqoq joylashishi bilan tavsiflandi. Mazkur natijalar turning Andijon sharoitidagi ozuqa aloqalari va o‘ simlikda joylashish xususiyatlariga oid ma’lumotlarni to‘ ldiradi.

XULOSA

Andijon shahrida *Parlatoria oleae* turining introduksiya qilingan *Berberis thunbergii* o‘ simligi bilan trofik aloqasi qayd etildi. Mazkur topilma turning hududiy ozuqa aloqalariga doir ma’lumotlarni to‘ ldiradi hamda introduksiya qilingan manzarali o‘ simliklarda Diaspididae vakillarini muntazam monitoring qilish zarurligini ko‘ rsatadi.

MUALLIFLAR BAYONOTLARI

Mualliflar hissasi. A.K. Xusanov va S.T. Tillayeva tadqiqot natijalarini tahlil qilish, muhokama etish hamda maqola matnini tayyorlash va tahrirlashda ishtirok etdilar. Barcha mualliflar maqolaning yakuniy variantini ko‘ rib chiqdilar va ma’qulladilar.

Manfaatlar to‘ qnashuvi. Mualliflar ushbu tadqiqot bilan bog‘ liq manfaatlar to‘ qnashuvi mavjud emasligini bildiradilar.

Moliyalashtirish. Tadqiqot maxsus grant yoki tashqi moliyaviy ko‘ mak asosida moliyalashtirilmagan.

QISHLOQ XO‘ JALIGI MAXSULOTLARINI QAYTA ISHLASHDA BIOTEXNOLOGIK USULLARNING AHAMIYATI

Yuldasheva Muhlisa Muhammadjon qizi
Qo‘ qon universiteti Andijon filiali
muhlisayoldasheva533@gmail.com.

Annotatsiya: *Ushbu maqolada qishloq xo‘ jaligi xomashyosini qayta ishlashda fermentativ va mikroorganizmlar asosidagi yondashuvlardan foydalanildi. Mikroorganizmlar asosidagi biokonversiya substratning hazm bo‘ lishini yengillashtirib, mikrobiologik xavfsizlik ko‘ rsatkichlarini yaxshilanadi. Fermentativ va mikrobiologik bosqichlarni birlashtirgan texnologiya aniq ustunlik berdi. Ushbu maqolada qishloq xo‘ jaligi mahsulotlarini qayta ishlashda samarali foyda beradigan, biotexnologik usullar haqida batafsil yoritiladi. Oziq-ovqat mahsulotlarini qayta ishlashda, ishlab chiqarishda fermentlardan, mikroorganizmlardan, biologik jarayonlardan foydalanish muhokama qilindi. Bundan tashqari biotexnologik usullarning mahsulot sifatiga ta’siri hamda uning sifatini oshirishdagi roli ko‘ rib chiqildi.*

Kalit so‘ zlar: *biokonversiya, fermentativ gidroliz, mikrobiologik xavfsizlik, saqlash muddati,biotexnologik usul, qishloq xo‘ jalik mahsulotlari.*

ЗНАЧЕНИЕ БИОТЕХНОЛОГИЧЕСКИХ МЕТОДОВ В ПЕРЕРАБОТКЕ СЕЛЬСКОХОЗЯЙСТВЕННОЙ ПРОДУКЦИИ

Аннотация. *Аннотация: В статье рассматривается применение ферментативных и микробиологических методов при переработке сельскохозяйственного сырья. Биоконверсия с использованием микроорганизмов способствует повышению усвояемости субстрата и улучшению показателей микробиологической безопасности. Технология, сочетающая ферментативные и микробиологические этапы, продемонстрировала явные преимущества. В статье представлен подробный обзор биотехнологических методов, обеспечивающих значительные выгоды при переработке сельскохозяйственной продукции. Обсуждаются вопросы использования ферментов, микроорганизмов и биологических процессов в пищевой промышленности. Кроме того, анализируется влияние биотехнологических методов на качество продукции и их роль в его повышении.*

Ключевые слова: *биоконверсия, ферментативный гидролиз, микробиологическая безопасность, срок годности, биотехнологический метод, сельскохозяйственная продукция.*

THE IMPORTANCE OF BIOTECHNOLOGICAL METHODS IN THE PROCESSING OF AGRICULTURAL PRODUCTS

Abctract: *This article examines the use of enzymatic and microorganism-based approaches in the processing of agricultural raw materials. Microorganism-based bioconversion facilitates substrate digestibility and improves microbiological safety indicators. A technology combining enzymatic and microbiological stages demonstrated distinct advantages. The article provides a detailed overview of biotechnological methods that offer significant benefits in agricultural product processing. It discusses the application of enzymes, microorganisms, and biological processes in food production and processing. Furthermore, the impact of biotechnological methods on product quality and their role in enhancing quality are analyzed.*

Keywords: *bioconversion, enzymatic hydrolysis, microbiological safety, shelf life, biotechnological method, agricultural products.*

KIRISH

Zamonaviy biotexnologiya oziq-ovqat mahsulotlarini qayta ishlash sohasida, jumladan rezavor-meva va sabzavotlarni qayta ishlash, sut mahsulotlari, ishlab chiqarishda muhim rol o‘ ynaydi. Qishloq xo‘ jaligi texnologiyasi eng diqqatga sazovor xususiyati shundan iboratki, iste’mol qilinmaydigan va tez buziladigan oziq-ovqat mahsulotini qayta ishlab ta’mli va uzoqroq saqlanadigan oziq-ovqatga aylantira oladi, bu esa oziqlanish, iste’mol qilish uchun xavfsiz va sifatli bo‘ ladi. Raqamlar shuni ko‘ rsatadiki, dunyo bo‘ yicha qayta ishlangan oziq-ovqatlarning uchdan bir qismi

fermentlangan oziq-ovqatdir, bu tabiiy yoki mikroblar qo‘ shilgan ixtiyoriy fermentatsiya bilan amalga oshiriladi. Noto‘ g‘ ri fermentatsiya toksin hosil bo‘ lishiga olib kelishi mumkin. Bu esa iste’mol qiluvchi organizm uchun xavfli bo‘ lishi mumkin. Shuning uchun sifat nazorati eng muhimdir. Yuqorida ta’kidlab o‘ tilganidek tuban hamda yuksak tuzilishga ega mikroorganizmlar ferment olish uchun istiqbolli manba hisoblanadi. Bu usulga zamonaviy usul bo‘ lgan rekombinant DNK olish texnologiyasini qo‘ shib qo‘ llash sarflanayotgan mikroblarni tejamkor, sanoat miqyosida qollashga yaroqli qiladi.

Fermentlangan oziq-ovqat mahsulotlarida bakeriosin hosil qiluvchi kulturadan foydalanishga e’tibor qaratish kerak. Bakteriosin- bakterialar tomonidan ishlab chiqariladigan, boshqa bakteriyalarni o‘ sishini to‘ xtatuvchi yoki ularni o‘ ldiruvchi oqsil tabiatli modda.(Harris va boshq., 1992, Ming va Daeschel, 1993, Mazotta va boshq., 1995). [1,2,3] .Ma’lum bir oziq-ovqat mahsulotini qayta ishlash jarayonida bir yoki bir nechta bakteriosindan foydalanish mumkin. Bundan tashqar i bakteriosin hosil qiluvchi shtamlardan foydalanishni ehtiyotkorlik bilan nazorat qilish kerak. Aks holda antibacterialga qarshi mutantlar paydo bo‘ lishiga sabab bo‘ lishi mumkin.

Hozirgi XXI asrda kundalik iste’mol qilinadigan ovqatlar tarkibiga fermentlanganw oziq-ovqatlar kiradi. Sanoat, fan-texnika rivojlanishi hisobga olgan holda fermentlangan mahsulotlarni tijorat miqyosida ishlab chiqarishda asosiy manba sut, go‘ sht, bodring va karam hisoblanadi. Bir so‘ z bilan aytganda, zamonaviy hisoblangan fermentativ texnologiyalar xomashyoni qayta ishlash hamda texnologik jarayonlarni tezlashtirish imkonini beradi. . Bu 20 xil turdagi 400 dan ortiq pishloq turini (Jay, 1996) va juda keng ko‘ lamli yogurt va fermentlangan sut ichimliklari, fermentlangan kolbasa va salyami, turshilar va sauerkraut beradi. [4]

Oziq-ovqatni fermentatsiya qilish orqali saqlash shakarlar va ularning hosilalarini oksidlanish prinsipi asosida amalga oshiriladi, natijada odatda kislota, spirt va karbonat angidrid kabi oxirgi mahsulotlar hosil bo‘ ladi. Bu oxirgi mahsulotlar oziq-ovqatni buzadigan mikroorganizmlarning o‘ sishini nazorat qiladi va chunki oksidlanish faqat qisman sodir bo‘ ladi, oziq-ovqat iste’molchi uchun yetarli darajada energiya salohiyatini saqlab qoladi.

Fermentatsiya atamasi uning eng qat’iy, kimyoviy ta’rifida quyidagilarni tavsiflash uchun ishlatiladi:

Oziq-ovqatlarni biopreservatsiya qilishda ishlatiladigan laktik kislota bakteriyalarining o‘ ziga xos mikroblarga qarshi mexanizmlari organik kislotalar, gidrogen peroksid, karbonat angidrid, diatsetil, reuterin kabi keng spektrli antimikrobiyallar va bakteriosinlar ishlab chiqarishni o‘ z ichiga oladi (De Vuyst va Vandamme, 1994). Ushbu omillarning ko‘ pchiligining MicroguardR ta’sirini bostirishda rol o‘ ynashi taxmin qilinadi (Al-Zoreky va boshq., 1991, Lyon va boshq., 1993). [5,6,7,8,9]. U suvsiz sutni fermentatsiya qilish orqali ishlab chiqariladi.

Qishloq xo‘ jaligi mahsulotlarining 30–180 daqiqalik fermentativ ishlovi saqlash muddati, oziqaviy qiymat va mikrobiologik xavfsizlikni bir vaqtda belgilaydi [10]. FAO ma’ lumotlari oziq-ovqat yo‘ qotishlari va chiqindilarining katta qismi dastlabki qayta ishlash bosqichida shakllanishini ko‘ rsatadi [11]. Shuning uchun biotexnologik usullar chiqimni kamaytirish bilan birga biofaollikni saqlashga yo‘ naltirilgan texnogik zarurat sifatida baholanadi [12]. Tadqiqot ob’ ekti — don, meva-sabzavot, sut xomashyosi va moyli urug‘ lar; tadqiqot predmeti — fermentativ qayta ishlash hamda mikroorganizmlar asosidagi biokonversiyaning samaradorligi. Maqsad qishloq xo‘ jaligi mahsulotlarini qayta ishlashda biotexnologik usullarning ahamiyatini laboratoriya sharoitida baholashdan iborat bo‘ ldi.

Dunyo bo‘ ylab turli xil fermentlangan ovqatlar mavjud bo‘ lib, ularda turli mikroorganizmlar turli substratlarni metabolizatsiya qilib, hamda biotexnologiyaning yutuqlaridan foydalanib noyob mahsulotlar hosil qilinmoqda. Ko‘ plab bunday ovqatlarda fermentatsiya jarayonlarining biologik va mikrobiologik asoslari yaxshi tushunilmagan. Mavjud bo‘ lgan ozroq ma’lumot asosan tayyor mahsulotdagi asosiy mikroflora identifikatsiyasi va ehtimol dastlabki xarakteristikasini o‘ rganishga qaratilgan.

Xulosa qilib aytganda, qishloq xo‘ jalik mahsulotlarini qayta ishlashda biotexnologik usullardan oqilona foydalanish oziq-ovqat sanoatining rivojlanishiga sabab bo‘ ladi. Shuni alohida ta’kidlash kerakki, fermentatsiya texnologiyalari, fermentativ jarayonlar hamda mikroorganizmlardan foydalanib oziq-ovqat mahsulotlariga ishlov berish sifatni yaxshilashga, saqlash muddatini uzaytirishga xizmat qiladi. Kelgusida yuqoridagi barcha texnologiyalarni ilmiy izlanishlar asosida yanada takomillashtirish, fermentlar amaliyotini joriy qilish va inson hayoti uchun xavfsiz bo‘ ladigan usullarni rivojlantirish aholini sifatli oziq-ovqat mahsulotlari bilan ta’minlashga imkon beradi.

Annotatsiya. *Ushbu maqolada Markaziy Osiyoning to‘rt davlatiga (O‘zbekiston, Qozog‘iston, Qirg‘iziston va Tojikiston) yumshoq bug‘doy navlarining fiziologik va morfologik xususiyatlari (barg sathi, transpiratsiya jadalligi, xlorofill miqdori, bargning umumiy suv miqdori va suv saqlash qobiliyati) o‘rtasidagi o‘zaro bog‘liqlik tahlil qilingan. Tadqiqot natijalari barg sathining kengayishi transpiratsiya intensivligi va xlorofill to‘planishiga ijobiy ta’sir etishini, qurg‘oqchilik sharoitida esa bargning suv saqlash xususiyati o‘simlik barqarorligini ta’minlovchi asosiy omil ekanini ko‘rsatdi.*

Kalit so‘zlar: *yumshoq bug‘doy, barg sathi, transpiratsiya, xlorofill, SPAD, suv saqlash xususiyati, fiziologik ko‘rsatkichlar.*

ВЗАИМОСВЯЗЬ МОРФОФИЗИОЛОГИЧЕСКИХ ПОКАЗАТЕЛЕЙ СОРТОВ МЯГКОЙ ПШЕНИЦЫ РАЗЛИЧНОГО ПРОИСХОЖДЕНИЯ.

Аннотация. *В данной статье проанализирована взаимосвязь между физиологическими и морфологическими параметрами (площадь листа, интенсивность транспирации, содержание хлорофилла, общее оводнение и водоудерживающая способность) сортов мягкой пшеницы четырех стран Центральной Азии (Узбекистан, Казахстан, Кыргызстан и Таджикистан). Результаты показали, что увеличение площади листа положительно влияет на транспирацию и накопление хлорофилла, а в условиях засухи ключевым фактором выживаемости растений является их водоудерживающая способность.*

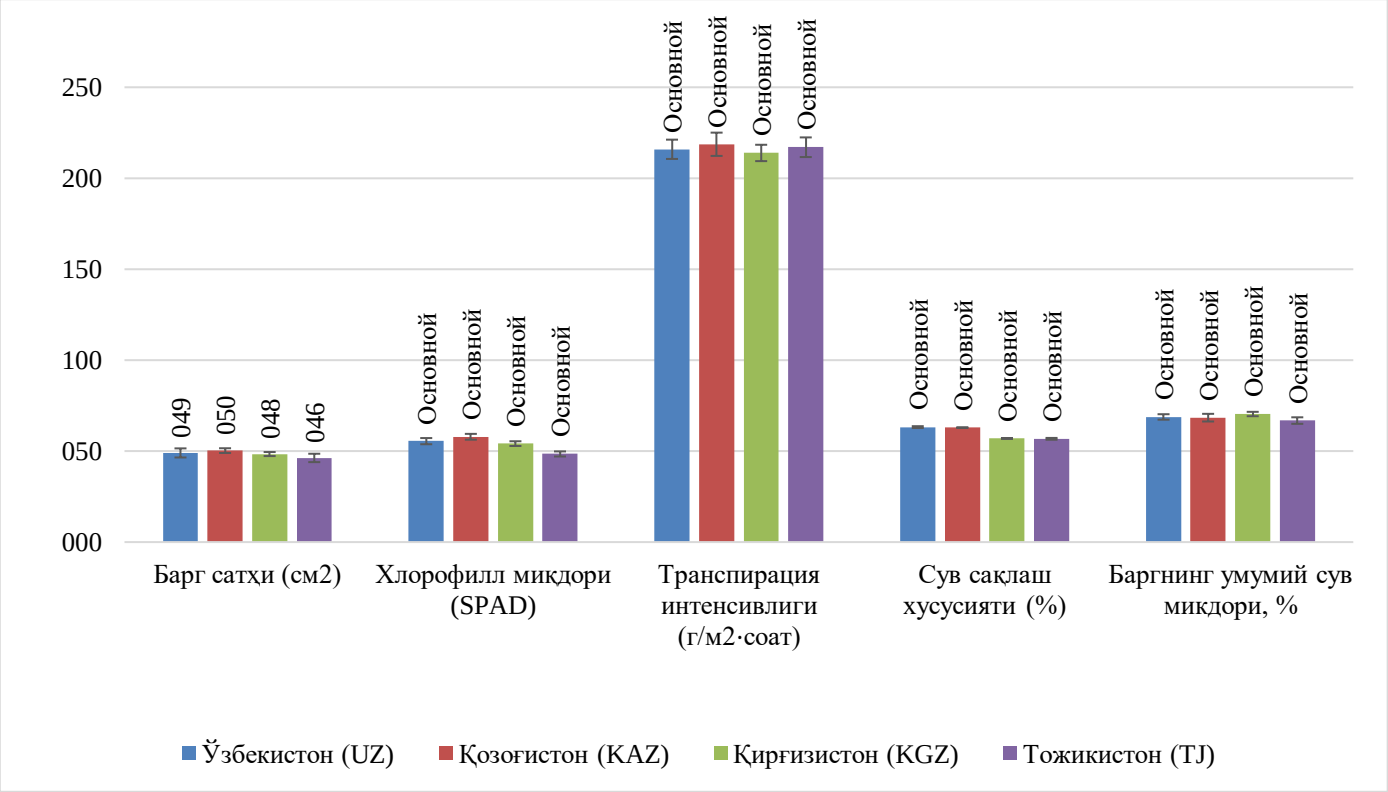
Ключевые слова: *мягкая пшеница, площадь листа, транспирация, хлорофилл, SPAD, водоудерживающая способность, физиологические показатели.*

INTERRELATIONSHIP BETWEEN THE MORPHO-PHYSIOLOGICAL INDICATORS OF SOFT WHEAT VARIETIES OF DIVERSE ORIGINS.

Abstract. *This article analyzes the relationship between the physiological and morphological parameters (leaf area, transpiration rate, chlorophyll content, total water content, and water-holding capacity) of soft wheat varieties from four Central Asian countries (Uzbekistan, Kazakhstan, Kyrgyzstan, and Tajikistan). The results revealed that an increased leaf area positively enhances transpiration intensity and chlorophyll accumulation. However, under drought conditions, the leaf water-holding capacity serves as the primary mechanism for plant survival.*

Keywords: *soft wheat, leaf area, transpiration, chlorophyll, SPAD, water-holding capacity, physiological traits.*

Kirish. Iqlim o‘zgarishi va suv resurslari tanqisligi sharoitida qishloq xo‘jaligi ekinlari, xususan, yumshoq bug‘doy navlarining qurg‘oqchilikka va issiqlikka moslashuvchanlik mexanizmlarini o‘rganish dolzarb ahamiyat kasb etadi [2,3]. O‘simliklarning suv rejimi, fotosintetik faolligi va barg morfologiyasi bir-birini to‘ldiruvchi yagona fiziologik tizim sifatida hosildorlikni belgilab beradi [4]. Markaziy Osiyo davlatlari geo-iqlimiy sharoiti jihatidan farqlangani bois, ushbu hududlarda yaratilgan navlarning adaptiv fiziologik xususiyatlarini qiyosiy tahlil qilish seleksiya jarayonida muhim ahamiyatga ega [1].



Materiallar va usullar. Tadqiqotlar davomida O‘zbekiston, Qozog‘iston, Qirg‘iziston va Tojikiston seleksiyasiga mansub yumshoq bug‘doy navlari o‘rganildi. Barg sathi (sm2), transpiratsiya jadalligi (g/m2 soat), xlorofill miqdori

(SPAD), bargning umumiy suv miqdori (%) va barglarning suv saqlash qobiliyati (%) umumiy qabul qilingan fiziologik-bioximik metodikalar va laboratoriya tahlillari asosida aniqlandi va statistik qayta ishlandi [2,4].

Natijalar va ularning muhokamasi.Tadqiqotlarimiz davomida to‘rt davlat (O‘zbekiston, Qozog‘iston, Qirg‘iziston va Tojikiston) navlarining fiziologik ko‘rsatkichlari orasida uzviy bog‘liqlik borligi aniqlandi (Rasm).

O‘simlikning suv rejimi, fotosintetik faolligi va barg morfologiyasi bir-birini to‘ldiruvchi tizim sifatida namoyon bo‘ldi. O‘tkazilgan tadqiqotlar natijalari shuni ko‘rsatadiki, barg sathining kengligi transpiratsiya intensivligi va xlorofill miqdori bilan to‘g‘ri proporsional bog‘liqlikka ega.

Xususan, barg sathi keng bo‘lgan Qozog‘iston (50,29 sm2) va O‘zbekiston (49,02 sm2) navlarida transpiratsiya jarayoni yuqori (mos ravishda 218,66 va 215,91 g/m2 soat) bo‘lishi kuzatildi. Bu barg yuzasining kengligi hisobiga o‘simlikning atrof-muhit bilan gaz va suv almashinuvi faol kechganini anglatadi. Jadal transpiratsiya xlorofill sinteziga ijobiy ta’sir ko‘rsatib, Qozog‘iston navlarida eng yuqori xlorofill miqdori (57,89 SPAD) qayd etildi, bu esa quyosh energiyasini yutish qobiliyati yuqoriligini tasdiqlaydi .

Rasm. Suv balansi ko‘rsatkichlarini o‘zaro bog‘liqligi.

O‘simliklarning issiq va qurg‘oqchil sharoitga chidamliligini belgilovchi asosiy omil suv saqlash xususiyatidir. O‘zbekiston navlarida suv saqlash qobiliyati (63,21 %) yuqori bo‘lib, umumiy suv miqdori (68,8 %) bilan mutanosiblik ko‘rsatdi. Qirg‘iziston navlarida umumiy suv miqdori eng yuqori (70,4 %) bo‘lsa-da, suv saqlash qobiliyati (56,96 %) pastroq bo‘ldi, bu esa suvni tez yo‘qotishi, ammo tuproq namligida jadal o‘zlashtirishini anglatadi. Tojikiston navlari barg sathi (46,27 sm2) va xlorofill (48,46 SPAD) bo‘yicha pastroq ko‘rsatkichga ega bo‘lgan bo‘lsa-da, transpiratsiya jadalligini (217,04 g/m2 soat) yuqori saqlab qolgan, bu esa yuqori haroratda to‘qimalarni sovutish mexanizmi sifatida xizmat qiladi.

Xulosa. Xulosa qilib aytganda, barg sathining kengayishi transpiratsiyaning kuchayishiga va natijada xlorofill miqdorining ortishiga xizmat qilgan. Biroq, suv tanqisligi va issiqlik sharoitida o‘simliklarning chidamliligi bargning suv saqlash xususiyati hamda to‘qimalardagi suv balansi barqarorligiga bevosita bog‘liqdir.

Qurg‘oqchilikka va issiqqa chidamli navlar seleksiyasida O‘zbekiston navlariga xos yuqori suv saqlash qobiliyati hamda Qozog‘iston navlariga xos fotosintetik faollik va barg yuzasi ko‘rsatkichlarini kombinatsiya qilish tavsiya etiladi.

Annotatsiya: *Maqolada O‘ zbekiston Respublikasi Fanlar akademiyasi Botanika instituti O‘ zbekiston Milliy gerbariysi (TASH) fondida saqlanayotgan Eremurus M.Bieb. turkumiga oid raqamlashtirilgan kolleksiya taksonomik, geografik va tarixiy jihatdan kompleks tahlil qilindi. Tadqiqot doirasida 1 921 ta gerbariy yozuvi tahlil qilindi. Namuna yozuvlarining noyob identifikatorlari tekshirilib, takroriy qiymatlar aniqlanmadi. Kolleksiya 38 turdan iborat bo‘ lib, eng ko‘ p namuna E. soogdianus (291), E. olgae (209), E. regelii (171), E. fuscus (170) va E. tianschanicus (133) turlariga to‘ g‘ ri keladi. 1 920 ta georeferensiyalangan yozuv davlat chegaralari bilan fazoviy solishtirildi: 1 057 ta yozuv O‘ zbekiston, 310 tasi Qirg‘ iziston, 250 tasi Qozog‘ iston, 231 tasi Tojikiston va 66 tasi Turkmaniston hududiga to‘ g‘ ri keldi. Yig‘ imlar 1905–2021-yillarni qamrab olib, 1930-yillarda eng yuqori faollik kuzatildi (626 yozuv; 32,6%). Kollektor(lar) maydonida 497 xil kollektor yoki kollektorlar guruhi yozuvi qayd etilgan; 22 yozuvda kollektor noma’lum. Natijalar TASH fondidagi Eremurus kolleksiyasining Markaziy Osiyo floristikasi, taksonomiyasi, biogeografiyasi va tarixiy kolleksiya tadqiqotlari uchun yuqori ilmiy qiymatini ko‘ rsatadi.*

Kalit so‘ zlar: *Eremurus; Asphodelaceae; O‘ zbekiston Milliy gerbariysi; TASH; gerbariy kolleksiyasi; Markaziy Osiyo; georeferensiya; raqamlashtirish.*

ТАКСОНОМИЧЕСКИЙ, ГЕОГРАФИЧЕСКИЙ И ИСТОРИЧЕСКИЙ АНАЛИЗ КОЛЛЕКЦИИ *EREMURUS* M.BIEB. (ASPHODELACEAE) В НАЦИОНАЛЬНОМ ГЕРБАРИИ УЗБЕКИСТАНА (TASH)

Аннотация: *В статье проведён комплексный таксономический, географический и исторический анализ оцифрованной коллекции рода Eremurus M.Bieb., хранящейся в Национальном гербарии Узбекистана (TASH) Института ботаники Академии наук Республики Узбекистан. В рамках исследования проанализирована 1 921 гербарная запись. Повторяющихся значений уникальных идентификаторов записей не обнаружено. Коллекция включает 38 видов; наиболее полно представлены E. soogdianus (291 образец), E. olgae (209), E. regelii (171), E. fuscus (170) и E. tianschanicus (133). Для 1 920 георефернцированных записей определена принадлежность к государствам: 1 057 записей относятся к Узбекистану, 310 — к Кыргызстану, 250 — к Казахстану, 231 — к Таджикистану и 66 — к Туркменистану. Сборы охватывают 1905–2021 гг.; максимальная активность приходится на 1930-е годы (626 записей; 32,6%). В поле сведений о коллекторах выявлено 497 различных записей имён коллекторов или групп коллекторов, при этом в 22 случаях коллектор указан как неизвестный. Полученные результаты подтверждают высокую научную ценность коллекции Eremurus TASH для флористических, таксономических, биогеографических и историко-гербарных исследований Центральной Азии.*

Ключевые слова: *Eremurus; Asphodelaceae; Национальный гербарий Узбекистана; TASH; гербарная коллекция; Центральная Азия; георефернцирование; оцифровка.*

TAXONOMIC, GEOGRAPHIC AND HISTORICAL ANALYSIS OF THE *EREMURUS* M.BIEB. (ASPHODELACEAE) COLLECTION IN THE NATIONAL HERBARIUM OF UZBEKISTAN (TASH)

Abstract: *This study provides an integrated taxonomic, geographic and historical analysis of the digitized Eremurus M.Bieb. collection preserved in the National Herbarium of Uzbekistan (TASH), Institute of Botany, Academy of Sciences of the Republic of Uzbekistan. A total of 1,921 herbarium records were analyzed. All unique record identifiers were checked and no duplicates were detected. The collection comprises 38 species, with E. soogdianus (291 records), E. olgae (209), E. regelii (171), E. fuscus (170) and E. tianschanicus (133) being the best represented. Country assignment was performed for 1,920 georeferenced records by spatial overlay with national boundaries: 1,057 records were assigned to Uzbekistan, 310 to Kyrgyzstan, 250 to Kazakhstan, 231 to Tajikistan and 66 to Turkmenistan. Collecting dates span 1905–2021, with a pronounced maximum in the 1930s (626 records; 32.6%). The collector-information field contains 497 distinct collector or collecting-team strings, including spelling variants and multi-person entries; 22 records are marked as unknown. The results demonstrate the high value of the TASH Eremurus collection for floristic, taxonomic, biogeographic and historical collection research in Central Asia.*

Keywords: *Eremurus; Asphodelaceae; National Herbarium of Uzbekistan; TASH; herbarium collection; Central Asia; georeferencing; digitization.*

Kirish

Gerbariy fondlari o‘ simliklar xilma-xilligini hujjatlashtiruvchi eng uzoq muddatli ilmiy arxivlardan biridir. Har bir gerbariy varag‘ i ma’lum vaqt va makonda uchragan o‘ simlik individini, uning taksonomik identifikatsiyasi, yig‘ ilgan sanasi, lokaliteti va kollektori haqidagi ma’lumotlar bilan birga saqlaydi. Shu sababli gerbariy namunasi faqat taksonomik dalil emas, balki tarixiy biogeografik kuzatuv sifatida ham katta ahamiyat kasb etadi [1, 2]. So‘ nggi o‘ n yilliklarda kolleksiyalarni raqamlashtirish, yorliq ma’lumotlarini standart maydonlarga ajratish va georeferensiyalash gerbariylardan foydalanish doirasini sezilarli kengaytirdi. Raqamlashtirilgan kolleksiyalar endilikda klassik sistematika bilan bir qatorda fenologiya, tarqalish dinamikasi, global o‘ zgarish biologiyasi, konservatsiya va katta hajmdagi biodiversitet ma’lumotlarini integratsiyalashda qo‘ llanmoqda [3–7].

O‘ zbekiston Milliy gerbariysi (TASH) Markaziy Osiyodagi yirik botanika kolleksiyalaridan biri bo‘ lib, uning fondi mintaqadagi floristik tadqiqotlarning ikki asrdan ortiq tarixini aks ettiradi. TASH fondining rivojlanishi, raqamlashtirilishi va xalqaro biodiversitet infratuzilmalariga ulanishi O‘ zbekiston florasi haqidagi tarixiy ma’lumotlarni qayta tahlil qilish uchun yangi imkoniyatlar yaratmoqda [1, 14, 17]. Bunday inventarizatsion tadqiqotlar gerbariy fondining qaysi taksonlar, hududlar va tarixiy davrlar bo‘ yicha kuchli yoki sust qamrab olinganini aniqlashga yordam beradi. Bu esa kelgusidagi dala tadqiqotlari, taksonomik reviziyalar va tarqalish modellarini rejalashtirishda bevosita amaliy ahamiyatga ega.

Eremurus M.Bieb. Asphodelaceae Juss. oilasining Markaziy va Janubi-g‘ arbiy Osiyoda keng tarqalgan, ayniqsa Markaziy Osiyoda yuqori xilma-xillikka ega turkumidir. O‘ zbekiston turkumning asosiy xilma-xillik markazlaridan biri hisoblanadi. O‘ zbekiston florasidagi *Eremurus* turlarining morfologik va taksonomik tarkibi qayta ko‘ rib chiqilgan, keyingi molekulyar-filogenetik va plastom tadqiqotlari esa turkumning evolyutsion tarixida Markaziy Osiyoning markaziy rolini ko‘ rsatgan [9–12]. Shuning uchun TASH fondidagi *Eremurus* kolleksiyasini alohida tahlil qilish bir vaqtning o‘ zida ikki muhim masalani yechadi: birinchidan, mavjud taksonomik bilimlar qanday tarixiy materiallar bilan ta’minlanganini ko‘ rsatadi; ikkinchidan, Markaziy Osiyodagi turkum tarqalishining makon-vaqt bo‘ yicha gerbariy dalillarini umumlashtiradi.

Mazkur tadqiqotning maqsadi TASH fondidagi *Eremurus* M.Bieb. kolleksiyasining raqamlashtirilgan ma’lumotlari asosida uning taksonomik tarkibi, davlatlar bo‘ yicha geografik qamrovi, yig‘ imlarning yillar va o‘ n yilliklar bo‘ yicha dinamikasi hamda kollektor yozuvlari tarkibini baholashdan iborat. Tadqiqotning amaliy vazifalari noyob identifikator maydonidagi takrorlanishlarni tekshirish, har bir tur bo‘ yicha gerbariy yozuvlari sonini hisoblash, koordinatalar asosida davlatga mansublikni aniqlash, tarixiy yig‘ im intensivligini baholash, kollektor(lar) maydonidagi asosiy kollektor yoki kollektorlar guruhi yozuvlarini ajratish va natijalarni jadval, diagramma hamda xarita ko‘ rinishida ifodalashdan iborat. Ushbu yondashuv TASH *Eremurus* kolleksiyasini mustaqil ilmiy ma’lumotlar majmuasi sifatida tavsiflash va keyingi taksonomik hamda biogeografik ishlarga tayyor holga keltirishga qaratilgan.

Adabiyotlar tahlili

Gerbariy kolleksiyalarining ilmiy vazifasi tarixan turlarni tavsiflash, nomlarni tekshirish va floristik ro‘ yxatlarni asoslash bilan bog‘ liq bo‘ lgan. Kolleksiyani shakllantirish, yorliq ma’lumotlarini saqlash, nomenklaturaviy tartibga keltirish va namunalarni kuratsiya qilishning asosiy tamoyillari klassik gerbariy metodologiyasida batafsil ishlab chiqilgan [2]. Biroq raqamli texnologiyalar gerbariyning funksiyasini statik arxivdan fazoviy-vaqtli biodiversitet ma’lumotlar bazasiga aylantirdi. Soltis [3] gerbariylarni raqamlashtirish ilgari bajarilishi qiyin bo‘ lgan keng ko‘ lamli

qiyosiy tadqiqotlarni amalga oshirish imkonini berganini ta'kidlaydi. Heberling va Isaac [4] esa tarixiy namunalar zamonaviy tadqiqotlarda dastlabki yig' ish maqsadidan ancha kengroq vazifalarni bajarayotganini ko' rsatgan.

Gerbariy ma'lumotlarining qo' llanish sohalari ham sezilarli diversifikatsiyalangan. Heberling va hammualliflar [5] 13 mingdan ortiq maqola tahlili asosida gerbariyga asoslangan tadqiqotlarda klassik taksonomik mavzular bilan birga global o' zgarish biologiyasi, DNK tahlili va biodiversitet informatikasining tez o' sayotganini ko' rsatgan. Lang va hammualliflar [6] tarixiy kolleksiyalarni ekologik va evolyutsion jarayonlarning uzoq muddatli guvohi sifatida baholaydi. Lavoie [7] gerbariy namunalarining biogeografik hamda ekologik o' zgarishlarni qayta tiklashdagi imkoniyatlarini tahlil qilib, ayniqsa kompyuterlashtirilgan kolleksiyalarning tadqiqotlarda ko' proq ishlatilishini qayd etgan. Shu bilan birga, bunday ma'lumotlarning yig' imdagi notekislik, taksonomik qayta aniqlashlar, georeferensiya noaniqligi va kollektor faoliyatidagi tarixiy tarafkashlik kabi cheklovlari mavjud. Demak, gerbariy ma'lumotlarini statistik tahlil qilishda natijalarni tabiiy populyatsiyaning mutlaq ko' pligi bilan tenglashtirmaslik muhim.

Raqamli bioxilma-xillik ma'lumotlarini almashishda standartlashtirish alohida ahamiyatga ega. Darwin Core takson, uchrashuv yoki namuna yozuvi, hodisa, lokalitet, koordinata va kollektor kabi asosiy ma'lumotlarni yagona atamalar tizimida ifodalash imkonini beradi [8]. Tahlil qilingan raqamli gerbariy yozuvlaridagi noyob identifikator, ilmiy nom, yig' im sanasi va yili, kollektor(lar), o' nlik geografik kenglik hamda o' nlik geografik uzunlik maydonlari ana shu xalqaro yondashuvga mos keladi. Bunday tuzilma TASH ma'lumotlarini kelgusida GBIF tizimiga uzatish yoki boshqa gerbariy fondlari bilan birlashtirish imkoniyatini oshiradi [17].

Eremurus bo' yicha O' zbekistonda olib borilgan zamonaviy tadqiqotlar turkumning mamlakat florasidagi yuqori xilma-xilligini ko' rsatadi. Makhmudjanov va hammualliflar [9] O' zbekiston florasidagi turlarni morfologik belgilar va mavjud nomenklaturaviy ma'lumotlar asosida qayta baholagan. Plastom ma'lumotlari *Eremurus* ichidagi filogenetik munosabatlarni aniqlashtirish va potensial molekulyar markerlarni ajratish imkonini berdi [10]. Kengroq evolyutsion tahlil Markaziy Osiyo turkum diversifikatsiyasining asosiy hududi ekanini ko' rsatdi [11]. Keyingi monografik umumlashtirish turkumni global miqyosda kompleks ko' rib chiqish uchun asos yaratdi [12]. Mazkur ishlarda TASH va boshqa gerbariy fondlarining namunalari takson identifikatsiyasi, morfologik taqqoslash va tasdiqlovchi namuna sifatida muhim rol o' ynaydi. Shuning uchun kolleksiyaning o' zi haqidagi metama'lumotlarni tahlil qilish *Eremurus* bo' yicha avvalgi biologik tadqiqotlarni to' ldiruvchi, ammo ulardan metodologik jihatdan farqli yo' nalishdir.

TASH tarixiga oid ma'lumotlar uning fondida milliondan ortiq namuna saqlanishi va kolleksiyaning raqamlashtirish bosqichiga faol kirganini ko' rsatadi [1]. TASHning tip namunalari ham GBIF orqali alohida ma'lumotlar to' plami sifatida e'lon qilingan [17]. Biroq raqamlashtirishning ilmiy qiymati faqat tasvir va yorliqlarni elektron shaklga o' tkazish bilan cheklanmaydi. Kolleksiya ichidagi taksonomik, geografik va vaqt bo' yicha qamrovni miqdoriy baholash fondning kuchli va zaif tomonlarini aniqlash imkonini beradi. Shu ma'noda *Eremurus* kolleksiyasi mintaqaning bir nechta davlatlarini, yuz yildan ortiq vaqt oralig' ini va ko' plab tarixiy ekspeditsiyalarni birlashtiruvchi qulay model guruhdir.

Tadqiqot metodologiyasi

Tahlilga TASH gerbariysining 1 921 ta raqamlashtirilgan *Eremurus* gerbariy yozuvi kiritildi. Ma'lumotlar jadvali Bioxilma-xillik bo' yicha global axborot tizimida (GBIF) qo' llaniladigan Darwin Core standartining asosiy tamoyillari asosida shakllantirildi [8, 17]. Jadval tarkibida quyidagi maydonlar qo' llanildi: namuna yozuvining noyob identifikatori, olam, oila, turkum, tur epiteti, ilmiy nom muallifi, taksonomik daraja, ilmiy nom, joylashuv, joylashuvga oid izoh, yig' im raqami, yig' im sanasi, kun, oy, yil, kollektor(lar), o' nlik geografik kenglik, o' nlik geografik uzunlik, geodezik datum, yozuv turi, muassasa kodi va kolleksiya kodi. Takson nomlari POWO ma'lumotlar bazasi bilan muvofiqlashtirildi [13].

Ma'lumotlar sifatini nazorat qilishning birinchi bosqichida namuna yozuvlarining noyob identifikatorlari tekshirildi. Bo' sh identifikatorlar hamda bir xil identifikatorning ikki yoki undan ortiq marta takrorlanish holatlari alohida hisoblandi. Natijada har bir gerbariy yozuvining noyobligi baholandi. Keyin ilmiy nomlar bo' yicha guruhlash amalga oshirilib, har bir takson uchun gerbariy namunalari soni hisoblandi. Taksonomik daraja maydonidagi ma'lumotlar va POWO bo' yicha qabul qilingan nomlar o' zaro solishtirilib, standartlashtirilgan ilmiy nomlar tahlilda qo' llanildi.

Har bir koordinatali gerbariy namunasining geografik o' rni yorliqdagi lokalitet ma'lumotlari asosida Google Earth dasturida birma-bir qo' lda georeferensiyalandi. Bunda yorliqda keltirilgan davlat, ma'muriy hudud, tog' tizmasi, daryo, soy, qishloq, dovon, yo' l, vodiy va boshqa topografik belgilar zamonaviy xaritadagi mos obyektlar bilan solishtirildi. Koordinatalash avtomatik ommaviy geokodlash usuli bilan emas, har bir gerbariy namunasi uchun alohida amalga oshirildi. Aniqlangan nuqtalar WGS84 geodezik datumida o' nlik geografik kenglik va o' nlik geografik uzunlik ko' rinishida qayd etildi. Jami 1 920 ta yozuv uchun koordinata aniqlandi, bitta yozuvda esa yetarli lokalitet ma'lumoti bo' lmagani sababli koordinata kiritilmadi. Keyingi davlatlar kesimidagi tahlilda ushbu qo' lda aniqlangan koordinatalar davlat chegaralari bilan fazoviy ustma-ust joylashtirildi. Xarita va davlat chegaralari uchun Natural Earth ochiq kartografik qatlamlaridan foydalanildi [15]. Chegara yaqinidagi nuqtalarda natija lokalitet tavsifi bilan qo' shimcha ravishda tekshirildi.

Vaqt bo‘ yicha tahlilda yig‘ ilgan yil maydoni sonli ko‘ rinishga keltirildi. Har bir yil uchun gerbariy yozuvlari soni hisoblandi, so‘ ng yillar o‘ n yillik davrlarga guruhlanib, har bir davrning kolleksiyadagi ulushi aniqlandi. Yig‘ imlar sonining ko‘ payishi turning tabiatdagi ko‘ pligini bevosita anglatmaydi; u ekspeditsiya faolligi, ilmiy ustuvorlik, transport imkoniyati, kollektorlar soni va kuratsion qarorlar bilan ham bog‘ liq bo‘ lishi mumkin [5–7]. Shu sababli ushbu natijalar kolleksiyaning shakllanish tarixi sifatida talqin qilindi.

Kollektorlar bo‘ yicha tahlil kollektor(lar) maydonidagi mavjud yozuvlar asosida amalga oshirildi. Ushbu maydonda ayrim kollektorlarning ismi, bir nechta shaxsdan iborat kollektorlar guruhi, ekspeditsiya tarkibi hamda imlo va qisqartirish variantlari uchraydi. Kollektor nomlarini avtomatik ravishda bir shaxsga birlashtirish amalga oshirilmadi, chunki barcha yozuvlarni ishonchli standartlashtirish uchun qo‘ shimcha biografik va katalog tekshiruvi talab etiladi. Shu bois natijalarda “kollektor yozuvi” atamasi qo‘ llanildi. “Noma’lum” deb qayd etilgan yozuvlar eng faol kollektorlar ro‘ yxatiga kiritilmadi.

Hisob-kitoblar kompyuter dasturlari yordamida bajarildi, jadvallar elektron jadval ko‘ rinishida umumlashtirildi, diagrammalar hamda tarqalish xaritasi statistik va geografik axborot vositalari yordamida tayyorlandi. Natijalar son, foiz va turlar boyligi ko‘ rsatkichlari bilan ifodalandi. Har bir koordinata qo‘ lda georeferensiyalangan bo‘ lsa-da, tarixiy yorliqlardagi toponimlarning noaniqligi, joy nomlarining vaqt davomida o‘ zgarishi va ayrim lokalitetlarning keng hududni ifodalashi koordinata aniqligiga ta’sir qilishi mumkin; shu sababli ular dala sharoitida zamonaviy sun’iy yo‘ ldosh qabul qilgichi bilan bevosita o‘ lchangan nuqtalar sifatida talqin qilinmadi.

Natijalar va ularning tahlili

Taksonomik tarkib va ma’lumotlar yaxlitligi

Taksonomik inventarizatsiya TASH fondida *Eremurus*ga oid 1 921 ta noyob gerbariy yozuvi mavjudligini ko‘ rsatdi. Noyob identifikator maydonida bo‘ sh yoki takrorlanuvchi qiymatlar topilmadi. Bu holat raqamli yozuvlar darajasida identifikatorlar yaxlitligining yuqori ekanini ko‘ rsatadi va keyingi ma’lumotlarni birlashtirish, yangilash yoki internetda nashr qilishda muhim texnik afzallik beradi. Kolleksiyada 38 ta ilmiy nom bo‘ yicha gerbariy yozuvi mavjud.

Namunalarning turlar bo‘ yicha taqsimoti juda notekis. Eng yirik blok *Eremurus* soogdianus (Regel) Benth. & Hook.f. ga tegishli bo‘ lib, 291 ta yozuv yoki umumiy fondning 15,1% ini tashkil qiladi. Keyingi o‘ rinlarda E. olgae Regel — 209 ta (10,9%), E. regelii Vved. — 171 ta (8,9%), E. fuscus (O.Fedtsch.) Vved. — 170 ta (8,8%) va E. tianschanicus Pazij & Vved. ex Pavlov — 133 ta (6,9%) turadi. Dastlabki besh tur jami 974 ta yozuvni, ya’ni kolleksiyaning qariyb yarmidan ko‘ prog‘ ini tashkil etadi. Dastlabki 15 tur esa barcha yozuvlarning 85% dan ortig‘ ini qamrab oladi. Bunga qarama-qarshi ravishda E. chloranthus Popov, E. roseolus Vved. va E. subalbiflorus Vved. faqat bittadan yozuv bilan ifodalangan.

Bunday notekislikni ikki jihatdan baholash lozim. Bir tomondan, ko‘ p yozuvga ega turlar turli lokalitetlar, yillar va kollektorlar bilan yaxshi hujjatlashtirilgan bo‘ lib, morfologik variatsiya va areal tahlili uchun mustahkam material beradi. Ikkinchi tomondan, kam namuna bilan ifodalangan turlar TASH fondida mavjud bo‘ lsa-da, ularning ichki variatsiyasi yoki tarixiy tarqalishini faqat ushbu kolleksiya asosida to‘ liq baholash qiyin. Shu bois kolleksiya inventarizatsiyasi kelgusidagi maqsadli yig‘ imlar uchun “namuna bo‘ shliqlari”ni aniqlash imkonini beradi. TASH fondini boshqa Markaziy Osiyo va yirik xalqaro gerbariylar bilan birlashtirish kam qamrab olingan taksonlar bo‘ yicha ma’lumot yetishmovchiligini kamaytirishi mumkin.

Jadval 1

TASH fondidagi *Eremurus* turlari: gerbariy yozuvlari soni bo‘ yicha yetakchi 15 takson

Tur	Yozuvlar soni	Ulushi, %
Eremurus soogdianus (Regel) Benth. & Hook.f.	291	15.1

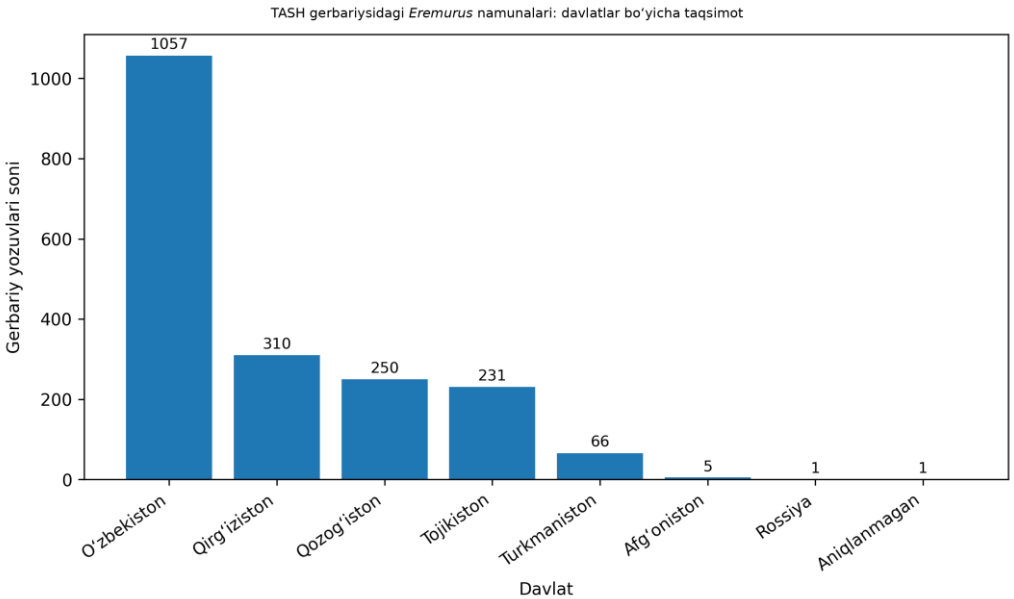
Eremurus cristatus Vved.	44	2.3
Eremurus comosus O.Fedtsch.	39	2.0

Tur	Yozuvlar soni	Ulushi, %
Eremurus luteus Baker	34	1.8

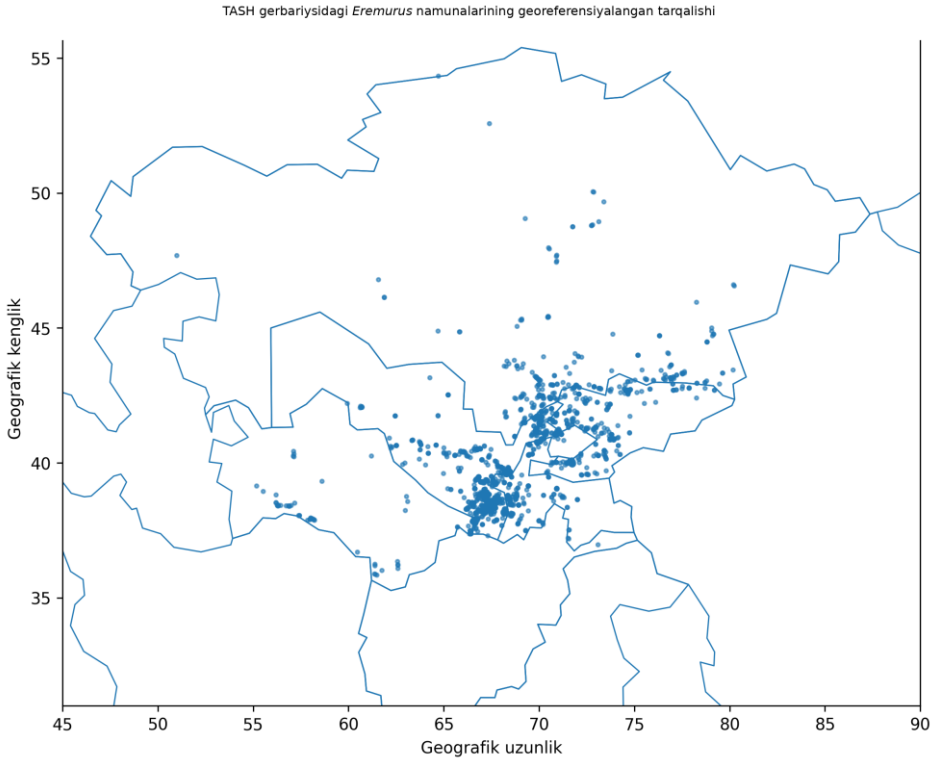
Geografik qamrov

1 920 ta georeferensiyalangan yozuvning davlatlar bo‘ yicha taqsimoti kolleksiyaning aniq Markaziy Osiyo markazlashuvini ko‘ rsatdi. O‘ zbekiston 1 057 ta yozuv bilan umumiy kolleksiyaning 55,0% ini tashkil etadi. Shu nuqtalarda 29 ta *Eremurus* turi qayd etilgan bo‘ lib, bu TASH fondining o‘ z mamlakati florasini qamrab olish funksiyasi juda kuchli ekanini tasdiqlaydi. Qirg‘ izistonda 310 ta yozuv va 18 tur, Qozog‘ istonda 250 ta yozuv va 11 tur, Tojikistonda 231 ta yozuv va 17 tur, Turkmanistonda 66 ta yozuv va 11 tur qayd etildi. Afg‘ oniston besh yozuv va ikki tur, Rossiya esa bitta yozuv bilan ifodalangan. Bitta yozuv koordinatasiz bo‘ lgani sababli “Aniqlanmagan” kategoriyasida qoldirildi.



Geografik tuzilma turkumning biologik tarqalishi bilan TASH kolleksiyasining tarixiy yig‘ im geografiyasi o‘ rtasidagi birikkan natijadir. O‘ zbekistonning katta ulushi fondning institutsional vazifasi va mamlakat ichidagi dala ekspeditsiyalari bilan izohlanadi. Biroq qo‘ shni Qirg‘ iziston, Qozog‘ iston va Tojikistondan yuzlab namunalar mavjudligi kolleksiyaning faqat milliy emas, balki mintaqaviy xarakterga ega ekanini ko‘ rsatadi. TASHning tarixiy kolleksiyasi Markaziy Osiyoda siyosiy chegaralardan qat’i nazar amalga oshirilgan ekspeditsiyalar natijasini saqlab qolgan. Bu xususiyat turkum areallarini hozirgi davlat chegaralari bilan cheklab talqin qilishdan ko‘ ra, tog‘ tizmalari va tabiiy floristik hududlar kesimida keyingi tahlillarni davom ettirish zarurligini ko‘ rsatadi.

Xaritada yozuvlarning Tyanshan, Pomir-Oloy, Kopetdog‘ va ularga tutash tekislik-cho‘ l hududlari bo‘ ylab keng tarqalganligi kuzatiladi. Biroq ushbu maqoladagi davlat poligonlari umumlashtirilgan Natural Earth chegaralariga asoslangan. Shuning uchun juda yaqin chegara nuqtalari ma’muriy aniqlik bo‘ yicha alohida yuqori aniqlikdagi geografik axborot tizimi (GAT) qatlamlari bilan tekshirilishi mumkin. Shunga qaramay, mamlakat darajasidagi umumiy statistik naqsh barqaror: kolleksiyaning 96% dan ko‘ prog‘ i O‘ zbekiston, Qirg‘ iziston, Qozog‘ iston va Tojikiston hissasiga to‘ g‘ ri keladi.



Jadval 2

Koordinatalar asosida davlatlar bo‘ yicha *Eremurus* gerbariy yozuvlarining taqsimoti

Davlat	Yozuvlar soni	Turlar soni	Ulushi, %
O‘ zbekiston	1057	29	55.0
Qirg‘ iziston	310	18	16.1
Qozog‘ iston	250	11	13.0
Tojikiston	231	17	12.0
Turkmaniston	66	11	3.4
Afg‘ oniston	5	2	0.3
Rossiya	1	1	0.1
Aniqlanmagan	1	1	0.1

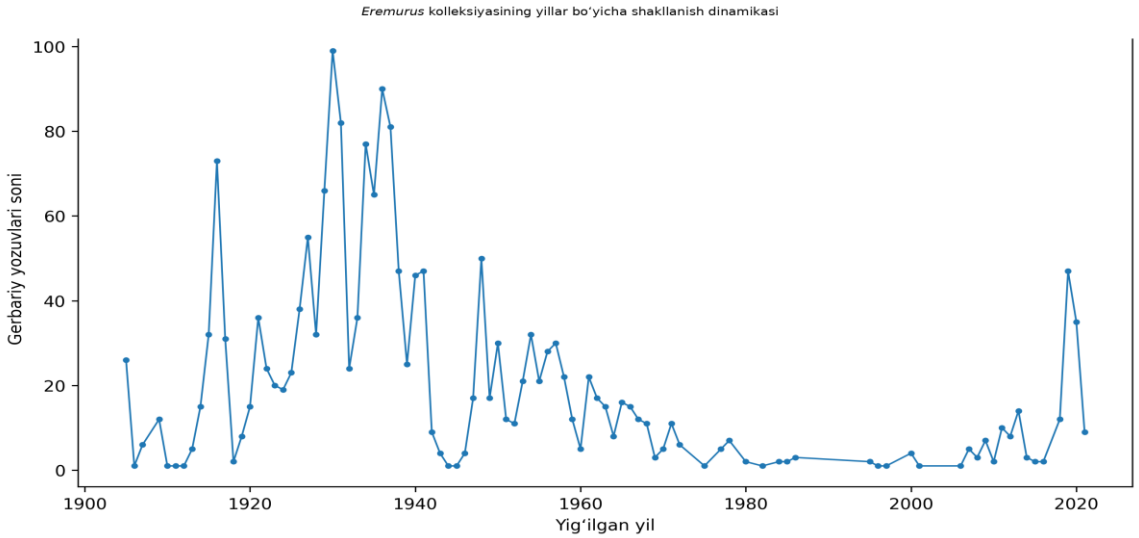
1-rasm. Davlatlar bo‘ yicha *Eremurus* gerbariy yozuvlari soni.

2-rasm. TASH fondidagi georeferensiyalangan *Eremurus* yozuvlarining tarqalish xaritasi.

Yig‘ imlarning vaqt bo‘ yicha dinamikasi

Yig‘ im sanalari TASHdagi *Eremurus* fondining bir asrdan ortiq shakllanish tarixini aks ettiradi. Eng erta yozuv 1905-yilga, eng so‘ nggisi 2021-yilga tegishli. 1900-yillarda 45 ta yozuv, 1910-yillarda 169 ta, 1920-yillarda 328 ta va 1930-yillarda 626 ta yozuv yig‘ ilgan. Demak, 1920–1939-yillarning o‘ zida 954 ta namuna yoki butun kolleksiyaning deyarli yarmi shakllangan. 1930-yillar 626 yozuv bilan eng yuqori o‘ n yillik bo‘ lib, umumiy kolleksiyaning 32,6% ini tashkil qiladi. 1940-yillarda 196, 1950-yillarda 219, 1960-yillarda 124 ta yozuv qayd etilgan. 1970-yillardan boshlab intensivlik keskin pasayadi: 1970-yillarda 35, 1980-yillarda 10, 1990-yillarda to‘ rtta yozuv mavjud. 2000-yillarda 21, 2010-yillarda 100 va 2020–2021-yillarda 44 ta yozuv qayd etilishi zamonaviy yig‘ imlarning yana faollashganini ko‘ rsatadi.

Yillik kesimda 1930-yil 99 yozuv bilan birinchi o‘ rinda turadi. Keyingi maksimumlar 1936-yilda 90, 1931-yilda 82, 1937-yilda 81 va 1934-yilda 77 ta yozuvdir. 1916-yilda ham 73 ta namuna yig‘ ilgan. Bunday cho‘ qqilar tabiiy populyatsiyalar sonining o‘ zgarishini emas, balki aynan o‘ sha yillarda *Eremurus*ga boy hududlarda faol botanika ekspeditsiyalari va kolleksiya yig‘ imi olib borilganini ko‘ rsatadi. Bu farq gerbariy ma’lumotlarini talqin qilish uchun prinsipial: tarixiy gerbariy namunalari opportunistik yoki maqsadli yig‘ im natijasi bo‘ lib, ularning vaqt bo‘ yicha zichligi yig‘ im harakati bilan kuchli bog‘ langan [5–7].



Shunga qaramay, vaqtga oid qatlam juda muhim ilmiy qiymatga ega. 1905–2021-yillar oralig‘ idagi materiallar ma’lum turlarning bir xil yoki yaqin hududlardan turli davrlarda yig‘ ilgan yozuvlarini aniqlash imkonini beradi. Kelgusida bunday takroriy lokalitetlar fenologik siljishlar, areal chegaralarining o‘ zgarishi yoki lokal populyatsiyalarning saqlanib qolishi bo‘ yicha tadqiqotlar uchun tanlanishi mumkin. Ayniqsa etiketkalardagi to‘ liq sana, balandlik va habitat ma’lumoti bilan birlashtirilganda, tarixiy TASH materiali global o‘ zgarish biologiyasida qo‘ llanadigan gerbariy vaqt qatorlariga aylanishi mumkin [6].

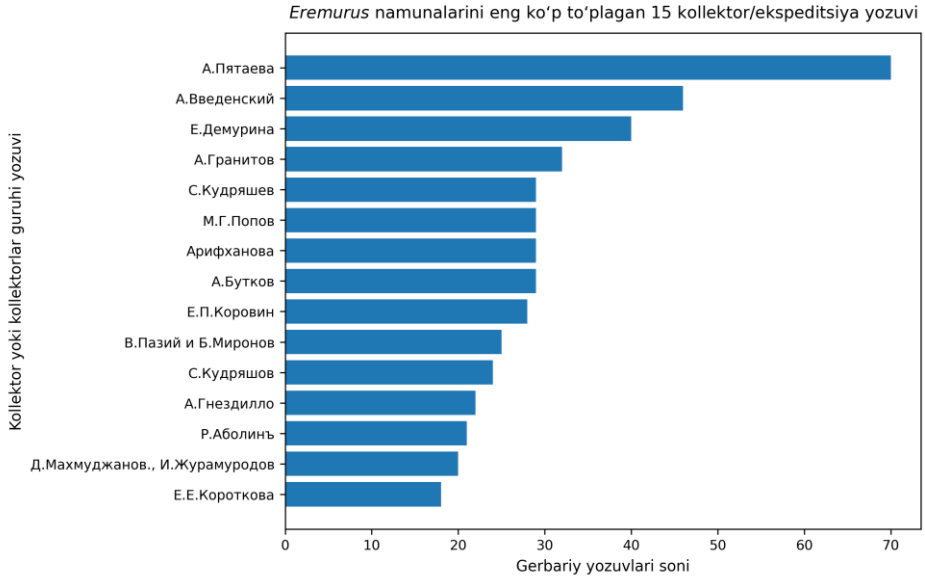
2020-yillar	44	2.3

3-rasm. *Eremurus* gerbariy yozuvlarining yig‘ ilgan yillar bo‘ yicha dinamikasi.

Kollektor yozuvlarining tarkibi

Kollektor(lar) ustuni kolleksiyaning insoniy va ekspeditsion tarixini aks ettiradi. Unda 497 xil matnli qiymat mavjud. Biroq bu sonni 497 alohida biologik shaxs deb talqin qilib bo‘ lmaydi: ayrim qatorlarda bir necha kollektor birgalikda yozilgan, ba’zi familiyalar turli imloda takrorlangan, shuningdek “Noma’lum” qiymati ham mavjud. Shuning uchun ushbu tahlil xom kollektor yozuvlari darajasida bajarildi. 22 ta gerbariy namunasi yozuvida kollektor “Noma’lum” sifatida qayd qilingan va eng faol kollektorlar ro‘ yxatiga kiritilmadi.

Eng ko‘ p uchraydigan yozuv “А.Пятаева” bo‘ lib, 70 ta gerbariy namunasi bilan bog‘ langan. “А.Введенский” 46, “Е.Демурина” 40, “А.Гранитов” 32, “С.Кудряшев” 29, “М.Г.Попов” 29, “Арифханова” 29 va “А.Бутков” 29 ta yozuvda qayd etilgan. “Е.П.Коровин” 28, “В.Пазий и Б.Миронов” esa 25 ta gerbariy namunasi bilan ifodalangan. Bir nechta muhim muammo ham ko‘ rinadi: masalan, “С.Кудряшев” va “С.Кудряшов”, shuningdek “А.Введенский” va “Введенский” kabi variantlar mavjud. Standartlashtirilgan nomlar nazorati jarayonida ularning haqiqiy shaxs identifikatori, ism-sharif kengaytmasi va tarixiy ekspeditsiya konteksti tekshirilsa, kollektorlar bo‘ yicha yanada aniq bibliometrik-tarixiy tahlil qilish mumkin bo‘ ladi.



Kollektorlar tarkibining kengligi TASH *Eremurus* fondi bir yoki ikki ekspeditsiya mahsuli emasligini, balki ko‘ plab avlod botanistlari yig‘ imlari asosida shakllanganini ko‘ rsatadi. eng ko‘ p uchraydigan 15 kollektor yozuvi jami materialning taxminan chorak qismini tashkil qiladi, qolgan namunalarning katta qismi yuzlab boshqa yozuvlar o‘ rtasida taqsimlangan. Bu diversifikatsiya geografik qamrovning kengayishiga ijobiy ta’sir qilgan bo‘ lishi mumkin. Shu bilan birga, kollektorlar faoliyati turlar va hududlar bo‘ yicha tanlanma og‘ ishi hosil qiladi. Kelgusi tahlillarda kollektor × yil × tur × lokalitet matritsasini tuzish qaysi turlar ma’lum ekspeditsiyalar bilan haddan tashqari kuchli bog‘ langanini aniqlash imkonini beradi.

Jadval 4

Kollektor(lar) maydonida eng ko‘ p uchraydigan 15 kollektor yoki kollektorlar guruhi yozuvi

Kollektor yoki kollektorlar guruhi yozuvi	Yozuvlar soni	Ulushi, %
А.Пятаева	70	3.6
А.Введенский	46	2.4
Е.Демурина	40	2.1
А.Гранитов	32	1.7
С.Кудряшев	29	1.5
М.Г.Попов	29	1.5
Арифханова	29	1.5
А.Бутков	29	1.5
Е.П.Коровин	28	1.5

В.Пазий и Б.Миронов	25	1.3
С.Кудряшов	24	1.2
А.Гнездилло	22	1.1
Р.Аболинъ	21	1.1
Д.Махмуджанов., И.Журамуродов	20	1.0
Е.Е.Короткова	18	0.9

4-rasm. Eng ko‘ p uchraydigan 15 kollektor/ekspeditsiya yozuvi.

Umumiy muhokama

Umumiy natijalar TASHdagi *Eremurus* fondi uch asosiy qatlamga ega ekanini ko‘ rsatadi: kuchli taksonomik reprezentatsiya, Markaziy Osiyoni qamrab oluvchi mintaqaviy geografik ko‘ lam va XX asr boshlariga borib taqaladigan chuqur tarixiy vaqt qatori. Bu xususiyatlar zamonaviy gerbariy tadqiqotlarida qayd etilgan “eski kolleksiya — yangi savollar” tamoyiliga to‘ liq mos keladi [4–6]. TASH kolleksiyasining katta qismi 1930-yillarda yig‘ ilgan bo‘ lsa-da, uning ma’lumot qiymati zamonaviy namunalardan kam emas; aksincha, aynan tarixiy qatlam hozirgi tarqalish ma’lumotlari bilan taqqoslash uchun tayanch nuqta beradi.

*Eremurus*ga oid zamonaviy taksonomik va filogenetik ishlar turlar chegarasi, turkum ichki tasnif va diversifikatsiya markazlari haqida yangi ma’lumotlarni berdi [9–12]. Shu sababli tarixiy gerbariy namunalari nomlarini hozirgi qabul qilingan taksonomiya bilan muntazam qayta bog‘ lash zarur. Mazkur ma’lumotlar to‘ plamida ilmiy nomlar POWO [13] bilan standartlashtirilgani turli yillarda ishlatilgan sinonimlar sababli yuzaga keladigan sun’iy bo‘ linishlarni kamaytiradi. Biroq gerbariy namunasining qabul qilingan nom bilan yozilishi uning morfologik identifikatsiyasi mutlaq xatosiz degani emas. Kam uchraydigan yoki tarixan chalkash taksonlar keyingi reviziyada gerbariy namunasi tasviri va asl yorlig‘ i bilan qayta tekshirilishi kerak.

Geografik natijalar O‘ zbekiston va qo‘ shni davlatlar TASH *Eremurus* fondining asosiy manbasi ekanini ko‘ rsatadi. Bu turkumning Markaziy Osiyodagi tabiiy xilma-xilligi bilan ham mos keladi [11, 12]. Biroq gerbariydagi nuqtalar zichligi biologik areal ichidagi real populyatsiya zichligini ko‘ rsatmaydi. Masalan, yirik shaharlar, tarixiy ekspeditsiya marshrutlari, avtomobil yo‘ llari yoki botanika jihatdan mashhur tog‘ vodiylari ko‘ proq namuna bilan ifodalanishi mumkin. Shuning uchun kelgusidagi areal yoki ekologik nisha modellarida fazoviy siyraklashtirish, takroriy lokalitet nazorati, koordinata noaniqligi va tanlanma og‘ ishini tuzatish kabi bosqichlar zarur.

Tadqiqotning yana bir muhim natijasi fondning boshqaruv nuqtayi nazaridan qaysi ma’lumotlar keyingi kuratsiyani talab qilishini ko‘ rsatishidir. Noyob identifikatorlar to‘ liq va noyob bo‘ lishi juda yaxshi ko‘ rsatkich. Aksincha, kollektor yozuvlaridagi transliteratsiya va imlo variantlari kelajakda kollektorlar uchun standartlashtirilgan nomlar ro‘ yxatini yaratish zarurligini ko‘ rsatadi. Xuddi shunday, koordinatasiz yoki past aniqlikdagi tarixiy lokalitetlarni georeferensiyalash, ma’muriy birliklarni yagona standartga keltirish va tip holati, aniqlovchi shaxs, aniqlangan sana kabi maydonlarni to‘ ldirish ma’lumotlar to‘ plamining xalqaro tizimlararo mosligini oshiradi. Darwin Core [8] va GBIF nashriyot amaliyotlari bunday standartlashtirish uchun tayyor ramka beradi.

Shunday qilib, mazkur ish oddiy katalog sanog‘ idan ko‘ ra kengroq ma’noga ega. Kolleksiyaning strukturasini miqdoriy tavsiflash orqali taksonomik qamrov, hududiy reprezentatsiya, tarixiy yig‘ im intensivligi va kollektorlar hissasi birgalikda ko‘ rsatildi. Ushbu uyg‘ unlashtirilgan ko‘ rinish TASH *Eremurus* ma’lumotlarini keyingi bosqichda boshqa gerbariylar, dala kuzatuvlari, GBIFdagi tarqalish qaydlari va molekulyar tasdiqlovchi namunalari bilan birlashtirish uchun boshlang‘ ich tekshiruv vazifasini bajaradi. Gerbariy ma’lumotlarining kuchi aynan shunday ko‘ p manbali uyg‘ unlashtirishda namoyon bo‘ ladi [5, 16].

Ilmiy yangilik va amaliy ahamiyati

Ilmiy yangilik va amaliy ahamiyat. Mazkur tadqiqotning yangiligi TASH fondidagi *Eremurus* kolleksiyasini bitta raqamli tekshiruv sxemasi doirasida taksonomik, fazoviy va tarixiy ko‘ rsatkichlar bo‘ yicha birgalikda baholashidadir. Avvalgi ishlar TASH gerbariysining umumiy tarixi va fond holatini, shuningdek *Eremurus*ning O‘ zbekiston florasidagi taksonomiyasi hamda evolyutsiyasini yoritgan [1, 9–12], biroq mazkur tadqiqotda noyob identifikator yaxlitligi, tur bo‘ yicha gerbariy namunalari soni, koordinatalardan hosil qilingan davlat taqsimoti, yig‘ imlarning yillik va o‘ n yillik dinamikasi hamda kollektor yozuvlari bir xil ish jarayoni asosida miqdoriy tekshirildi. Bunday yondashuv kolleksiyani faqat “qancha namuna bor?” savoli bilan cheklamay, ma’lumotlarning qaysi qatlamlari kelgusidagi ilmiy qayta foydalanishga tayyor, qaysilari esa qo‘ shimcha kuratsiyani talab qilishini ko‘ rsatadi.

Amaliy nuqtayi nazardan, natijalar dala tadqiqotlari va gerbariy kuratsiyasi uchun ustuvor yo‘ nalishlarni aniqlash imkonini beradi. Bir yoki bir necha gerbariy namunasi bilan ifodalangan taksonlar maqsadli qayta yig‘ ish va boshqa gerbariylar bilan ma’lumot almashish uchun yuqori ustuvorlikka ega. Koordinatasi mavjud tarixiy namunalar zamonaviy qaydlar bilan qiyoslanib, areal chegaralari va lokal populyatsiyalarning uzoq muddatli dinamikasini tekshirishda ishlatilishi mumkin. Yirik gerbariy namunasi qatorlariga ega turlar esa morfologik o‘ zgaruvchanlik, fenologiya va geografik differensiasiya bo‘ yicha keyingi tadqiqotlar uchun yaxshi asos yaratadi. Noyob identifikatorlarning takrorlanmasligi gerbariy namunasi tasviri, molekulyar tasdiqlovchi namuna, nashr va tashqi gerbariy yozuvlarini aynan bitta fizik namunaga bog‘ lash uchun barqaror identifikator qatlamini ta’minlaydi. Shu ma’noda mazkur tekshiruv TASHdagi *Eremurus* fondini GBIF/Darwin Core tamoyillari asosida yanada boyitish va tizimlararo mos ilmiy resursga aylantirishning amaliy yo‘ l xaritasini ham beradi [8, 17].

Tadqiqot cheklovlari

Tadqiqot cheklovlari. Natijalarni talqin qilishda bir necha cheklovni hisobga olish zarur. Birinchidan, har bir koordinata yorliqdagi lokalitet ma’lumotlari asosida Google Earth dasturida birma-bir qo‘ lda georeferensiyalangan bo‘ lsa-da, tarixiy toponimlarning noaniq yozilishi, joy nomlarining vaqt davomida o‘ zgarishi, ayrim lokalitetlarning juda keng hududni ifodalashi hamda eski yorliqlarda masofa va yo‘ nalishlarning taxminiy berilishi koordinata aniqligiga ta’sir qilishi mumkin. Shu sababli ushbu koordinatalarni dala sharoitida zamonaviy sun’iy yo‘ ldosh qabul qilgichi bilan bevosita o‘ lchangan nuqtalar bilan mutlaq tenglashtirish mumkin emas. Ikkinchidan, davlatlar kesimidagi umumlashtirish koordinatalarni Natural Earth davlat chegaralari bilan fazoviy ustma-ust joylashtirish orqali bajarilganligi sababli xalqaro chegaraga juda yaqin nuqtalar yuqori aniqlikdagi ma’muriy qatlamlar bilan qayta tekshirilishi mumkin. Uchinchidan, kollektor(lar) maydonidagi 497 xil matnli yozuv hali to‘ liq standartlashtirilmagan; imlo, transliteratsiya, initsial va kollektorlar guruhi variantlari mavjudligi sababli bu sonni alohida biologik shaxslar soni deb qabul qilish mumkin emas. To‘ rtinchidan, gerbariy yig‘ imlari tabiatan notekis bo‘ lib, ekspeditsiya marshruti, transport qulayligi, ilmiy qiziqish va tarixiy sharoit ayrim hudud va turlarning ortiqcha ifodalanishiga olib kelishi mumkin. Nihoyat, ilmiy nomlarning zamonaviy nomenklaturaga moslashtirilishi gerbariy namunasining morfologik qayta aniqlanishi o‘ rnini bosa olmaydi; noyob yoki tarixan chalkash materiallar fizik namuna yoki yuqori sifatli raqamli tasvir asosida ekspert tomonidan qayta tekshirilishi zarur.

Xulosalar

O‘ zbekiston Milliy gerbariysi (TASH) fondidagi *Eremurus* kolleksiyasining raqamli inventarizatsiyasi 1 921 ta noyob gerbariy yozuvi va 38 ta ilmiy nomni qamrab olishini ko‘ rsatdi. Noyob identifikator maydonidagi identifikatorlarning takrorlanmasligi raqamli yozuvlarning texnik yaxlitligini tasdiqlaydi. Taksonomik tarkibda *E. soogdianus, E. olgae, E. regelii, E. fuscus va E. tianschanicus* eng katta ulushga ega bo‘ lib, ayrim kam uchraydigan turlar esa juda oz namuna bilan ifodalangan.

Geografik jihatdan 1 920 ta koordinatali yozuvning 55,0% O‘ zbekiston hududiga, qolgan asosiy qismi Qirg‘ iziston, Qozog‘ iston, Tojikiston va Turkmanistonga to‘ g‘ ri keladi. Bu TASH *Eremurus* fondining milliy chegaradan kengroq, Markaziy Osiyo miqyosidagi ilmiy resurs ekanini ko‘ rsatadi. Kolleksiyaning vaqt qatori 1905–2021-yillarni qamrab olib, 1930-yillarda maksimal yig‘ im faolligi kuzatilgan. Kollektor(lar) maydonidagi 497 xil yozuv esa fondning ko‘ plab botanistlar va ekspeditsiyalar hissasi bilan shakllanganini tasdiqlaydi, biroq kollektor nomlarini standartlashtirilgan nomlar nazorati asosida normallashtirish zarur.

Kelgusida TASH *Eremurus* kolleksiyasini yanada kuchaytirish uchun kam namuna bilan ifodalangan turlar bo‘ yicha maqsadli dala yig‘ imlarini rejalashtirish, tarixiy lokalitetlarni yuqori aniqlikda georeferensiyalash, kollektor va

aniqlovchi shaxslar uchun standartlashtirilgan shaxslar ro‘ yxatlarini yaratish, gerbariy namunasi tasvirlari bilan elektron yozuvlarni bog‘ lash va ma’lumotlarni GBIF/Darwin Core talablariga muvofiq to‘ liq nashr etish maqsadga muvofiq. Ushbu yondashuv TASH fondini *Eremurus* taksonomiyasi, biogeografiyasi, konservatsiyasi va umumjahon o‘ zgarish biologiyasi bo‘ yicha qayta foydalaniladigan ochiq ilmiy infratuzilmaga aylantirish imkonini beradi.

Muallif bayonotlari

Mualliflar hissasi: tadqiqot konsepsiyasi, ma’lumotlarni kuratsiya qilish va standartlashtirish, statistik va fazoviy tahlil, tasviriy ifodalash, natijalarni talqin qilish, maqolaning dastlabki matnini yozish va yakuniy tahrirlash — D.I. Maxmudjanov, I.J. Jo‘ ramurodov; standartlashtirish, statistik va fazoviy tahlil — A.N. Najmiddinov

Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi mavjud emasligini bildiradi.

Moliyalashtirish: Ushbu tadqiqot O‘ zbekiston Respublikasi Fanlar akademiyasi Botanika instituti tomonidan amalga oshirilayotgan “Raqamli tabiat: Markaziy O‘ zbekiston florasi uchun raqamli platformani ishlab chiqish” (2025–2029) davlat dasturi doirasida bajarildi. Qo‘ shimcha moliyaviy ko‘ mak “O‘ zbekiston florasidagi polimorf oilalarning taksonomik reviziyasi” (A-FA-2021-427) hamda “O‘ zbekiston florasining o‘ zbek tilidagi birinchi nashrini tayyorlash” (AL-9224104450) loyihalari tomonidan ta’minlandi. Tadqiqot, shuningdek, Namangan davlat universiteti Biologiya kafedrasida amalga oshirilayotgan 2025–2027-yillarga mo‘ ljallangan “Bioxilma-xilligi xavf ostidagi hudud sifatida Farg‘ ona vodiysi florasining raqamli platformasini ishlab chiqish” nomli amaliy tadqiqot loyihasi (AL–9224104319) tomonidan qo‘ llab-quvvatlandi.

Ma’lumotlarning mavjudligi: maqolada ishlatilgan umumlashtirilgan statistik jadvallar muallifning ishchi materiallari tarkibida saqlanadi.

Annotatsiya: *Tojikiston Markaziy Osiyodagi Eremurus M.Bieb. turkumining muhim xilma-xillik markazlaridan biridir. Ushbu tadqiqotda turkumning mamlakat hududida tarqalishi gerbariy namunalari, Plantarium.ru hamda Global Biodiversity Information Facility (GBIF) ma’ lumotlari asosida qayta ko‘ rib chiqildi. Turlar ro‘ yxatini tuzishda gerbariy namunalari asosiy tekshiriladigan ilmiy dalil sifatida qabul qilindi. Asosiy ishchi ma’ lumotlar bazasidagi koordinatalarni Tojikiston davlat chegarasi bilan fazoviy solishtirish natijasida dastlab 1 510 ta yozuv ajratildi; aynan takrorlangan yozuvlar chiqarilgach, 1 286 ta noyob yozuv qoldi. GBIFning faqat tabiiy sharoitdagi qaydlarni o‘ z ichiga olgan bazasidan Tojikistonga tegishli 113 ta yozuv aniqlandi, ulardan 35 tasi asosiy bazadagi yozuvlar bilan barqaror identifikatorlar orqali o‘ zaro mos keldi. Ma’ lumotlarni ehtiyotkorlik bilan birlashtirish natijasida jami 1 364 ta tarqalish qaydi shakllantirildi. Taksonomik sifat nazoratidan so‘ ng 1 345 ta yozuv 25 ta qabul qilingan tur hamda E. stenophyllus subsp. ambigens kenja turiga biriktirildi. Biroq ushbu ko‘ rsatkich Tojikiston florasidagi Eremurus turlarining umumiy boyligini to‘ liq ifodalamaydi. Shu sababli 2025-yilda chop etilgan global monografiyada har bir turning umumiy tarqalishi haqidagi ma’ lumotlar, klassik Flora Tadzhikskoi SSR, zamonaviy ilmiy adabiyotlar hamda POWO/WCVP 2026 taksonomik ma’ lumotlar bazasi bilan qiyosiy tahlil qilindi. Natijada Tojikiston florasi uchun 33 turdan iborat zamonaviy ishchi ro‘ yxat taklif etildi; E. cristatusning mamlakat hududida tarqalishi esa qo‘ shimcha gerbariy namunalarini tekshirishni talab qiladigan muvaqqat holat sifatida baholandi. GBIFda tayyor koordinatalar bilan keltirilgan yozuvlardan tashqari, o‘ rganilgan barcha gerbariy namunalari yorliq ma’ lumotlari asosida Google Earth dasturi yordamida alohida georeferensiyalandi. Olingan natijalar Tojikistondagi Eremurus turlarining taksonomik qayta ko‘ rib chiqilishi, muhofaza holatini baholash va maqsadli dala tadqiqotlarini rejalashtirish uchun ishonchli dalilly asos yaratadi.*

Kalit so‘ zlar: *Eremurus; Asphodelaceae; Tojikiston; gerbariy specimenlari; checklist; georeferensiyalash; GBIF; Plantarium; POWO.*

ЧЕК-ЛИСТ И ГЕОРЕФЕРЕНЦИРОВАННЫЙ АНАЛИЗ РАСПРОСТРАНЕНИЯ ВИДОВ EREMURUS M.BIEB. (ASPHODELACEAE) В ТАДЖИКИСТАНЕ НА ОСНОВЕ ГЕРБАРНЫХ ОБРАЗЦОВ

Аннотация: *Таджикистан является одним из ключевых центров разнообразия рода Eremurus M.Bieb. в Центральной Азии. В настоящей работе распространение видов рода пересмотрено на основе гербарных образцов, данных Plantarium.ru и Global Biodiversity Information Facility (GBIF). Гербарные образцы рассматривались как основной проверяемый источник для формирования чек-листа. Пространственная проверка координат основной базы относительно государственной границы Таджикистана выявила 1 510 исходных записей; после удаления точных дублей осталось 1 286 уникальных записей. В очищенном наборе GBIF natural-only выявлено 113 записей из Таджикистана, 35 из*

которых были непосредственно сопоставлены с основной базой по устойчивым идентификаторам. Консервативное объединение сформировало 1 364 записи. После таксономического контроля 1 345 записей были отнесены к 25 принятым видам и E. stenophyllus subsp. ambigens. Эта цифра отражает полноту георефернцированной базы, а не полное видовое богатство флоры страны. Сопоставление видовых очерков монографии 2025 г., Flora Tadzhikskoi SSR, современной литературы и POWO/WCVP 2026 позволило предложить рабочий современный список из 33 видов для Таджикистана; присутствие E. cristatus оставлено предварительным до повторной проверки ваучерных образцов. За исключением записей GBIF с уже имеющимися координатами, исследованные гербарные образцы были индивидуально георефернцированы в Google Earth по данным этикеток. Полученный синтез создаёт воспроизводимую основу для дальнейшей таксономической ревизии, охраны и полевых исследований Eremurus в Таджикистане.

Ключевые слова: *Eremurus; Asphodelaceae; Таджикистан; гербарные образцы; чек-лист; георефернцирование; GBIF; Plantarium; POWO.*

A SPECIMEN-BASED CHECKLIST AND GEOREFERENCED OCCURRENCE SYNTHESIS OF EREMURUS M.BIEB. (ASPHODELACEAE) IN TAJIKISTAN

Abstract: *Tajikistan is one of the principal centres of diversity of Eremurus M.Bieb. in Central Asia. This study reassesses the distribution of the genus in the country using an integrated evidence base assembled from herbarium specimens, Plantarium.ru and the Global Biodiversity Information Facility (GBIF). Herbarium vouchers were treated as the primary verifiable evidence for checklist construction because their identifications, labels and geographic interpretations can be re-examined. Spatial screening of the principal working database identified 1,510 coordinate records within Tajikistan; exact duplicate removal reduced this to 1,286 unique records. The quality-controlled GBIF natural-only dataset contained 113 Tajikistan records, 35 of which matched records in the principal database through stable identifiers. Conservative integration therefore produced 1,364 occurrence records. After taxonomic quality control, 1,345 records were assignable to 25 accepted species and E. stenophyllus subsp. ambigens. This number represents direct coverage of the georeferenced occurrence dataset rather than total national richness. Examination of the "General distribution" statement for every species in the 2025 global monograph, together with Flora Tadzhikskoi SSR, recent literature and the current POWO/WCVP 2026 backbone, supports a working modern checklist of 33 species for Tajikistan; E. cristatus is retained provisionally pending renewed voucher-based confirmation. Except for GBIF records already supplied with geographic coordinates, examined herbarium specimens were individually georeferenced in Google Earth from specimen-label locality data. The resulting synthesis provides an auditable baseline for taxonomic revision, conservation assessment, historical biogeography and targeted field surveys of Eremurus in Tajikistan.*

Keywords: *Eremurus; Asphodelaceae; Tajikistan; herbarium specimens; checklist; georeferencing; GBIF; Plantarium; POWO.*

Introduction

Herbarium collections are long-term scientific archives that document the occurrence of plants in a defined place and time. A herbarium voucher can be re-examined when species concepts change, when identifications are questioned, or when historical locality information needs reinterpretation. Digitization has extended this classical taxonomic role by transforming collections into spatial and temporal biodiversity datasets that can be used for systematics, biogeography, phenology, conservation and global-change research [1–6].

For floristic checklist construction, this verifiability is particularly important. A country-level checklist should not be treated merely as a compilation of names reported in literature; ideally, the presence of each taxon should be traceable to voucher material or another critically evaluated source. Observation data are useful for extending geographic coverage, but they do not always permit the same level of taxonomic reassessment as preserved specimens.

Tajikistan is almost entirely mountainous and lies within the Pamir-Alai and adjacent Central Asian mountain systems. Its strong elevational gradients, geological heterogeneity and historical climatic dynamics have generated exceptional floristic richness and endemism. Recent analyses place the country among the major centres of plant endemism in the Mountains of Central Asia biodiversity hotspot [10, 11]. The genus *Eremurus* is one of the characteristic geophytic components of this flora.

Eremurus is distributed principally from the eastern Mediterranean and Southwest Asia through Central Asia to western China and the Himalaya. Central Asia is one of the principal centres of diversity and evolutionary history of the genus [12, 13]. The 2025 global monograph recognizes at least 61 non-hybrid species and 14 hybrid taxa worldwide and reports 52 species for Central Asia, 31 of them endemic to the region [13].

The number of *Eremurus* taxa reported for Tajikistan has varied through time because of changes in taxonomic concepts and data availability. Flora Tadzhikskoi SSR listed 28 species [8, 13]. Later biodiversity syntheses commonly referred to approximately 29 taxa, and recent work characterizes Tajikistan as a core distributional area for 29 *Eremurus*

taxa, about half of them endemic or subendemic [10]. The current study revisits this question using a combined specimen, occurrence and modern taxonomic framework.

The aims were to: (1) identify all georeferenced records attributable to Tajikistan in the supplied *Eremurus* databases; (2) remove traceable duplicate records and document data provenance; (3) evaluate taxonomic names against current accepted nomenclature; (4) compare direct occurrence evidence with the country distribution stated in the 2025 monograph and other floristic sources; (5) estimate the current working species richness of *Eremurus* in Tajikistan; and (6) provide a reproducible evidence base for future taxonomic, conservation and field studies.

Literature review

The botanical exploration of Tajikistan and the broader former Soviet Central Asian region produced extensive herbarium collections from the late nineteenth century onward. Flora Tadzhikskoi SSR remains a fundamental historical source for the flora of the country [8]. Its treatment of *Eremurus* formed the basis for many later floristic and conservation publications.

More recently, Illustrated Flora of Tajikistan and adjacent areas has provided an updated regional synthesis [9], while Plants of the World Online (POWO), using the World Checklist of Vascular Plants (WCVP), supplies a continuously updated taxonomic and country-distribution backbone [16]. These modern sources are especially valuable for reconciling historical synonyms and changing species concepts.

Tajikistan-wide biodiversity studies emphasize the country's high endemism and vulnerability to biodiversity loss [10, 11]. Raduła et al. [10] explicitly identified Tajikistan as a core distributional area for 29 *Eremurus* taxa. The Red Book of the Republic of Tajikistan (2017) lists nine *Eremurus* species of conservation concern: *E. aitchisonii*, *E. candidus*, *E. lachnostegius*, *E. micranthus*, *E. tadshikorum*, *E. hilariae*, *E. korowinii*, *E. pubescens* and *E. roseolus* [20].

Tajik research has also addressed economically and biologically important species. *Eremurus hissaricus*, for example, has been studied for root polysaccharides and traditional medicinal use, and that literature likewise notes approximately 29 *Eremurus* species in Tajikistan [15]. Such studies demonstrate that the genus is important not only for systematics and floristics but also for conservation and applied plant research.

Phylogenomic work has further reinforced the importance of Central Asia for *Eremurus* evolution. Plastome and nuclear data suggest that the traditional infrageneric classification is not fully congruent with molecular relationships and identify Central Asia as a key region in the origin and diversification of the genus [12]. This makes careful linkage between historical specimens and modern accepted names essential.

Materials and methods

Data sources

Two principal electronic datasets supplied for this study were analysed. The first, is a working compilation of historical and contemporary *Eremurus* specimen and observation records from multiple herbarium repositories and Plantarium.ru. The second, is a previously quality-controlled GBIF dataset restricted to records interpreted as belonging to natural distributions.

The principal database contains records representing LE, TAD, TASH, MW, AA and FRU, together with Plantarium.ru. These sources were integrated because a national checklist cannot be reliably reconstructed from any single herbarium alone. Importantly, the term "all herbarium data" in this paper refers to the herbarium records assembled in the supplied working database; it should not be interpreted as a claim that every physical *Eremurus* sheet preserved in every herbarium worldwide has been digitized or examined.

The GBIF quality-control workbook contains 6,420 original GBIF rows, 2,896 records with coordinates and 2,277 records retained in the global natural-only final dataset after exclusion of cultivated, botanic-garden, severe coordinate-quality and range-inconsistent records. The Tajikistan subset comprised 113 records.

Geographic screening and georeferencing

Except for GBIF occurrence records already supplied with geographic coordinates, all examined herbarium specimens represented in the working herbarium database were individually georeferenced using Google Earth. Localities were reconstructed from specimen-label information, including country, administrative unit, mountain range, river, valley, gorge, settlement, pass, road and other topographic features. Historical and variant toponyms were compared with modern geographic objects wherever possible.

Coordinates were standardized as decimal latitude and longitude in WGS84. Reconstructed historical coordinates should therefore be interpreted as georeferenced locality estimates rather than direct GPS measurements collected in the field. Border records and geographically anomalous points were checked against the locality text.

A systematic orientation problem was identified in the principal workbook: in most historical rows, the numeric values placed under the written "Longitude" and "Latitude" headers were geographically reversed. Coordinate orientation was therefore normalized from plausible Central Asian geographic ranges before spatial screening.

Duplicate control and database integration

Geographic screening of the principal database identified 1,510 raw coordinate records falling inside Tajikistan. Exact duplicate comparison across the populated record fields removed 224 repeated rows, leaving 1,286 unique records.

The GBIF natural-only subset contained 113 Tajikistan records. Catalogue numbers, occurrence identifiers, specimen/record numbers and other stable identifiers were cross-compared to reduce double counting of institutional specimens that were also exposed through GBIF. Thirty-five GBIF records matched records already represented in the principal database. The resulting conservative integrated count was therefore 1,286 + 113 − 35 = 1,364 occurrence records.

Because some duplicate digital representations may lack a shared persistent identifier, 1,364 is treated as a conservative evidence-record estimate rather than an absolute count of physically distinct herbarium sheets.

Taxonomic standardization and species-richness reconciliation

Historical names and spelling variants were standardized against POWO/WCVP 2026 and the modern *Eremurus* literature [13, 16]. Examples include *E. angustifolius* as a synonym of *E. olgae* and *E. pectiniformis* as a synonym of *E. hissaricus*. Original identifications were retained conceptually for auditability even when an accepted name was applied analytically.

The "General distribution" statement of every non-hybrid species account in The genus *Eremurus* of the world [13] was screened for Tajikistan. This produced 34 nominal species names mentioning Tajikistan when *E. alberti* is included. These names were then reconciled with the current POWO/WCVP backbone. *Eremurus ambigens* is currently treated as *E. stenophyllus subsp. ambigens* and was therefore not counted as an additional species. *Eremurus himalaicus* is accepted but its current native range in POWO is Afghanistan to the western Himalaya and does not include Tajikistan, so it was excluded pending convincing voucher evidence. Conversely, *E. zenaidae* is currently recognized by POWO as native to Kyrgyzstan, Tajikistan and Uzbekistan and was added to the national working checklist. *Eremurus cristatus* was retained provisionally because the 2025 monograph reports Tajikistan whereas the current POWO country backbone does not; voucher reassessment is required.

Accordingly, the present paper uses 33 species as the working modern checklist for Tajikistan, one of them (*E. cristatus*) distributionally provisional. A strict POWO-only interpretation would contain 32 species. *Eremurus stenophyllus subsp. ambigens* is additionally recognized at infraspecific rank.

Temporal analysis

Collection dates were standardized when interpretable. Obvious chronological anomalies and uninterpretable date fields were excluded from decade-level summaries rather than silently corrected. Approximately 1,200 reliable dated records spanning 1869–2025 were retained for temporal analysis.

Results and discussion

Structure of the integrated evidence base

The combined analysis demonstrates that the majority of the Tajikistan evidence is specimen-based and historically distributed among several major herbaria. The principal database yielded 1,286 unique Tajikistan records after exact deduplication, whereas the GBIF natural-only subset contributed 113 records. After removal of 35 directly identifiable cross-dataset overlaps, the conservative integrated dataset contained 1,364 records.

Table 1

Principal stages in constructing the Tajikistan Eremurus evidence database

Dataset / QC stage	Records
Raw principal-database coordinates inside Tajikistan	1,510
Principal database after exact duplicate removal	1,286
Exact duplicate rows removed	224
GBIF natural-only records from Tajikistan	113
GBIF records directly matched to principal database	35
Conservative integrated occurrence dataset	1,364
Records assignable to accepted taxa after taxonomic QC	1,345
Unidentified or taxonomically/geographically flagged records	19
Reliable dated records used for temporal analysis	ca. 1,200

The 1,286 unique records in the principal database were distributed among LE (664), TAD (265), TASH (249), MW (74), Plantarium.ru (29), AA (3) and FRU (2). LE therefore contributed more than half of the principal evidence base, while TAD and TASH together contributed another 514 records. This pattern shows the importance of integrating collections across national and institutional boundaries.

Table 2

Sources represented in the principal Tajikistan working database

Source	Records	Share, %
LE	664	51.6
TAD	265	20.6
TASH	249	19.4
MW	74	5.8
Plantarium.ru	29	2.3
AA	3	0.2
FRU	2	0.2
Total	1,286	100.0*

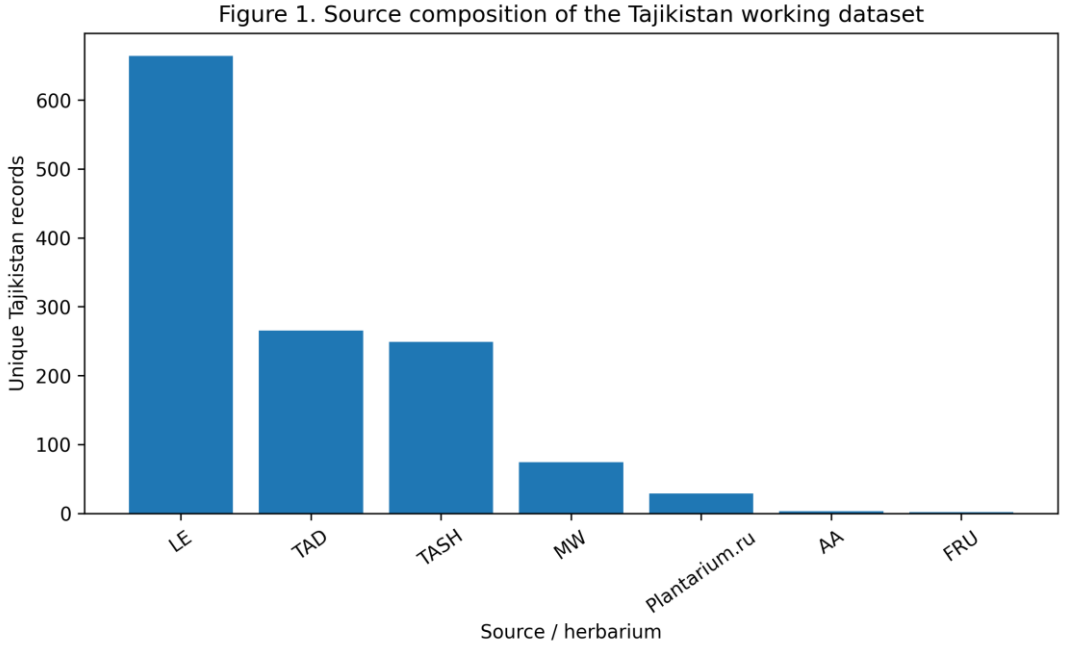

Figure 1. Source composition of the Tajikistan working dataset. Herbarium codes and Plantarium.ru refer to the sources represented in the supplied principal database.

Within the 113 Tajikistan GBIF records, 82 were PRESERVED_SPECIMEN, 27 HUMAN_OBSERVATION and four LIVING_SPECIMEN records linked to wild-source locality information. Thus, even within the GBIF layer, preserved specimens comprised the dominant evidence category.

Species richness: from occurrence coverage to a national checklist

After synonymization and quality control, 1,345 records were assignable to 25 accepted species plus *E. stenophyllus subsp. ambigens*. Nineteen records were retained outside the accepted occurrence total because they were unidentified to species or represented taxonomically/geographically questionable determinations requiring renewed examination. The occurrence-dataset richness must not be interpreted as the full flora of Tajikistan.

Table 3

Historical and current estimates of Eremurus richness in Tajikistan

Source / interpretation	Richness	Comment
Flora Tadzhikskoi SSR (1963)	28 species	Classical national flora [8, 13]
Recent biodiversity synthesis (2021)	29 taxa	Tajikistan described as a core distributional area [10]
2025 monograph species accounts	34 nominal species	Reconstructed from all “General distribution” statements mentioning Tajikistan
Current QC georeferenced database	25 species + 1 subspecies	Direct specimen/occurrence representation in the analysed databases
Present taxonomically reconciled checklist	33 species + 1 subspecies	Recommended working total; E. cristatus provisional

Strict current POWO country interpretation	32 species + 1 subspecies	Excludes provisional E. cristatus

Table 4

Working modern checklist of Eremurus species in Tajikistan

No.	Accepted species	Evidence status in this study	Notes
1	*Eremurus aitchisonii*	Database-supported	Red Book: VU
2	*Eremurus alberti*	Database-supported	Pamir-Alai; type locality near Kulob region
3	*Eremurus altaicus*	Database-supported	Widespread Central Asian mountain species
4	*Eremurus brachystemon*	Database-supported	Tajikistan endemic in 2025 monograph
5	*Eremurus buchаricus*	Database-supported	Tajikistan–N Afghanistan regional endemic
6	*Eremurus candidus*	Database-supported	Tajikistan endemic; Red Book: VU
7	*Eremurus comosus*	Database-supported	Pamir-Alai / Alay
8	*Eremurus cristatus*	Literature-supported; provisional	Voucher and country-distribution reassessment required
9	*Eremurus fuscus*	Database-supported	Pamir-Alai and Tian Shan
10	*Eremurus hilariae*	Database-supported	Red Book: CR
11	*Eremurus hissaricus*	Database-supported	Gissar–Zarafshan; E. pectiniformis synonymized
12	*Eremurus iae*	Literature-supported	Pamir-Alai; Chulbair region
13	*Eremurus inderiensis*	Literature-supported	Current POWO also includes Tajikistan
14	*Eremurus kaufmannii*	Database-supported	Pamir-Alai
15	*Eremurus korowinii*	Literature-supported	Red Book: EW
16	*Eremurus korshinskyi*	Database-supported	Afghanistan–Pakistan–Tajikistan
17	*Eremurus lachnostegius*	Literature-supported	Red Book: VU
18	*Eremurus luteus*	Literature-supported	Afghanistan–Iran–Central Asia
19	*Eremurus micranthus*	Literature-supported	Tajikistan endemic; Red Book: VU
20	*Eremurus olgae*	Database-supported	Includes historical E. angustifolius
21	*Eremurus parviflorus*	Database-supported	Pamir-Alai regional endemic
22	*Eremurus pubescens*	Database-supported	Red Book: EW
23	*Eremurus regelii*	Database-supported	Pamir-Alai / Tian Shan
24	*Eremurus robustus*	Database-supported	Mountain meadows
25	*Eremurus roseolus*	Database-supported	Red Book: CR
26	*Eremurus saprjagajevii*	Database-supported	Tajikistan endemic in 2025 monograph
27	*Eremurus soogdianus*	Database-supported	Pamir-Alai / Tian Shan
28	*Eremurus stenophyllus*	Database-supported	Accepted species; widespread in SW/Central Asia
29	*Eremurus suworowii*	Database-supported	Pamir-Alai
30	*Eremurus tadshikorum*	Database-supported	Tajikistan endemic; Red Book: VU
31	*Eremurus tianschanicus*	Database-supported	Tian Shan / Pamir-Alai

32	*Eremurus turkestanicus*	Database-supported	Central Asian mountain endemic
33	*Eremurus zenaidae*	POWO-supported	Current POWO includes Tajikistan; absent from 2025 monograph Tajik distribution

The reconciliation highlights why checklist richness and occurrence-database richness answer different questions. The national checklist summarizes critically evaluated taxonomic knowledge, whereas the occurrence database documents the individual georeferenced records presently available for analysis. Eight checklist species are currently absent from, or not reliably represented in, the accepted georeferenced occurrence subset: *E. inderiensis*, *E. micranthus*, *E. cristatus*, *E. iae*, *E. korowinii*, *E. lachnostegius*, *E. luteus* and *E. zenaidae*. Their absence from the final coordinate dataset should therefore be interpreted as a digitization, georeferencing or verification gap rather than proof of biological absence.

Table 5

Accepted taxa represented in the conservative integrated georeferenced dataset

Accepted taxon	Merged records
Eremurus stenophyllus	309
Eremurus robustus	153
Eremurus parviflorus	148
Eremurus soogdianus	148
Eremurus olgae	143
Eremurus suworowii	72
Eremurus comosus	51
Eremurus hissaricus	48
Eremurus altaicus	46
Eremurus alberti	39
Eremurus fuscus	35
Eremurus kaufmannii	31
Eremurus turkestanicus	27
Eremurus korshinskyi	16
Eremurus regelii	14
Eremurus aitchisonii	13
Eremurus stenophyllus subsp. ambigens	12
Eremurus brachystemon	10
Eremurus tianschanicus	10
Eremurus roseolus	6
Eremurus bucharicus	5
Eremurus hilariae	3
Eremurus saprjagajevii	2
Eremurus tadshikorum	2
Eremurus candidus	1
Eremurus pubescens	1

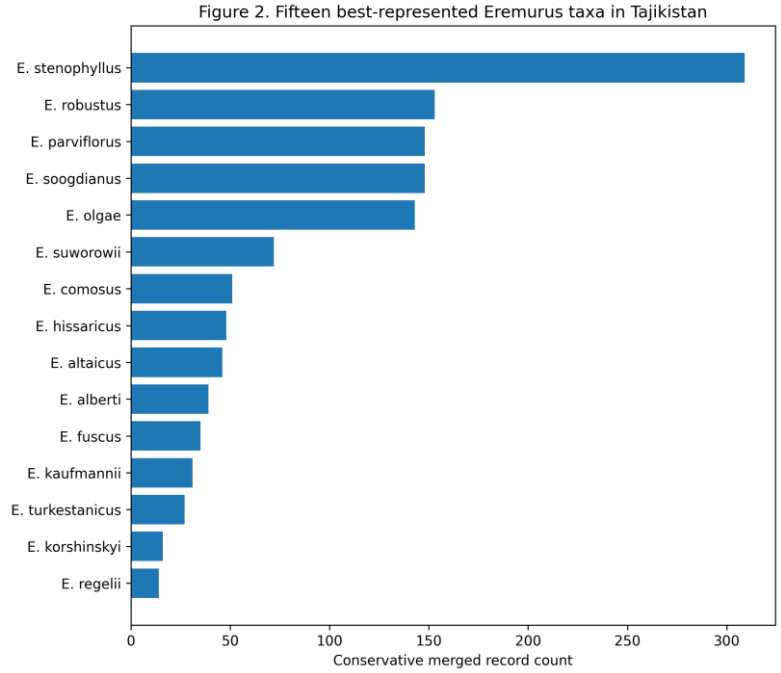

Figure 2. Fifteen best-represented *Eremurus* taxa in the conservative integrated Tajikistan dataset.

The best-represented species were *E. stenophyllus* (309 records), *E. robustus* (153), *E. parviflorus* (148), *E. soogdianus* (148) and *E. olgae* (143). These counts quantify documentary representation rather than population abundance. Collection effort, taxonomic history, accessibility and digitization intensity all influence record counts.

Geographic pattern

The 1,286 unique records in the principal herbarium/Plantarium layer form a broad spatial network across Tajikistan, with concentration in historically accessible mountain valleys and collecting routes. The distribution pattern corresponds primarily to the Pamir-Alai and associated ranges, but the point density is strongly affected by collecting history. Consequently, the map should be interpreted as a map of documented botanical evidence, not a census of population density.

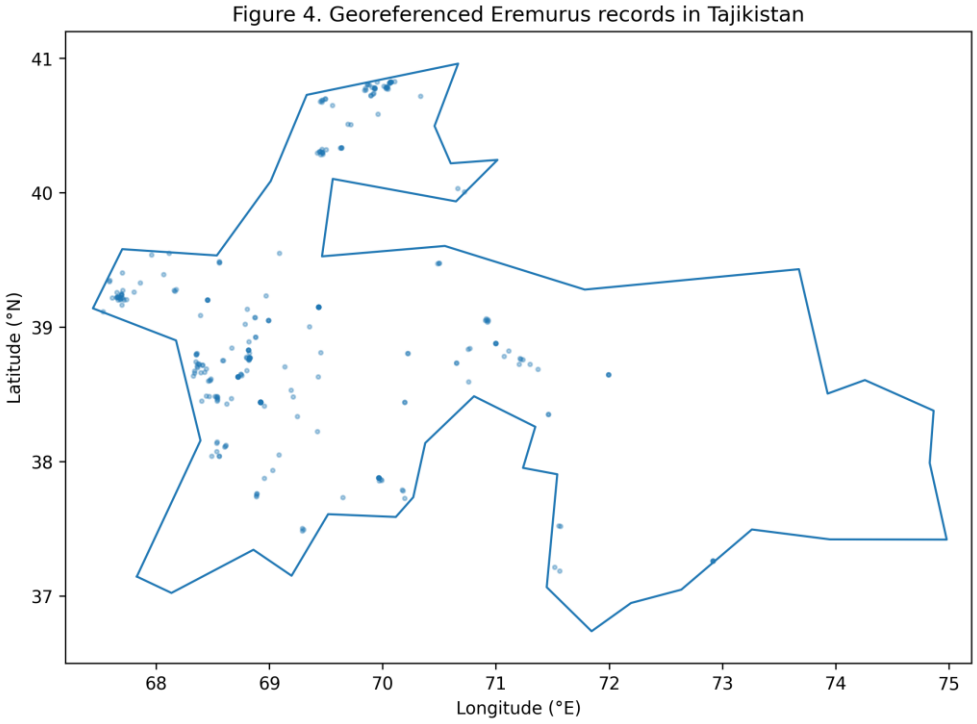

Figure 4. Georeferenced *Eremurus* records from the principal herbarium/Plantarium database falling within Tajikistan. Historical coordinates were reconstructed from specimen labels and are not equivalent to field-measured GPS points.

Historical dynamics of botanical collecting

Table 6

Dated Eremurus records by decade

Decade	Records
1860s	1
1870s	4
1880s	29
1890s	16
1900s	17
1910s	98
1920s	37
1930s	291
1940s	167
1950s	153
1960s	244
1970s	27
1980s	15
1990s	6
2000s	4
2010s	63
2020s	28

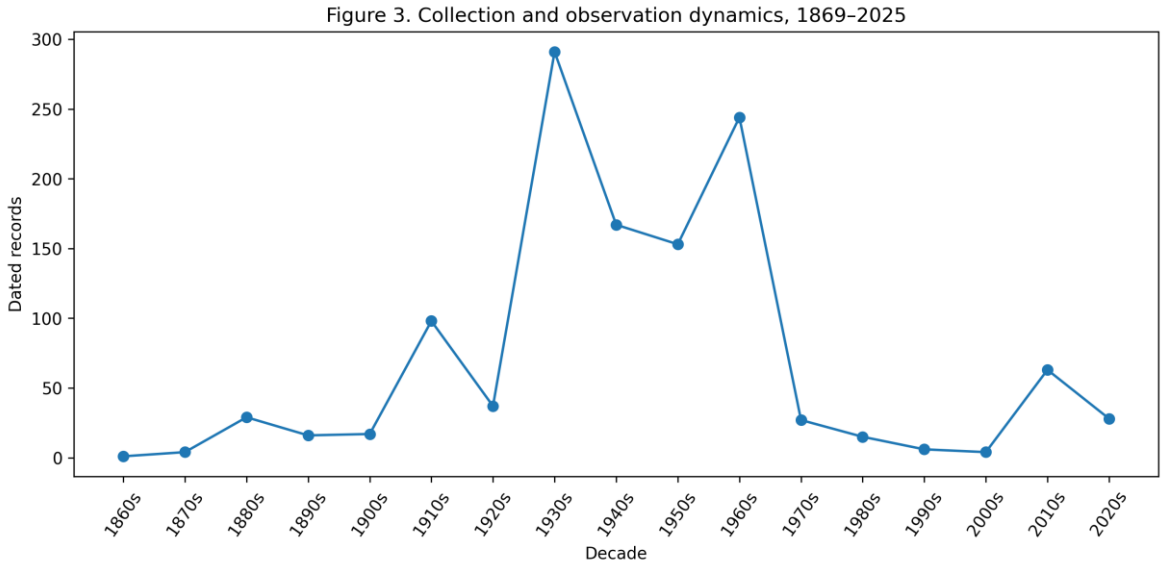

Figure 3. Collection and observation dynamics of the reliable dated Tajikistan records, 1869–2025.

The temporal series shows pronounced collecting maxima in the 1930s (291 records) and the 1960s (244 records). These peaks reflect intensified botanical exploration rather than changes in natural abundance. Historical specimens nevertheless provide an important baseline for identifying repeated localities and for future comparison with modern field observations.

Conservation implications

The Red Book of the Republic of Tajikistan (2017) lists nine *Eremurus* species: *E. aitchisonii* (VU), *E. candidus* (VU), *E. lachnostegius* (VU), *E. micranthus* (VU), *E. tadshikorum* (VU), *E. hilariae* (CR), *E. korowinii* (EW), *E. pubescens* (EW) and *E. roseolus* (CR) [20]. Historical herbarium vouchers are especially valuable for these taxa because they may preserve the only verifiable evidence for former populations or localities that have not been recently confirmed.

The occurrence gaps identified in this study provide a practical survey agenda. Literature-supported species missing from the quality-controlled coordinate dataset should be targeted first for herbarium digitization and re-georeferencing, followed by field verification of historical localities. Particular priority should be given to narrow endemics and Red Book taxa.

Scientific novelty and practical significance

The novelty of this study lies in combining several evidence layers within one quality-controlled workflow: historical herbarium records, Plantarium.ru occurrences, GBIF natural-only records, modern taxonomic reconciliation and country-level floristic literature.

The analysis independently screens coordinates against Tajikistan, documents duplicate removal, distinguishes voucher-based evidence from observations, identifies coordinate-orientation errors in the source workbook, standardizes synonyms, and explicitly separates direct occurrence coverage from national checklist richness.

Practically, the resulting framework can be used to prioritize specimen revision, direct future expeditions, identify historical localities requiring resurvey, support Red Book assessments, and prepare specimen-level supplementary data for international biodiversity infrastructures.

Study limitations

First, coordinates reconstructed from historical labels are estimates and may carry substantial uncertainty where toponyms are broad, obsolete or ambiguous. They should not be equated with GPS measurements taken at the time of collection.

Second, exact duplicate removal and stable-identifier matching cannot detect every possible duplicate. Two databases may represent the same physical sheet using different identifiers or slightly different transcriptions.

Third, occurrence density is strongly biased by expedition history, accessibility and digitization. Record counts are not a proxy for population size or abundance.

Fourth, the national checklist is constrained by the taxonomic concepts adopted. The case of *E. stenophyllus subsp. ambigens* illustrates how species-level richness changes when a taxon is treated at species versus subspecies rank.

Fifth, the status of *E. cristatus* in Tajikistan remains unresolved in the present synthesis because the 2025 monograph and current POWO country backbone are not fully concordant. The original voucher material and locality evidence should be re-examined before the record is treated as unambiguously confirmed.

Finally, the phrase “all herbarium data” is restricted to the records assembled in the supplied databases. Additional non-digitized specimens may remain in regional and international collections.

Conclusions

The integrated analysis demonstrates that Tajikistan possesses one of the richest national assemblages of *Eremurus*. The principal coordinate database yielded 1,510 raw Tajikistan records and 1,286 unique records after exact duplicate removal. Integration with 113 GBIF natural-only records, while removing 35 directly traceable overlaps, produced a conservative total of 1,364 occurrence records.

After taxonomic quality control, 1,345 records provide direct georeferenced evidence for 25 accepted species plus *E. stenophyllus subsp. ambigens*. This figure describes the present specimen/occurrence database, not total floristic richness.

Critical comparison of the 2025 global monograph, Flora Tadzhikskoi SSR, recent Tajikistan biodiversity literature and current POWO/WCVP supports a working modern checklist of 33 species for Tajikistan, with *E. cristatus* retained provisionally pending voucher confirmation. Under a strictly current POWO country assignment, 32 species are accepted, plus *E. stenophyllus subsp. ambigens*.

Except for GBIF occurrences already supplied with coordinates, examined herbarium specimens were individually georeferenced using Google Earth from specimen-label locality information. This preserves the value of historical collections while making their spatial uncertainty explicit.

Herbarium vouchers remain indispensable for checklist research because their identities, labels and geographic interpretations can be revisited. The combined specimen, literature and digital-occurrence approach used here provides a reproducible foundation for future taxonomic revision, targeted collection, conservation assessment and historical-biogeographic analysis of *Eremurus* in Tajikistan.

Funding

This study was conducted within the framework of the state program “Digital Nature: Development of a Digital Platform for the Flora of Central Uzbekistan” (2025–2029), implemented by the Institute of Botany, Academy of Sciences of the Republic of Uzbekistan. Additional financial support was provided by the projects “Taxonomic Revision of Polymorphic Families of the Flora of Uzbekistan” (A-FA-2021-427) and “Preparation of the First Uzbek-Language Edition of the Flora of Uzbekistan” (AL-9224104450). The study was also supported by the applied research project “Development of a Digital Platform for the Flora of the Fergana Valley as a Biodiversity-Threatened Region” (AL-9224104319), implemented at the Department of Biology, Namangan State University, for the period 2025–2027.

Аннотация: *В статье приведен анализ образующихся вторичного животного и растительного сырья, богатого белками. Приведены анализы литературных данных о химическом составе, пищевой и биологической ценности вторичного сырья животного и растительного происхождения. Также изучены технологии переработки вторичного сырья растительного и животного происхождения. Даны методики проведения экспериментов, технологические схемы, технологические параметры, рецептуры кормов, богатых белками приготовленные из вторичного животного и растительного сырья.*

Ключевые слова: *корм для рыб, протеин, белок, клетчатка, жир, микробиологический показатель, тяжелые металлы, пестициды, вторичное сырьё, костная мука, бычья шкура.*

DEVELOPMENT OF TECHNOLOGY FOR PROTEIN-RICH FISH FEED FROM SECONDARY RAW MATERIALS

Abstract: This article analyzes protein-rich secondary raw materials of both animal and plant origin. It reviews literature regarding the chemical composition, as well as the nutritional and biological value, of these materials. Processing technologies for secondary raw materials of plant and animal origin are also examined. The paper presents experimental methodologies, process flow diagrams, processing parameters, and formulations for protein-rich fish feeds produced from these secondary raw materials.

Keywords: fish feed, protein, fiber, fat, microbiological indicators, heavy metals, pesticides, secondary raw materials, bone meal, bovine hide.

Преобразования в последние годы коснулись все отрасли экономики и сельского хозяйства. В настоящее время можно ощущать положительные сдвиги во всех сферах народного хозяйства. Наибольшие положительные результаты также получены в сфере рыбоводства. Раньше этот продукт питания практически был дефицитом и в основном потребность населения в этом пищевом сырье обеспечивалось благодаря поставкам замороженных рыб из России и Казахстана, Азербайджана, также рыбными консервами. Благодаря особому вниманию правительства пашей республики и проводимым реформам в отрасле рыбоводства расширился ассортимент рыб, улучшилась качества, снизился стоимость продукции, обеспечение стало круглогодичным.

Постановка проблемы: На основании принятых указов и решений Правительством по развитию рыбоводства были достигнуты успехи по выращиванию рыб. На основании этих указов выделяются земли, льготные кредиты, обеспечивается породистыми личинками рыб. В последнее время все шире применяют интенсивные методы выращивания рыб. Это также способствует увеличению количества выращиваемых рыб.

Все вышеуказанные позитивные работы способствует улучшению обеспечения населения рыбными продуктами. С развитием отрасли, увеличением выращиваемых рыб, образованием новых водоемов возникает другая проблема: Проблема кормов для рыб. Как общеизвестно производство кормов для рыб в нашей республике не сильно развита. Во многих фермерских хозяйствах рыб кормят комбикормами и их потеря очень велика. Корм или комбикорма выбрасывают в воду и освоение этих кормов составляет 40-50% , а остальнае часть корма загрязняет воду. И оседая на дно озер гниют. Это тоже приводит к подорожанию готовой продукции. Проведенные нами исследования показывают, что в европейских стран при потреблении кормов 1 кг привес рыб также составляет 1 кг, а потери до 10 % от объема кормов. Эти корма также не загрязняет воду и богатый

дрожжами, жирами, витаминами, минералами и другими веществами, которые необходимы для хорошего развития рыб.

Учитывая вышесказанные нами была сформулирована цель создания кормов для рыб из местного вторичного животного сырья богатого протеинами и разрабатываемый корм имел все вышесказанные характеристики.

Так нами была выбрана разработка технологии кормов богатого протеинами, нам необходимо было критически анализировать существующие технологии, их ингредиенты, основные компоненты входящих в состав рецептур.

Мы анализируя рецептуры кормов для рыб, также изучали возможности получения рецептурных компонентов непосредственно в нашей республике. Это также влияет на образование цен рыбных кормов.

Литературный обзор: Анализируя рецептурные компоненты рыбных кормов мы выявили, что основным источником протеинов является сырьё животного происхождения. Здесь необходимо учесть тот фактор, чтобы этот компонент не способствовал к подорожанию выпускаемого продукта т.к. продукты животного происхождения стоит дорого. Учитывая эти особенности мы взяли в качестве мясного компонента бычью и каровью шкуру. Нам необходимо было изучить химический состав этого сырья т.к, стоимость и распространенность приемлемое и в достаточном количестве.

Анализ литературных источников показывает, что бычья шкура один из важнейших продуктов убоя крупного рогатого скота. Она составляет около 7-8% всей убойной живой массы.(1). По данным авторов тяжелые шкуры весом 27-37,5 кг получают в 15 месячном возрасте. Данные авторов Г.Р. Залялюдинова и др (2) свидетельствует, что в химический состав шкуры входят органические и неорганические вещества. К органическим веществам относится: белки, жиры, углеводы, ферменты, гормоны, витамины.

Авторами работы (3) установлено, что у всех животных масса шкур возрастает равномерно с живой массой тела. В 6-месячном, 1,5-гадовалом и 3-годичном возрасте % выход шкур от живой массы значительно превышают аналогичные показатели чем другие животные.

Авторами (3) исследования установлено, что наиболее приемлемыми для дальнейшего использования и переработки шкуры крупного рогатого скота являются в возрасте 3-4 лет.

В указанном возрасте шкуры крупного рогатого скота достигнет наибольшего объема, и имеют наилучший химический состав.

Как мы раньше говорили, в химический состав шкуры крупного рогатого скота входят вода, белки (коллаген, эластин, ретикулин, муцины и мукоиды, альбумины и глобулины), липиды, минеральные вещества, мукополисахаридные экстрактивные вещества, гликоген, витамины. (4). Наиболее распространённым белком в шкуре, соединительной ткани является коллаген. По количеству в организме он составляет около $^1/_3$ всех белков. По данным авторов (4) содержание коллагена в различных тканях (в % к сырой ткани)

Сухожилия	25-35
Кости	10-20
Хрящи	10-15
Кожа	15-25
Стенки сосудов	5-12
Почки	0,4-0,6
Печень	0,1-1
Мозг	0,2-0,4

Коллаген характеризуется некоторыми особенностями аминокислотного состава. В нем очень мало тирозина, метионина и нет триптофана, цистеина и цистеина, поэтому этот белок неполноценный.(4). Свойства коллагена заключается в том, что он сильно набухает, причем его масса увеличивается в 1,5-2 раза. Так как мы при приготовлении кормов для рыб взяли шкуру крупного рогатого скота, анализировали способность набухания в средах при 5,0-7,0. По данным авторов она по набуханию уступает миозину (масса набухшего белка взята в % к массе сухого):

Коллаген	200
Миозин	300
Ретикулин	30
Эластин	25
Кератин	40

Фиброин	32

По литературным данным (5) содержание воды составляет 64-68%, сухое вещество 32-36%. На долю белковых веществ приходится примерно 90-95% от массы сухого вещества шкуры (5). Количество липидов в шкурах колеблется в пределах 3-10%. Углеводы содержатся в шкуре в небольших количествах 1,5-2%.(5). Минеральные вещества шкуры в основном представлены ионами калия и натрия, а также небольшими количествами ионов кальция, железа, магния, алюминия, цинка и др. Содержание минеральных веществ не превышает 0,8% от массы сухого вещества шкуры. Это компоненты шкуры играют существенную роль в физиологических процессах, ответственных за формирование морфологических структур, а также обуславливает наличие целого ряда ценных свойств шкуры. Поэтому нам необходимо анализировать работы об изменениях химического состава и свойствах в процессах первичной обработки и дальнейшего производства.

Имея некоторые представления о химическом составе шкуры крупного рогатого скота, нам необходимо изучить научные исследования по изучению изменений происходящих в процессе первичной обработки.

На качество шкуры крупного рогатого скота влияют первичная обработка. В доменных условиях (5) сырьё сначала окунают на 4 часа в чистую воду, после того на протяжении 12 часов его выдерживают в солевом растворе, что готовится из расчёта 20 гр соли на 1л воды. Здесь необходимо учесть, что шкура начнет набухать и необходимо заготовить на килограмм 8л жидкости. Потом идёт удаление жирного покрова, мойка, покалывание, дубление, жировка и другие процессы.(5). В литературных источниках отмечают, что длительность технологических операций по обработке шкурах до консервирования, включая обрядку не должна превышать для крупного рогатого скота 3 часа(6).

В промышленности в цехах по обработке шкуры крупного рогатого скота устанавливают чаны для промывки и дезинфекции шкур, барабаны для поселки, пикеливания и промывки сырья, подмостки или стеллажи, мездрильные, навалосгоночные и отжимные машины.(7). Шкуры крупного рогатого скота в промышленности консервируют мокросоленым способом. По данным авторов на 1 кг парной шкуры крупного рогатого скота идет 4 л солевого раствора длительность тузлукования в бурсаках чанов 18-20 ч, и для стекания раскола развешивают в течение 1-2 часа. В настоящее время шкуру крупного рогатого скота консервируют радиоактивным облучением.(8).

Для удаления волосяного покрова из шкуры крупного рогатого скота используют известь. Для приготовления известкового раствора берут 3 л воды на 1 кг извести.(9). Учеными ведутся разработки ферментативного обезволосывания шкур (10). Сущность данного действия заключается в том, что ферментативное обезволосывания шкур крупного рогатого скота проводят в растворе фермента коллагенолитической протеазы из гепатопанкреатина в количестве 0,001-0,005% от массы сырья, а при солении используют сульфид натрия в количестве 0,5-1,1% от массы сырья (10). По мнению авторов метод обеспечивает сокращения длительности процесса, улучшается качество, и за счет интенсификации повышается экономическая эффективность (10). В работе исследователи (11) был использовань метод обработки шкуры крупного рогатого скота используя жидкий азот в течении 3-20 мин. В работах (12,13,14,15,16) также авторами проведены исследовательские работы по интенсификации процесса обезвоживания.

Вышепреведенный анализ подготовки бычьей шкуры показывает, что оно также имеет особое значение при производстве различных видов продукции, в том числе кормовом производстве. При разработке технологии корма для рыб с использованием бычьей шкуры будем учитывать этот фактор.

Тенерь рассмотрим и анализируем технологии приготовления кормов для разных видов рыб.

Исследователи М.Д. Мукатова и др (17). Разработали рецептуру рыборастительной кормовой смеси

Таблица 1

№	Наименование ингредиента	Соотношение %
1	Измельченные рыбные отходы	41,2
2	Карбамид	0,24
3	Отходы от разделки речных раков	18,8
4	Водное растение рдест пронзеннолистный	2,94
5	Отруби пшеничные	17,0
6	Соевый изолят	2,94
7	Плотны ходок корня солодки	0,59
8	Молочная сыворотка	3,1
9	Прессованные хлебопекарное изделие	1,4
10	Вода горячая	11,8

11	Итого	100

При сравнительном анализе качественных показателей она имеет внешний вид формы гранулы цилиндрической с неравномерной поверхностью и мелкими порами, цвет темно коричневый, запах свойственный набору входящих в рецепт комбикорм компонентов, без затхлого, плесневелого и других посторонних запахов.

Авторы установили (17) возможность использования рыборастительных кормов на основе измельченных рыбных отходов с внесением сухих ингредиентов с выходом сухих гранул, содержащих воду не более 10%, в количестве 43% от массы корм смеси и в пересчете на исходную массу рыбных отходов и выявлена хорошая посдаемость опытной партии.

К использованию вторичных рыбных ресурсов рыбной промышленности как источник пищевых и биологических добавок посвящена работа авторов Самойловой Д.А, Цибизова М.Е. (18).

Ученые из Казахстана В.И.Сидорова, Н.И.Январова, С.Ж.Асылбекова и др (19) разработали новую технику и технологию для рыбных кормов. Разработанная рецептура комбикормов для форели авторами исследований включает следующие ингредиенты:

Нормы ввода компонентов в комбикорма для форели,%

Таблица 2

№	Компонент	Форел	
		сеголетки	Товарная рыба
1	Пшеница	0-20	0-30
2	Отруби пшеничные	0-5	0-7
3	Соя полно жирная	0-7	0-7

Анализ состава рецептур основных компонентов показывает, что авторы выбрали богатые белками продукты, но некоторые из них являются микробнообсеменными.

Авторы (18) также исследовали физико-механические свойства комбикормов для форели.

Физико-механические свойства комбикормов для форели

Таблица 3

№	Показатель	Рецепт комбикормов для форели	
		стартовый	продукционный
1	Влажность,%	8,8	8,03
2	Цвет	Темно-коричневый	Темно-коричневый
3	Запах	Приятный рыбный	Приятный рыбный
4	Объемная масса кг/м^3	613,1±11,2	563,8±8,5
5	Размер гранул мм	2	5

6	Водостойкость, мин	825±35,5	725±35,5
7	Разбухаемость, мин	122±15	90±20
8	Крошимость, %	2,5±0,034	2,5±0,022
9	Коэффициент водопоглощения	0,83±0,002	0,73±0,002

Как показывает анализ данных табл.4. стартовый корм не уступает по всем своим показателям к продуктивным.

Авторы вышеприведенного исследования также разработали технологию экстрадированных стартовых комбикормов для молоди судака, тиляпи и кларисвого сома (20). Представленные комбикорма представляют собой крупки размером 0,2 мм, 0,5 мм, 1 мм, 2 мм. Цвет крупок варьировалось от темно коричневого до светло коричневого, значение водостойкости составляет не менее 2,5 часов, крошимость и не более разбухаемость 1,5% минут, объемная масса ниже 1000кг/м³. Эти показатели практически не уступают стартовой продукции.

В работе С.Л.Чернявская, Л.М.Есина, А.С.Виннов, О.Н.Кривонос разработали (21) технологию кормовых продуктов из мелких азово-черноморских рыб: авторы исследования исследовали химический состав сырья использованного при производстве кормов

Химический состав рыбного и растительного сырья

Таблица 5

Показатели	Хамса	Широш	Тюлька	Тщеница	Кукуруза
Белок %	14,1±0,8	13,3±0,8	15,3±0,9	10,6±0,8	9,0±0,7
Жир %	17,5±0,9	6,5±0,5	17,4±0,8	1,7±0,8	4±0,2
Зола %	1,7± 0,1	2,9±0,1	2,5±0,1	1,6±0,09	1,3±0,09
Вода %	66,7 ±2,7	76±3,3	64,8±2,2	4,4±1,0	13±0,1

Авторы доказали, что использование данных видов рыб в качестве белково жировых компонентов является целеобразным. Как видно из анализов рецептур комбикормов для рыб для обогащения их белками используют мясокостную муку, рыбные отходы, кровяную муку, рыбную муки и некоторое растительное сырьё, которое богато белками.

В исследовательской работа Н.В.Сорокиной (22) комбикорма для осетровых рыб разработали с использованием тыквенного жмыха. Авторы предложили следующий состав комбикормов:

Рецепт продукционного комбикорма для осетровых рыб

Таблица 6

Кормовые компоненты	Содержание, %
Мука рыбная	50
Тыквенный жмых	10
Витазар	20
Дрожи кормовые	10
Пшеница	3
Жир рыбий	6
Премикс ВМП ПО-1	1

По заключению авторов этот комбикорм отличается высоким содержанием протеинов и липидов, которое является важнейшим питательным продуктом при кормлении осетровых рыб. (22) Добавление в рецептуру дрожжей также способствовало обогещию протеинами, у которого количество сырого протеина составляет 45,5 %.

По утверждению авторов введения в рецептуру тыквенного жмыха способствиует обогащению витаминами, минералами, клетчаткой, что благотоверно влияет на пищеварения осетровых рыб.

Авторы также исследовали содержание в нем основных питательных веществ отдельных компонентов.

Состав продукционного комбикорма с тыквенным жмыхом и содержание в нем основных питательных веществ отдельных компонентов

Таблица 7

Показатель	Мука рыбная жирная	Дрожжи кормо	Жмых тыквенный	Жыр рыбий	Пшеница	Витазар	Прямике	Комбикорм

		вые сухие						
Содержание компонентав в состава комбикорма,	50	12	10	4	3		2	1
Сырой протеин, г/кг	267,5	54,6	36,8	-	4,0	64,9	-	428
Сырой жир,г/кг	54,0	1,8	11,3	39,2	0,6	16	-	123
Сырая клетчатка, г/кг	-	0,2	30,2	-	0,5	8,4	-	39
Безазотистые в-ва	47,5	42,1	7,7	-	19,8	76	-	193
Сырая зола, г/кг	81,0	9,2	4,9	-	0,6	14	-	110

По результатам исследований авторы достигли гарантированных величин индикаторных показателей протеиновой и липидной питательности: сырого протеина -42,8 %, сырого жира-12,3 %, клетчатки-3,9 % . Авторы указывают, что содержание сырого протеина в опытном превышает 1,18 раз чем контрольный, сырого жира 1,29 раза больше, чем в контрольном, а массовая доля клетчатки 1,77 раза выше, чем в контрольном.

В работе Габеевой А.Р., (23) исследовано возможность использование канычи для приготовления кормов зеркалного карпа. Авторы вводими в цион как источник белкововитаминной добавки при нагуле карпа и они установили и эффективности использования канычи для выращивания карпа. (23)

Кошак Ж.В., Гадлевекая Н.Н анализировали ассортимент и показатели кормов для радужной форели в республике Беларус. По заключению авторов корм для форели в основном завозят из за рубежа. Авторы указывают что свойства отечественных кормов для форели не всегда отвечает современным требованиям, что приводит к более высоким затратам кормов на килограмм прироста живой массы, загрязнению окрутающей среды и повышенным непроизводительным затратам. По нашему мнению такая же обстановка в кормо производстве для рыбы в нашей республике.

Все качественные корма рабовладельческие хозяйства завозят из-за рубежа. Они качественные, богатые, белками, жирами, витаминами, углеводами. Но их высокая стоимость влияет на стоимость готовой продукции.

Исходя из вышеприведенных можно сделат вывод о том что необходимо наладить производство отечественных комбикормов для рыб в нашей республике. Анализ существующих технологий показывает, что в нашей республике имеются все компоненты для производества рыбных кормов. Надо развивать отечественную отрасль кормопроизводства для рыб.

Мы анализируя существующие технологии пришли к выводу что на этих технологиях имеются ряд недостатков:

-используют мясокостную муку, которая значительно влияет на себестоимость кормов;

-в некоторых кормах используют кровяную муку и она имеет особый запах, что снижает качество кормов;

- многие технологии приготовления проводятся с отработкой высокой температурой, что снижает пищевую и биологическую ценность кормов.

Исходя из вышеприведенных нами была разработана технология при приготовлении рыбных кормов богатого протеинами, на основе вторичного животного сырья богатого белками. Для проведения исследований были выбраны следующие методы исследований и материалы.

Материали и методы исследований:

Материалами для проведения исследовательских работ были выбраны бычья шкура ГОСТ 28425-90 (25), мука кукурузная ГОСТ14176-69 (26), из рисовой сечки ГОСТ 6292-93 (27), мука из пшеничных отрубей ГОСТ 7169-66 (28), соевого жмыха ГОСТ 3898-56 (29), мясокостная мука ГОСТ 59296-2021 (30). Все выбранные продукты отвечали требованиям вышестоящих ГОСТов.

В работе использовали бычья шкура, полученная в убойном цехе животных города Намангана мука кукурузную, рисовую, приобрели на рынках города Намангана. Мясокостную муку получили путем нагревания костей в муфельных печах и с последующим измельчением. Соевый жмых получили с масло заводов г Учкургана.

Для приготовления кормов для рыб, из бичей шкуры удалили во лосяной покров и измельчали, после чего сушили методом атмосферной сублимационной сушки и сушеную шкуру измельчали, получали порошок.

В экспериментах использовали корм, полученный по разработанной технологии.

Для получения средней пробы кормов для рыб отбирали пробы от трёх образцов одного вида кормов, смешивали их и получали средную пробу согласно по ГОСТ 26929 в количестве 1% от массы корма, но менее 500-600г. Все эксперименты в производственных и лабораторных условиях проводили в пятикратной повторности, результаты экспериментов подвергались статистической обработке по методу наименьших квадратов (7)

Объектом исследования настоящей работы является рыбный корм полученный из вторичного животного и растительного сырья.

В лабораторных условиях кафедри Биотехнологии были разработаны рецептуры и технологические схемы кормов для рыб.

Были исследованы основы физико-химические, микробиологические показатели, а также безопасность и пригодность кормов для рыб.

Влажность рыбных кормов исследовали по ГОСТ 10385-2014 (31). Пробу рыбных кормов сушили в сушилном шкафу в течении 4 часов при 105^0С до постоянной массы. Сырой протеин определяли по ГОСТ 10385-2014 (32), сыров жир исследовали по ГОСТ 20385-2014 (33), без азотистые экстрактивные вещества по ГОСТ 10385-2014 (34), сырую клетчатку в рыбных кормах определяли по ГОСТ 10385-2014 (35), и исследовали содержание золы по ГОСТ 10358-2014 (36) в исследуемом образце. Также были исследованы содержания тяжелых металлов свинца, по ГОСТ 26932-80 (37), кадмия по ГОСТ 26932-80 (38), ртути по ГОСТ 26927-80 (39), мышьяка по ГОСТ 26930-86 (40), йода по OzDst 1091:2011 (41), содержание α, β, γ- ГХЦГ (11), метоболиты ДДТ по МУ 012-300/10 (42).

Результаты исследования и их обсуждения:

При разработке новых технологических схем и рецептур, необходимо учесть основные технологические принципы, такие как наилучшее использование сырья, сокращения времени проведения процесса, рациональное использование энергии и оборудования, оптимальный вариант. Эти принципы соблюдают с учетом фундаментальных физико-химических и биологических закономерностей а также закономерностей экономики и кибернетики. Необходимо иметь ввиду, что фундаментальные законы дают лишь качественную характеристику технологического процесса, а для эффективности нужна количественная оценка.

Необходимо ещё учесть, что стоимость готовой продукции завесить от стоимости исходного сырья. Полное использование сырья является одним из основных методов снижения удельных затрат на производство готовой продукции. При анализе и синтеза технологических схем необходимо составить материальный баланс. Он позволяет оценить степен использования исходного сырья и установить этапы процесса, на которых его используют более эффективно.

При разработке рецептур новых продуктов здесь необходимо иметь ввиду что ценообразования зависит от исходного сырья и целесообразно это учесть.

Повышенный расход сырья приводит к снижению производительности технологической линии по готовому продукту, увеличению затрат труда, топлива, электроэнергии и воды на единицу продукции.т.е.к повышению её себестоимости.

Основная задача нашей исследовательской работы заключается в снижении себестоимости, повышению пищевой и биологической ценности кормов.

Учитывая вышеизложенное нами были проанализированы рецептуры существующих кормов для рыб, а также изучены состав сырья, которое способствует увеличению и обогащению белками этих кормов, а также учитывалось себестоимость и доступность этих видов сырья.

Исходя из вышесказанных нами была изучен бычья шкура как источник белковой основы рыбных кормов.

Данные о химическом составе бычьей шкуры приведены в литературном обзор этой статьи. Технология приготовления кормов для рыб с повышенным содержанием белка заключается в очистке волосяного покрова с обработкой щелочью, выдерживанием в течении суток и последующем после очистки шкуры его выдерживают в растворе уксусной кислоты в течении суток, после чего тщательно моют в проточной холодной воде и промытая бычья шкура измельчается в измельчителе, после чего мелкоизмельченному бычье шкуре дают форму пластов толщиной 8-12 мм и замораживает при температуре -18^0 С, замороженные пласты сушат в атмосферном сублимационном сушке в течении 7-8 часов, после чего измельчают, просеивают через сито № 0,28 и в просеянный порошок бычьей шкуры добавляют просоленную муку кукурузную, просеянную муку рисовой сечки, просеянную муку из семян амаранта, просеянную муку из соевого жмыха и просеянную мясо-костную муку, смешивают, смесь вводят в экструдер при непрерывном перемешивании желатинируют крахмал и дают форму сушат и сверху обрабатывают пищевым парафином.

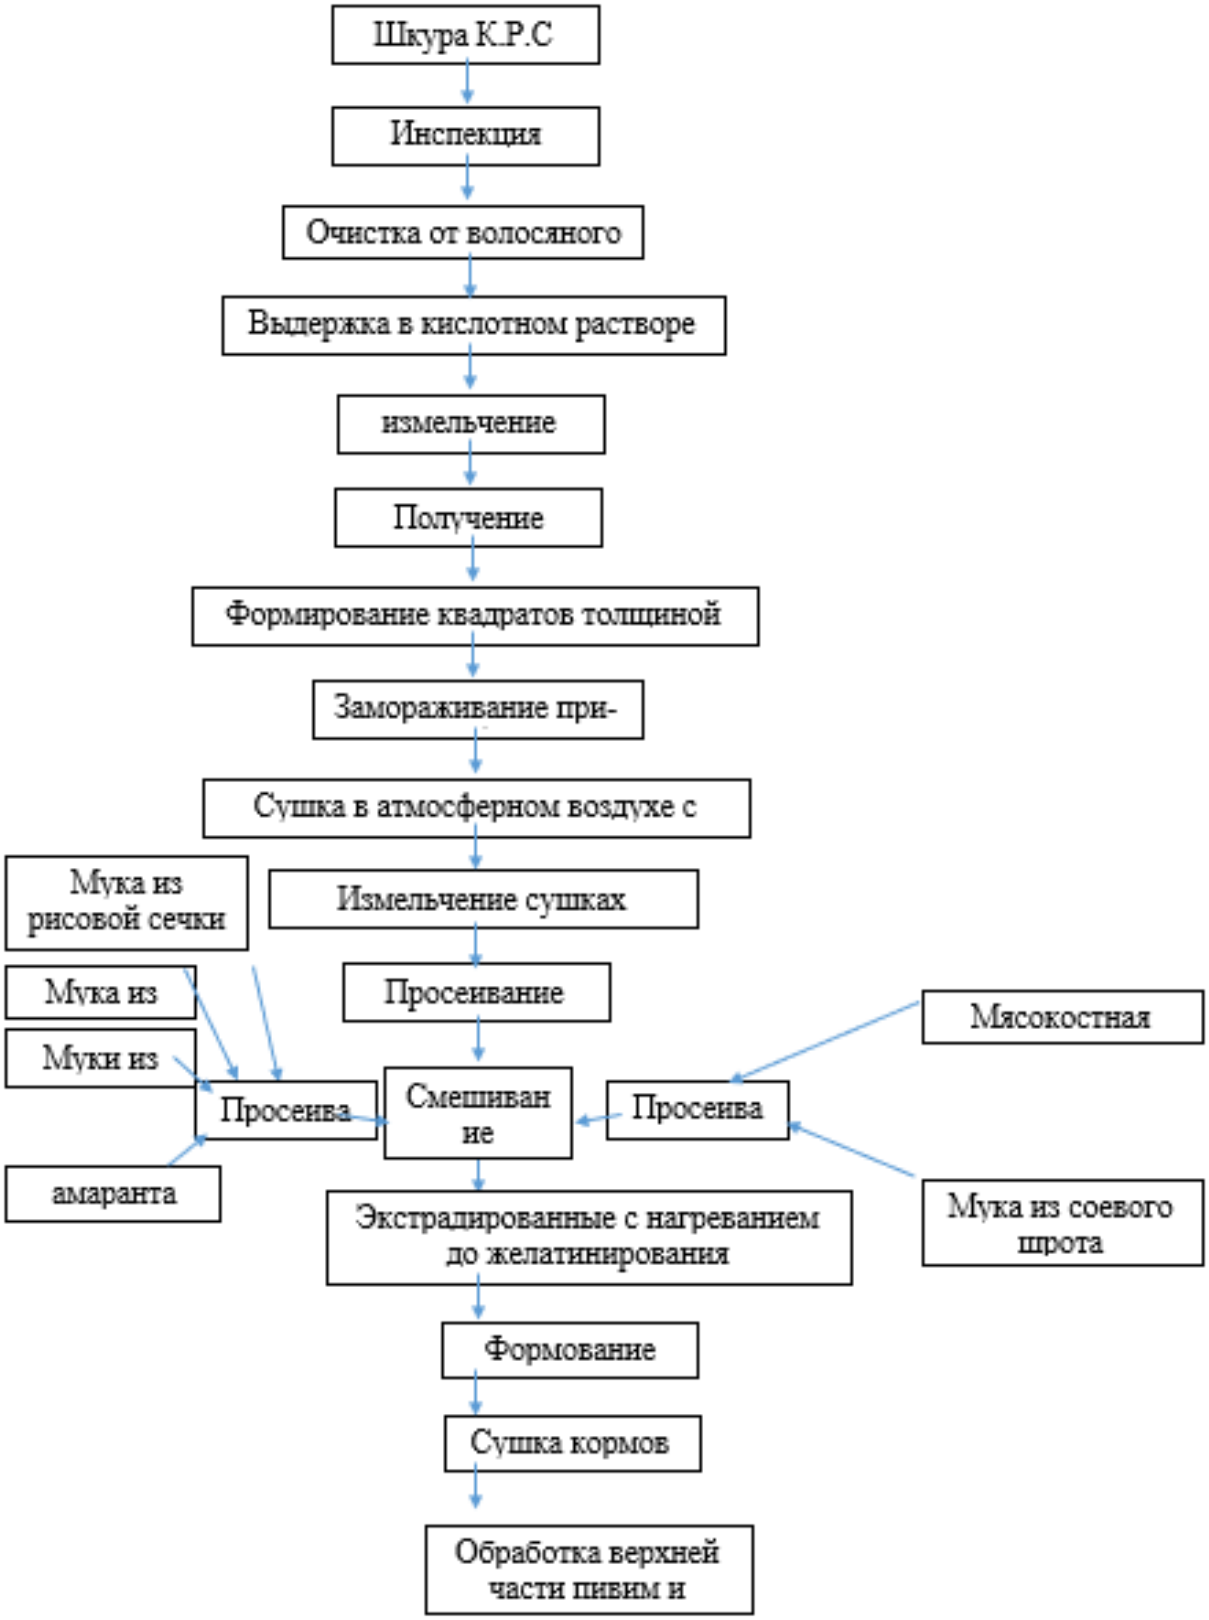
Рецептура рыбного корма богатого протеинами из вторичного животного и растительного сырья

№	Наименование сырья	Количество, гр		
1	Мука из шкуры крупного рогатого скота	45	50	55
2	Мука кукурузная	10	9	8
3	Мука из рисовой сечки	5	4	3
4	Мука из семян амаранта	10	9	8

5	Мука из жмыха соевого шрота	25	24	23
6	Мясо-костная мука	5	4	3
Итого		100	100	100

При разработке рецептур мы выбрали 3 варианта рецептур. Наиболее оптимальным был II-вариант рецептур.

При разработке рецептур корма для рыб мы обосновывали причинно-следственную связь между соотношениями составляющих компонентов. Одним из компонентов корма для рыб является мука из шкуры крупного рогатого скота. Использование этой муки менее 45 мас. % не приведет к обогащению.



К обогащению белками и превышению этого количества более 55% масс способствует к ухудшению органолептических показателей. Только указанные количественные пределы способствуют получению корма с повышенным содержанием белка.

Использования муки из кукурузы, рисовой сечки, соевого шрота способствовало к обогащению углеводами, белками, клетчаткой и формированию вкуса корма для рыб. Только указанные пределы вышеуказанных сырьевых компонентов способствовали получению кормов для рыб с повышенным содержанием белка и высокими органолептическими показателями.

При использовании амарантовой муки, мы брали листья и корневую часть, а также семенную головку. Наиболее лучшие результаты были получены при использовании семенных головок, т. к. он богат белками, жирами, а также оно способствовало улучшению органолептических показателей, таких как цвета кормов для рыб.

Использование мясо-костной муки способствовало к обогащению корма жирами, а также минеральными веществами, повышению количества добавленной мясо-костной муки более 5 мас % приводит к ухудшению органолептических показателей, а снижению этого показателя менее 3мас% не позволяет достичь цель данной исследовательской работы.

Ниже приводим технологическую схему приготовления производства корма для рыб (рис.1).

Ы Рис.1. Технологическая схема приготовления рыбных кормов с повышенным содержанием белка из вторичного сырья животного и растительного сырья

Наиболее полного представления о пищевой ценности и безвредности мы исследовали микробиологические, органолептические и физико-химические показатели рыбного корма.

Таблица 2. Содержание тяжелых металлов и других постоянных веществ в рыбном корме

№	Показатели составных частей	Определенная концентрация	Единица измерения	Документы, использованние при исследовании	Соответсвие показателей (требований)
1	Свинец	0.00	мг/кг	ГОСТ 26932-86	Соответствует
2	Кадмий	мг/кг	мг/кг	ГОСТ 26933-86	Соответствует
3	Ртут	мг/кг	мг/кг	ГОСТ 26927-86	Соответствует
4	Мышяк	мг/кг	мг/кг	ГОСТ 26930-86	Соответствует
5	Элементарный	0.00118	мг/кг	O‘ z DST 1091-2011	Соответствует
6	α, β, γ ГХЦГ	0.00	мг/кг	МУ 012-3/0010	Соответствует
7	Метаболиты ДДТ	мг/кг	мг/кг	МУ 012-3/0020	Соответствует

Как показывает анализ данных табл.2, что соли тяжелых металлов не обнаружены в рыбном корме, полученном из вторичного животного и растительного сырья

Также были исследованы основные микробиологические показатели таблица.3.

Таблица 3. Основные микробиологические показатели рыбных кормов полученных из вторичного животного и растительного сырья

№	Наименование Исследуемого образца	Общее микроби. число КМА/КОЕ в 1,0 гр		БГКП		Возбуждение болезни Патоген микрофлора, сальмонелла		Плесень, дрожжи КОЕ, в 1,0		Saureus		L. monositigenes		В сочец ГОСТ	
		Норма	Факт. Форма	Норма	Факт. норма	Норма	Факт. норма	Норма	Факт. норма	Норма	Факт. норма	Норма	Факт. норма	Норма	Факт. норма
1	Рыбный корм	2,5x10 4	Не определено	1,0 гр	Не определено	50 гр не допуск кается	Не определено	100 г КОЕ	Отрицательный	1,0 гр не допуск кается	Отрицательный	50 гр не допуск кается		200 гр не допуск кается	Отрицательный

Анализ данных табл.3. свидетельствует что, рыбные корма отвечают всем требованиям по микробиологическим показателям, предъявляемым рыбным кормам.

Ещё основным показателем рыбных кормов является их органолептические и физико-химические показатели. Данные об этих показателях приведены в таблице 4,

№	Показатели	Определенная концентрация	Единица измерения	Документы использованние при исследовании	Соответствие показателей (требований)
1	Влажность	4,5 %	%	ГОСТ 10385-2014	Соответствует
2	Сырой протеин	17,6 %		ГОСТ 10385-2014	
3	Сырой жир	8,7 %		ГОСТ 10385-2014	
4	Без азотистые экстрактивные вещества	31,9 %		ГОСТ 10385-2014	
5	Сырая клетчатка	32,4 %		ГОСТ 10385-2014	
6	Зола	13,9 %		ГОСТ 20385-2014	
7	Внешний вид	Круглые, длиной 1-1,5-см			
8	Вкус	Приятный			

9	Запах	Приятный, без постороннего запаха
10	Цвет	Ярко желтый
11	Консистенция	Твердая

Как показывает анализ данных таблицы 4, влажность данного рыбного корма полученного из вторичного животного и растительного сырья составляет 4.5%, сырой протеин 17.6% и оно по сравнению существующим ГОСТ кормов рыбных 2.4 раза превышает , сырой жир 8.7%, без азотистые экстрактивные вещества 31.9% , сырая клетчатка 32.4%, зола 13.9%.

Использование бычьей шкуры и вторичного растительного сырья богатого белками способствовало повышению содержанию сырого протеина.

При разработке данной технологии впервые были применены атмосферная сублимационная сушка, что способствовало полному сохранению пищевых веществ, таких как белки, жиры в бычьей шкуре.

Использование вторичных сырьевых ресурсов животного и растительного сырья богатого белками привело к снижению себестоимости разрабатываемого рыбного корма

Заключение: Проведенные исследования показали , что в условиях нашей республики целесообразно использовать шкуру крупного рогатого скота для производства рыбных кормов, т.к. во первых их в достаточном количестве, во вторых стоит дёшево и ещё не нужно его переработка в крупных масштабах. Обработка шкуры крупного рогатого скота без тепловой обработки, получая из него порошка также способствует повышению пищевой и биологической ценности разрабатываемого корма Использование при производстве кормов продуктов вторичных сырьевых материалов, таких как рисовая сечка, кукурузная мука, соевого жмыха семена амаранта, а также костной муки способствует не только получению продукта с повышенным содержанием белка, жиров, углеводов, клетчатки минералов, витаминов, а также снижению себестоимости разрабатываемых рыбных кормов. Дальнейшее наши исследования будут изучение освоения рыбами этих кормов а также не быстрому оседанию данных кормов в водоемах. Освоение разработанной технологии в условиях республики Узбекистан будут способствовать увеличению переработки вторичных сырьевых ресурсов, получению качественных рыбных кормов с низкой себестоимостью, а также к снижению цен на готовую рыбную продукцию.

Annotatsiya: *Ushbu maqolada yuqori Chirchiq daryosi sharoitida qafas usulida yetishtirilayotgan triploid kamalak gulbaliqlarining (Oncorhynchus mykiss) biometrik ko‘ rsatkichlari va oziqlantirish xususiyatlari o‘ rganildi. Tadqiqot davomida 80 ta baliqning tana uzunligi va vazni individual ravishda o‘ lchanib, ularning o‘ lcham ko‘ rsatkichlari tahlil qilindi. Baliqlarni oziqlantirishda tana kattaligiga mos granulali yemlardan foydalanildi; kichik baliqlar uchun mayda, yirik baliqlar uchun esa kattaroq granulalar tanlandi. O‘ lchangan baliqlarning umumiy tana uzunligi 15,5–45,5 sm, tana vazni 39–1420 g oralig‘ ida bo‘ ldi. O‘ rtacha tana uzunligi 30,88±9,63 sm, o‘ rtacha tana vazni 508,54±399,24 g ni tashkil etdi. Baliqlarning uzunligi ortishi bilan tana vaznining ham muntazam ortib borishi kuzatildi. O‘ lcham guruhlarini alohida ko‘ rib chiqish kichik baliqlardan yirik tovar baliqlargacha bo‘ lgan o‘ sish qatorini aniq ko‘ rsatdi. Olingan natijalar qafas sharoitida baliqlarni biometrik kuzatib borish, o‘ lchamiga mos yem granulasi tanlash va oziqlantirish jarayonini samarali tashkil etish uchun amaliy ahamiyatga ega. Tadqiqot ma’lumotlari yuqori Chirchiq daryosi sharoitida sovuq suv baliqchiligini rivojlantirish bo‘ yicha keyingi tajribalar uchun boshlang‘ ich baza bo‘ lib xizmat qiladi.*

БИОМЕТРИЧЕСКИЕ ПОКАЗАТЕЛИ И ХАРАКТЕРИСТИКИ КОРМЛЕНИЯ ТРИПЛОДНОЙ РАДУЖНОЙ РЫБЫ (Oncorhynchus mykiss), ВЫРАЩИВАЕМОЙ В СКАДАХ В ВЕРХНЕМ РЕКЕ ЧИРЧИК

Аннотация: *В статье приведены результаты изучения биометрических показателей и особенностей кормления триплоидной радужной форели (Oncorhynchus mykiss), выращиваемой в садках в условиях верхнего течения реки Чирчик. В исследовании измерены 80 рыб. Определяли длину и массу каждой особи и сравнивали полученные показатели между размерными группами. Для кормления использовали гранулированный корм с размером гранул, соответствующим величине рыбы. Общая длина исследованных рыб составила 15,5–45,5 см, масса — 39–1420 г. Средняя длина равнялась 30,88±9,63 см, средняя масса — 508,54±399,24 г. По мере увеличения размеров рыб наблюдалось последовательное увеличение их массы. Полученные материалы могут быть использованы при организации биометрического мониторинга, подборе размера гранул и совершенствовании кормления радужной форели в садковых хозяйствах.*

BIOMETRIC INDICATORS AND FEEDING CHARACTERISTICS OF TRIPLOID RAINBOW TROUT (*ONCORHYNCHUS MYKISS*) RAISED IN CAGES IN THE UPPER CHIRCHIK RIVER

Abstract: *The paper presents the biometric characteristics and feeding features of triploid rainbow trout (Oncorhynchus mykiss) reared in cages under the conditions of the upper Chirchiq River. Eighty fish were individually measured for body length and weight. Fish were fed with granulated feed selected according to fish size, with smaller pellets used for smaller fish and larger pellets for larger individuals. Total length ranged from 15.5 to 45.5 cm and body weight from 39 to 1420 g. Mean total length was 30.88±9.63 cm and mean body weight was 508.54±399.24 g. A clear increase in body weight with increasing fish size was observed across the measured groups. The results can be used for biometric monitoring, feed-pellet selection and improvement of feeding practices in rainbow trout cage farming under local conditions.*

Keywords: *rainbow trout,* Oncorhynchus mykiss, *triploid fish, cage aquaculture, biometric measurements, body weight, body length, pelleted feed, feeding, Chirchiq River.*

KIRISH

Kamalak gulbaliq (Oncorhynchus mykiss) sovuq suv akvakulturasida eng ko‘ p yetishtiriladigan baliq turlaridan biri bo‘ lib, uning xo‘ jalik qiymati tez o‘ sishi, intensiv oziqlantirishga moslashishi va bozorbop go‘ sht sifatiga egaligi bilan bog‘ liq. Qafas usuli tabiiy suv almashinuvidan foydalanish imkonini beradi va tog‘ oldi daryo hamda suv omborlarida forel yetishtirishni samarali tashkil etishning amaliy yo‘ llaridan hisoblanadi. Kamalak gulbaliq uchun oziqlantirishda baliq o‘ lchami va suv sharoitiga mos yem miqdori hamda pellet o‘ lchamini tanlash muhimdir. FAO ma’lumotlarida ham forel uchun yem granulasi o‘ lchami baliq massasi bilan bog‘ liq ravishda oshib borishi ko‘ rsatilgan [1].

Triploid baliqlar akvakulturada jinsiy yetilish bilan bog‘ liq ayrim muammolarni kamaytirish, mahsuldorlikni saqlash va biologik xavfsizlikni kuchaytirish maqsadida o‘ rganilmoqda. Triploid kamalak gulbaliqlarning o‘ sishi va xo‘ jalik ko‘ rsatkichlari ularni parvarishlash sharoiti, nasliy xususiyatlari va zichligiga bog‘ liq bo‘ lishi mumkin [2–4]. Shu sababli har bir hududda mahalliy sharoitga mos real biometrik ma’lumotlarni to‘ plash muhimdir.

Baliqlarning tana uzunligi va vaznini muntazam o‘ lchash amaliy monitoringning sodda, lekin juda foydali usuli hisoblanadi. Ushbu ko‘ rsatkichlar baliqlar o‘ sishining umumiy holatini, o‘ lcham guruhlari o‘ rtasidagi farqlarni va oziqlantirish jarayonining tashkiliy jihatlarini baholash imkonini beradi. Oldingi tadqiqotlarda ham kamalak gulbaliqda uzunlik, vazn va konditsiya ko‘ rsatkichi o‘ zaro bog‘ liq ekanligi ko‘ rsatilgan [5].

Tadqiqotning maqsadi —Yuqori Chirchiq daryosi sharoitida qafaslarda yetishtirilayotgan triploid kamalak gulbaliqlarning biometrik ko‘ rsatkichlarini baholash, baliqlarning o‘ lcham guruhlarini tavsiflash hamda oziqlantirishda yem granulasi o‘ lchamini tanlash amaliyotini ilmiy tavsiflash.

TADQIQOT HUDUDI, MATERIALLARI VA USULLARI

Tadqiqot yuqori Chirchiq daryosi sharoitidagi qafas xo‘ jaligida yetishtirilayotgan triploid kamalak gulbaliqlar ustida olib borildi. Tadqiqot materiali sifatida 80 ta baliq olindi. Har bir individ bo‘ yicha umumiy tana uzunligi (L, sm), tana uzunligi (l, sm) va tana vazni (Q, g) qayd etildi.

Biometrik o‘ lchovlar dala sharoitida bajarildi. Baliqlar avvalo ehtiyotkorlik bilan olinib, individual tarozida tortildi; keyin tana uzunligi o‘ lchandi va natijalar yozma qayd etilib, elektron jadvalga ko‘ chirildi. Olingan ma’lumotlar asosida o‘ rtacha ko‘ rsatkichlar, eng kichik va eng yuqori qiymatlar hamda o‘ lcham guruhlari bo‘ yicha o‘ rtacha vaznlar aniqlandi.

Oziqlantirishda Turkiyadan keltirilgan granulali yemdan foydalanildi. Kuzatuv materiallarida yem granulalari baliqlarning o‘ lchamiga qarab farqlanishi ko‘ rsatilgan: 0,8–1,2 mm, 1,2–2,0 mm, 2,0–3,0 mm, 3,0–4,5 mm va 4,5–6,0 mm. Kichik baliqlar mayda, yirik baliqlar esa kattaroq granulalar bilan oziqlantirildi. Oziqlantirish chastotasi ham baliq kattaligiga qarab o‘ zgartirildi: kichik baliqlar 4–5 mahal, o‘ rta kattalikdagilar 3 mahal, yirik baliqlar 2 mahal oziqlantirildi.

Olingan biometrik ko‘ rsatkichlar sodda variatsion-statistik usulda tahlil qilindi. Maqolaning asosiy e’tibori baliqlarning real o‘ lcham ko‘ rsatkichlari va ularning oziqlantirish jarayoni bilan bog‘ liq amaliy kuzatuvlarga qaratildi. O‘ sish sur’ati va yemdan foydalanish samaradorligini chuqurroq baholash uchun keyingi bosqichda boshlang‘ ich va yakuniy massa, tajriba davomiyligi hamda sarflangan yem miqdorini parallel qayd etish rejalashtiriladi.

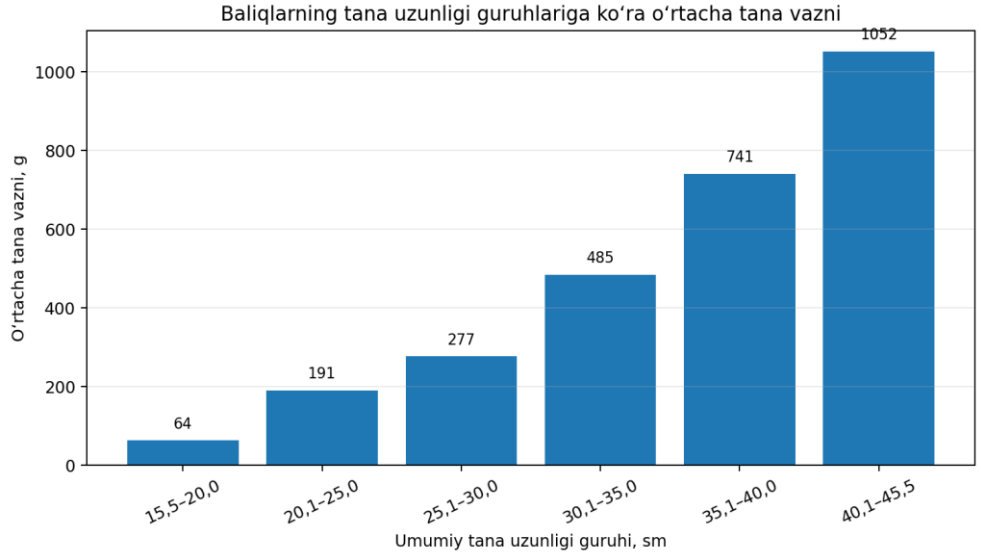
1-rasm. Tajriba xo‘ jaligida foydalanilgan granulali yem va uning baliq o‘ lchamiga mos fraksiyalari.

2-rasm. Turli o‘ lchamdagi yem granulalarini o‘ lchov shkalasida taqqoslash.

TADQIQOT NATIJALARI

Tadqiqot davomida o‘ lchangan 80 ta baliqning umumiy tana uzunligi 15.5–45.5 sm, tana uzunligi 13.0–43.0 sm, tana vazni esa 39–1420 g oralig‘ ida bo‘ ldi. Umumiy tana uzunligining o‘ rtacha qiymati 30.88±9.63 sm, tana uzunligining o‘ rtacha qiymati 28.75±9.64 sm, tana vaznining o‘ rtacha qiymati esa 508.54±399.24 g ni tashkil etdi.

Tana vazni bo‘ yicha keng farq mavjudligi tanlanmada turli kattalikdagi baliqlar birgalikda mavjudligini ko‘ rsatadi. Eng kichik baliqlar 15,5 sm atrofidagi uzunlikda bo‘ lib, ularning vazni 39–60 g diapazonda qayd etilgan. Tana uzunligi 40 sm dan oshgan baliqlarda esa tana vazni odatda 700–1400 g atrofida bo‘ ldi. Bu holat baliq kattalashgani sari tana massasining tez ortishini amaliy jihatdan ham yaqqol ko‘ rsatadi.



1-jadval. 80 ta kamalak gulbaliqning asosiy biometrik ko‘ rsatkichlari

Ko‘ rsatkich	n	O‘ rtacha	Min	Max	Izoh
Umumiy tana uzunligi, L (sm)	80	30.88±9.63	15.5	45.5	Baliqning umumiy o‘ lchami
Tana uzunligi, l (sm)	80	28.75±9.64	13.0	43.0	Asosiy tana uzunligi
Tana vazni, Q (g)	80	508.54±399.24	39	1420	Individual massa
Konditsiya koeffitsiyenti, K	80	1.291±0.163	0.957	1.697	Tana to‘ liqligining yordamchi ko‘ rsatkichi

2-jadval. Tana uzunligi guruhlari bo‘ yicha o‘ rtacha tana vazni

Uzunlik guruhi, sm	Baliqlar soni	O‘ rtacha uzunlik, sm	O‘ rtacha vazn, g	O‘ rtacha K
15,5–20,0	20	17.68	63.50	1.136
20,1–25,0	4	24.00	191.00	1.374
25,1–30,0	16	27.47	276.81	1.332
30,1–35,0	4	33.88	485.00	1.246
35,1–40,0	18	38.06	741.11	1.331
40,1–45,5	18	42.28	1052.22	1.380

Jadvaldan ko‘ rinib turibdiki, tana uzunligi oshgan sari o‘ rtacha tana vazni ham izchil ravishda ortib borgan. Eng kichik o‘ lcham guruhida o‘ rtacha vazn 63,5 g bo‘ lgan bo‘ lsa, 40,1–45,5 sm uzunlikdagi baliqlarda o‘ rtacha vazn 1052,2 g ga yetgan. Bu farq qafasdagi baliqlar turli yosh va o‘ lcham bosqichlarida ekanligini ko‘ rsatadi.

OZIQLANTIRISH JARAYONINING AMALIY BAHOSI

Tajriba davomida baliqlarni oziqlantirishda yem granulasi o‘ lchamini baliq kattaligiga moslashtirishga alohida e’tibor berildi. Bu usul baliqning yemni yutishi va undan foydalanishini osonlashtiradi. Kuzatilgan yem granulalari mayda yosh baliqlardan boshlab yirik tovar baliqlargacha bosqichma-bosqich kattalashib borgan. Ushbu yondashuv forelchilikda qo‘ llanadigan umumiy oziqlantirish tamoyillariga mos bo‘ lib, yem granulasi o‘ lchami baliq massasiga mos holda oshiriladi [1].

Baliq kattaligiga qarab oziqlantirish chastotasining o‘ zgarishi ham tajribaning muhim jihati bo‘ ldi. Kichik baliqlarning 4–5 mahal, o‘ rta kattalikdagi baliqlarning 3 mahal va yirik baliqlarning 2 mahal oziqlantirilishi amaliy kuzatuvlar asosida tashkil qilindi. Bunday yondashuvda asosiy maqsad baliqlarni bir vaqtning o‘ zida ortiqcha yem bilan ta’minlamaslik, yemni yaxshi qabul qilinishi va suvga tushadigan ortiqcha yem miqdorini kamaytirishdan iborat.

Baliqlarning oziqlantirish jarayoni bilan birga ularning tashqi ko‘ rinishi va xatti-harakatlarini kuzatish ham muhim bo‘ ldi. Amaliy akvakulturada qo‘ lda oziqlantirish baliqning yemga reaksiyasi, sog‘ lig‘ i va suv muhitidagi o‘ zgarishlarni bir vaqtda kuzatish imkonini berishi qayd etilgan [6].

MUHOKAMA

Tadqiqotda qayd etilgan biometrik ko‘ rsatkichlar baliqlar tarkibida o‘ lchamlar bo‘ yicha katta farq mavjudligini ko‘ rsatdi. Bunday farq qafas xo‘ jaligida baliqlarning turli yosh bosqichlarida bo‘ lishi, individual o‘ sish xususiyatlari va oziqlanish sharoitlari bilan bog‘ liq bo‘ lishi mumkin. Shu sababli biometrik o‘ lchovlarni muntazam ravishda takrorlash baliqchilik xo‘ jaligida boshqaruv qarorlarini qabul qilish uchun foydali.

Bizning tanlagan baliqlarimizda tana uzunligi va vazni o‘ rtasida aniq musbat bog‘ liqlik kuzatildi. Ushbu qonuniyat kamalak gulbaliqda boshqa xo‘ jaliklarda ham kuzatilgan bo‘ lib, uzunlik va vaznni birgalikda baholash baliqning umumiy konditsiya holati haqida qo‘ shimcha ma’lumot beradi [5]. Shuni alohida ta’kidlash kerakki, boshqa hududlardagi natijalarni bevosita tenglashtirish to‘ g‘ ri emas, chunki suv harorati, ozuqa, genotip, yosh va yetishtirish tizimi natijaga ta’sir qiladi.

Triploid kamalak gulbaliqlar bo‘ yicha olib borilgan tadqiqotlar ham ploidlik, nasliy xususiyat va yetishtirish sharoiti o‘ sish ko‘ rsatkichlariga ta’sir qilishi mumkinligini ko‘ rsatadi [2–4]. Shu jihatdan yuqori Chirchiq daryosi sharoitida to‘ plangan ushbu 80 ta baliqning biometrik ma’lumotlari keyingi mavsumiy kuzatuvlar uchun muhim boshlang‘ ich baza hisoblanadi.

Mazkur maqolada o‘ sish sur’ati (SGR), yemdan foydalanish koeffitsiyenti (FCR) va absolyut va nisbiy o‘ sish kabi vaqtga bog‘ liq ko‘ rsatkichlar kiritilmadi. Buning sababi, ularni ishonchli hisoblash uchun tajriba boshidagi va oxiridagi massa hamda tajriba davomida sarflangan yem miqdori bo‘ yicha to‘ liq, bir xil usulda yig‘ ilgan ma’lumotlar zarur. Keyingi kuzatuvlarda ushbu ko‘ rsatkichlarni qo‘ shish tavsiya etiladi.

XULOSA

Yuqori Chirchiq daryosi sharoitida qafas usulida yetishtirilayotgan 80 ta triploid kamalak gulbaliqning umumiy tana uzunligi 15.5–45.5 sm, tana vazni 39–1420 g oralig‘ ida qayd etildi.

Baliqlarning o‘ rtacha umumiy tana uzunligi 30.88 sm, o‘ rtacha tana vazni 508.54 g ni tashkil etdi. O‘ lcham guruhlari bo‘ yicha tana uzunligi oshgani sari o‘ rtacha vazn ham izchil ravishda ortdi.

Tajriba davomida baliqlarning kattaligiga mos yem granulalari tanlandi va oziqlantirish chastotasi baliq o‘ lchamiga qarab o‘ zgartirildi. Bu yondashuv qafas xo‘ jaligida oziqlantirishni tartibli tashkil etish uchun amaliy jihatdan qulay bo‘ ldi.

Biometrik o‘ lchovlarni muntazam takrorlash yuqori Chirchiq daryosi sharoitida kamalak gulbaliqning o‘ sishini baholash va oziqlantirish rejimini takomillashtirish uchun asos bo‘ la oladi.

Keyingi bosqichda tajriba davomiyligi, boshlang‘ ich va yakuniy massa, sarflangan yem miqdori, suv harorati va boshqa gidrokimyoviy ko‘ rsatkichlarni bir tizimda qayd etish maqolaning ilmiy imkoniyatlarini yanada kengaytiradi.

DEVELOPMENT OF AN INTEGRATED HYDROECOLOGICAL STABILITY INDEX FOR THE LAKES OF THE AMU DARYA DELTA

Abstract. *The article proposes a new approach to assessing the hydro-ecological state of Amudarya delta lakes based on the integrated hydro-ecological stability index (Hydroecological Stability Index - HESI). The necessity of developing the index is due to the intensification of anthropogenic impact on the water ecosystems of the Southern Aral Sea region, the reduction of the Amu Darya flow, the increase in mineralization, and changes in the hydrological regime of the lakes. The index combines hydrological, hydrochemical, biological, and environmental indicators into a unified assessment system. The developed methodology allows for a comparative analysis of the condition of various lakes in the delta and the identification of the most vulnerable water bodies.*

Keywords: *hydroecology, Amudarya delta lakes, ecosystem stability, integral index, Southern Aral Sea region, hydrochemistry, monitoring.*

AMUDARYO DELTASI KO‘ LLARI GIDROEKOLOGIK BARQARORLIGINING INTEGRAL INDEKSINI ISHLAB CHIQISH

Annotatsiya. *Mazkur maqolada Amudaryo deltasidagi ko‘ llarning gidroekologik holatini baholash uchun gidroekologik barqarorlikning integral indeksiga (Hydroecological Stability Index – HESI) asoslangan yangicha yondashuv taklif etiladi. Bunday indeksni ishlab chiqish zarurati Janubiy Orolbo‘ yi suv ekotizimlariga antropogen ta’sirning kuchayishi, Amudaryo oqimining kamayishi, ko‘ llar minerallashuvining ortishi va gidrologik rejimining o‘ zgarishi bilan izohlanadi. Indeks gidrologik, gidrokimyoviy, biologik va ekologik ko‘ rsatkichlarni yagona baholash tizimiga birlashtiradi. Ishlab chiqilgan metodika delta hududidagi turli ko‘ llarning holatini qiyosiy tahlil qilish hamda eng zaif suv havzalarini aniqlash imkonini beradi.*

Введение

Озёра Амударьинской дельты являются уникальными природными водными экосистемами аридной зоны Центральной Азии и представляют собой важнейшие элементы экологического каркаса Южного Приаралья. На протяжении многих столетий формирование и функционирование озёрных систем дельты определялось гидрологическим режимом реки Амударьи, сезонными паводками и сложными процессами взаимодействия поверхностных и подземных вод. Благодаря этому в дельте сформировался комплекс водно-болотных угодий, имеющих исключительно важное значение для сохранения биоразнообразия, регулирования водного режима территории и поддержания экологического равновесия региона.

В современных условиях большинство озёр дельты функционируют в качественно новых природно-хозяйственных условиях. Если ранее основным источником их питания являлись воды Амударьи, то в настоящее время значительная часть водных ресурсов поступает через систему коллекторно-дренажных каналов. Подобная трансформация водопитания привела к изменению гидрохимического состава воды, увеличению минерализации, накоплению биогенных веществ и загрязняющих компонентов. Вследствие этого существенно изменились условия существования гидробионтов, структура водных экосистем и механизмы их функционирования.

Дополнительным фактором трансформации озёрных систем выступают современные климатические изменения. Согласно многочисленным исследованиям, в регионе Центральной Азии наблюдается устойчивый рост среднегодовой температуры воздуха, увеличение продолжительности засушливых периодов и повышение испаряемости. В условиях аридного климата данные процессы оказывают значительное влияние на водный баланс озёр, способствуя сокращению площади водной поверхности и увеличению концентрации растворённых солей. Изменение климатических условий усиливает антропогенную нагрузку на водные объекты и снижает устойчивость озёрных экосистем к внешним воздействиям.

Современные принципы экологического мониторинга требуют перехода от анализа отдельных параметров к комплексной оценке устойчивости природных систем. В связи с этим особую актуальность приобретает разработка интегральных индексов, позволяющих объединять различные показатели в единую систему количественной оценки. Использование подобных индексов широко применяется при исследовании речных бассейнов, водохранилищ и водно-болотных угодий, однако для озёр Амударьинской дельты такие подходы практически не разработаны.

Таким образом, разработка интегрального индекса гидроэкологической устойчивости озёр Амударьинской дельты является актуальной научной задачей, имеющей важное теоретическое и практическое значение. Результаты исследования могут быть использованы при организации системы мониторинга водных объектов, оценке эффективности природоохранных мероприятий и разработке стратегий устойчивого управления водными ресурсами Южного Приаралья.

Цель исследования

Разработка интегрального индекса гидроэкологической устойчивости озёр Амударьинской дельты и определение возможности его использования для экологического мониторинга.

Материалы и методы исследования. Объектами исследования являлись озёра Амударьинской дельты: Судочье, Жылтырбас, Машанкуль, Рыбачье и Каратерень, расположенные на территории Южного Приаралья. Выбор данных водоёмов обусловлен различиями в условиях водопитания, гидрохимическом режиме и степени антропогенного воздействия.

Для оценки гидроэкологической устойчивости озёр разработан интегральный индекс Hydroecological Stability Index (HESI), основанный на комплексном учёте гидрологических, гидрохимических, биологических и экологических показателей.

В состав индекса включены четыре блока:

- гидрологический блок (H); гидрохимический блок (C); биологический блок (B); - экологический блок (E).

Для обеспечения сопоставимости показателей выполнялось их нормирование по методу минимаксного преобразования:

$Xn=(X-Xmin)/(Xmax-Xmin)$

где Xn — нормированное значение показателя; X — фактическое значение показателя; Xmin и Xmax — минимальное и максимальное значения исследуемого параметра.

Для показателей, негативно влияющих на устойчивость экосистемы (минерализация, загрязнение, деградация земель и др.), использовалось обратное нормирование:

$Xn=(Xmax-X)/(Xmax-Xmin)$

После нормирования рассчитывались частные индексы:

H=(A+L+V+W)/4; C=(M+pH+O+S+Cl)/5;

B=(R+F+W+P)/4; E=(P+D+L+A)/4

Интегральный индекс гидроэкологической устойчивости определялся по формуле: HESI=(H+C+B+E)/4

Полученные значения интерпретировались следующим образом:

0,80–1,00 – очень высокая устойчивость; 0,60–0,79 – высокая устойчивость; 0,40–0,59 – средняя устойчивость; 0,20–0,39 – низкая устойчивость; менее 0,20 – критическое состояние.

Результаты исследования. Для формирования индекса нами предлагается использовать четыре группы показателей:

1. Гидрологический блок (H) характеризует водообеспеченность озера.

Гидрологический блок является одним из основных компонентов интегрального индекса гидроэкологической устойчивости озёр Амударьинской дельты и предназначен для оценки степени водообеспеченности и стабильности функционирования водной экосистемы. Гидрологические характеристики оказывают определяющее влияние на формирование экологического состояния озёр, поскольку именно водный режим определяет условия существования гидробионтов, особенности гидрохимических процессов и устойчивость экосистемы к внешним воздействиям.

Для оценки гидрологического состояния озёр предлагается использовать четыре основных показателя: площадь водной поверхности, уровень воды, объём водных ресурсов и коэффициент водообмена.

Площадь водной поверхности является одним из наиболее информативных показателей состояния озёрных экосистем. Изменение площади озера отражает реакцию водоёма на колебания водного баланса, климатические изменения и антропогенное воздействие. Уменьшение площади водной поверхности обычно свидетельствует о снижении водообеспеченности, усилении процессов испарения и ухудшении экологического состояния водоёма. Напротив, сохранение стабильной площади или её увеличение указывает на благоприятные гидрологические условия и достаточное водоснабжение озера.

Важным показателем является уровень воды, который характеризует динамику водного режима и отражает баланс между поступлением и расходованием водных ресурсов. Колебания уровня воды оказывают непосредственное влияние на состояние прибрежных экосистем, площадь водно-болотных угодий, условия нереста рыб и места обитания водоплавающих птиц.

Коэффициент водообмена характеризует интенсивность обновления водной массы озера и отражает степень его гидрологической связанности с внешними источниками водоснабжения. Высокий коэффициент водообмена способствует улучшению качества воды, снижению накопления загрязняющих веществ и поддержанию благоприятного гидрохимического режима.

Для обеспечения сопоставимости различных показателей все гидрологические параметры нормируются в диапазоне от 0 до 1. После нормирования рассчитывается интегральный гидрологический индекс по следующей формуле: H = (A + L + V + W) / 4 где: A – нормированная площадь озера; L – уровень воды; V – объём воды; W – коэффициент водообмена.

Полученный гидрологический индекс позволяет количественно оценить степень водообеспеченности озера и является важной составляющей интегрального индекса гидроэкологической устойчивости. Высокие значения показателя H свидетельствуют о стабильном гидрологическом режиме и благоприятных условиях функционирования экосистемы, тогда как низкие значения указывают на развитие деградационных процессов и снижение устойчивости водоёма.

Таким образом, гидрологический блок обеспечивает комплексную оценку состояния водных ресурсов озёр Амударьинской дельты и позволяет учитывать ключевые процессы, определяющие устойчивость озёрных экосистем в условиях изменения климата и антропогенной трансформации водного режима региона.

2. Гидрохимический блок (C) характеризует качество воды.

Гидрохимический блок является важнейшим элементом интегрального индекса гидроэкологической устойчивости озёр Амударьинской дельты, поскольку химический состав воды оказывает непосредственное влияние на состояние водных экосистем, биологическую продуктивность водоёмов и процессы формирования гидробиоценозов. В условиях Южного Приаралья, где большинство озёр испытывают значительное антропогенное воздействие и функционируют в условиях дефицита водных ресурсов, гидрохимические показатели выступают одними из наиболее чувствительных индикаторов экологических изменений.

В последние десятилетия в большинстве озёр дельты наблюдается тенденция к увеличению минерализации воды, изменению ионного состава и накоплению биогенных веществ. Эти процессы оказывают существенное влияние на устойчивость озёрных экосистем и требуют комплексного учёта при оценке их современного состояния.

Минерализация воды является одним из важнейших показателей гидрохимического состояния озёр. Она характеризует общее содержание растворённых солей и отражает степень засоления водоёма. Для озёр

Амударьинской дельты данный показатель имеет особое значение, поскольку именно рост минерализации является одним из основных последствий сокращения речного стока и увеличения роли коллекторно-дренажных вод. Повышение минерализации приводит к изменению условий обитания гидробионтов, снижению биологического разнообразия и ухудшению экологического состояния озёр.

Водородный показатель (pH) характеризует кислотно-щелочное состояние водной среды и является важным фактором функционирования гидробиологических процессов. Большинство гидробионтов наиболее благоприятно развивается в условиях нейтральной или слабощелочной среды. Значительные отклонения pH от оптимальных значений могут приводить к нарушению обменных процессов, изменению химической подвижности элементов и снижению экологической устойчивости водоёмов.

Содержание растворённого кислорода является одним из ключевых показателей качества воды и экологического благополучия озёрных экосистем. Кислород обеспечивает жизнедеятельность большинства водных организмов и участвует в процессах самоочищения водоёмов. Снижение концентрации растворённого кислорода свидетельствует об ухудшении экологического состояния озера, развитии процессов эвтрофикации и накоплении органических загрязнений.

Концентрация сульфатов является важным показателем гидрохимического состава воды в аридных регионах. Повышенное содержание сульфат-ионов характерно для многих водоёмов Приаралья и связано как с природными особенностями региона, так и с поступлением коллекторно-дренажных вод. Рост концентрации сульфатов может свидетельствовать об усилении процессов засоления и ухудшении качества водных ресурсов.

Для обеспечения сопоставимости различных гидрохимических показателей все параметры переводятся в безразмерную форму путём нормирования. Нормирование позволяет привести показатели, измеряемые в различных единицах, к единой шкале от 0 до 1 и использовать их в составе интегрального индекса.

Полученный гидрохимический индекс отражает степень благоприятности химического состава воды для функционирования озёрной экосистемы. Высокие значения показателя свидетельствуют о хорошем качестве воды и устойчивом гидрохимическом режиме, тогда как низкие значения указывают на ухудшение экологического состояния водоёма, усиление процессов засоления и снижение способности экосистемы к саморегуляции.

Таким образом, гидрохимический блок позволяет комплексно оценить качество водной среды озёр Амударьинской дельты и является одним из основных элементов интегрального индекса гидроэкологической устойчивости. Его использование обеспечивает возможность выявления неблагоприятных тенденций в развитии водных экосистем и разработки научно обоснованных мер по сохранению водных ресурсов Южного Приаралья.

3. Биологический блок (B) характеризует состояние экосистемы.

Биологический блок является одним из важнейших компонентов интегрального индекса гидроэкологической устойчивости озёр Амударьинской дельты, поскольку именно состояние биологических сообществ наиболее полно отражает уровень экологического благополучия водоёма. В отличие от гидрологических и гидрохимических показателей, которые характеризуют отдельные компоненты природной системы, биологические показатели позволяют оценить суммарный результат воздействия природных и антропогенных факторов на экосистему.

Озёра Амударьинской дельты представляют собой уникальные природные комплексы, выполняющие функции сохранения биоразнообразия Южного Приаралья. Они являются местом обитания многочисленных видов гидрофитов, беспозвоночных организмов, рыб, земноводных, млекопитающих и водоплавающих птиц.

Разнообразие водной растительности является важнейшим индикатором экологического состояния водоёма. В условиях устойчивого гидрологического режима формируются сложные растительные сообщества, включающие тростниковые заросли, камышовые ассоциации и разнообразные гидрофиты.

Изменение площади и видового состава растительности часто является первым признаком деградации экосистемы. Уменьшение площади тростниковых массивов, исчезновение отдельных видов гидрофитов и нарушение структуры растительных сообществ свидетельствуют о неблагоприятных экологических изменениях.

Для озёр Амударьинской дельты рыбные ресурсы имеют не только экологическое, но и социально-экономическое значение. Многие водоёмы традиционно использовались для рыболовства и обеспечения населения рыбной продукцией. Поэтому сохранение устойчивости ихтиофауны является одним из важнейших критериев оценки экологического благополучия озёр.

Сокращение площади водно-болотных угодий приводит к нарушению экологического равновесия и снижению устойчивости всей озёрной системы. В связи с этим данный показатель является важным элементом интегральной оценки гидроэкологического состояния.

Особую роль в экосистемах Южного Приаралья играет орнитофауна. Озёра Амударьинской дельты являются важнейшими пунктами остановки перелётных птиц на Центрально-Азиатском миграционном пути.

Здесь обитают десятки видов водоплавающих и околоводных птиц, многие из которых имеют международный природоохранный статус.

Численность и видовое разнообразие птиц рассматриваются как универсальные биоиндикаторы состояния окружающей среды. Изменение условий водоснабжения, сокращение площади водной поверхности и деградация водно-болотных угодий немедленно отражаются на состоянии орнитофауны.

Для интегральной оценки биологического состояния озёр все показатели переводятся в безразмерную форму путём нормирования. После нормирования рассчитывается биологический индекс устойчивости:

$B = (R + F + W + P) / 4$

где: B – биологический индекс; R – индекс разнообразия водной растительности; F – индекс состояния ихтиофауны; W – индекс состояния водно-болотных угодий; P – индекс орнитофауны.

Полученные значения позволяют количественно оценить степень сохранности биологических компонентов озёрной экосистемы. Высокие значения индекса свидетельствуют о благоприятном экологическом состоянии водоёма и высокой способности экосистемы к саморегуляции. Низкие значения указывают на деградацию биологических сообществ и снижение экологической устойчивости.

Таким образом, биологический блок является важнейшим элементом интегрального индекса гидроэкологической устойчивости, поскольку отражает конечный результат воздействия гидрологических, гидрохимических и антропогенных факторов на функционирование озёрных экосистем. Использование данного блока позволяет комплексно оценить состояние биологических ресурсов и определить степень экологической устойчивости озёр Амударьинской дельты в условиях современных климатических и антропогенных изменений.

4. Экологический блок (E) отражает антропогенную нагрузку. Экологический блок является завершающим компонентом интегрального индекса гидроэкологической устойчивости озёр Амударьинской дельты и предназначен для оценки степени антропогенного воздействия на водные экосистемы. В современных условиях именно антропогенные факторы во многом определяют направление и интенсивность трансформации озёрных систем Южного Приаралья. Поэтому учёт экологических рисков и уровня хозяйственной нагрузки является необходимым условием объективной оценки устойчивости водоёмов.

В отличие от гидрологических, гидрохимических и биологических показателей, характеризующих текущее состояние экосистемы, экологический блок позволяет оценить факторы внешнего воздействия, способные вызвать её дальнейшую деградацию или, наоборот, обеспечить сохранение экологического равновесия. Особое значение данный блок приобретает для озёр Амударьинской дельты, где процессы антропогенной трансформации природной среды продолжаются на протяжении нескольких десятилетий.

Поступление минерализованных вод приводит к изменению гидрохимического режима, росту содержания солей и ухудшению условий существования гидробионтов. В отдельных случаях наблюдается накопление токсичных соединений и усиление процессов эвтрофикации. Поэтому степень воздействия коллекторно-дренажных вод рассматривается как один из ключевых показателей экологического блока.

Важным индикатором экологического состояния является уровень загрязнения водоёма. Загрязнение может быть связано как с сельскохозяйственной деятельностью, так и с поступлением различных химических соединений через дренажную сеть.

Для условий Южного Приаралья особую актуальность имеет оценка степени антропогенной трансформации ландшафтов. Расширение сельскохозяйственного освоения, изменение структуры землепользования и строительство гидротехнических сооружений оказывают существенное влияние на процессы формирования озёрных экосистем.

Для количественной оценки экологического состояния озёр предлагается использовать следующие показатели:

– индекс загрязнения вод; индекс воздействия коллекторно-дренажных вод; индекс деградации земель; индекс антропогенной трансформации территории.

Использование экологического блока позволяет учитывать влияние хозяйственной деятельности на состояние озёрных экосистем и обеспечивает более объективную оценку их устойчивости. Это особенно важно в условиях Амударьинской дельты, где современное функционирование озёр определяется не только природными факторами, но и интенсивностью антропогенного воздействия.

Таким образом, экологический блок завершает систему оценки гидроэкологической устойчивости озёр и обеспечивает комплексный учёт факторов, определяющих современное состояние водных экосистем Южного Приаралья.

Для апробации разработанного интегрального индекса гидроэкологической устойчивости (HESI) были использованы основные гидрологические, гидрохимические, биологические и экологические показатели, характеризующие современное состояние озёр Амударьинской дельты.

Озеро Жылтырбас также сохраняет относительно устойчивое экологическое состояние, однако влияние коллекторно-дренажного водоснабжения способствует увеличению минерализации воды и снижению биологического разнообразия.

Наиболее неблагоприятные показатели зафиксированы для озера Каратерень, где наблюдаются высокая минерализация воды, сокращение площади водно-болотных угодий, уменьшение биологического разнообразия и значительная антропогенная нагрузка. Полученные данные свидетельствуют о необходимости проведения комплексной интегральной оценки устойчивости озёрных экосистем.

Наиболее высокие показатели устойчивости характерны для озера Судочье. Это связано с относительно стабильным водоснабжением, наличием развитых водно-болотных угодий и высоким уровнем биологического разнообразия. Кроме того, Судочье сохраняет важное значение как место концентрации водоплавающих птиц и один из крупнейших природных водоёмов Южного Приаралья.

Озеро Жылтырбас характеризуется несколько более низкими значениями индекса. Несмотря на удовлетворительное состояние гидрологического режима, на устойчивость водоёма оказывает влияние повышенная минерализация и зависимость от коллекторно-дренажного водоснабжения.

Наиболее низкие значения индекса зафиксированы для озера Каратерень. Это свидетельствует о высокой степени экологической трансформации водоёма и необходимости разработки специальных природоохранных мероприятий.

Особенно ярко эта зависимость проявляется в годы маловодья, когда происходит снижение площади водной поверхности, рост минерализации и ухудшение условий существования гидробионтов.

Разработанный индекс может использоваться в качестве инструмента экологического мониторинга озёрных систем Амударьинской дельты.

Особенно перспективным является использование индекса HESI совместно с данными дистанционного зондирования Земли. Это позволит проводить регулярную оценку состояния озёр и получать оперативную информацию о динамике экологических процессов.

Выводы

1. Установлено, что устойчивость озёр Амударьинской дельты определяется совокупным воздействием гидрологических, гидрохимических, биологических и антропогенных факторов.

2. Разработан интегральный индекс гидроэкологической устойчивости озёр (HESI), позволяющий комплексно оценивать современное состояние водных экосистем.

3. Предложенная методика включает четыре взаимосвязанных блока: гидрологический, гидрохимический, биологический и экологический, обеспечивающие всестороннюю характеристику функционирования озёрных систем.

4. Апробация индекса показала, что наиболее устойчивым водоёмом среди исследованных объектов является озеро Судочье, тогда как озеро Каратерень характеризуется наиболее низкими показателями устойчивости.

Заключение

Разработанный интегральный индекс гидроэкологической устойчивости HESI представляет собой новый инструмент комплексной оценки состояния озёр Амударьинской дельты. Его применение позволяет перейти от анализа отдельных параметров к системному исследованию функционирования озёрных экосистем. Использование индекса создаёт научную основу для долгосрочного мониторинга, прогнозирования экологических изменений и разработки мероприятий по сохранению водно-болотных угодий Южного Приаралья в условиях изменения климата и антропогенной трансформации водных ресурсов.

Abstrakt: *Mazkur tadqiqotda O'zbekiston Respublikasi Sirdaryo viloyati tuproq-iqlim sharoitida yetishtiriluvchi ayrim mahalliy anor (Punica granatum L.) navlari sharbati, meva po'sti va urug'i ekstraktlarining eksperimental diabet sharoitida gipoglikemik faolligi tahlil qilingan. Tadqiqotlarda "Alloksan monogidrat" (150 mg/kg) in'yeksiyasi yordamida yuzaga keltirilgan eksperimental diabet modelida kalamush qonida glyukoza konsentratsiyasi 7-sutkada 27,8±0,2 mmol/l, 14-sutkada 29,5±0,3 mmol/l ga ortishi sharoitida (nazorat guruhida 7-sutka va 14-sutkalarda mos ravishda – 4,7±0,05 mmol/l va 4,8±0,04 mmol/l), anor (Punica granatum L.) navlari ekstraktlari (sharbat, po'st, urug') (150 mg/kg) sezilarli darajadagi gipoglikemik faollikka ega bo'lib, bunda qonda glyukoza konsentratsiyasi maksimal "Qizil anor" po'sti ekstrakti ta'sirida 7-sutka va 14-sutkada mos ravishda – 7,8±0,04 mmol/l va 7,6±0,02 mmol/l, urug'i ekstrakti ta'sirida mos ravishda – 8,1±0,03 mmol/l va 8,3±0,04 mmol/l gacha pasayishi aniqlangan. Anor (Punica granatum L.) navlari sharbati, meva po'sti va urug'i ekstraktining antidiabet faolligi ularning tarkibidagi polifenol birikmalar bilan bog'liqligi tahmin qilingan. Olingan natijalar anor (Punica granatum L.) ekstrakti asosida diabet terapiyasi maqsadlarida, biologik faol qo'shimcha ishlab chiqishda ilmiy asos sifatida foydalanilishi mumkinligi ta'kidlangan.*

Kalit so'zlar: *Anor (Punica granatum L.) ekstrakti, ekspermental diabet, qonda glyukoza konsentratsiyasi, gipoglikemik faollik.*

АНАЛИЗ ГИПОГЛИКЕМАТИЧЕСКОЙ АКТИВНОСТИ СОКА, ЭКСТРАКТОВ КОЧЕШКИ ПЛОДОВ И СЕМЯН НЕКОТОРЫХ МЕСТНЫХ СОРТОВ ГРАНАТА (Punica granatum L.)

Аннотация: *В данном исследовании проанализирована гипогликемическая активность сока, экстрактов кожуры и семян некоторых местных сортов граната (Punica granatum L.), выращиваемых в почвенно-климатических условиях Сырдарьинской области Республики Узбекистан, в условиях экспериментального диабета. В экспериментальной модели диабета, индуцированного инъекцией аллоксана моногидрата (150 мг/кг), концентрация глюкозы в крови крыс повышалась до 27,8±0,2 ммоль/л на 7-е сутки и до 29,5±0,3 ммоль/л на 14-е сутки (в контрольной группе — соответственно 4,7±0,05 ммоль/л и 4,8±0,04 ммоль/л). Установлено, что экстракты различных частей граната (Punica granatum L.) — сока, кожуры и семян — в дозе 150 мг/кг обладают выраженной гипогликемической активностью. Наиболее значительное снижение концентрации глюкозы в крови отмечено под влиянием экстракта кожуры сорта «Кизил анор»: до 7,8±0,04 ммоль/л на 7-е сутки и до 7,6±0,02 ммоль/л на 14-е сутки. Под действием экстракта семян данного сорта концентрация глюкозы снижалась соответственно до 8,1±0,03 ммоль/л и 8,3±0,04 ммоль/л. Предполагается, что антидиабетическая активность сока, экстрактов кожуры и семян граната (Punica granatum L.) связана с содержащимися в них полифенольными соединениями. Полученные результаты могут служить научной основой для разработки биологически активных добавок на основе экстрактов граната (Punica granatum L.) с целью их применения в комплексной терапии диабета.*

Ключевые слова: *экстракт граната (Punica granatum L.), экспериментальный диабет, концентрация глюкозы в крови, гипогликемическая активность.*

ANALYSIS OF THE HYPOGLYCEMIC ACTIVITY OF JUICE, PEEL, AND SEED EXTRACTS FROM CERTAIN LOCAL POMEGRANATE (*PUNICA GRANATUM* L.) VARIETIES

Abstract: *This study evaluated the hypoglycemic activity of juice, peel, and seed extracts from selected local pomegranate (Punica granatum L.) cultivars grown under the soil and climatic conditions of the Syrdarya Region of the Republic of Uzbekistan in*

an experimental model of diabetes. In rats with experimental diabetes induced by alloxan monohydrate injection (150 mg/kg), blood glucose concentrations increased to 27.8±0.2 mmol/L on day 7 and 29.5±0.3 mmol/L on day 14, compared with 4.7±0.05 mmol/L and 4.8±0.04 mmol/L, respectively, in the control group. Pomegranate (Punica granatum L.) juice, peel, and seed extracts administered at a dose of 150 mg/kg exhibited pronounced hypoglycemic activity. The greatest reduction in blood glucose concentration was observed with the peel extract of the "Qizil anor" cultivar, reaching 7.8±0.04 mmol/L on day 7 and 7.6±0.02 mmol/L on day 14. The seed extract reduced blood glucose levels to 8.1±0.03 mmol/L and 8.3±0.04 mmol/L on days 7 and 14, respectively. The antidiabetic activity of pomegranate (Punica granatum L.) juice, peel, and seed extracts is presumed to be associated with their polyphenolic compounds. These findings may provide a scientific basis for the development of biologically active supplements based on pomegranate (Punica granatum L.) extracts for use in diabetes therapy.

Keywords: *pomegranate (Punica granatum L.) extract, experimental diabetes, blood glucose concentration, hypoglycemic activity.*

I. KIRISH

Hozirda dunyo miqyosida qandli diabet kasalligi jiddiy tibbiy-ijtimoiy, iqtisodiy muammolardan biri bo'lib, ayrim tadqiqotchilar tomonidan kasallikning patogenez jarayoni, zamonaviy terapevtik usullar batafsil tavsiflangan [Borozdina va boshq., 2024; 412-435-b.; Elkhalifa et al., 2024; 1-21-b.].

Mazkur **tadqiqotning maqsadi** – O'zbekiston Respublikasi Sirdaryo viloyati tuproq-iqlim sharoitida yetishtiriluvchi ayrim mahalliy anor (*Punica granatum* L.) navlari sharbati, meva po'sti va urug'i ekstraktlarining eksperimental diabet sharoitida gipoglikemik faolligini tahlil qilishdan tashkil topgan.

II. TADQIQOT MATERIALLARI VA USLUBLARI

2.1. Tadqiqot materiallari va sharoiti. Tajribalarda tadqiqot ob'yekti sifatida O'zbekiston Respublikasi Fanlar akademiyasi O.S.Sodiqov nomidagi Bioorganik kimyo instituti Farmakologiya laboratoriyasi vivariyasida standart sharoitda (*t*=+20±5°S, havoning nisbiy namligi 70-75±5%, yorug'lik rejimi 12:12 soat) plastik katakchalarda, standart ozuqa (suv) bilan boqilgan, oq, zotsiz kalamushlardan (*Rattus norvegicus*; ♂, *m*=130-160 gr.) foydalanildi [Belenkiy, 1963; 146-b.; Spasov va boshq., 2012; 670-684-b.; Pourghasem et al., 2014; 11-15-b.; Balamurugan et al., 2014; S442-S448-b.; Aluwong et al., 2016; 1-15-b.; Gharib and Kouhsari, 2019; 358-368-b.][1,2].

Tadqiqotlarda tajriba hayvonlari bilan ishlashda Xalqaro tibbiy ilmiy jamiyatlar kengashi (CIOMS – *The council for international organizations of medical sciences*) tomonidan ishlab chiqilgan qoidalar (1985), Tajriba va boshqa ilmiy maqsadlarda umurtqali hayvonlardan foydalanish to'g'risida Yevropa konvensiyasi (*European Convention for the Protection of Vertebrate Animals used for Experimental and other Scientific Purposes*) (Strasburg, 1986) Xalqaro bioetika talablariga amal qilindi[3,4,5].

Tajriba guruhlari tahlil qilinayotgan ko'rsatkichlar uchun matematik-statistik jihatdan ishonchli natija olishni nazarda tutgan holda, tajriba hayvonlaridan minimal sonda foydalanish asosida tuzildi [Aluwong et al., 2016; 1-15-b.] (2.1-jadval).

Tajribalar quyidagi sxema asosida amalga oshirildi (2.1-rasm).

2.1-rasm. Tajriba sxemasi. Bunda, alloksan monogidrat (150 mg/kg) kalamush qorin sohasiga in'yeksiya qilingandan keyin, 3-sutkada (eksperimental diabet modeli yuzaga kelganligiga ishonch hosil qilish maqsadida) hamda 7-sutkada, 14-sutkada ertalab ochlik holatida qon tarkibida glyukoza konsentratsiyasi (mmol/l) tahlil qilindi. Tajriba guruhida anor (*Punica* L.) ekstrakti 1-7 sutka davomida, sutkada 1 marta og'iz orqali kalamush organizmiga kiritildi (Nazorat guruhida ekvivalent miqdorda distillangan suvdan foydalanildi).

2.2. Eksperimental diabet modelini yuzaga keltirish uslubi. Tadqiqotlarda kalamushda eksperimental diabet modeli alloksan monogidrat ("Sigma-Aldrich", Germaniya) (150 mg/kg tana vazni) fiziologik eritmada (NaCl 0,9%) eritilgan shaklda qorin sohasiga bir marta in'yeksiya qilish yordamida yuzaga keltirildi [Pourghasem et al., 2014; 11-15-b.; Balamurugan et al., 2014; S442-S448-b.; Roy et al., 2015; 268-280-b.; Aluwong et al., 2016; 1-15-b.; Nawale et al., 2016; 41-46-b.; Gharib and Kouhsari, 2019; 358-368-b.; Bagheri et al., 2023; 870-878-b.].

Bunda, alloksan monogidrat in'yeksiyasi ta'sirida dastlab gipoglikemiya yuzaga kelishining oldini olish maqsadida, 60 minut davomida hayvonlarga glyukoza eritmasi (5%) berildi [Aluwong et al., 2016; 1-15-b.].

Ma'lumki, qandli diabet kasalligida diagnostikasida turli markerlar, jumladan antioksidant tizim disfunksiyasi, ayniqsa qonda glyukoza konsentratsiyasi nazorati muhim ahamiyatga ega hisoblanadi [Bavarva and Narasimhacharya, 2008; 620-626-b.; Onwuli et al., 2014; 1-4-b.; Nawale et al., 2016; 41-46-b.].[6]

2.3. Qon sinov-namunasi tarkibida glyukoza konsentratsiyasini aniqlash uslubi. Qon namunasi kalumush dum vena qon tomiridan steril holatdagi tibbiyot shprisi bilan olinib, glyukoza konsentratsiyasi hayvonlarni 12 soat davomida och qoldirilgandan keyin, ertalab soat 9:00 da (ovqatlantirishdan oldin), "Contour Plus" glyukometr asbobi ("Ascensia Diabetes Care", Shveysariya) yordamida, FAD-GDH – flavin-adenin dinukleotidga bog'liq glyukoza-degidrogenaza (*Flavin adenine dinucleotide-dependent glucose dehydrogenase*) uslubida tahlil qilindi (2.2-rasm) [Bernstein et al., 2013; 1386-1399-b.; Aluwong et al., 2016; 1-15-b.; Nyakudya et al., 2018; 1-16-b.; Klaff et al., 2021; 1382-1389-b.; Ferradj et al., 2024; 1-21-b.; Bikulciene et al., 2024; 1-13-b.].

2.2-rasm. Alloksan monogidrat (150 mg/kg) yordamida yuzaga keltirilgan eksperimental diabet sharoitida **anor (*Punica granatum* L.) navlari sharbati, meva po'sti va urug'i ekstraktining antidiabet faolligini tahlil qilish jarayoni**

O'zbekiston Respublikasi Fanlar akademiyasi O.S.Sodiqov nomidagi Biorganik kimyo instituti Farmakologiya laboratoriyasi, 2024 yil 30 oktyabr). *"Contour Plus" glyukometr asbobi test-plastinkasi (5×28 mm) bir tomoni elektrod bilan bog'lanadi, ikkinchi tomonida qon sinov-namunasi uchun kameraga ega bo'lib, uning tarkibida Aspergillus sp. asosida olingan FAD-GDH fermenti (21%), mediator (54%), stabilizator-bufer tizim (25%) joylashtirilgan. O'lchash aniqlik darajasi ISO 15197:2013 xalqaro standartiga muvofiq bo'lib, test-plastinka yordamida qon sinov-namunasida (minimal 0,6 mkl) +5...+45°S harorat sharoitida,*

[6] American diabetes association. 7. Diabetes technology: Standards of medical care in diabetes – 2020. Diabetes Care. – 2020. – V.43(Suppl 1). – P.S77-S88 // *[Электронный ресурс]. Режим доступа:* https://pubmed.ncbi.nlm. nih.gov/31862750/ *Дата обращения: 16.09.2026 г.*

glyukoza konsentratsiyasini 0,6-33,3 mmol/l diapazonda aniqlash mumkin (qurilma xotirasida 480 ta o'lchash natijalarini saqlash imkoniyati mavjud)[7].

Bunda, glyukometr test-sensor tizimida glyukozaning fermentativ oksidlanishi reaksiyasi amalga oshadi [Zafar et al., 2012; 2069-2077-b.; Adachi and Tsujimura, 2019; 189-193-b.]:

β-*D*-glyukoza + FAD-GDH → glyukono-δ-lakton + $FADH_2$-GDH

Bunda, reaksiya jarayonida β-*D*-glyukoza molekulasidan elektronning (ye^-) FAD-GDH molekulasi kofaktor qismiga (FAD) ko'chishida (elektro-kimyoviy sensor) tok o'zgarishi asosida sinov-namunasi tarkibidagi glyukoza konsentratsiyasi tahlili amalga oshiriladi (glyukoza konsentratsiyasi elektr signaliga transformatsiyasida, ya'ni kofaktordan elektrodga ye^- transportida maxsus mediator ishtirok etadi).

Alloksan monogidrat (150 mg/kg) oshqozon osti bezida β-hujayralarning struktura-funksional faolligiga salbiy ta'siri natijasida insulin orqali glyukoza konsentratsiyasi regulyasiyasi izdan chiqadi, ROS generatsiyasi ortadi, o'z navbatida giperglikemiya rivojlanadi [Szkudelski, 2001; 536-546-b.; Das et al., 2012; 296-308-b.; *Kiran et al., 2013; 20-22-b.*; Aluwong et al., 2016; 1-15-b.; Gharib and Kouhsari, 2019; 358-368-b.].

Bunda, navbadagi 7 sutka davomida qonda glyukoza konsentratsiyasi barqaror holatda oshishi kuzatilib, glyukozaning glikogenga aylanishi, shuningdek yog'lar katabolizmida insulin ishtiroki buzilishi, β-hujayralar struktura-funksiyasi izdan chiqishi orqali lipoliz jarayoni disfunksiyasi ta'sirida tana vazni kamayishi qayd qilinadi [Gillespie, 2006; 165-170-b.].

Bunda, qon tarkibida glyukoza miqdori ≥14-17 mmol/l holat diabet yuzaga kelishi sifatida baholanadi [Onwuli et al., 2014; 1-4-b.; Aluwong et al., 2016; 1-15-b.; Gharib and Kouhsari, 2019; 358-368-b.].

Tadqiqotlarda solishtirish maqsadida, klinik tibbiyot amaliyotida qandli diabet terapiyasida foydalaniluvchi – **"Asformin"** (Metformin gidroxlorid) ("Ali Raif Ilac San. A.S.", Turkiya Respublikasi), **"Ala-Diabet"** kapsulasidan ("AS-Sunna Pharmaceutical" MCHJ, O'zbekiston Respublikasi) foydalanildi.

2.4. Olingan natijalarni matematik-statistik qayta ishlash. Olingan natijalarni matematik-statistik qayta ishlashda OriginLab OriginPro v. 8.5 SR1 (EULA, Northampton, MA 01060-4401, AQSH) kompyuter dasturidan foydalanildi. Natijalar *n* marta takroriylikda amalga oshirilgan tajribalar natijalarining *M*±*m* shaklida keltirilgan bo'lib, *M* – o'rtacha arifmetik qiymat va *m* – standart xatolik qiymatini ifodalaydi. Shuningdek, tajriba natijalari va nazorat guruhi o'rtasidagi qiymatlarning statistik ishonchlilik darajasi Styudent *t*-mezoni asosida hisoblandi va $r<0,05$, $r<0,01$ qiymatlarda statistik ishonchli deb baholandi [Glans, 1999; 125-459-b.; Dospexov, 1985; 122-b.].

III. OLINGAN NATIJALAR VA ULARNING TAHLILI

Alloksan monogidrat (150 mg/kg) in'yeksiyasi yordamida yuzaga keltirilgan diabet eksperimental modelida anor (*Punica granatum* L.) mahalliy navlari meva sharbati, po'sti va urug'i ekstraktlarining (150 mg/kg) kalamush qonida glyukoza konsentratsiyasiga ta'siri quyidagi jadvalda keltirilgan (2.2-jadval).

2.2-jadval

Alloksan monogidrat (150 mg/kg) in'yeksiyasi yordamida yuzaga keltirilgan diabet eksperimental modelida anor (*Punica granatum* L.) mahalliy navlari meva sharbati, po'sti va urug'i ekstraktlarining (150 mg/kg) kalamush qonida glyukoza konsentratsiyasiga ta'siri tahlili (*M*±*m*)

T/r	Tajriba guruhlari		Qonda glyukoza konsentratsiyasi (mmol/l)	
			7-sutka	14-sutka

***Izoh*:** Nazorat (sog‘lom) hayvonlar guruhiga nisbatan alloksan monogidrat (150 mg/kg) in’yeksiyasi guruhida ** – $p<0,05$; alloksan monogidrat (150 mg/kg) in’yeksiyasi guruhiga nisbatan anor ekstraktlari (150 mg/kg) guruhlarida ## – $p<0,05$; n=3-4).

Shunday qilib, nazorat (sog‘lom) kalamushlar qonida glyukoza konsentratsiyasi 3-sutkada (ertalab, ovqat berishdan oldin) 4,8±0,04 mmol/l ga teng bo‘lib, 7-sutka va 14-sutkalarda mos ravishda – 4,7±0,05 mmol/l va 4,8±0,04 mmol/l ni tashkil qilishi qayd qilindi.

Alloksan monogidrat (150 mg/kg) in’yeksiyasida kalamush qonida glyukoza konsentratsiyasi 3-sutkada (ertalab, ovqat berishdan oldin) 27,5±0,4 mmol/l ga teng bo‘lib, 7-sutka va 14-sutkalarda mos ravishda – 27,8±0,2 mmol/l va 29,5±0,3 mmol/l ga tengligi aniqlandi.

Diabet eksperimental modelida “Asformin” (metformin) (“Ali Raif Ilac San. A.S.”, Turkiya Respublikasi) preparati (150 mg/kg) kalamush qonida glyukoza konsentratsiyasini 7-sutka va 14-sutkalarda mos ravishda – 5,3±0,05 mmol/l va 5,1±0,04 mmol/l gacha kamaytirishi, shuningdek “Ala-Diabet” kapsulasi (“AS-Sunna Pharmaceutical” MCHJ, O‘zbekiston Respublikasi) (150 mg/kg) ta’sirida kalamush qonida glyukoza konsentratsiyasi 7-sutka va 14-sutkalarda mos ravishda – 8,4±0,05 mmol/l va 7,8±0,04 mmol/l gacha kamayishi kuzatildi.

Diabet eksperimental modelida “Oq dona (Tuyatish)” sharbati ekstrakti (150 mg/kg) kalamush qonida glyukoza konsentratsiyasini 7-sutkada 10,6±0,07 mmol/l, 14-sutkada 10,3±0,08 mmol/l ga tushirishi, anor po‘sti ekstrakti mos ravishda – 10,1±0,07 mmol/l, 9,9±0,04 mmol/l, urug‘i ekstrakti mos ravishda – 9,8±0,05 mmol/l, 9,7±0,03 mmol/l ga tushirishi aniqlandi. Bunda, “Qoraqayin” sharbat ekstrakti (150 mg/kg) kalamush qonida glyukoza konsentratsiyasini 7-sutkada 9,8±0,04 mmol/l, 14-sutkada 9,6±0,03 mmol/l ga tushirishi, anor po‘sti ekstrakti mos ravishda – 8,7±0,03 mmol/l, 8,4±0,04 mmol/l, urug‘i ekstrakti mos ravishda – 8,6±0,06 mmol/l, 8,2±0,03 mmol/l ga tushirishi, “Oq shirin” sharbati ekstrakti (150 mg/kg) 7-sutkada 9,9±0,03 mmol/l, 14-sutkada 9,7±0,05 mmol/l, anor po‘sti ekstrakti mos ravishda

– 9,4±0,06 mmol/l, 9,2±0,03 mmol/l, urug‘i ekstrakti mos ravishda – 8,9±0,05 mmol/l, 8,8±0,04 mmol/l ga tushirishi aniqlandi.

Shuningdek, eksperimental diabet sharoitida “Achchiq dona” sharbati ekstrakti (150 mg/kg) kalamush qonida glyukoza konsentratsiyasini 7-sutkada 11,5±0,08 mmol/l, 14-sutkada 10,2±0,07 mmol/l ga tushirishi, anor po‘sti ekstrakti mos ravishda – 9,8±0,03 mmol/l, 9,7±0,04 mmol/l, urug‘i ekstrakti mos ravishda – 9,6±0,05 mmol/l, 9,4±0,03 mmol/l, “Qizil anor” sharbati ekstrakti (150 mg/kg) kalamush qonida glyukoza konsentratsiyasini 7-sutkada 9,5±0,03 mmol/l, 14-sutkada 9,2±0,04 mmol/l ga tushirishi, anor po‘sti ekstrakti mos ravishda – 7,8±0,04 mmol/l, 7,6±0,02 mmol/l, urug‘i ekstrakti mos ravishda – 8,1±0,03 mmol/l, 8,3±0,04 mmol/l ga tushirishi aniqlandi.

XULOSALAR

Shunday qilib, amalga oshirilgan tadqiqotlarda alloksan monogidrat (150 mg/kg) in’yeksiyasi yordamida yuzaga keltirilgan eksperimental diabet modelida kalamush qonida glyukoza konsentratsiyasi 7-sutkada 27,8±0,2 mmol/l, 14-sutkada 29,5±0,3 mmol/l ga ortishi sharoitida (nazorat guruhida 7-sutka va 14-sutkalarda mos ravishda – 4,7±0,05 mmol/l va 4,8±0,04 mmol/l), anor (*Punica granatum* L.) mahalliy navlari ekstraktlari (sharbat, po‘st, urug‘) (150 mg/kg) sezilarli darajadagi gipoglikemik faollikka ega bo‘lib, bunda qonda glyukoza konsentratsiyasi “Qizil anor” po‘sti ekstrakti ta’sirida 7-sutka va 14-sutkada mos ravishda – 7,8±0,04 mmol/l va 7,6±0,02 mmol/l, urug‘i ekstrakti ta’sirida mos ravishda – 8,1±0,03 mmol/l va 8,3±0,04 mmol/l gacha pasayishi tasdiqlandi.

Anor (*Punica granatum* L.) navlari sharbati, meva po‘sti va urug‘i ekstraktining antidiabet faolli tarkibidagi polifenol birikmalar bilan bog‘liqligi tahmin qilish mumkin.

Olingan natijalar anor (*Punica granatum* L.) ekstrakti asosida diabet terapiyasi maqsadlarida, biologik faol qo‘shimcha ishlab chiqishda ilmiy asos sifatida foydalanilishi mumkin.

Foydalanilgan qisqartmalar ro‘yxati:

- FAD-GDH – flavin-adenin dinukleotidga bog‘liq glyukoza-degidrogenaza (*Flavin adenine dinucleotide-dependent glucose dehydrogenase*);
- AMPK – Adenozinmonofosfatga bog‘liq faollashuvchi proteinkinaza (AMP-*activated protein kinase*);

- $GLUT_4$ – glyukozaning insulinga bog‘liq tashilishida ishtirok etuvchi transportyor (*Glucose transporter type* 4).
- IL-6 – yallig‘lanish jarayoni regulyasiyasida ishtirok etuvchi sitokin – interleykin-6 (*interleukin*-6);
- NF-κB – yallig‘lanish jarayonida ishtirok etuvchi omillar regulyasiyasida ishtirok etuvchi yadro transkripsiya omili (*nuclear factor kappa-light-chain-enhancer of activated B cells*);
- TNF-α – o‘sma nekroz omili/yallig‘lanish sitokini (*Tumor necrosis factor alpha*);

Minnatdorchilik

Mualliflar tadqiqotlarni amalga oshirishda yaqindan yordam bergan – O‘zbekiston Respublikasi Fanlar akademiyasi O.S.Sodiqov nomidagi Biorganik kimyo instituti Farmakologiya laboratoriyasi ilmiy xodimi – Maxmudov Lazizbek Umarjonovichga minnatdorchilik bildiradi.

BACILLUS LICHENIFORMIS SHTAMMINING FITOPATOGEN MIKROORGANIZMLARGA QARSHI ANTAGONISTIK FAOLLIGI

Abdulloyeva Sarvinoz Fayzulloyevna
Samarqand davlat universiteti tayanch doktoranti
e-mail: sarvinozabdullayeva63@gmail.com
Turayeva Bahora Ismoilovna
O‘ zRFA Mikrobiologiya instituti katta ilmiy xodimi
e-mail: turaevabakhora@mail.ru

Annotatsiya: *Ushbu tadqiqotda Samarqand shahridagi tarixiy obyektlar hududida o‘ suvchi asriy daraxtlar mikrobiomi MALDI-TOF mass-spektrometriya usuli yordamida o‘ rganildi. Ajratilgan mikroorganizmlar orasidan yuqori antagonistik faollikka ega* ***Bacillus licheniformis*** *shtammi tanlanib, uning fitopatogenlarga qarshi biologik faolligi baholandi. Natijalar* ***B. licheniformis*** *patogen mikroorganizmlar o‘ sishini cheklashi va aniq inhibisiya zonalari hosil qilishini ko‘ rsatdi. Dala sinovlarida 10^{-2} suyultirilgan suspenziya qo‘ llanilganda biologik himoya samaradorligi yuqori bo‘ lib, ushbu shtamm asriy daraxtlarni himoyalash uchun istiqbolli biokontrol agenti ekanligi aniqlandi.*

Kalit so‘ zlar: Bacillus licheniformis, *antagonizm, fitopatogenlar, mikrobiom, MALDI-TOF, biologik himoya, asriy daraxtlar.*

АНТАГОНИСТИЧЕСКАЯ АКТИВНОСТЬ ШТАММА *BACILLUS LICHENIFORMIS* ПРОТИВ ФИТОПАТОГЕННЫХ МИКРООРГАНИЗМОВ

Аннотация: *В данном исследовании с использованием метода MALDI-TOF масс-спектрометрии изучен микробиом вековых деревьев, произрастающих на территории исторических объектов города Самарканда. Среди выделенных микроорганизмов был отобран штамм* ***Bacillus licheniformis*** *с высокой антагонистической активностью, и проведена оценка его биологической эффективности против фитопатогенов. Результаты показали, что* ***B. licheniformis*** *эффективно подавляет рост патогенных микроорганизмов и формирует зоны ингибирования. В полевых испытаниях применение суспензии в разведении 10^{-2} обеспечило высокую эффективность биологической защиты, что подтверждает перспективность данного штамма как биоконтрольного агента для защиты вековых деревьев.*

Ключевые слова: Bacillus licheniformis, *антагонизм, фитопатогены, микробиом, MALDI-TOF, биологическая защита.*

ANTAGONISTIC ACTIVITY OF THE *BACILLUS LICHENIFORMIS* STRAIN AGAINST PHYTOPATHOGENIC MICROORGANISMS

Abstract: *This study investigated the microbiome of monumental trees growing in historical sites of Samarkand using MALDI-TOF mass spectrometry. Among the isolated microorganisms, the* ***Bacillus licheniformis*** *strain with high antagonistic activity was selected, and its biological efficacy against phytopathogens was evaluated. The results demonstrated that* ***B. licheniformis*** *effectively inhibited the growth of pathogenic microorganisms and formed distinct inhibition zones. Field trials showed high biological protection efficiency when a 10^{-2} diluted suspension was applied by spraying, confirming the potential of this strain as a biocontrol agent for protecting monumental trees.*

Keywords: Bacillus licheniformis, *antagonism, phytopathogens, microbiome, MALDI-TOF MS, biological control, monumental trees.*

Kirish.

Asriy daraxtlar shahar ekotizimi va madaniy merosning muhim tarkibiy qismi bo‘ lib, ekologik barqarorlik, biologik xilma-xillik va tarixiy landshaftni saqlashda katta ahamiyatga ega [1]. Biroq vaqt o‘ tishi bilan fitopatogen bakteriyalar va zamburug‘ lar ta’sirida daraxtlarning fiziologik holati yomonlashishi, nekroz va chirish jarayonlari rivojlanishi mumkin. Kimyoviy himoya vositalaridan foydalanish tarixiy obyektlar hududida ekologik jihatdan cheklanganligi sababli biologik himoya usullarini ishlab chiqish dolzarb hisoblanadi [2].

Adabiyotlar tahlili va Metodologiya

O‘ simlik mikrobiomi tarkibidagi **Bacillus** turkumiga mansub bakteriyalar biologik faol metabolitlar ishlab chiqarishi orqali fitopatogenlarning rivojlanishini bostiradi. Zamonaviy **MALDI-TOF mass-spektrometriya** usuli yordamida bunday mikroorganizmlar tezkor aniqlanadi [3]. Mazkur tadqiqotning maqsadi Samarqand shahri tarixiy obidalari hududida mavjud asriy daraxtlar mikrobiomidan ajratilgan ***Bacillus licheniformis*** shtammining fitopatogen mikroorganizmlarga qarshi antagonistik faolligini baholash va uni biologik himoya vositasi sifatida qo‘ llash imkoniyatlarini aniqlashdan iborat [4].

Adabiyotlar tahlili. So‘ nggi yillarda o‘ simlik mikrobiomi va uning fitopatogenlarga qarshi himoyadagi roli bo‘ yicha tadqiqotlar sezilarli darajada kengaydi. Sog‘ lom o‘ simlik mikrobiomi patogenlarning rivojlanishini cheklaydi va o‘ simlik immunitetini faollashtirishda muhim rol o‘ ynaydi [5]. Antagonistik bakteriyalar fitopatogenlar bilan raqobatlashish, antibiotik va antifungal birikmalar ishlab chiqarish hamda induksiyalangan sistemik rezistentlikni faollashtirish orqali biologik nazoratda ishtirok etadi. Ayniqsa, **Bacillus, Paenibacillus** va **Pseudomonas** avlodlari vakillari samarali biokontrol agentlari sifatida keng o‘ rganilmoqda [6]. Asriy daraxtlar mikrobiomi uzoq yillar davomida shakllangan murakkab ekologik tizim bo‘ lib, fiziologik holati va kasalliklarga chidamliligida muhim ahamiyatga ega [7].

Bacillus turkumiga mansub bakteriyalar ekologik xavfsizligi, spora hosil qilish qobiliyati va biologik faol metabolitlar sintez qilishi sababli biologik himoya vositalari orasida alohida o‘ rin egallaydi. *Bacillus subtilis*, *B. velezensis* va *B. licheniformis* ko‘ plab fitopatogenlarga qarshi yuqori antagonistik faollikka ega ekanligi aniqlangan [8]. ***Bacillus licheniformis*** iturin, surfaktin, fengitsin va boshqa lipopeptidlarni ishlab chiqarib, fitopatogenlarning hujayra membranasiga ta’sir qiladi hamda ularning rivojlanishini cheklaydi. Ushbu bakteriyaning *Fusarium oxysporum*, *Alternaria alternata*, *Botrytis cinerea* kabi patogenlarga qarshi samaradorligi ko‘ plab tadqiqotlarda tasdiqlangan. Genomik tadqiqotlar **Bacillus** vakillarida antagonistik metabolitlar sintezida ishtirok etuvchi NRPS, PKS va siderofor gen klasterlari mavjudligini ko‘ rsatgan [9]. Bu mexanizmlar bakteriyalarni fitopatogenlarga qarshi kompleks himoya ta’sirini ta’minlaydi. MALDI-TOF mass-spektrometriya mikroorganizmlarni tezkor identifikatsiya qilish imkonini beruvchi zamonaviy usul bo‘ lib, ekologik namunalardagi **Bacillus, Pantoea, Paenibacillus** va **Pseudomonas** vakillarini aniqlashda samarali qo‘ llanmoqda [10].

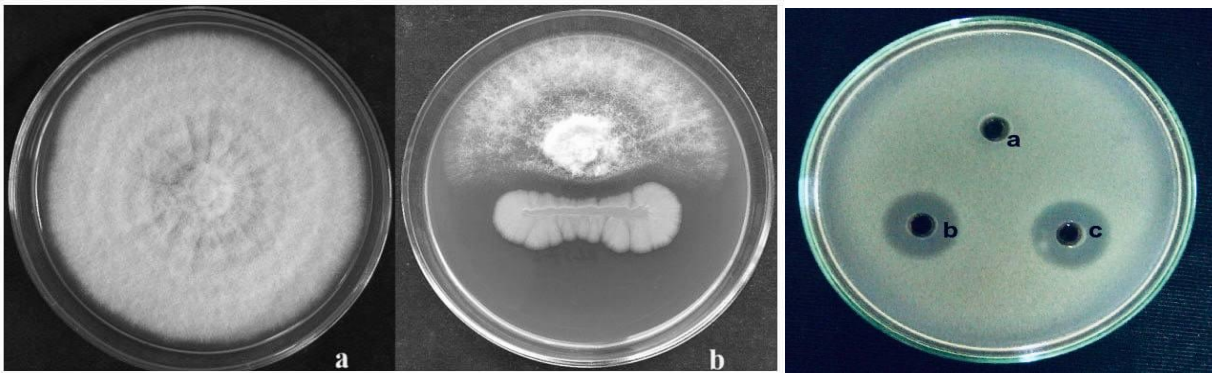
Bacillus licheniformis fitopatogenlarga qarshi yuqori antagonistik faollikka ega istiqbolli biokontrol agentidir. Shu bilan birga, madaniy meros obyektlaridagi asriy daraxtlar mikrobiomidan ajratilgan mahalliy shtammlarning biologik xususiyatlari yetarlicha o‘ rganilmagan. Mazkur tadqiqot asriy daraxtlar mikrobiomidan ajratilgan mahalliy antagonistik shtammlarning biologik imkoniyatlarini baholash orqali ushbu yo‘ nalishdagi tadqiqotlarni rivojlantirishga xizmat qiladi [11].

Materiallar va tadqiqot metodlari. Tadqiqot obyekti sifatida Samarqand shahridagi madaniy meros obyektlari - Go‘ ri Amir maqbarasi, Sherdor madrasasi va Ulug‘ bek rasadxonasi hududlarida o‘ suvchi **Juniperus, Thuja, Cupressus, Pinus, Morus, Platanus** va **Aesculus** turkumlariga mansub asriy daraxtlardan olingan namunalar hamda daraxtlar atrofidagi tuproq namunalari foydalanildi. Namunalar daraxt tanasi, po‘ stloq yuzasi va zararlangan to‘ qimalardan aseptik sharoitda olinib, mikrobiologik tahlillar uchun laboratoriyaga yetkazildi. Ajratib olingan mikroorganizmlar sof kultura holiga keltirilib, ularning tur tarkibi **MALDI-TOF mass-spektrometriya** usuli yordamida identifikatsiya qilindi. Olingan mass-spektrlar ma’lumotlar bazasi bilan taqqoslanib, mikroorganizmlar tur darajasida aniqlandi. Antagonistik faollik ikki kulturani birgalikda o‘ stirish usulida baholanib, patogen koloniyasi o‘ sishining cheklanishi va inhibisiya zonasi hosil bo‘ lishiga ko‘ ra yuqori faollikka ega shtamm tanlab olindi.

Laboratoriya sinovlari natijalariga ko‘ ra eng faol antagonistik shtamm sifatida ***Bacillus licheniformis*** tanlandi. Ushbu shtammning biologik samaradorligini baholash maqsadida dala sharoitida sinovlar o‘ tkazildi. Bunda bakteriya suspenziyasi **10^{-2} (1:100)** suyultirish darajasida tayyorlanib, daraxt tanasi hamda fitopatogenlar bilan zararlangan qismlariga purkash usulida qo‘ llanildi. Tajriba davomida daraxtlarning umumiy fitosanitar holati, zararlanish darajasi va biologik preparatning fitopatogen mikroflora rivojlanishiga ta’siri monitoring qilindi.

Natijalar va muhokama.

Asriy daraxtlardan ajratib olingan mikroorganizmlar MALDI-TOF mass-spektrometriya usulida identifikatsiya qilindi (1-jadval). Identifikatsiya natijalari daraxtlar mikrobiomi tarkibida antagonistik, fitopatogen va shartli patogen mikroorganizmlar birgalikda uchrashini ko‘ rsatdi [12].



1-jadval.

Asriy daraxtlardan ajratilgan mikroorganizmlar

Obyekt	Bakteriya shtammlari	Mikromitset nomlari
Juniper Verginiana, Juniperus sp.,	*P. agglomerans, B. subtilis, B. megaterium*	*A. alternata, C. cladosporioides*
Pinus sylvestris	*B. subtilis, B. megaterium, B. pumilus, B. licheniformis, P. agglomerans*	*F. oxysporum, A. alternata, P. chrysogenum*
Thuja orientalis	*B. subtilis, B. vallismortis, P. agglomerans*	*A. niger, P. citrinum*
Morus alba	*B. vallismortis, B. subtilis A. viridans,*	*F. oxysporum, A. alternata*
Platanus orientalis	*B. subtilis, Pseudomonas syringae*	*C. herbarum, A. alternata*
Pinus eldarica	*B. subtilis, B. licheniformis*	*F. solani, P. chrysogenum*
Pinus nigra	*Pn. peoriae, Pn. polymyxa, A. baumannii, B. simplex*	*A. flavus, C. cladosporioides*
Pinus pungens	*B.licheniformis, Cutaneotrichosporon jirovecii*	*A. alternata, F. oxysporum*
Tuproq	*B. subtilis, B. megaterium, Az. chroococcum*	*P. citrinum, A. niger*

Tahlillar natijasida ***Bacillus subtilis, Bacillus licheniformis*** va ***Bacillus megaterium*** ko‘ pchilik namunalarda uchragan bo‘ lsa, ***Pseudomonas syringae*** va ***Acinetobacter baumannii*** ayrim daraxt turlarida aniqlandi. Bu esa asriy daraxtlar mikrobiomida foydali va fitopatogen mikroorganizmlar o‘ rtasida tabiiy biologik muvozanat mavjudligini ko‘ rsatadi [13].

Ajratib olingan fitopatogen mikroorganizmlar hamda Mikrobiologiya instituti kolleksiyasidagi antagonistik shtammlar o‘ rtasida skrining tadqiqotlari o‘ tkazildi. Natijada ***Bacillus licheniformis*** yuqori antagonistik faollikka ega shtamm sifatida tanlab olindi. Laboratoriya tajribalarida ushbu shtamm fitopatogen mikroorganizmlar koloniyalarining o‘ sishini sezilarli darajada cheklab, aniq inhibisiya zonalari hosil qildi (1-rasm).

A) **B)**

1-rasm. ***Bacillus licheniformis*** **shtammining fitopatogen mikroorganizmlarga nisbatan antagonistik faolligi: A-** ***Bacillus licheniformis*** **va** ***Fusarium oxysporum*** **o‘ rtasidagi o‘ zaro antagonistik munosabat; B-** ***Bacillus licheniformisning*** **patogen mikroorganizmlarga qarshi antagonizmi.**

Olingan natijalar ***Bacillus licheniformis*** shtammi madaniy meros obyektlari hududida o‘ suvchi asriy daraxtlarni fitopatogen mikroorganizmlardan biologik himoya qilishda istiqbolli biokontrol agenti ekanligini ko‘ rsatdi [14].

Tadqiqot natijalari asriy daraxtlar mikrobiomi tarkibida foydali va fitopatogen mikroorganizmlar o‘ rtasida tabiiy biologik muvozanat mavjudligini ko‘ rsatdi. MALDI-TOF tahlillari natijasida aniqlangan ***Bacillus subtilis, Bacillus licheniformis*** va ***Bacillus megaterium*** kabi bakteriyalar biologik himoyada muhim ahamiyatga ega bo‘ lsa, ***Pseudomonas syringae*** va ***Acinetobacter baumannii*** kabi mikroorganizmlar daraxtlarning fitosanitar holatiga salbiy ta’sir ko‘ rsatishi mumkin.

Skrining tadqiqotlari natijasida ***Bacillus licheniformis*** shtammining yuqori antagonistik faolligi aniqlandi. Adabiyotlarda ushbu bakteriya fitopatogen mikroorganizmlarga qarshi lipopeptid antibiotiklar va gidrolitik fermentlar ishlab chiqarishi hamda ularning rivojlanishini samarali bostirishi qayd etilgan [15].

Laboratoriya va dala sinovlari ***Bacillus licheniformis*** shtammining mahalliy sharoitda biologik himoya vositasi sifatida qo‘ llash uchun istiqbolli ekanligini tasdiqladi. Ayniqsa, mahalliy daraxt mikrobiomidan ajratib olingan shtammdan foydalanish uning ekologik moslashuvchanligini oshirib, biologik preparat samaradorligini ta’minlaydi.

Xulosa.

MALDI-TOF mass-spektrometriya usuli yordamida madaniy meros obyektlari hududida o‘ suvchi asriy daraxtlar mikrobiomining tur tarkibi aniqlandi va antagonistik hamda fitopatogen mikroorganizmlar mavjudligi qayd etildi.

Skrining tadqiqotlari natijasida ***Bacillus licheniformis*** yuqori antagonistik faollikka ega shtamm sifatida tanlandi. Laboratoriya va dala sharoitlarida o‘ tkazilgan sinovlar uning fitopatogen mikroorganizmlar rivojlanishini samarali cheklashini ko‘ rsatdi.

Olingan natijalar ***Bacillus licheniformis*** shtammi asosida biologik preparatlar yaratish va ularni madaniy meros obyektlari hududidagi asriy daraxtlarni ekologik xavfsiz usulda fitopatogen mikroorganizmlardan himoyalashda qo‘ llash istiqbolli ekanligini ko‘ rsatadi. Bu yondashuv daraxtlarning biologik barqarorligini saqlash va tarixiy landshaftlarni muhofaza qilishda muhim amaliy ahamiyatga ega.

Annotatsiya. *Ko‘p yillik gelmintologik materiallar hamda adabiyot ma’lumotlari asosida Farg‘ona vodiysi reptiliyalari gelmintofaunasining taksonomik tarkibi, hududiy tarqalishi va ekologik-funksional tuzilishi tahlil qilindi. Reptiliyalarning faunistik ro‘yxatidan lokalitetlarni qayta tanlab olish natijasida Farg‘ona vodiysi bilan bog‘liq 44 ta gelmint taksoni hamda mustaqil faunistik shakllar ajratib olindi. Ulardan 34 tasi Nematoda (77,27%), 7 tasi Cestoda (15,91%) va 3 tasi Acanthocephala (6,82%) guruhlariga mansub. Viloyatlar darajasida aniq lokalizatsiyaga ega 39 ta taksondan Namangan viloyatida 27 ta, Farg‘ona viloyatida 17 ta va Andijon viloyatida 7 ta takson qayd etildi. Jakkar o‘xshashlik koeffitsienti Namangan–Farg‘ona juftligi uchun J=0,158, Andijon–Farg‘ona uchun J=0,143 hamda Andijon–Namangan uchun J=0,133 ni tashkil etdi. Faunalar kesishmasi tahlili (Venn diagrammasi) natijalariga ko‘ra, 18 ta takson faqat Namangan viloyatida, 9 tasi Farg‘ona viloyatida va 1 tasi Andijon viloyatida qayd etilgan bo‘lib, uchala hudud uchun yagona umumiy komponent Tachygonetria longicollis turi hisoblanadi. Autoxton voyaga yetgan shakllar bilan bir qatorda alloxthon lichinka bosqichlarining mavjudligi Eremias, Phrynocephalus va Trapelus avlodlariga mansub kaltakesaklar parazitlarning trofik tizimlarida oraliq, rezervuar va paratenik bo‘g‘inlar vazifasini o‘tashidan dalolat beradi. Aksincha, Testudo horsfieldii gelmintofaunasida to‘g‘ri (monoksen) rivojlanish sikliga ega ichak nematodalari ustunlik qiladi. Olingan natijalar shuni ko‘rsatadiki, vodiy reptiliyalarining gelmintofaunasi hududiy jihatdan tabaqalashgan tizim bo‘lib, uning shakllanishi xo‘jayin taksonomiyasi, biotop, oziqlanish spektri, oraliq xo‘jayinlar bilan aloqalar hamda parazitlarning hayot sikllari orqali belgilanadi.*

Kalit so‘zlar: *Farg‘ona vodiysi, Reptilia, gelmintofauna, Nematoda, Cestoda, Acanthocephala, Eremias velox, Testudo horsfieldii, Jakkar indeksi, trofik aloqalar.*

ТАКСОНОМИЧЕСКИЙ СОСТАВ, ТЕРРИТОРИАЛЬНАЯ ДИФФЕРЕНЦИАЦИЯ И ЭКОЛОГИЧЕСКАЯ СТРУКТУРА ГЕЛЬМИНТОФАУНЫ РЕПТИЛИЙ ФЕРГАНСКОЙ ДОЛИНЫ

Аннотация. *Проведён анализ таксономического состава, территориального распределения и эколого-функциональной структуры гельминтофауны рептилий Ферганской долины на основе многолетних гельминтологических материалов и литературных данных. В результате повторной выборки локалитетов из фаунистического списка рептилий выделено 44 таксона гельминтов и самостоятельные фаунистические формы, связанные с Ферганской долиной. Из них 34 относятся к Nematoda (77,27%), 7 - к Cestoda (15,91%) и 3 - к Acanthocephala (6,82%). Среди 39 таксонов с точной локализацией на уровне областей в Наманганской области зарегистрировано 27, в Ферганской - 17 и в Андижанской - 7 таксонов. Коэффициент сходства Жаккара составил J=0,158 для пары Наманган–Фергана, J=0,143 для пары Андижан-Фергана и J=0,133 для пары Андижан–Наманган. Согласно результатам анализа пересечения фаун (диаграмма Венна), 18 таксонов зарегистрированы исключительно в Наманганской области, 9 — в Ферганской и 1 — в Андижанской; при этом единственным общим компонентом для всех трех регионов являлся вид Tachygonetria longicollis. Присутствие наряду с автохтонными половозрелыми формами аллохтонных личиночных стадий свидетельствует о функциях ящериц родов Eremias, Phrynocephalus и Trapelus в качестве промежуточных, резервуарных и паратенических звеньев трофических паразитарных систем. В гельминтофауне Testudo horsfieldii,*

напротив, доминируют кишечные нематоды с прямым (моноксенным) циклом развития. Полученные результаты свидетельствуют, что гельминтофауна рептилий долины представляет собой территориально дифференцированную систему, формирование которой определяется таксономией хозяина, биотопом, спектром питания, контактами с промежуточными хозяевами и жизненными циклами паразитов.

Ключевые слова: *Ферганская долина, Reptilia, гельминтофауна, Nematoda, Cestoda, Acanthocephala, Eremias velox, Testudo horsfieldii, индекс Жаккара, трофические связи.*

TAXONOMIC COMPOSITION, TERRITORIAL DIFFERENTIATION AND ECOLOGICAL STRUCTURE OF REPTILE HELMINTHOFAUNA IN THE FERGANA VALLEY

Abstract. *The taxonomic composition, territorial distribution, and ecological-functional structure of the helminth fauna of reptiles in the Fergana Valley were analyzed based on long-term helminthological materials and literature data. Reassessment of localities from the faunal records of reptiles resulted in the identification of 44 helminth taxa and independent faunal forms associated with the Fergana Valley. Of these, 34 belong to Nematoda (77.27%), 7 to Cestoda (15.91%), and 3 to Acanthocephala (6.82%). Among the 39 taxa with precise regional localization, 27 were recorded in the Namangan Region, 17 in the Fergana Region, and 7 in the Andijan Region. The Jaccard similarity coefficient was J=0.158 for the Namangan–Fergana pair, J=0.143 for Andijan–Fergana, and J=0.133 for Andijan–Namangan. According to the analysis of faunal overlap (Venn diagram), 18 taxa were recorded exclusively in the Namangan Region, 9 in the Fergana Region, and 1 in the Andijan Region; Tachygonetria longicollis was the only common component shared by all three regions. The occurrence of allochthonous larval stages alongside autochthonous adult forms indicates the roles of lizards of the genera Eremias, Phrynocephalus, and Trapelus as intermediate, reservoir, and paratenic links in trophically transmitted parasitic systems. In contrast, the helminth fauna of Testudo horsfieldii is dominated by intestinal nematodes with a direct (monoxenous) life cycle. Overall, the results demonstrate that the reptile helminth fauna of the valley represents a territorially differentiated system shaped by host taxonomy, biotope, diet composition, interactions with intermediate hosts, and parasite life cycles.*

Key words: *Fergana Valley, Reptilia, helminth fauna, Nematoda, Cestoda, Acanthocephala, Eremias velox, Testudo horsfieldii, Jaccard index, trophic relationships.*

ВВЕДЕНИЕ

Рептилии являются важным компонентом пищевых цепей наземных экосистем, а состав их гельминтофауны тесно связан с филогенетической принадлежностью хозяина, средой обитания, стратегией питания и трофическим уровнем. В жизненных циклах гельминтов рептилии выступают не только в качестве дефинитивных хозяев, но также могут выполнять функции промежуточных, дополнительных, паратенических и резервуарных хозяев. Поэтому изучение систем «рептилия-гельминт» не ограничивается фаунистической инвентаризацией, а позволяет раскрывать механизмы естественной циркуляции паразитов и их биоценотические связи [1-4].

Ферганская долина относится к экологически сложным регионам Центральной Азии и характеризуется близким соседством песчаных пустынь, полупустынь, адыров, предгорий, горных участков, речных долин и интенсивно освоенных агроэкосистем. Такое ландшафтное разнообразие формирует широкий спектр экологических ниш для рептилий и одновременно создаёт различные пути передачи гельминтов. Наземные насекомоядные ящерицы, потребляя членистоногих, включаются в жизненные циклы спируридных нематод, цестод и акантоцефалов, тогда как у черепах устойчивые комплексы образуют преимущественно кишечные нематоды с прямым циклом развития.

Специальные исследования гельминтов рептилий Ферганской долины активизировались в конце XX-начале XXI века. При обследовании представителей Testudines и Sauria в равнинных и предгорных зонах долины в 1993-2001 гг. для фауны Узбекистана было выявлено 14 новых видов гельминтов, в том числе 2 вида цестод и 12 видов нематод [5]. В последующих исследованиях были уточнены новые связи «хозяин-паразит», описаны новые виды нематод и расширены представления о функциональной роли рептилий в жизненных циклах гельминтов [6-9].

Вместе с тем значительная часть имеющихся сведений носит фрагментарный характер и ограничено отдельными видами хозяев или локалитетами. Комплексный анализ таксономического состава, межобластного фаунистического сходства и эколого-функциональной структуры гельминтофауны рептилий Ферганской долины до настоящего времени оставался недостаточно разработанным. Настоящее исследование направлено на восполнение этого пробела на основе ревизии и обобщения многолетних паразитологических сборов.

Цель исследования определить таксономический состав гельминтов, зарегистрированных у рептилий Ферганской долины, оценить их территориальное распределение в Андижанской, Наманганской и Ферганской областях на основе подхода presence-absence, определить фаунистическое сходство с использованием

коэффициента Жаккара и охарактеризовать эколого-функциональную роль рептилий в жизненных циклах паразитов.

МАТЕРИАЛЫ И МЕТОДЫ

Основу базы данных составили обобщённые фаунистические материалы, собранные в 2000–2026 гг. в различных природно-ландшафтных зонах Узбекистана. В общем диссертационном материале исследовано 3096 особей рептилий. В настоящей работе Ферганская долина рассматривалась как восточный территориально-экологический комплекс, включающий Андижанскую, Наманганскую и Ферганскую области.

Гельминтологическое исследование рептилий проводили методом полного гельминтологического вскрытия по К.И. Скрябину [10]. Паразитов собирали из органов и тканей, фиксировали и идентифицировали по морфологическим признакам. Для характеристики заражённости использовали экстенсивность инвазии (ЭИ, %), интенсивность инвазии (ИИ) и, при наличии соответствующих данных, среднюю интенсивность инвазии.

В матрице presence-absence подтверждённое присутствие таксона в конкретной области кодировали как 1, отсутствие регистрации-как 0. Фаунистическое сходство между двумя территориями рассчитывали по коэффициенту Жаккара: J=a/(a+b+c), где a - число общих для обеих территорий таксонов, b и c - число таксонов, отмеченных только на одной из сравниваемых территорий. Пересечения для трёх областей оценивали по логике диаграммы Венна с выделением семи секторов: трёх уникальных, трёх попарно общих и одного общего для всех трёх территорий.

При экологической интерпретации гельминтов подразделяли на два функциональных компонента: (1) автохтонные половозрелые формы, достигающие половой зрелости в рептилиях; (2) аллохтонные личиночные формы, циркулирующие в паразитарных системах других позвоночных и использующие рептилий как промежуточных, дополнительных или резервуарных хозяев. Такой подход позволил связать структуру гельминтофауны со спектром питания рептилий и механизмами передачи паразитов в биотопах.

РЕЗУЛЬТАТЫ

У рептилий Ферганской долины выделено 44 таксона гельминтов и самостоятельные фаунистические формы. Из них 34 относятся к Nematoda (77,27%), 7 - к Cestoda (15,91%) и 3 - к Acanthocephala (6,82%). Следовательно, гельминтофауна рептилий долины имеет отчётливо выраженный нематодный характер. Доля нематод примерно в 4,9 раза превышает долю цестод и в 11,3 раза - долю акантоцефалов.

Таблица 1

Таксономическая структура гельминтофауны рептилий Ферганской долины

Таксономическая группа	Число таксонов	Доля, %
Cestoda	7	15,91
Acanthocephala	3	6,82
Nematoda	34	77,27
Всего	44	100,00

В составе Cestoda зарегистрированы представители *Oochoristica, Mathevotaenia*, *Diplopylidium* и *Mesocestoides*. Экологически эта группа включает два различных компонента: половозрелые кишечные паразиты, такие как *Oochoristica*, и личиночные формы *Diplopylidium* и *Mesocestoides*. Несмотря на небольшое число Acanthocephala, присутствие *Macracanthorhynchus catulinus*, *Centrorhynchus scanensis* и *Plagiorhynchus (Prosthorhynchus) transversus* свидетельствует об участии рептилий в циркуляции гельминтов птиц и млекопитающих более высоких трофических уровней.

Nematoda оказались наиболее богатой группой-34 таксона, относящиеся к Physalopteridae, Spirocercidae, Pharyngodonidae, Ascarididae, Cosmocercidae, Seuratidae, Strongyloididae и Atractidae. Особенно разнообразны Pharyngodonidae, формирующие специфические комплексы у *Testudo, Eremias, Phrynocephalus* и *Trapelus.*

Таблица 2

Богатство гельминтных таксонов с точной областной локализацией

Территория	Число таксонов (S)	От 39 таксонов, %	Примечание
Наманганская область	27	69,23	наибольшее число регистраций
Ферганская область	17	43,59	среднее богатство
Андижанская область	7	17,95	наименьшее число регистраций

Высокие показатели Наманганской области обусловлены прежде всего объемами материалов из песчаного массива Мингбулак — Аккум, урочища Алами, Чуст-Наманганских и Касансай-Янгикурганских адыров, а также

Туракургана. В Ферганской области ключевыми локалитетами являлись Бувайда, Язъяван, Сох, Алтыарык и Шахимардан, а в Андижанской — Боз, Улугнор и Пахтаабад.

На основе матрицы presence–absence во всех попарных сравнениях установлено низкое сходство по Жаккару. Для пары Наманган–Фергана при 6 общих и 38 объединённых таксонах J=0,158; для Андижан–Фергана при 3 общих и 21 объединённом таксоне J=0,143; для Андижан–Наманган при 4 общих и 30 объединённых таксонах J=0,133.

Таблица 3

Сходство гельминтофауны рептилий областей Ферганской долины по Жаккару

Пара областей	Общие таксоны (a)	Объединённое число	Jaccard J
Андижан–Наманган	4	30	0,133
Андижан–Фергана	3	21	0,143
Наманган–Фергана	6	38	0,158

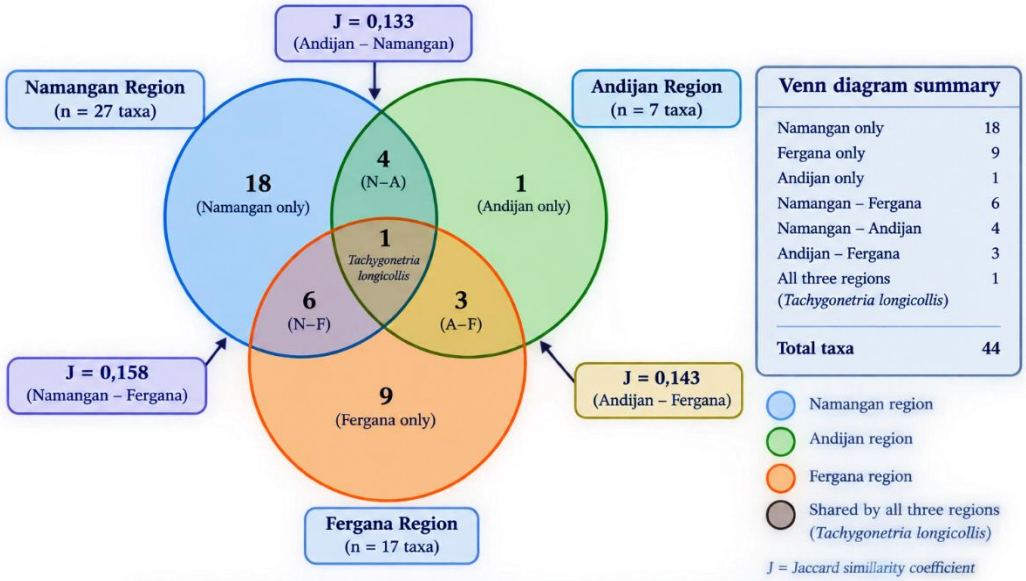

Рис. 1. Диаграмма Венна таксонов гельминтов и коэффициенты сходства Жаккара между областями.

По результатам анализа Венна 18 таксонов зарегистрированы только в Наманганской области, 9-только в Ферганской и 1-только в Андижанской. Попарно общими компонентами являлись 3 таксона для Андижанской и Наманганской областей, 2-для Андижанской и Ферганской, 5-для Наманганской и Ферганской. Единственным таксоном, зарегистрированным во всех трёх областях, был *Tachygonetria longicollis* (рисунок 1).

Эти данные свидетельствуют о высокой территориальной гетерогенности зарегистрированных комплексов гельминтов, несмотря на географическую целостность долины.

Среди исследованных рептилий *Eremias velox* является одним из ключевых связующих хозяев паразитарных систем Ферганской долины. Наряду с половозрелыми нематодами у него встречаются личиночные стадии цестод, акантоцефалов и спируридных нематод. Личинки *Plagiorhynchus (Prosthorhynchus) transversus* обнаружены у *E. velox* в Сохском районе Ферганской области; ЭИ составила 0,82%, ИИ – 2- экз. Эта находка свидетельствует о роли E. velox как нового резервуарного хозяина данного акантоцефала в Узбекистане.

Представители *Phrynocephalus* являются важным элементом циркуляции гельминтов в песчаных и полупустынных биотопах. Личинки *Diplopylidium acanthoptera* зарегистрированы у *P. helioscopus* в песках Аккум Мингбулакского района Наманганской области; ЭИ у P. helioscopus составила 6,06%, ИИ - 2-5 экз. *Abbreviata schulzi* обнаружена у *P. mystaceus* в Бувайдинском, Язъяванском и Мингбулакском районах, что указывает на устойчивую циркуляцию физалоптеридных нематод в песчано-аридных ландшафтах.

Комплекс гельминтов *Testudo horsfieldii* экологически резко отличается от комплексов насекомоядных ящериц. *Tachygonetria longicollis* зарегистрирована во всех трёх областях; ЭИ составила 24,68%, ИИ – 200-400 экз. *T. lobota* отмечена в Наманганской и Ферганской областях, *T. macrolaimus* и *T. dentata* - в Наманганской. ЭИ *Atractis dactyluris* достигала 40,25%, что свидетельствует о формировании у черепах устойчивой паразитарной системы нематод с прямым циклом развития.

Особое таксономическое значение имеет регистрация *Raillietnema uzbekistanica* у *Testudo horsfieldii* в Чуст-Наманганских адырах Наманганской области. Этот вид нематод был описан как новый для науки из северной части Ферганской долины [6], что подчёркивает значение региона не только с точки зрения фаунистического богатства, но и как территории таксономической диверсификации гельминтов.

Таблица 4

Состав гельминтофауны рептилий Ферганской долины и её территориальное распределение

№	Тип	Вид	Места обнаружения
1	Cestoda	*Oochoristica tuberculata*	Ферганская
2		*O. sobolevi*	Наманганская

44		*Atractis dactyluris*	Наманганская

Обсуждение

Доля Nematoda в гельминтофауне рептилий Ферганской долины, достигающая 77,27%, отражает экологическую закономерность, характерную для паразитофауны наземных рептилий. Среди нематод представлены как формы с прямым циклом развития - прежде всего Pharyngodonidae и Atractidae, - так и виды Physalopteridae и Spirocercidae, развивающиеся с участием членистоногих. Таким образом, даже в пределах одной крупной таксономической группы реализуются различные стратегии передачи, что способствует повышению общего видового богатства.

В более раннем исследовании рептилий Ферганской долины у восьми видов хозяев было выявлено 14 видов гельминтов, новых для фауны Узбекистана [5], что уже тогда указывало на высокую перспективность региона для гельминтологических исследований. Выделение 44 таксонов в настоящем повторном анализе отражает существенное расширение фаунистических знаний вследствие многолетних сборов и увеличения круга обследованных хозяев. Однако эти показатели нельзя напрямую интерпретировать как «рост с 14 до 44 видов»: работа 2004 г. учитывала новые для фауны Узбекистана находки, тогда как настоящее исследование суммирует все фаунистические компоненты, связанные с долиной.

Низкие значения коэффициента сходства Жаккара (J=0,133-0,158) свидетельствуют о слабо выраженной фаунистической общности гельминтов между сравниваемыми областями. Относительно высокий, хотя в целом невысокий показатель установлен для пары Наманган — Фергана. Одной лишь географической близости недостаточно для объяснения выявленной картины: на дифференциацию состава гельминтов совместно влияют видовое разнообразие рептилий, соотношение песчаных и адырных биотопов, доступность промежуточных хозяев и неравномерность полноты обследования локалитетов.

По данным диаграммы Венна, только вид *T. longicollis* зарегистрирован во всех трех областях, что представляет научный интерес, однако данный результат не следует трактовать как абсолютную биогеографическую закономерность. Широкое распространение *Testudo horsfieldii* в пределах Ферганской долины и узкая хозяинная специфичность *T. longicollis* могут способствовать её регистрации во всех исследованных областях. В то же время формальная «уникальность» ряда таксонов для отдельных областей может быть связана не с истинным эндемизмом, а с различиями в полноте и объёме исследовательских сборов.

Экологическая структура гельминтофауны рептилий особенно отчётливо проявляется в соотношении автохтонного и аллохтонного компонентов. Автохтонные формы достигают половой зрелости в рептилиях и отражают длительные эволюционные связи с хозяином. Аллохтонные личинки относятся к паразитарным системам других позвоночных и превращают рептилию в биологический аккумулятор в трофической цепи

передачи. Наземные насекомоядные ящерицы, поедая жуков, прямокрылых, мокриц и других беспозвоночных, заражаются личинками цестод, спируридных нематод и акантоцефалов [2, 8, 9].

Например, в жизненном цикле *P. (P.) transversus* наземные мокрицы могут выполнять роль промежуточных хозяев, *E. velox* - резервуарного хозяина, а хищные птицы - дефинитивных хозяев. Тем самым формируется трофическая цепь «беспозвоночное →рептилия →птица». Для Spirocerca lupi и ряда других спирурид преобладает модель «членистоногое → рептилия → хищное млекопитающее». Такие связи делают рептилий одним из функционально важных звеньев наземных паразитарных систем.

У черепах наблюдается иная экологическая стратегия. Высокая интенсивность заражения представителями *Tachygonetria, Mehdiella, Thaparia, Raillietnema* и *Atractis* в популяциях *T. horsfieldii* связана с прямой передачей, контаминацией внешней среды инвазионными стадиями и длительным использованием хозяевами одних и тех же микробиотопов. Поэтому гельминтофауна черепах по сравнению с насекомоядными ящерицами характеризуется более выраженным специфическим моноксенным компонентом.

Разнообразие природных и антропогенных ландшафтов Ферганской долины также влияет на циркуляцию паразитов. В естественных песчаных, адырных и предгорных биотопах более полно сохраняются трофические связи между членистоногими, рептилиями, птицами и млекопитающими. В агроэкосистемах и урбанизированных территориях отдельные связи могут разрываться, тогда как другие, в частности связанные с синантропными и домашними животными, способны усиливаться. В исходных материалах для восточного территориально-экологического комплекса приведено 48 регистраций гельминтов рептилий в естественных экосистемах и 12 - в урбанизированных; эти величины следует рассматривать именно как записи по типам экосистем, а не как независимое число видов.

Полученные результаты можно интерпретировать в рамках интегративной экологической модели: «региональный пул гельминтов →ландшафтно-биотопический фильтр →экологическая ниша хозяина →спектр питания →контакты с промежуточными хозяевами →механизм передачи →биологическая совместимость хозяина и паразита →реально сформированное гельминтное сообщество». Такая схема позволяет объяснять различия между рептилиями не только их систематическим положением, но и трофической и пространственной экологией.

ЗАКЛЮЧЕНИЕ

С рептилиями Ферганской долины связано 44 таксона гельминтов и самостоятельные фаунистические формы. В таксономической структуре абсолютное доминирование принадлежит Nematoda - 34 таксона (77,27%); Cestoda представлены 7 таксонами (15,91%), Acanthocephala - 3 (6,82%).

На областном уровне в Наманганской области зарегистрировано 27, в Ферганской – 17 и в Андижанской – 7 таксонов. Фаунистическое сходство по Жаккару во всех попарных сравнениях было низким: Наманган–Фергана J=0,158, Андижан–Фергана J=0,143 и Андижан–Наманган J=0,133. Единственным таксоном, общим для всех трёх областей по результатам анализа Венна, являлся *Tachygonetria longicollis.*

В функциональном отношении гельминтофауна рептилий включает два основных компонента: автохтонные формы, достигающие половой зрелости в рептилиях, и аллохтонные личиночные формы, принадлежащие паразитарным системам других позвоночных. Представители *Eremias, Phrynocephalus* и *Trapelus* имеют важное значение как промежуточные и резервуарные звенья трофически передающихся гельминтов, тогда как *Testudo horsfieldii* служит дефинитивным хозяином для ряда моноксенных кишечных нематод.

Формирование гельминтных сообществ рептилий Ферганской долины определяется таксономической принадлежностью хозяина, биотопической специализацией, стратегией питания, контактами с промежуточными хозяевами и особенностями жизненных циклов паразитов. Выявленные территориальные различия могут отражать как экологическую гетерогенность, так и неравномерность выборочного охвата; поэтому дальнейшие исследования должны основываться на стандартизированном территориальном мониторинге.

MARKAZIY O‘ ZBEKISTONDA *SEMENOVIANA PLOTNIKOVI* (UVAROV, 1914)NING TARQALISHI VA EKOLOGIYASI

Turayeva Zuxra Rajaboevna
Farg‘ ona davlat universiteti DSc doktoranti, biologiya fanlari bo‘ yicha PhD, dotsent
ORCID: 0009-0005-0435-8899; e-mail: z_turaeva78@mail.ru;

Annotatsiya. *Semenoviana plotnikovi (Uvarov, 1914) Markaziy Osiyo faunasiga xos Tettigoniidae vakili bo‘ lib, Markaziy O‘ zbekistondagi tarqalishi va biotop aloqalari maxsus tur darajasida yetarlicha umumlashtirilmagan. Tadqiqotning maqsadi muallifning Markaziy O‘ zbekistonda olib borgan dala izlanishlarini Buxoro–Qorovulbozor, Navoiy–Qiziltepa, Samarqand–Urgut hamda Jizzax–Zomin va Nurota hududlaridagi qaydlar asosida tizimlashtirish, turning hududiy uchrashi hamda ekologik diapazonini baholashdan iborat. Barcha asosiy hisoblarda 50 × 2 m transekt, 60 daqiqalik faol kuzatuv va 100 sweep-net zarbasidan iborat standart protokol qo‘ llangan. Markaziy O‘ zbekistonning beshta nuqtasida jami 76 individ qayd etilgan: Nurotada 24, Urgutda 22, Zominda 20, Qorovulbozor va Qiziltepada 5 tadan. Ulardan 45 tasi urg‘ ochi va 31 tasi erkak. Farg‘ ona vodiysi va Namangan bo‘ yicha jami 45 individga oid ma’lumotlar hamda Arslonbobdagi bitta fotoqayd asosiy tanlanmaga qo‘ shilmay, hududiy taqqoslash uchun ishlatildi. Bir xil protokol asosiy nuqtalardagi qayd sonlarini tavsifiy qiyoslash imkonini berdi, biroq har bir nuqta bir sana bilan ifodalanganligi sababli farqlar populyatsiya zichligining barqaror statistik ko‘ rsatkichi sifatida talqin qilinmadi. Natijalar turning Markaziy O‘ zbekistonda arid tekislik, voha, tog‘ oldi va tog‘ biotoplarini qamrab olishini ko‘ rsatdi.*

Kalit so‘ zlar: *Semenoviana plotnikovi; Tettigoniidae; Orthoptera; Markaziy O‘ zbekiston; tarqalish; biotop; tog‘ oldi hududlari; faunistika.*

РАСПРОСТРАНЕНИЕ И ЭКОЛОГИЯ *SEMENOVIANA PLOTNIKOVI* (UVAROV, 1914) В ЦЕНТРАЛЬНОМ УЗБЕКИСТАНЕ

Аннотация. *Semenoviana plotnikovi (Uvarov, 1914) — представитель семейства Tettigoniidae, характерный для фауны Центральной Азии; его распространение и биотопические связи в Центральном Узбекистане ранее не были обобщены на видовом уровне. Цель исследования — систематизировать авторские полевые данные из Караулбазара (Бухарская область), Кызылтепы (Навоийская область), Ургута (Самаркандская область), Заамина и Нуратинского государственного заповедника (Джизакская область), а также оценить региональную встречаемость и экологический диапазон вида. На основных учетных пунктах применяли стандартный протокол: трансекта 50 × 2 м, 60 минут активного наблюдения и 100 взмахов энтомологическим сачком. В пяти пунктах Центрального Узбекистана зарегистрировано 76 особей: в Нурате — 24, Ургуте — 22, Заамине — 20, Караулбазаре и Кызылтепе — по 5. Среди них отмечено 45 самок и 31 самец. Данные о 45 особях из Ферганской долины и Наманганской области, а также одна фоторегистрация из Арсланбоба использованы только для регионального сравнения. Результаты показывают, что вид встречается в аридно-равнинных, оазисных, предгорных и горных биотопах, однако единичные учеты не позволяют трактовать различия как устойчивые показатели плотности популяции.*

Ключевые слова: *Semenoviana plotnikovi; Tettigoniidae; Orthoptera; Центральный Узбекистан; распространение; биотоп; предгорные территории; фаунистика.*

DISTRIBUTION AND ECOLOGY OF *SEMENOVIANA PLOTNIKOVI* (UVAROV, 1914) IN CENTRAL UZBEKISTAN

Abstract. *Semenoviana plotnikovi (Uvarov, 1914) is a member of Tettigoniidae characteristic of the Central Asian fauna, but its distribution and biotope associations in Central Uzbekistan have not previously been synthesized at the species level. This study aimed to systematize the author’s field records from Qorovulbozor (Bukhara Region), Qiziltepa (Navoiy Region), Urgut (Samarkand Region), and Zomin and the Nurota State Nature Reserve (Jizzakh Region), and to assess the species’ regional occurrence and ecological range. A standardized protocol consisting of a 50 × 2 m transect, 60 minutes of active observation, and 100 sweep-net strokes was applied at the principal survey sites. In total, 76 individuals were recorded at five sites in Central Uzbekistan: 24 in*

Nurota, 22 in Urgut, 20 in Zomin, and five each in Qorovulbozor and Qiziltepa. The sample comprised 45 females and 31 males. Records of 45 individuals from the Fergana Valley and Namangan Region, together with one photographic record from Arslanbob, were used only for regional comparison. The findings indicate occurrence across arid plains, oases, foothills, and mountain biotopes; however, single-visit counts should not be interpreted as stable estimates of population density.

Key words: *Semenoviana plotnikovi; Tettigoniidae; Orthoptera; Central Uzbekistan; distribution; biotope; foothills; faunistics.*

KIRISH

To‘ g‘ riqanotlilar (Orthoptera) quruqlik ekotizimlarida o‘ simlik qoplami, mikroiqlim va landshaft tuzilishiga sezgir bo‘ lgan muhim faunistik komponentdir. Ensifera tarkibidagi Tettigoniidae vakillarining hududiy qaydlarini aniq koordinata, sana va tekshiriladigan dalil bilan hujjatlashtirish mintaqaviy faunani yangilash, areal chegaralarini aniqlashtirish va monitoring nuqtalarini belgilash uchun zarur [1, 10–15].

Mazkur bo‘ shliq uch ilmiy savolni yuzaga keltiradi: (1) standart hisoblar turning Markaziy O‘ zbekistondagi tarqalishini qanday tavsiflaydi; (2) qayd sonlari arid tekislik, voha, tog‘ oldi va tog‘ biotoplari bo‘ yicha qanday farqlanadi; (3) Farg‘ ona vodiysi, Namangan va Arslonbob qaydlari asosiy natijalar bilan qanday qiyoslanadi? Tadqiqotning maqsadi — muallifning Qorovulbozor, Qiziltepa, Urgut, Zomin va Nurota bo‘ yicha dala natijalarini tur darajasida yaxlit tahlil qilish, nomenklaturaviy maqomni aniqlashtirish va qolgan hududiy qaydlardan faqat qiyosiy kontekst sifatida foydalanish.

ADABIYOTLAR TAHLILI

Semenoviana plotnikovi dastlab B.P. Uvarov tomonidan 1914-yilda *Platycleis plotnikovi* nomi bilan tavsiflangan [2]. Orthoptera Species File bazasida amalda qabul qilingan kombinatsiya *Semenoviana plotnikovi* (Uvarov, 1914) shaklida beriladi; urg‘ ochi golotip Toshkentdan bo‘ lib, Rossiya Fanlar akademiyasi Zoologiya institutida saqlanadi [1]. Zeuner 1941-yilda Semenoviana guruhining taksonomik holatini qayta ko‘ rib chiqqan [3, 4]. Shu sababli ayrim ikkilamchi manbalardagi “Uvarov, 1941” yozuvi turning mualliflik sanasi emas, avlodning taksonomik qayta talqin qilingan davriga bog‘ liq xatodir.

Tur O‘ zbekiston va Janubiy Qozog‘ istondan ma’lum; tarixiy xo‘ jalik-entomologik ma’lumotlarda uning Qoratov yonbag‘ irlaridagi tau-sag‘ izning generativ qismlariga zarar yetkazgani qayd etilgan [5, 6]. Muallifning Markaziy O‘ zbekistonda olib borgan tadqiqotlari *S. plotnikovi*ning Buxoro, Navoiy, Samarqand va Jizzax hududlarida uchrashini hujjatlashtirgan [9, 10]. Farg‘ ona vodiysi va Namangan bo‘ yicha ma’lumotlar turning sharqiy hududlardagi tarqalishini qiyoslash imkonini beradi [8, 11, 16]. Biroq mazkur natijalar ilgari aynan *S. plotnikovi*ning hududiy tarqalishi, qayd soni va biotop doirasiga bag‘ ishlangan yagona tahlilda umumlashtirilmagan.

Mavjud adabiyotlarni qiyoslash turning o‘ rganilishida uch yo‘ nalish ustunligini ko‘ rsatadi. Birinchi yo‘ nalish nomenklatura va supragenerik tasnifga bag‘ ishlangan bo‘ lib, unda turning 1914-yildagi dastlabki tavsifi, keyingi kombinatsiyalari va Platycleidini tizimidagi o‘ rni aniqlashtirilgan [1–4]. Ikkinchi yo‘ nalish Janubiy Qozog‘ iston va Markaziy Osiyodagi xo‘ jalik-entomologik kuzatuvlarga tayangan; bu manbalarda turning ayrim o‘ simliklar bilan trofik aloqasi hamda arid landshaftlarda uchrashi qayd etilgan [5, 6]. Uchinchi yo‘ nalish O‘ zbekiston Orthoptera faunasining hududiy tarkibi va ekologik guruhlanishini yoritadi [7–16]. Biroq ushbu ishlarning aksariyati ko‘ p turli faunistik majmualarga bag‘ ishlanganligi sababli *S. plotnikovi*ning alohida tur sifatidagi hududiy son ko‘ rsatkichlari, jinsiy tarkibi va biotoplar bo‘ yicha qaydlari yagona standartda taqqoslanmagan.

Shu jihatdan mazkur tadqiqot avvalgi manbalarni takrorlamaydi, balki mualliflik dala qaydlarini bir tur kesimida qayta tizimlashtiradi. Tarixiy va zamonaviy manbalar turning areali uchun umumiy biogeografik fonni beradi, standartlashtirilgan mualliflik hisoblari esa Markaziy O‘ zbekiston nuqtalarini bir xil kuzatuv birligi asosida tavsiflash imkonini yaratadi. Farg‘ ona vodiysi, Namangan va Arslonbob ma’lumotlari asosiy tanlanmaga aralashtirilmay, tashqi qiyosiy qatlam sifatida ishlatilgani tahlilning hududiy chegaralarini aniq saqlaydi. Bunday ajratish tur tarqalishining geografik ko‘ lamini ko‘ rsatish bilan birga, turli metod va sanalarda olingan qaydlarni statistik jihatdan tenglashtirib yuborish xavfini kamaytiradi.

TADQIQOT METODOLOGIYASI

Tadqiqot dizayni, mualliflik materiallari va manbalarni tanlash

Tadqiqotning birlamchi ilmiy asosini muallifning Markaziy O‘ zbekiston ortopterofaunasi bo‘ yicha dala va kolleksiya izlanishlari tashkil etdi [9, 10]. Asosiy hududiy blok Buxoro viloyatining Qorovulbozor tumani, Navoiy viloyatining Qiziltepa tumani, Jizzax viloyatining Forish tumanidagi Nurota davlat qo‘ riqxonasi [18], Samarqand viloyatining Urgut tumani, Jizzax viloyatining Zomin milliy tabiat bog‘ idagi nuqtalarni qamrab oldi. Farg‘ ona viloyatining Yozyovon, Andijon viloyatining Xo‘ jaobod va Namangan viloyatining Pop tumanlaridagi qaydlar hududiy

qiyoslash guruhiga ajratildi [8, 11, 16]. Arslonbob fotoqaydi esa alohida transchegaraviy qiyosiy ma’lumot sifatida qaraldi.

O‘ zbekistondagi har bir dala hisobida 50 × 2 m transekt, 60 daqiqalik faol kuzatuv va 100 sweep-net zarbasidan iborat bir xil protokol qo‘ llangan [7, 17]. Har bir qayd uchun hudud, sana, koordinata, balandlik, jami individlar soni, jins yoki rivojlanish bosqichi, dalil turi va manba ajratildi. Qiziltepadagi barcha 5 imago jins bo‘ yicha aniqlangan: 3♀ va 2♂. Koordinatalar jadvalda standart daraja–daqiqa–soniya (DMS) shaklida berildi; manbada balandligi ko‘ rsatilmagan nuqtalar uchun qiymat taxminan tiklanmadi.

Qo‘ shimcha qiyosiy fotoqayd: Arslonbob

O‘ zbekiston materiallarining tog‘ sharoitidagi qaydlar bilan qiyoslanishi uchun 2026-yil 31-iyul kuni Qirg‘ iziston Respublikasi, Jalolobod viloyati, Bozorqo‘ rg‘ on tumani, Arslonbob atrofidagi Qorot tomonida olingan fotoqayd ham tahlilga kiritildi. Bitta individ soat 11:50 da 41.343125° N, 72.873408° E koordinatada, 1883 m balandlikda va 28 °C haroratda kuzatilgan. Bu qayd asosiy dala tanlanmasining qismi emas, balki turning baland tog‘ -o‘ rmon cheti sharoitida uchrashini ko‘ rsatuvchi qo‘ shimcha taqqoslovchi ma’lumotdir.

Fotoqayd tog‘ yonbag‘ ridagi daraxt-buta va zich o‘ t qoplami mavjud o‘ rmon cheti mikrobiotopida olingan. Individ qo‘ lda ushlab suratga olingani sababli fon o‘ simliklari oziqa o‘ simligi sifatida talqin qilinmadi; boshqa davlat hududida kuzatilgani uchun kolleksiya namunasi olinmadi. Fotosurat Andijon davlat universiteti tadqiqotchisi Turdiyev Zafarbek Salohiddin o‘ g‘ li tomonidan olingan va undan ilmiy foydalanishga ruxsat berilgan. Identifikatsiya Nukus davlat universiteti professori M.J. Medetov tomonidan foto asosida tasdiqlangan.

Identifikatsiya va tahlil chegaralari

Nomenklatura Orthoptera Species File bo‘ yicha tekshirildi [1]. Arslonbob materiali kolleksiya va voucher katalog raqamiga ega bo‘ lmagani uchun u specimen record emas, ekspert tomonidan tasdiqlangan photographic occurrence sifatida qaraldi. Fotoqaydning daliliy maqomi, namuna olinmagani va meteorologik o‘ zgaruvchilarning to‘ liq o‘ lchanmagani natijalar hamda muhokamada ochiq cheklov sifatida ko‘ rsatildi.

O‘ zbekistondagi qaydlar bir xil hisob protokolida olingani sababli har bir nuqtada qayd etilgan individlar soni tavsifiy ravishda qiyoslandi. Markaziy O‘ zbekistonning beshta nuqtasi asosiy guruh, Yozyovon, Xo‘ jaobod va Pop esa qiyosiy guruh sifatida tahlil qilindi. Jami, jins va rivojlanish bosqichi bo‘ yicha arifmetik yig‘ indilar tekshirildi. Biroq har bir nuqta faqat bitta sana va bitta hisob bilan ifodalanganligi sababli dispersiya, ishonch oralig‘ i va statistik ahamiyatlilik hisoblanmadi; qayd sonlari populyatsiya zichligining ko‘ p yillik barqaror bahosi sifatida talqin qilinmadi.

Tahlil birligi sifatida har bir hududdagi bitta standart hisob qabul qilindi. Foiz ulushlari asosiy Markaziy O‘ zbekiston guruhidagi 76 individga nisbatan hisoblandi; qiyosiy guruhdagi 45 individ va Arslonbob fotoqaydi bu maxrajga kiritilmadi. Tog‘ oldi–tog‘ guruhi Urgut, Zomin va Nurota, arid-tekislik guruhi esa Qorovulbozor va Qiziltepa qaydlaridan shakllantirildi. Hisoblar soni har bir hudud uchun bittadan bo‘ lgani sababli o‘ rtacha qiymatlar faqat tavsifiy ko‘ rsatkich sifatida berildi. Jinslar yig‘ indisi alohida tekshirildi: asosiy guruhda 45 urg‘ ochi + 31 erkak = 76 imago; qiyosiy guruhda 23 urg‘ ochi + 14 erkak + 8 nimfa = 45 individ. Bu nazorat jadval, diagramma va matndagi sonlarning o‘ zaro mosligini ta’minladi.

NATIJALAR VA ULARNING TAHLILI

Taksonomik holat

Qabul qilingan nom — *Semenoviana plotnikovi* (Uvarov, 1914); bazionimi — *Platycleis plotnikovi* Uvarov, 1914 [1, 2]. Tur Tettigoniidae oilasi Tettigoniinae kenja oilasiga mansub. Shuning uchun maqola sarlavhasi, jadval va rasm izohlarida “Uvarov, 1914” shakli izchil qo‘ llandi.

Markaziy O‘ zbekistondagi asosiy qaydlar

Markaziy O‘ zbekistonning beshta asosiy nuqtasida jami 76 individ qayd etildi (1-jadval; 1-rasm). Eng ko‘ p qayd Nurota davlat qo‘ riqxonasida — 24 individ (31,6%), keyin Urgutda — 22 (28,9%) va Zomin milliy tabiat bog‘ ida — 20 individ (26,3%) kuzatildi. Qorovulbozor va Qiziltepada 5 tadan individ (har biri 6,6%) qayd etildi. Asosiy guruhda 45 urg‘ ochi (59,2%) va 31 erkak (40,8%) mavjud. Farg‘ ona vodiysi va Namangan qiyosiy guruhida jami 45 individ qayd etilgan: Yozyovonda 15, Xo‘ jaobodda 13 va Popda 17 individ. Arslonbobdagi bitta imago O‘ zbekiston dala hisoblari yig‘ indisiga qo‘ shilmadi.

1-jadval. *Semenoviana plotnikovi* (Uvarov, 1914)ning Markaziy O‘ zbekistondagi asosiy qaydlari va hududiy qiyoslash uchun keltirilgan qo‘ shimcha ma’lumotlar. O‘ zbekistondagi dala qaydlari 50 × 2 m transekt, 60 daqiqalik kuzatuv va 100 sweep-net zarbasi asosida olingan.

Arslonbob–Qorot, Qirg‘ iziston	31.07. 2026	41.343125° N; 72.873408° E; 1883 m	1	Imago; jins ehtiyotkor talqin qilinadi	Qo‘ shimcha qiyosiy fotoqayd; specimen olinmagan	Ushbu tadqiqot

1-rasm. *Semenoviana plotnikovi* (Uvarov, 1914) qaydlarining hududlar bo‘ yicha taqsimlanishi. Yashil ustunlar Markaziy O‘ zbekistonning asosiy tadqiqot nuqtalarini, kulrang ustunlar hududiy qiyosiy guruhni ko‘ rsatadi.

Diagrammada Nurota (24), Urgut (22) va Zomin (20) nuqtalaridagi qaydlar Qorovulbozor va Qiziltepadagi ko‘ rsatkichlardan (5 tadan) ancha yuqori ekani yaqqol ko‘ rinadi. Bu natija turning mazkur hisoblar doirasida tog‘ oldi–tog‘ hududlarida ko‘ proq qayd etilganini tasviriy jihatdan tasdiqlaydi; qiyosiy guruhdagi Pop (17), Yozyovon (15) va Xo‘ jaobod (13) ko‘ rsatkichlari oraliq o‘ rin egallaydi.

Arslonbob qaydining taqqoslashdagi o‘ rni

Arslonbobda foto orqali qayd etilgan bitta imago (2-rasm) O‘ zbekistondagi 121 individlik dala hisoblari yig‘ indisiga qo‘ shilmadi. Uning ilmiy vazifasi Urgut, Zomin, Nurota va Pop kabi tog‘ oldi-tog‘ qaydlari bilan ekologik qiyoslash doirasini kengaytirishdan iborat. Koordinata, sana-vaqt, balandlik, asl foto va ekspert tasdig‘ i qaydni tekshiriladigan qiladi, biroq voucher yo‘ qligi sababli u morfometrik yoki genetik xulosalar uchun asos bo‘ la olmaydi.

2-rasm. Arslonbob–Qorot hududida fotoqayd qilingan *Semenoviana plotnikovi* (Uvarov, 1914). 41.343125° N, 72.873408° E; 1883 m; 31.07.2026, 11:50. Foto: Turdiyev Zafarbek Salohiddin o‘ g‘ li, Andijon davlat universiteti; ruxsat bilan foydalanildi.

Markaziy O‘ zbekiston qaydlarining mavsumiy va ekologik diapazoni

Markaziy O‘ zbekistonning asosiy qaydlari 7-iyundan 24-avgustgacha bo‘ lgan davrni qamrab oldi. Qorovulbozor, Qiziltepa, Urgut va Nurota qaydlari iyun oyiga, Zomin qaydi esa avgust oxiriga to‘ g‘ ri keladi. Urgut, Zomin va Nurotadan iborat tog‘ oldi–tog‘ guruhida jami 66 individ, ya’ni asosiy tanlanmaning 86,8% i qayd etildi; bir nuqtaga o‘ rtacha 22 individ to‘ g‘ ri keldi. Qorovulbozor va Qiziltepadan iborat arid-tekislik guruhida jami 10 individ (13,2%), bir nuqtaga o‘ rtacha 5 individ qayd etildi. Demak, mazkur bir martalik standart hisoblar doirasida tog‘ oldi–tog‘ nuqtalaridagi o‘ rtacha qayd soni arid-tekislik nuqtalariga nisbatan 4,4 marta yuqori bo‘ lgan. Biroq bu farq takroriy hisoblar bilan tasdiqlanmagani sababli biotopning sababiy ta’siri yoki doimiy populyatsiya zichligi farqi deb talqin qilinmaydi. Yozyovon, Xo‘ jaobod va Pop qaydlari sharqiy O‘ zbekiston bilan hududiy qiyoslash uchun keltirildi; Arslonbobdagi 1883 m fotoqayd esa qo‘ shimcha transchegaraviy tog‘ kuzatuvidir.

Markaziy O‘ zbekistonning beshta hisobida 76 imago qayd etilgan: 45 urg‘ ochi (59,2%) va 31 erkak (40,8%). Qiyosiy O‘ zbekiston guruhida 45 individ mavjud bo‘ lib, ulardan 23 tasi urg‘ ochi, 14 tasi erkak va 8 tasi nimfa. Barcha sakkizta O‘ zbekiston nuqtasi bo‘ yicha jami 121 individ qayd etilgan: 68 urg‘ ochi, 45 erkak va 8 nimfa. Turli sana va yillardagi bir martalik hisoblar sababli jinsiy tarkib haqiqiy populyatsion nisbat sifatida talqin qilinmadi.

Natijalarni muhokama qilish

Mualliflik natijalarining biogeografik ahamiyati

*S. plotnikovi*ning O‘ zbekiston va Janubiy Qozog‘ istonda ma’lum bo‘ lishi taksonomik va xo‘ jalik-entomologik manbalarda ko‘ rsatilgan [1, 5, 6]. Mazkur ishning markaziy natijasi turning Markaziy O‘ zbekistondagi beshta standart hisob nuqtasini yagona tur darajasidagi tahlilda birlashtirishidir. Nurota, Urgut va Zominda 20–24 individ, Qorovulbozor va Qiziltepada esa 5 tadan individ qayd etilishi hududiy uchrash darajasining bir xil emasligini ko‘ rsatdi. Shu bilan birga, nuqtalar turli sana va yillarda bir martadan tekshirilganligi sababli kuzatilgan farqni faqat landshaft omili bilan izohlash mumkin emas. Ishning asosiy yangiligi muallifning Markaziy O‘ zbekiston bo‘ yicha standart protokolda olingan ma’lumotlarini bitta tur kesimida qayta tahlil qilish va ularni sharqiy hamda transchegaraviy qaydlar bilan aniq ajratilgan holda qiyoslashdadir.

Arslonbob fotoqaydi ushbu O‘ zbekiston markazli xulosaga qo‘ shimcha hududiy kontekst beradi: u turning Farg‘ ona tizimiga tutash tog‘ -o‘ rmon cheti sharoitida ham uchrash ehtimolini ko‘ rsatadi. Biroq u yagona individga asoslangan, voucher bilan mustahkamlanmagan va standart O‘ zbekiston dala protokolining davomi emas. Shu sababli bu qayd Qirg‘ iziston uchun birinchi mamlakat qaydi yoki maqolaning mustaqil bosh yangiligi sifatida emas, balki asosiy natijalarni ehtiyotkor qiyoslashga xizmat qiluvchi ekspert-tasdiqlangan fotoqayd sifatida baholandi.

Ekologik talqin

Turga nisbatan o‘ simlikxo‘ r xortobiont talqini Markaziy Osiyo Orthoptera ekologik tasniflari bilan mos keladi [12–15]. Tarixiy Qoratov ma’lumotlarida tau-sag‘ izning to‘ pgul, g‘ uncha va urug‘ qutichalaridan oziqlanish qayd

etilgan [6]. Ammo bunday trofik bog‘ lanishni O‘ zbekiston yoki Arslonbobdagi barcha populyatsiyalarga ko‘ chirish mumkin emas. Arslonbob individi qo‘ lda fotoqayd qilingan; uning fonidagi o‘ simliklar oziqa o‘ simligi ekanini isbotlamaydi.

Standart hisoblarda turning voha va arid tekisliklardan 1062 m balandlikdagi Urgut hamda tog‘ -tog‘ oldi hududlarigacha qayd etilishi ekologik diapazonining kengligini ko‘ rsatadi. Nurota nuqtasi 870 m, Qorovulbozor esa 191 m balandlikda joylashgan; Arslonbobdagi 1883 m fotoqayd faqat qo‘ shimcha qiyosiy kontekst beradi. O‘ simlik qoplami, namlik, ekspozitsiya va tuproq harorati barcha nuqtalarda bir xil miqdoriy o‘ lchanmagani sababli balandlik yoki landshaft qayd sonidagi farqning bevosita sababi deb xulosa qilinmadi.

Kuzatilgan 4,4 martalik tavsifiy farqni ehtiyotkor talqin qilish zarur. Bir tomondan, tog‘ oldi va tog‘ nuqtalarida murakkab o‘ simlik qoplami, mikrorelyef hamda namlik mozaikasi xortobiont Tettigoniidae vakillari uchun ko‘ proq mikrobiotop yaratishi mumkin [12–15]. Ikkinchi tomondan, hisob sanalari, fenologik bosqich va yillar bir xil emasligi kuzatilgan sonlarga ta’sir qilishi ehtimol. Shu bois natija turning tog‘ oldi–tog‘ hududlarida ko‘ proq qayd etilganini ko‘ rsatadi, ammo ushbu farqni yashash muhitini tanlash yoki doimiy zichlikning qat’iy isboti sifatida qabul qilish mumkin emas. Tadqiqotning kuchli tomoni — protokol va hisob birliklarining ochiq berilgani; asosiy cheklovi esa hududlar bo‘ yicha takroriy hisoblarning yo‘ qligidir.

Tadqiqot cheklovlari va tekshiriladigan keyingi qadamlar

Tadqiqotning uch asosiy cheklovi mavjud. Birinchidan, hisob protokoli bir xil bo‘ lsa-da, har bir nuqta bitta sana va ayrim hollarda turli yil bilan ifodalangan; shu sababli mavsumlararo va yillararo o‘ zgaruvchanlik baholanmadi. Ikkinchidan, ayrim nuqtalarda balandlik yoki mikrobiotopning miqdoriy tavsifi yetishmaydi. Uchinchidan, Arslonbob ma’lumoti voucher emas, faqat photographic occurrence bo‘ lib, O‘ zbekistonning standart dala hisoblaridan alohida qiyosiy dalil sifatida qaralishi kerak. Salbiy kuzatuv nuqtalari hujjatlashtirilmagani uchun occupancy yoki ekologik niche modeli qurilmadi.

Keyingi monitoringda may–sentabr oylarida kamida oyiga ikki marta 50 × 2 m transekt, 60 daqiqalik faol kuzatuv va 100 sweep-net zarbasi qo‘ llanishi tavsiya etiladi. Har bir qaydda GPS, balandlik, vaqt, havo va tuproq harorati, nisbiy namlik, o‘ simlik qoplami, asosiy o‘ simlik turlari, jins, bosqich, jami kuzatuv va voucherlar soni alohida qayd qilinishi kerak. Qirg‘ iziston hududidagi keyingi ishlar mahalliy ruxsatlar asosida voucher olish va kataloglashtirishni ko‘ zda tutishi lozim.

XULOSALAR

*Semenoviana plotnikovi*ning to‘ g‘ ri nomenklaturaviy nomi *Semenoviana plotnikovi* (Uvarov, 1914) bo‘ lib, “Uvarov, 1941” varianti turning dastlabki tavsif sanasini noto‘ g‘ ri ifodalaydi. Standart protokol asosidagi beshta Markaziy O‘ zbekiston hisobida jami 76 individ qayd etildi. Shundan 66 tasi (86,8%) Urgut, Zomin va Nurota tog‘ oldi–tog‘ nuqtalariga, 10 tasi (13,2%) Qorovulbozor va Qiziltepa arid-tekislik nuqtalariga to‘ g‘ ri keldi. Bir nuqtaga o‘ rtacha qayd soni tog‘ oldi–tog‘ guruhida 22 ta, arid-tekislik guruhida 5 ta bo‘ lib, kuzatilgan farq 4,4 martani tashkil etdi. Natijalar turning Markaziy O‘ zbekistonda tog‘ oldi hududlarida ko‘ proq qayd etilganini ko‘ rsatadi, ammo bir martalik hisoblar sababli bu tendensiya barqaror populyatsiya zichligi farqi deb baholanmadi. Farg‘ ona vodiysi va Namangandagi jami 45 individ hududiy qiyoslash, Arslonbobdagi bitta fotoqayd esa qo‘ shimcha transchegaraviy ekologik kontekst sifatida talqin qilindi. Takroriy standart monitoring aniqlangan tendensiyani tekshirishi lozim.

Foydalanilgan adabiyotlar

Аннотация: *Цель исследования данного работа оценить влияние фитохимически стандартизированной скутелларин-содержащей фракции (Skutellarin), полученной из надземных частей Inula salicina L., на основные параметры коагуляционного гемостаза плазма крови крыс в условиях in vitro. В исследовании использовали Skutellarin, стандартизированную по содержанию скутелларина, а также плазму препараты крыс. Оценивали тромбиновое время (ТВ), время рекальцификации плазмы, активированное частичное тромбопластиновое время (АЧТВ), протромбиновое время (ПВ). Skutellarin вызывала дозозависимое увеличение времени свертывания в исследованных тестах, включая ТВ, время рекальцификации, АЧТВ и ПВ, что указывает на выраженный гипокоагулянтный эффект in vitro. Полученные данные подтверждают наличие комплексного влияния Skutellarin на плазменные и клеточные звенья гемостаза.*

Ключевые слова: *гемостаз, коагуляция, тромбин, АЧТВ, протромбиновое время, тромбоциты, скутелларин, Skutellarin, Inula salicina.*

IN VITRO SHAROITIDA KALAMUSH QONI PLAZMASI KOAGULYATSION GEMOSTAZIGA SKUTELLARIN FLAVONOIDINING TA’SIRI

Annotatsiya: *Mazkur tadqiqotning maqsadi Inula salicina L. o‘ simligining yer ustki qismlaridan olingan, fitokimyoviy jihatdan standartlashtirilgan skutellarin saqlovchi fraksiyaning (Skutellarin) in vitro sharoitida kalamushlar qon plazmasining koagulyatsion gemostazining asosiy ko‘ rsatkichlariga ta’sirini baholashdan iborat. Tadqiqotda skutellarin miqdori bo‘ yicha standartlashtirilgan Skutellarin hamda kalamushlarning qon plazmasi va trombotsit preparatlaridan foydalanildi. Trombin vaqti (TV), plazmani rekalsifikatsiya qilish vaqti, faollashtirilgan qisman tromboplastin vaqti (QFTV) hamda protrombin vaqti (PV) baholandi. Skutellarin o‘ rganilgan testlarning barchasida, jumladan TV, plazmani rekalsifikatsiya qilish vaqti, QFTV va PV bo‘ yicha ivish vaqtining dozaga bog‘ liq ravishda uzayishiga olib keldi. Mazkur natijalar birikmaning in vitro sharoitida yaqqol gipokoagulyant ta’sirga ega ekanligini ko‘ rsatadi. Olingan ma’lumotlar Skutellarinning gemostazning plazmatik va hujayraviy bo‘ g‘ inlariga kompleks ta’sir ko‘ rsatishi mumkinligini tasdiqlaydi.*

Kalit so‘ zlar: *gemostaz, koagulyatsiya, trombin, QFTV, protrombin vaqti, trombotsitlar, skutellarin, Skutellarin, Inula salicina.*

IN VITRO EFFECT OF THE FLAVONOID SCUTELLARIN ON THE COAGULATION HEMOSTASIS OF RAT BLOOD PLASMA

Abstract: *The aim of this study was to evaluate the effect of a phytochemically standardized scutellarin-containing fraction (Scutellarin), obtained from the aerial parts of Inula salicina L., on the main parameters of coagulation hemostasis in rat blood plasma*

in vitro. The study used Scutellarin standardized for scutellarin content, as well as rat blood plasma and platelet preparations. Thrombin time (TT), plasma recalcification time, activated partial thromboplastin time (APTT), and prothrombin time (PT) were assessed. Scutellarin caused a dose-dependent prolongation of clotting time in all tests examined, including TT, plasma recalcification time, APTT, and PT, indicating a pronounced hypocoagulant effect in vitro. The obtained findings suggest that Scutellarin may exert a complex effect on both the plasma and cellular components of the hemostatic system.

Keywords: *hemostasis, coagulation, thrombin, APTT, prothrombin time, platelets, scutellarin, Scutellarin, Inula salicina.*

Введение

Система гемостаза представляет собой высокоорганизованный физиологический механизм, обеспечивающий поддержание целостности сосудистого русла и предотвращение кровопотери при повреждении сосудистой стенки. Избыточная или неконтролируемая активация гемостатических механизмов, напротив, может приводить к патологическому тромбообразованию и развитию тромботических осложнений. Тромбоэмболические состояния, включая ишемическую болезнь сердца, ишемический инсульт, глубокий венозный тромбоз и тромбоэмболию легочной артерии, относятся к основным причинам заболеваемости и смертности во всем мире; по эпидемиологическим оценкам, тромбоэмболические состояния в совокупности были связаны примерно с одной четвертью всех случаев смерти в мире в 2010 г. [1,2].

Современная концепция гемостаза существенно расширяет классическое представление о коагуляции как о линейном каскаде реакций. В соответствии с клеточно-ориентированной моделью гемостаза коагуляция реализуется как динамическое взаимодействие клеток и плазменных факторов и включает взаимоперекрывающиеся стадии инициации, амплификации и пропагации. Существенное значение при этом имеют тканевой фактор, активированные тромбоциты и клеточные поверхности, на которых формируются комплексы, обеспечивающие генерацию тромбина [3-5].

Тромбин занимает центральное положение в регуляции гемостаза, поскольку участвует в образовании фибрина и одновременно усиливает активацию тромбоцитов и последующее формирование тромба. Поэтому изменение образования или функциональной активности тромбина может отражаться сразу на нескольких звеньях гемостаза. Оценка коагуляционного состояния в экспериментальных условиях обычно включает исследование протромбинового времени, АЧТВ, тромбинового времени и других функциональных показателей, однако эти тесты характеризуют отдельные стороны коагуляционного процесса и не позволяют самостоятельно определить конкретную молекулярную мишень исследуемого соединения [3-5].

Необходимость поиска новых регуляторов гемостаза сохраняет актуальность вследствие ограничений существующих антитромботических подходов, включая риск кровотечений, лекарственные взаимодействия и необходимость мониторинга в ряде клинических ситуаций [6,7]. В связи с этим природные биологически активные соединения представляют интерес как потенциальные источники веществ, способных модулировать несколько взаимосвязанных звеньев гемостаза.

Особый интерес представляет скутелларин — флавоноид, входящий в состав ряда лекарственно значимых растительных фракций. Для оценки потенциальных антигемостатических свойств стандартизированных фракций необходим комплексный подход, включающий как плазменные коагуляционные тесты, так и исследование функции тромбоцитов. В литературе показано, что близкое по структуре соединение скутеллареин способно подавлять активацию и агрегацию тромбоцитов, однако молекулярные механизмы антиагрегационного действия флавоноидов могут быть различными и не должны выводиться только из результатов стандартных агрегометрических тестов [8-10].

Цель исследования

Оценить влияние Scutellarina на основные параметры коагуляционного гемостаза в плазме крови крыс *in vitro*, а также определить направления дальнейшего изучения механизма её действия.

Материалы и методы

Исследуемый материал и фитохимическая стандартизация

В исследовании использовали фитохимически стандартизированную скутелларин-содержащую фракцию (Skutellarin), выделенную из надземных частей растения Inula salicina L. Растительное сырьё было собрано в период цветения в районе Бурчимулла Бостанлыкского района Ташкентской области, подвергнуто ботанической идентификации и высушено в затенённых условиях.

3,0 кг высушенного сырья многократно экстрагировали 70%-ным этанолом при комнатной температуре. Объединённые экстракты концентрировали под вакуумом при 40 °C, после чего последовательно разделяли на гексановую, хлороформную, этилацетатную и n-бутанольную фракции. Этил ацетатную фракцию

дополнительно фракционировали на силикагелевой колонке с использованием градиентной системы CHCl3–MeOH.

Химический профиль Skutellarin характеризовали с использованием HPLC/UPLC/LC–MS и данных $^{1}H/^{13}C$-NMR. По данным количественного HPLC-анализа, фракция содержала 84,0% скутелларина, 6,0% апигенин-7-О-глюкуронида, 4,0% производных лютеолина и около 6,0% других флавоноидных и фенольных компонентов. Указанный состав использовали как критерий контроля качества и стандартизации исследуемой фракции. Поскольку Skutellarin представляет собой многокомпонентную стандартизированную фракцию, наблюдаемые биологические эффекты в настоящем исследовании следует относить к Skutellarin в целом, а не исключительно к чистому скутелларину.

Животные и экспериментальный дизайн

Исследование проводили на здоровых адаптированных самцах беспородных белых крыс массой 200–250 г. Животных содержали при температуре 22±2 °C в условиях 12-часового цикла свет/темнота при свободном доступе к стандартному корму и питьевой воде. Продолжительность адаптационного периода составляла не менее 7 суток.

Работа с лабораторными животными проводилась с учетом принципов ARRIVE 2.0 и концепции 3R [11]. Институциональное биоэтическое разрешение было оформлено протоколом №4 от 17 февраля 2026 года Института биофизики и биохимии при Национальном университете Узбекистана. Все экспериментальные процедуры выполнялись в соответствии с институциональными требованиями по содержанию, обращению и обеспечению надлежащих условий для лабораторных животных.

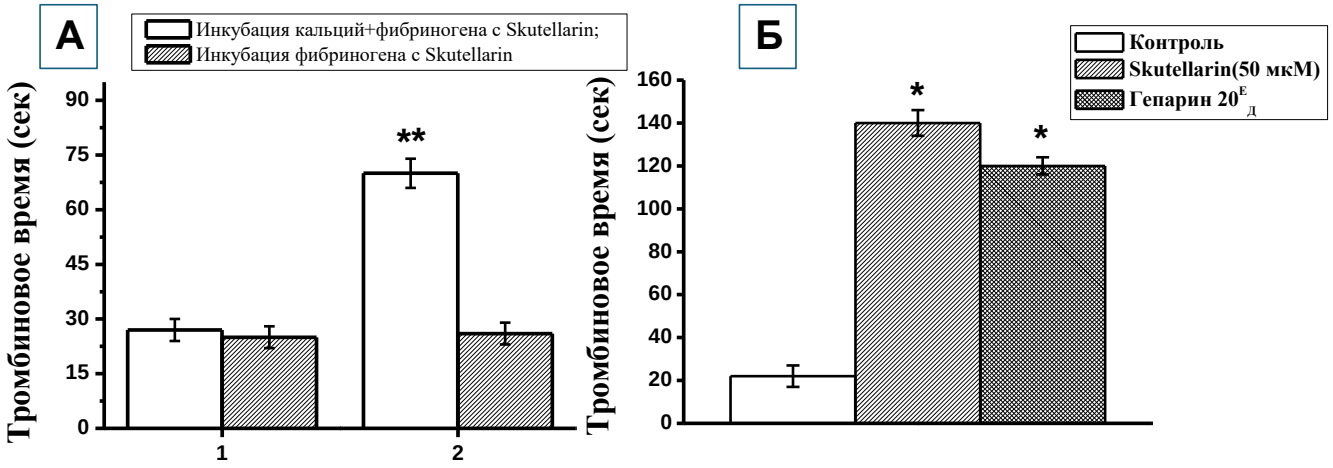
Выделение тромбоцитов

Для выделения тромбоцитов к крови добавляли 3,8%-ный раствор цитрата натрия в соотношении 1:9. Тромбоцитсодержащую плазму получали центрифугированием при 1150 об/мин в течение 15 мин. После этого тромбоцитсодержащую плазму дополнительно центрифугировали при 3000 об/мин в течение 10 мин. Полученную суспензию тромбоцитов переводили в рабочую среду следующего состава: NaCl - 150 мМ, KCl - 2,7 мМ, NaH2PO4 - 0,37 мМ, MgCl2 - 1 мМ, CaCl2 -1 мМ, глюкоза -5 мМ, HEPES-NaOH - 10 мМ, гепарин - 50 ЕД/мл, сывороточный альбумин - 0,35% и апираза - 0,15 мг/мл; pH среды составлял 6,5. Все процедуры выделения и последующего анализа проводили при комнатной температуре (+20…+24 °C). Оптическая агрегометрия как метод оценки агрегации тромбоцитов основана на изменении светопропускания суспензии тромбоцитов [12].

Коагуляционные тесты

В цитратной плазме определяли тромбиновое время (ТВ), время рекальцификации плазмы, протромбиновое время (ПВ) и активированное частичное тромбопластиновое время (АЧТВ) [13,14]. ПВ преимущественно отражает состояние внешнего и общего путей коагуляции, АЧТВ - внутреннего и общего путей, тогда как ТВ чувствительно к этапу превращения фибриногена в фибрин под действием тромбина и последующей полимеризации фибрина. Все коагуляционные исследования выполняли в соответствии с рекомендациями производителя с использованием одноканального коагулометра CYANCoag (Бельгия; модель CY003, №5400439).

Статистический анализ



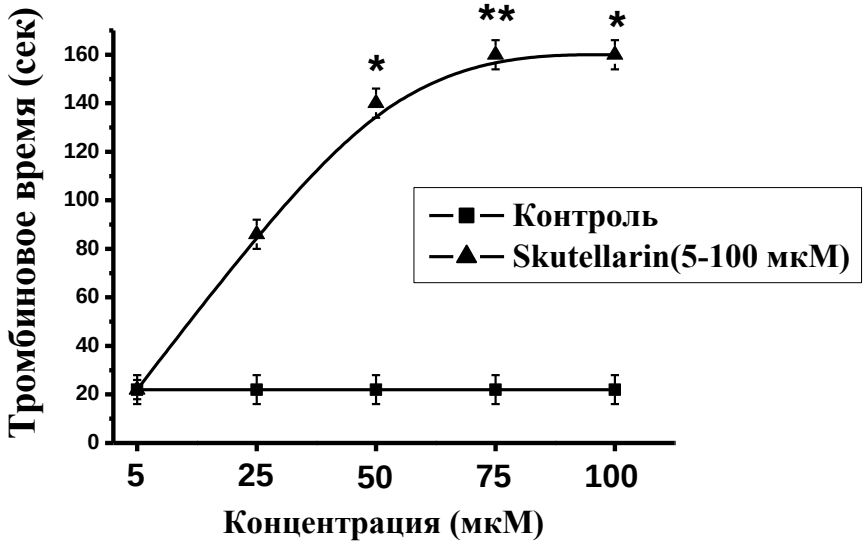
Полученные результаты были статистически обработаны с использованием специализированного программного пакета OriginPro 7.5 (OriginLab Corporation, США). Данные представлены в виде Mean ± SEM (среднее значение ± стандартная ошибка среднего). Статистически значимыми считали различия при $p < 0,05$. Для статистической обработки экспериментальных данных использовали однофакторный дисперсионный анализ (one-way ANOVA) с последующим применением критериев Dunnett или Tukey.

Результаты и их обсуждение

Влияние Skutellarin на тромбиновое время

Предыдущие исследования, проведённые нами, позволили установить некоторые механизмы ингибирующего действия различных биологически активных соединений, выделенных из местного растительного сырья, на суспензию кровяной плазмы и тромбоцитов крыс, а также на синаптосомальную суспензию головного мозга [15–24]. В настоящем исследовании целью проведённых экспериментов было оценить влияние флавоноидного соединения на систему гемостаза с использованием комплекса коагуляционных тестов.

В исследованиях на плазме крови крыс оценивали влияние различных концентраций Skutellarin на тромбиновое время. В контрольных образцах время образования сгустка после добавления тромбина составляло примерно 18–24 с. При концентрации Skutellarin 50 мкМ в одной из экспериментальных постановок выраженного удлинения ТВ не наблюдали, тогда как при предварительной инкубации фракции с плазмой в присутствии тромбина и кальция с последующим добавлением фибриногена отмечалось дозозависимое увеличение ТВ. При концентрации 50 мкМ ТВ возрастало до приблизительно 140 с (рис. 1 А, Б).

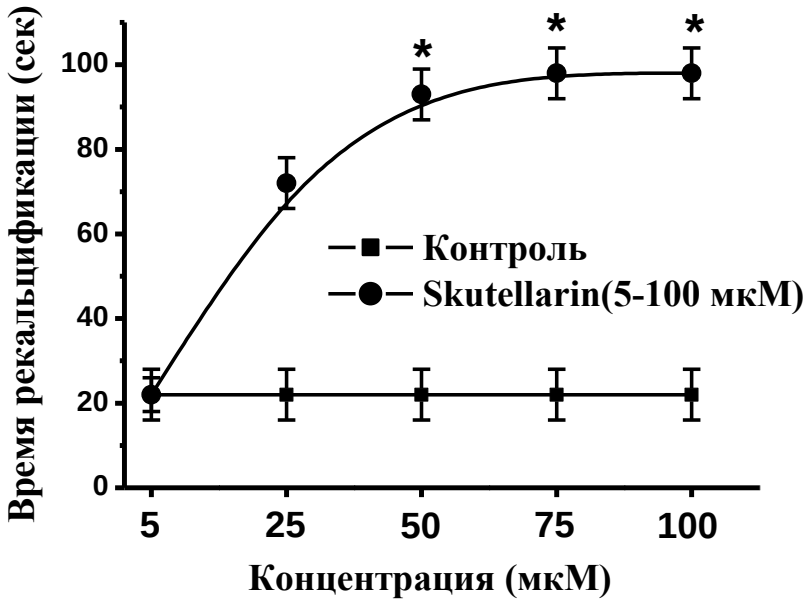


1. Рисунок. А) Влияние Skutellarina на тромбиновое время. 1 - Контроль; 2- Skutellarin (50 мкМ). Б) Исследование влияния Skutellarina на тромбиновое время. Показатель достоверности: * - P <0,05; (n = 6

Полученные данные указывают на влияние Skutellarin на конечный этап формирования фибринового сгустка. Однако изолированное удлинение ТВ не позволяет сделать вывод о прямом ингибировании превращения протромбина в тромбин. Для разграничения влияния на активность тромбина, функциональные свойства фибриногена и процессы полимеризации фибрина необходимы специализированные биохимические тесты.

Дозозависимое влияние Skutellarin на тромбиновое время

При исследовании диапазона концентраций 5–100 мкМ выявлялось дозозависимое удлинение ТВ, причем при 25 мкМ эффект был минимальным, а при повышении концентрации до 75–100 мкМ увеличение времени свертывания становилось более выраженным (рис. 2).

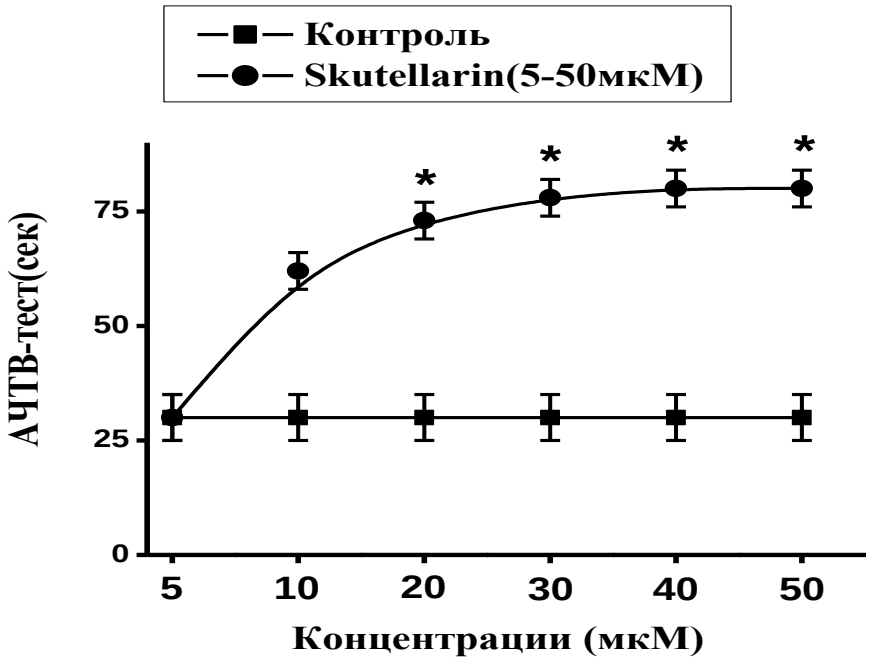


2. Рисунок. Исследование влияния Skutellarina в концентрациях (5-100 мкМ) на тромбиновое время. Показатель достоверности: * - P <0,05; ** - P <0.01; (n = 6).

Полученная зависимость указывает на наличие концентрационно-зависимого антикоагулянтного эффекта Skutellarin в использованной экспериментальной системе.

Влияние Skutellarin на время рекальцификации плазмы

Под действием Skutellarin в диапазоне 5–100 мкМ отмечалось удлинение времени рекальцификации плазмы (рис. 3). Выраженность эффекта увеличивалась по мере повышения концентрации исследуемой фракции.

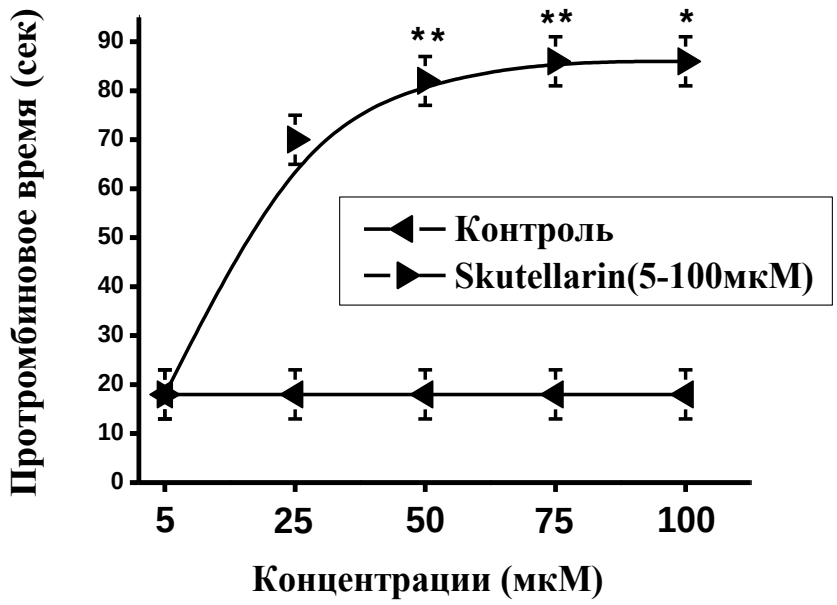


3. Рисунок. Влияние Skutellarina на активированное время рекальцификации плазмы. Показатель достоверности: * - P <0,05; (n = 6).

Полученные результаты свидетельствуют о снижении коагуляционного потенциала плазмы в условиях эксперимента. При этом изменение времени рекальцификации само по себе не позволяет установить конкретный фактор свертывания или белок-мишень.

Влияние Skutellarin на АЧТВ

Skutellarin в исследованном диапазоне (5-50 мкМ) концентраций вызывала дозозависимое удлинение АЧТВ (рис. 4). АЧТВ является интегральным функциональным тестом, чувствительным преимущественно к изменениям внутреннего и общего путей коагуляции.



4. Рисунок. Исследование влияния Skutellarina (5-50 мкМ) на АЧТВ-тест. Показатель достоверности: * - P <0,05; (n = 6).

Поэтому полученный эффект свидетельствует об изменении коагуляционного потенциала, но не позволяет определить конкретный фактор или молекулярную мишень Skutellarin без проведения фактор-специфических исследований.

Влияние Skutellarin на протромбиновое время

В диапазоне концентраций 5–100 мкМ Skutellarin вызывала дозозависимое удлинение ПВ; максимальное значение достигало приблизительно 85 с (рис. 5).

5. Рисунок. Влияние Skutellarina на протромбиновое время. Показатель достоверности: * - P <0,05; ** - P <0.01; (n = 6).

Удлинение ПВ свидетельствует о снижении коагуляционной активности внешнего и/или общего путей свертывания. Однако данный тест не позволяет определить, какой именно фактор свертывания является непосредственной мишенью действия исследуемой фракции.

Обсуждение

Совокупность результатов демонстрирует, что Skutellarin оказывает комплексное влияние на гемостатическую систему in vitro, затрагивая как плазменный компонент коагуляции, так и функцию тромбоцитов. Удлинение ТВ, времени рекальцификации, АЧТВ и ПВ указывает на снижение коагуляционного потенциала плазмы. Вместе с тем стандартные коагуляционные тесты являются интегральными и не позволяют самостоятельно локализовать действие исследуемой фракции на уровне конкретного фактора или фермента. Такое ограничение особенно важно для многокомпонентных растительных фракций, биологический эффект которых может определяться совокупным действием нескольких компонентов.

Полученное удлинение ТВ заслуживает отдельного внимания. Поскольку в тестовой системе конечный этап формирования сгустка оценивается после добавления экзогенного тромбина, повышение ТВ можно использовать как подавления превращения протромбина в тромбин. Удлинение АЧТВ и ПВ одновременно указывает на то, что эффект Skutellarin не ограничивается одним из путей коагуляции. Возможно, Skutellarin ингибирует одного из факторов IXa, Xa, XIa, XIIa, VII или II.

Заключение

Skutellarin оказывает выраженное гипокоагулянтное и антиагрегационное действие в использованной экспериментальной системе *in vitro*. Skutellarin дозозависимо увеличивает тромбиновое время, время рекальцификации, АЧТВ и протромбиновое время. Совокупность результатов свидетельствует о влиянии Skutellarin на плазменный компоненты система гемостаза. Полученные результаты создают научно обоснованную основу для дальнейшего изучения Skutellarina в качестве перспективного соединения для разработки новых антикоагулянтных лекарственных средств.

Annotatsiya: *Alsgeymer kasalligi (AK) amiloid-β (Aβ) to‘ planishi va patologik Tau o‘ zgarishlari bilan bir qatorda, erta sinaptik disfunksiya, glutamatergik neyrotransmissiya va kalsiy (Ca^{2+}) signalizatsiyasining buzilishi, mitoxondrial disfunksiya, oksidativ stress va neyroyallig‘ lanish bilan kechuvchi ko‘ p omilli neyrodegenerativ jarayondir. Ushbu obzorning maqsadi AK bilan bog‘ liq sinaptik disfunksiyada glutamatergik signalizatsiya va neyronal Ca^{2+} gomeostazining fiziologik ahamiyatini tizimlashtirish hamda polifenollarning ushbu jarayonlarni modulyatsiya qilish potentsialini baholashdan iborat. Fiziologik sharoitda AMPA va NMDA retseptorlari orqali nazoratlangan ion oqimlari, endoplazmatik retikulum va mitoxondriya bilan Ca^{2+} almashinuvi sinaptik plastiklik va neyron bioenergetikasini ta’ minlaydi. AK modellarida Aβ/Tau bilan bog‘ liq o‘ zgarishlar retseptor funksiyasi, organellalar o‘ rtasidagi Ca^{2+} almashinuvi va mitoxondrial metabolizmni izdan chiqarishi mumkin. Kalamush bosh miyasi sinaptosomalarida olingan mahalliy eksperimental ma’ lumotlar ayrim polifenollar L-glutamatga bog‘ liq Ca^{2+} javoblarini va NMDA/VGCC bilan bog‘ liq funksional jarayonlarni modulyatsiya qilishini ko‘ rsatadi. Biroq funksional Ca^{2+} o‘ zgarishlarini to‘ g‘ ridan-to‘ g‘ ri retseptor bog‘ lanishi yoki insonda terapevtik samara bilan tenglashtirish mumkin emas. Ca^{2+} disgomeostazi Aβ yoki Tau gipotezasining o‘ rnini bosuvchi emas, balki sinaptik, mitoxondrial va oksidativ mexanizmlarni o‘ zaro bog‘ lovchi muhim fiziologik-patofiziologik komponent sifatida qaralishi maqsadga muvofiq.*

Kalit so‘ zlar: *Alsgeymer kasalligi; sinaptik disfunksiya; glutamat; NMDA-retseptor; AMPA-retseptor; kalsiy gomeostazi; mitoxondriya; polifenollar; sinaptosoma.*

РОЛЬ КАЛЬЦИЕВОГО ГОМЕОСТАЗА И ГЛУТАМАТЕРГИЧЕСКОЙ СИГНАЛИЗАЦИИ В СИНАПТИЧЕСКОЙ ДИСФУНКЦИИ ПРИ БОЛЕЗНИ АЛЬЦГЕЙМЕРА: НЕЙРОПРОТЕКТОРНЫЙ ПОТЕНЦИАЛ ПОЛИФЕНОЛОВ

Аннотация: *Болезнь Альцгеймера (БА) представляет собой многофакторный нейродегенеративный процесс, протекающий наряду с накоплением амилоида-β (Aβ) и патологическими изменениями Tau, с ранней синаптической дисфункцией, нарушением глутаматергической нейротрансмиссии и кальциевой (Ca^{2+}) сигнализации, митохондриальной дисфункцией, оксидативным стрессом и нейровоспалением. Цель настоящего обзора — систематизировать физиологическое значение глутаматергической сигнализации и нейронального Ca^{2+} гомеостаза в синаптической дисфункции при БА, а также оценить потенциал полифенолов в модуляции данных процессов. В физиологических условиях контролируемые ионные потоки через AMPA- и NMDA-рецепторы, а также обмен Ca^{2+} с эндоплазматическим ретикулумом и митохондриями обеспечивают синаптическую пластичность и биоэнергетику нейрона. При моделях БА изменения, связанные с Aβ/Tau, могут нарушать функцию рецепторов, межорганелльный обмен Ca^{2+} и митохондриальный метаболизм. Локальные экспериментальные данные, полученные на синаптосомах головного мозга крыс, показывают, что отдельные полифенолы модулируют Ca^{2+}-ответы, связанные с L-глутаматом, и функциональные процессы, связанные с NMDA/VGCC. Однако функциональные изменения Ca^{2+} нельзя напрямую отождествлять со связыванием рецептора или терапевтическим эффектом у человека. Дисгомеостаз Ca^{2+} следует рассматривать не как замену амилоидной или Tau-гипотезы, а как важный физиолого-патофизиологический компонент, связывающий синаптические, митохондриальные и оксидативные механизмы.*

Ключевые слова: *болезнь Альцгеймера; синаптическая дисфункция; глутамат; NMDA-рецептор; AMPA-рецептор; кальциевый гомеостаз; митохондрия; полифенолы; синаптосома.*

CALCIUM HOMEOSTASIS AND GLUTAMATERGIC SIGNALING IN SYNAPTIC DYSFUNCTION IN ALZHEIMER'S DISEASE: NEUROPROTECTIVE POTENTIAL OF POLYPHENOLS

Annotation: *Alzheimer's disease (AD) is a multifactorial neurodegenerative process characterized, alongside amyloid-β (Aβ) accumulation and pathological Tau changes, by early synaptic dysfunction, disrupted glutamatergic neurotransmission and calcium (Ca^{2+}) signaling, mitochondrial dysfunction, oxidative stress, and neuroinflammation. This review aims to systematize the physiological relevance of glutamatergic signaling and neuronal Ca^{2+} homeostasis in AD-related synaptic dysfunction, and to evaluate the potential of polyphenols to modulate these processes. Under physiological conditions, controlled ion flux through AMPA and NMDA receptors, together with Ca^{2+} exchange with the endoplasmic reticulum and mitochondria, sustains synaptic plasticity and neuronal bioenergetics. In AD models, Aβ/Tau-related changes may disrupt receptor function, inter-organelle Ca^{2+} exchange, and mitochondrial metabolism. Local experimental data obtained on rat brain synaptosomes indicate that certain polyphenols modulate L-glutamate-dependent Ca^{2+} responses and NMDA/VGCC-related functional processes. However, functional Ca^{2+} changes cannot be directly equated with receptor binding or therapeutic efficacy in humans. Ca^{2+} dyshomeostasis should not be regarded as a substitute for the amyloid or Tau hypotheses, but as an important physiological–pathophysiological component linking synaptic, mitochondrial, and oxidative mechanisms.*

Key words: *Alzheimer's disease; synaptic dysfunction; glutamate; NMDA receptor; AMPA receptor; calcium homeostasis; mitochondria; polyphenols; synaptosome.*

Kirish

Alsgeymer kasalligi neyrodegenerativ kasalliklar orasida sinaptik funksiya va kognitiv jarayonlarning progressiv buzilishi bilan tavsiflanadi. Aβ va patologik Tau uning asosiy morfomolekulyar belgilari bo‘ lsa-da, zamonaviy qarashlar kasallikni bir yo‘ nalishli amiloid kaskad sifatida emas, balki sinaptik signalizatsiya, ion gomeostazi, organellalar funksiyasi, oksidativ stress va yallig‘ lanish o‘ zaro ta’ sir qiladigan tarmoq sifatida baholaydi [1–5].

Fiziolog nuqtai nazaridan sinaps AK patogenezini tushunish uchun qulay funksional darajadir. Neyromediator ajralishi, postsinaptik retseptorlar faolligi, membrana potensiali va Ca^{2+} signalining amplitudasi hamda davomiyligi sinaptik plastiklikni belgilaydi. Shu sabab glutamatergik signalizatsiya va Ca^{2+} gomeostazining buzilishi morfologik o‘ zgarishlar bilan funksional neyronal etishmovchilik o‘ rtasidagi muhim bog‘ lanishlardan biri hisoblanadi [6–10].

Ushbu obzor klinik davolash natijalarini emas, birinchi navbatda eksperimental neyrofiziologiyani markazga qo‘ yadi. Inson to‘ qimalari va klinik tadqiqotlardan olingan ma’ lumotlar eksperimental mexanizmlarni inson patofiziologiyasi bilan solishtirish va translyatsion chegaralarni belgilash uchun qo‘ llaniladi.

Tadqiqot metodologiyasi (adabiyotlarni tanlash tamoyillari)

Ushbu obzorda Alsgeymer kasalligida sinaptik disfunksiya, glutamatergik signalizatsiya va Ca^{2+} gomeostazining fiziologik mexanizmlarini yorituvchi ilmiy ishlarga ustuvorlik berildi. Asosiy e’ tibor eksperimental neyrofiziologik tadqiqotlar, jumladan sinaptosomalar, neyronal modellar, Ca^{2+} dinamikasini baholash va elektrofiziologik yondashuvlarga qaratildi. So‘ nggi yillardagi tadqiqotlar bilan bir qatorda AMPA/NMDA-retseptorlar, sinaptik plastiklik va Ca^{2+} signalizatsiyasi fiziologiyasini asoslovchi fundamental ishlar ham tahlil qilindi. Inson to‘ qimalariga oid tadqiqotlar eksperimental natijalarni inson patofiziologiyasi bilan qiyoslash maqsadida qo‘ llanildi.

Adabiyotlar tahlili

1. Aβ va Tau patologiyasi: sinaptik fiziologiya bilan bog‘ lanishi

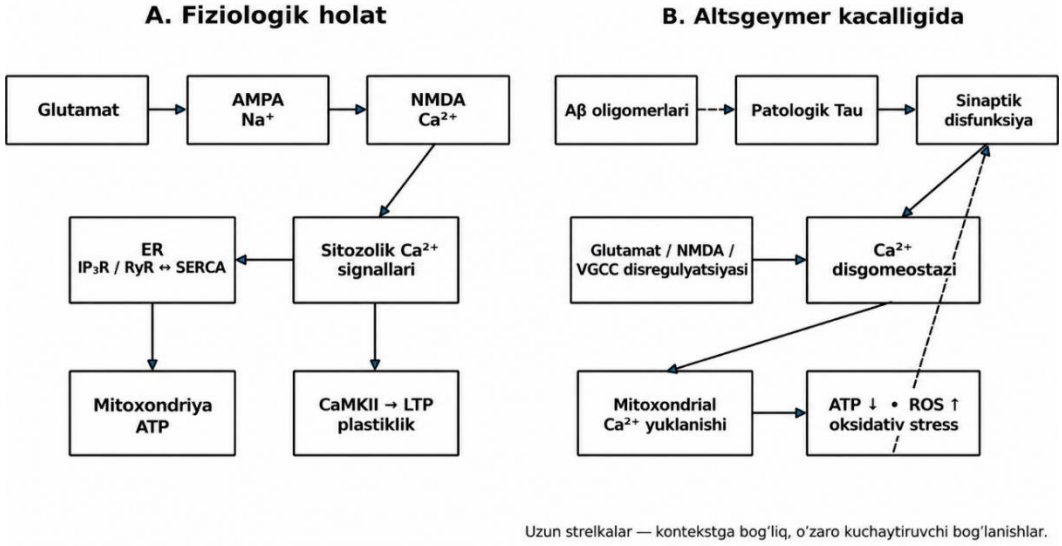
Amyloid precursor protein (APP) membrana oqsili bo‘ lib, β- va γ-sekretazalar ishtirokida amiloidogen yo‘ l bilan parchalanganda Aβ peptidlari hosil bo‘ ladi. Aβ42 agregatlanishga moyilroq; ayniqsa eruvchan Aβ oligomerlari sinaptik funksiyaga ta’ sir qiluvchi biologik faol shakllar sifatida qaraladi [11–14].

Tau normal sharoitda mikrotrubochkalarni barqarorlashtirish va aksonal transportni ta’ minlashda ishtirok etadi. Patologik fosforlanish va konformatsion o‘ zgarishlar Tauning mikrotrubochkalardan ajralishi, agregatlanishi va neyron ichi transport jarayonlarining buzilishi bilan bog‘ liq [15–17]. Aβ va Tauni bir-biriga qat’ iy ketma-ket sabab sifatida emas, sinaptik va hujayraviy signal yo‘ llarida o‘ zaro ta’ sir qiluvchi patologiyalar sifatida talqin qilish maqsadga muvofiq.

Aβ oligomerlari retseptor traffigi, membrana xususiyatlari va Ca^{2+} signalizatsiyasiga ta’ sir qilishi mumkin. Eksperimental modellarda Aβ ta’ siri NMDA va AMPA retseptorlari bilan bog‘ liq Ca^{2+} kirishi, sinaptik tarmoq holati va membrana mexanikasiga bog‘ liq ekani ko‘ rsatilgan [18–20]. Bu ma’ lumotlar Aβ →NMDA giperaktivatsiyasi kabi soddalashtirilgan modeldan ko‘ ra ko‘ p komponentli fiziologik yondashuvni qo‘ llab-quvvatlaydi.

2. Sinaptik disfunksiya va glutamatergik signalizatsiya

Glutamat markaziy asab tizimining asosiy qo‘ zg‘ atuvchi neyromediatori bo‘ lib, ionotrop AMPA, NMDA va kainate retseptorlari hamda metabotrop glutamat retseptorlari orqali ta’ sir qiladi. Tez qo‘ zg‘ atuvchi postsinaptik tokning katta qismi AMPA-retseptorlar bilan bog‘ liq. AMPA orqali Na^+ kirishi postsinaptik membranani depolyarizatsiya qilib, NMDA-retseptor kanalidagi potentsialga bog‘ liq Mg^{2+} blokini yengillashtiradi (1-jadval) [21–24].



NMDA-retseptor faollashishi uchun glutamat bilan bir qatorda glitsin yoki D-serin ko-agonisti va etarli depolyarizatsiya talab etiladi. Kanal ochilganda Na^+ va Ca^{2+} kirishi, K^+ chiqishi yuz beradi. Fiziologik Ca^{2+} signali CaMKII va boshqa signal kaskadlari orqali sinaptik plastiklik, LTP va xotira mexanizmlarida ishtirok etadi [25–28]. Shu sabab NMDA-retseptorni o‘ z-o‘ zidan “toksik retseptor” sifatida ta’ riflash noto‘ g‘ ri.

Patologik sharoitda signalning joyi, davomiyligi va retseptor subtipi ahamiyat kasb etadi. Sinaptik va ekstrasinaptik NMDAR signallari turlicha hujayraviy natijalar bilan bog‘ lanishi mumkin [29–31]. Inson AD miyasi bo‘ yicha sistematik obzor va meta-tahlil glutamatergik tizimda bir xil giperfunktsiya emas, balki miya hududiga bog‘ liq geterogen o‘ zgarishlar, jumladan ayrim hududlarda glutamat, qayta qamrab olish, GluA2/3 va GluN2B ko‘ rsatkichlarining pasayishini ko‘ rsatgan [32].

Jadval 1

Glutamat retseptorlarining fiziologik roli va AK konteksti

Retseptor	Asosiy ion/signal	Fiziologik vazifa	AKdagi ahamiyati
AMPA	Na^+/K^+; GluA2 bo‘ lmasa Ca^{2+} ham	Tez EPSC, depolyarizatsiya, LTPda retseptor traffiki	Retseptor traffiki va subbirlik tarkibi o‘ zgarishi mumkin
NMDA	Ca^{2+}, Na^+/K^+; Mg^{2+} blok	Coincidence detection, LTP/LTD, Ca^{2+} signal	Sinaptik/ekstrasinaptik balans va subbirlikka bog‘ liq disregulyatsiya
Kainate	Na^+/K^+	Pre- va postsinaptik modulyatsiya	Kamroq o‘ rganilgan, tarmoq qo‘ zg‘ aluvchanligiga ta’ sir
mGluR	G-protein/ikkinchi messenjerlar	Neyromediator ajralishi va plastiklik modulyatsiyasi	Aβ va sinaptik signal yo‘ llari bilan o‘ zaro ta’ sir

1-rasm. Fiziologik sinaptik Ca^{2+} signalizatsiyasi va Alsgeymer kasalligida Ca^{2+} disgomeostazining integrativ modeli.

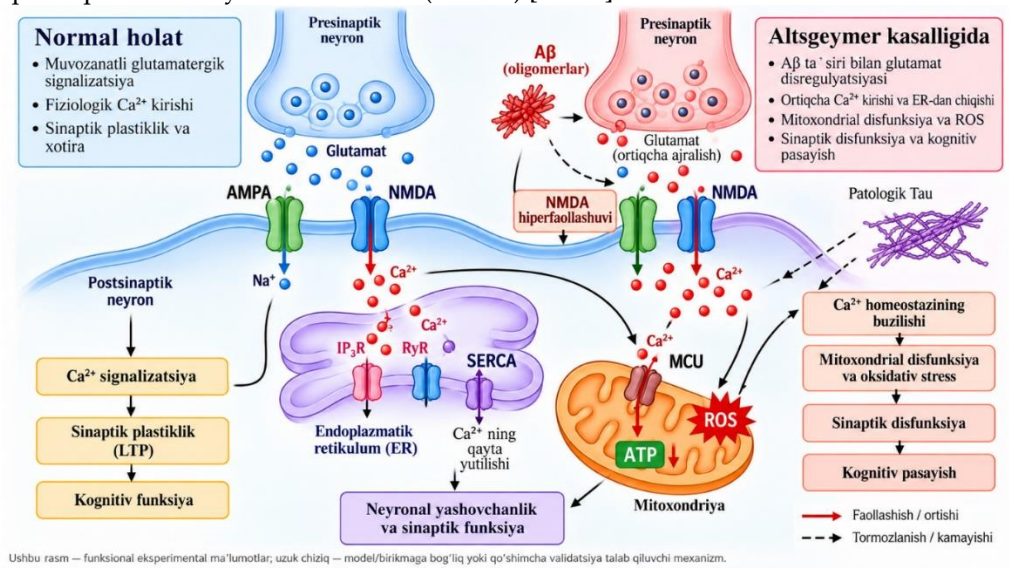
3. Neyronal Ca^{2+} gomeostazi

Ca^{2+} neyronda universal ikkinchi messenjer bo‘ lib, neyromediator ajralishi, gen ekspressiyasi, fermentlar faolligi, plastiklik va metabolizmni boshqaradi. Funksional natija faqat umumiy Ca^{2+} miqdoriga emas, signalning amplitudasi, davomiyligi va subhujayraviy lokalizatsiyasiga bog‘ liq [33–35].

Plazmatik membrana orqali Ca^{2+} NMDAR va potentsialga bog‘ liq Ca^{2+} kanallari (VGCC) orqali kirishi mumkin. ERdan Ca^{2+} IP_3R va RyR orqali ajraladi, SERCA esa uni ER lyumeniga qayta yig‘ adi. PMCA va NCX sitozolik Ca^{2+}ni hujayradan chiqarishda ishtirok etadi. Mitoxondriya Ca^{2+}ni MCU kompleksi orqali qabul qilib, fiziologik sharoitda metabolik talab bilan ATP ishlab chiqarishni muvofiqlashtirishga yordam beradi (2-jadval) [36–40].

AKda “Ca^{2+} doimo yuqori” degan ta’ rif etarli emas. Asosiy masala Ca^{2+} signalining fazoviy-vaqtiy nazorati va organellalar o‘ rtasidagi taqsimlanishining buzilishidir. ER–mitoxondriya kontaktlari orqali ortiqcha Ca^{2+} uzatilishi mitoxondrial yuklanish, bioenergetik disfunksiya va ROS hosil bo‘ lishi bilan bog‘ lanishi mumkin (1-rasm) [41–44].

Jadval 2



Neyronal Ca^{2+} transportining asosiy tizimlari

Tizim	Lokalizatsiya	Funksiya	Disregulyatsiyada ehtimoliy natija
NMDAR	Postsinaptik membrana	Ligand va potentsialga bog‘ liq Ca^{2+} kirishi	Ortiqcha/noto‘ g‘ ri lokal signal
VGCC	Plazmatik membrana	Depolyarizatsiyaga bog‘ liq Ca^{2+} kirishi	Qo‘ zg‘ aluvchanlik va Ca^{2+} yuklamasi o‘ zgarishi
IP_3R / RyR	ER	ERdan Ca^{2+} ajralishi	Tsitozolik va mitoxondrial signalning kuchayishi
SERCA	ER	Ca^{2+}ni ERga qaytarish	ER zaxirasi va sitozolik signal o‘ zgarishi
PMCA / NCX	Plazmatik membrana	Ca^{2+}ni hujayradan chiqarish	Ca^{2+} klirensining sekinlashishi
MCU kompleksi	Mitoxondriya ichki membranasi	Mitoxondrial Ca^{2+} qabul qilinishi	Ortiqcha yuklanish, ROS va ATP disfunktsiyasi

4. Aβ/Tau–Ca^{2+} va mitoxondriya–ROS o‘ qi

Aβ va Tau bilan bog‘ liq patologik jarayonlar Ca^{2+} signalizatsiyasi bilan ikki tomonlama o‘ zaro ta’ sir qiladi. Aβ oligomerlari membrana retseptorlari, ER Ca^{2+} chiqishi va mitoxondrial funksiyaga ta’ sir qilishi mumkin; o‘ z navbatida Ca^{2+}-bog‘ liq kinazalar, fosfatazalar va proteazalar Tau fosforlanishi, sitoskelet va sinaptik funksiyaga ta’ sir ko‘ rsatadi [45–47]. Bu munosabatni qat’ iy bir yo‘ nalishli kaskad emas, o‘ zaro kuchaytiruvchi tarmoq sifatida ko‘ rish to‘ g‘ riroq.

Mitoxondriyaga fiziologik Ca^{2+} kirishi degidrogenazalar va ATP sintezini metabolik talabga moslashtirishi mumkin. Ortiqcha yoki uzoq davom etuvchi Ca^{2+} yuklanishi esa elektron-transport zanjiri disfunksiyasi, membrana potensiali o‘ zgarishi va ROS hosil bo‘ lishi bilan bog‘ liq. ROS esa lipidlar, oqsillar va Ca^{2+} transport tizimlarini shikastlab, qaytar aloqa halqasini kuchaytirishi mumkin (3-rasm) [41–44].

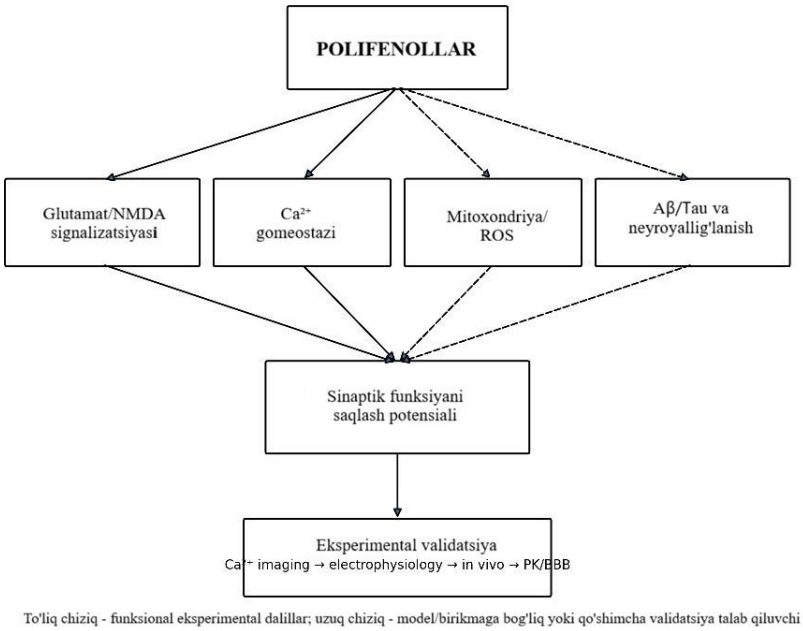
3-rasm. Alsgeymer kasalligida sinaptik glutamatergik signalizatsiya, Ca^{2+} gomeostazi, ER–mitoxondriya aloqasi va Aβ/Tau patologiyasining integrativ mexanizmi.

Natijalar va ularning tahlili

1. Polifenollar va Ca^{2+} signalizatsiyasi: fiziologik yondashuv

Polifenollar an’ anaviy ravishda antioksidant xususiyatlari bilan muhokama qilingan bo‘ lsa-da, zamonaviy ma’ lumotlar ularning membrana oqsillari, kinazalar, yallig‘ lanish signallari, mitoxondriya va ion gomeostaziga ham ta’ sir qilishi mumkinligini ko‘ rsatadi [48–50]. Shu sabab ularni faqat ROSni neytrallovchi birikmalar sifatida emas, ko‘ p nishonli funktsional modulyatorlar sifatida o‘ rganish maqsadga muvofiq (2-rasm).

Kalamush bosh miyasi sinaptosomalarida Khoshimov va hammualliflar tomonidan o‘ tkazilgan ishlar polifenollar–glutamat–Ca^{2+} o‘ qini eksperimental o‘ rganishga qaratilgan. Euphorbin, PC-6, PC-7 va keyingi birikmalar ishtirokidagi



tajribalarda L-glutamatga bog‘ liq Ca^{2+} javoblari, farmakologik blokatorlar va fluoresent indikatorlar orqali funksional o‘ zgarishlar baholangan [51–56]. 2023 yilgi PC-6/PC-7 ishida mualliflar NMDA-retseptor ion kanali ochilishini regulyatsiya qilish sohasida polifenollar va glutamat o‘ rtasida “possible competition” mavjudligini taklif qilgan; obzorda bu to‘ g‘ ridan-to‘ g‘ ri molekulyar bog‘ lanish isboti emas, funksional farmakologik talqin sifatida qabul qilindi [55].

2024 yilgi modellangan AK sharoitida PC-7 bilan o‘ tkazilgan in vivo ishda xulq-atvor ko‘ rsatkichlari va keyin ajratilgan sinaptosomalarda Ca^{2+} dinamikasi birgalikda baholangan [57]. Bu ex vivo sinaptosomal natijalarni organizm darajasidagi funktsional fenotip bilan bog‘ lashga qaratilgan muhim bosqichdir. Biroq Ca^{2+} ko‘ rsatkichlaridagi o‘ zgarish kognitiv natijaning bevosita sababi ekanini aniqlash uchun elektrofiziologik va molekulyar validatsiya zarur (3-jadval).

Jadval 3

Khoshimov va hammualliflarning Ca^{2+}/glutamat yo‘ nalishidagi eksperimental ishlari

Yil/birikma	Model	Baholangan jarayon	Natijaning ehtiyotkor talqini	Obzordagi o‘ rni
2017 Cytisinum	Kalamush miyasi sinaptosomalari	Glutamatergik mediatorlar va Ca^{2+}	Ca^{2+} kanal/glutamat tizimiga funktsional ta’ sir	Metodologik boshlanish
2018 Euphorbin	Sinaptosomalar	L-glutamat va Ca^{2+} javobi	Glutamatga bog‘ liq Ca^{2+} modulyatsiyasi	Polifenol yo‘ nalishining boshlanishi
2021 PC-7	Sinaptosomalar	Sitozolik Ca^{2+} dinamikasi	VGCC/NMDA bilan bog‘ liq mexanizm taklif qilingan	Funktsional Ca^{2+} farmakologiyasi
2022 PC-6/PC-7	Sinaptosomalar	NMDA bilan bog‘ liq Ca^{2+} transporti	Glutamat bilan funktsional raqobat ehtimoli	Mexanizmni aniqlashtirish
2023 PC-6/PC-7	Sinaptosomalar	L-glutamat, Mg^{2+} va blokatorlar	NMDA kanal ochilishini regulyatsiya qilishga ta’ sir	Asosiy lokal eksperimental dalil
2024 PC-7	In vivo AK modeli + sinaptosoma	Xulq-atvor + Ca^{2+}	Organizm va sinaptik darajani bog‘ lash	*Ex vivo →in vivo* ko‘ prik

2-rasm. Polifenollarning sinaptik Ca^{2+} signalizatsiyasiga ehtimoliy ko‘ p nishonli ta’ sir nuqtalari.

2. Mavjud dalillar, hal etilmagan masalalar va istiqbolli yo‘ nalishlar

Sinaptosoma sinaptik terminalning ko‘ p funksional komponentlarini saqlab qolgani uchun neyromediator transporti, membrana retseptorlari va Ca^{2+} dinamikasini nisbatan izolyatsiyalangan sharoitda o‘ rganishda qimmatli modeldir. Biroq u butun neyron tarmog‘ i, gliya, qon–miya to‘ sig‘ i va sistemali farmakokinetikani to‘ liq aks ettirmaydi.

Shu sabab sinaptosomal natijalarni to‘ g‘ ridan-to‘ g‘ ri inson AKga ko‘ chirish emas, keyingi bosqichda validatsiya qilish kerak.

Fluoresent Ca^{2+} o‘ lchovlari birikmaning funksional ta’ sirini ko‘ rsatadi, ammo molekulaning qaysi retseptor subbirligi yoki bog‘ lanish sayti bilan to‘ g‘ ridan-to‘ g‘ ri o‘ zaro ta’ sir qilganini avtomatik ravishda isbotlamaydi. Shuning uchun istiqbolli polifenollar uchun Ca^{2+} imaging natijalarini patch-clamp elektrofiziologiyasi, retseptor subtipiga selektiv farmakologiya, bog‘ lanish/struktura-funktsional tahlil va mutatsiya eksperimentlari bilan birlashtirish maqsadga muvofiq.

Keyingi translyatsion zanjir ADga mos neyron kulturalari yoki iPSC-modellar, in vivo hayvon modellari, miya to‘ qimasida kontsentratsiyani aniqlash, farmakokinetika va qon–miya to‘ sig‘ idan o‘ tishni baholashni qamrab olishi kerak. Shunda “polifenol →retseptor/kanal →Ca^{2+} →sinaptik funksiya →kognitiv fenotip” zanjirining qaysi bo‘ g‘ inlari haqiqatan sababiy ekani aniqlanadi.

Xulosalar

Altsgeymer kasalligida sinaptik disfunksiya Aβ va Tau patologiyasi, glutamatergik signalizatsiya, Ca^{2+} gomeostazi, ER–mitoxondriya aloqasi va oksidativ stress o‘ zaro ta’ sir qiladigan ko‘ p darajali jarayon sifatida qaralishi kerak. Fiziologik NMDAR–Ca^{2+} signalizatsiyasi sinaptik plastiklik uchun zarur; patologik holatda esa signalning lokalizatsiyasi, davomiyligi va organellalar o‘ rtasida taqsimlanishining buzilishi funktsional etishmovchilikka hissa qo‘ shishi mumkin.

Ca^{2+} disgomeostazi amiloid yoki Tau gipotezasining o‘ rnini bosuvchi emas, balki ularni membrana, sinaps va mitoxondrial mexanizmlar bilan bog‘ lovchi muhim fiziologik-patofiziologik komponentdir. Polifenollar, ayniqsa sinaptosomal modellarda o‘ rganilgan PC-6, PC-7, Euphorbin va boshqa birikmalar, glutamatga bog‘ liq Ca^{2+} javoblarini modulyatsiya qilish potentsialini ko‘ rsatadi. Ularning aniq molekulyar nishonlari va translyatsion ahamiyatini elektrofiziologik, struktura-funktsional va farmakokinetik usullar bilan tasdiqlash kelgusi tadqiqotlarning mantiqiy davomidir.

Annotatsiya: *Maqolada Euphorbia rigida o' simligidan ajratib olingan va shartli ravishda GL25 deb nomlangan 1-O-galloyl-6-bisgalloyl-2,4-valoneoyl-β-D-glucose polifenol birikmasining kalamush bosh miyasi sinaptosomalarida hujayra ichki Ca^{2+} gomeostaziga ta'siri tahlil qilindi. Sinaptosomalar differensial sentrifugalash usulida ajratildi, sitozolik Ca^{2+} dinamikasi esa Fluo-4 AM fluorescent zondi yordamida qayd etildi. GL25 ning 10–100 μM konsentratsiyalari fluorescent intensivlikni konsentratsiyaga bog' liq ravishda kamaytirgani aniqlandi. L-tipli Ca^{2+} kanallari blokatorlari nifedipin va sinnarizin (0,01 μM) alohida qo' llanganda ham sinaptosomal Ca^{2+} miqdori sezilarli pasaydi. Biroq blokatorlar fonida GL25 qo' shilganda fluorescent intensivlikning ortishi kuzatildi. Ushbu natija GL25 va L-tipli kanallar blokatorlari o' rtasida digidropiridin-sezgir Ca^{2+} kanallarining funksional boshqaruv uchastkalari darajasida o' zaro ta'sir mavjud bo' lishi mumkinligini ko' rsatadi. Natijalar GL25 ning presinaptik Ca^{2+} signalizatsiyasini modulyatsiya qiluvchi biologik faol birikma sifatidagi xususiyatlarini yoritadi.*

Kalit so' zlar: *GL25, polifenol, sinaptosoma, Ca^{2+} gomeostazi, Fluo-4 AM, nifedipin, sinnarizin, L-tipli kalsiy kanali.*

ВЛИЯНИЕ ПОЛИФЕНОЛА GL25 НА ГОМЕОСТАЗ Ca^{2+}, ОПОСРЕДОВАННЫЙ КАЛЬЦИЕВЫМИ КАНАЛАМИ L-ТИПА, В СИНАПТОСОМАХ ГОЛОВНОГО МОЗГА КРЫС

Аннотация: *В статье проанализировано влияние полифенольного соединения 1-O-galloyl-6-bisgalloyl-2,4-valoneoyl-β-D-glucose, выделенного из растения Euphorbia rigida и условно обозначенного как GL25, на внутриклеточный гомеостаз Ca^{2+} в синаптосомах головного мозга крыс. Синаптосомы выделяли методом дифференциального центрифугирования, а динамику цитозольного Ca^{2+} регистрировали с использованием флуоресцентного зонда Fluo-4 AM. GL25 в концентрациях 10–100 мкМ вызывал концентрационно-зависимое снижение интенсивности флуоресценции. Блокаторы L-типа Ca^{2+}-каналов нифедипин и циннаризин (0,01 мкМ) также снижали уровень внутрисинаптосомального Ca^{2+}. При добавлении GL25 на фоне блокаторов наблюдалось повышение флуоресцентной интенсивности. Полученные данные указывают на возможное функциональное взаимодействие GL25 с дигидропиридин-чувствительными участками регуляции L-типа Ca^{2+}-каналов и подтверждают способность полифенола модулировать пресинаптическую кальциевую сигнализацию.*

Ключевые слова: *GL25, полифенол, синаптосома, Ca^{2+}-гомеостаз, Fluo-4 AM, нифедипин, циннаризин, L-тип кальциевых каналов.*

EFFECT OF GL25 POLYPHENOL ON Ca^{2+} HOMEOSTASIS MEDIATED BY L-TYPE CALCIUM CHANNELS IN RAT BRAIN SYNAPTOSOMES

Abstract: *This study analyzed the effect of the polyphenolic compound 1-O-galloyl-6-bisgalloyl-2,4-valoneoyl-β-D-glucose, isolated from Euphorbia rigida and designated GL25, on intracellular Ca^{2+} homeostasis in rat brain synaptosomes. Synaptosomes were isolated by differential centrifugation, while cytosolic Ca^{2+} dynamics were monitored using the fluorescent probe Fluo-4 AM. GL25 at 10–100 μM produced a concentration-dependent decrease in fluorescence intensity. The L-type Ca^{2+} channel blockers*

nifedipine and cinnarizine (0.01 μM) also significantly reduced synaptosomal Ca^{2+} levels when applied separately. In contrast, addition of GL25 in the presence of these blockers increased fluorescence intensity. This response may indicate a functional interaction between GL25 and regulatory sites associated with dihydropyridine-sensitive Ca^{2+} channels. The findings characterize GL25 as a biologically active modulator of presynaptic Ca^{2+} signaling and provide an experimental basis for further studies of its neuroprotective potential.

Keywords: *GL25, polyphenol, synaptosome, Ca^{2+} homeostasis, Fluo-4 AM, nifedipine, cinnarizine, L-type calcium channel.*

KIRISH

Ca^{2+} ionlari neyronlarda ikkilamchi messenjer sifatida membrana qo‘ zg‘ aluvchanligi, neyromediatorlar sekretsiyasi, fermentlar faolligi, gen ekspressiyasi va sinaptik plastiklikni boshqarishda markaziy o‘ rin tutadi. Tinch holatda sitozolik Ca^{2+} miqdori hujayra tashqarisidagi konsentratsiyaga nisbatan bir necha tartib past bo‘ lib, ushbu katta elektrokimyoviy gradient ion kanallari, Ca^{2+}-ATFazalar, Na^{+}/Ca^{2+} almashinuvchisi, endoplazmatik retikulum va mitoxondriyal transport tizimlari orqali saqlanadi. Ayniqsa presinaptik terminalda harakat potensiali bilan chaqiriladigan Ca^{2+} oqimi sinaptik vezikulalarning membrana bilan qo‘ shilishi va neyromediatorlarning ajralishi uchun asosiy signal hisoblanadi [1–4].

Potensialga bog‘ liq kalsiy kanallari neyronal Ca^{2+} signalining muhim kirish yo‘ llaridan biridir. L-tipli CaV1.2 va CaV1.3 kanallari uzoq davom etuvchi depolyarizatsiyaga javob beradi va Ca^{2+} ga bog‘ liq signal kaskadlari, transkripsion jarayonlar hamda sinaptik plastiklik bilan bog‘ langan. Ca^{2+} gomeostazining buzilishi mitoxondriyal disfunksiya, oksidlovchi stress va hujayra o‘ limi yo‘ llarining faollashuvi bilan kechishi mumkin. Shu sababli L-tipli kanallarni farmakologik modulyatsiya qilish neyronal Ca^{2+} ortiqcha yuklanishini o‘ rganishda muhim eksperimental yondashuvdir [3,5,6].

Polifenollar o‘ simliklardan olinadigan biologik faol birikmalar bo‘ lib, ularning membranaviy va hujayra ichki signal tizimlariga ta’siri katta qiziqish uyg‘ otadi. Ayrim polifenollar Ca^{2+} signalizatsiyasi, glutamatergik uzatish va oksidlovchi jarayonlarni modulyatsiya qilishi ko‘ rsatilgan. Biroq Euphorbia rigida dan ajratilgan GL25 polifenolining presinaptik Ca^{2+} transportiga, xususan L-tipli kanallar bilan bog‘ liq komponentga ta’siri yetarlicha tavsiflanmagan.

Ushbu ishning maqsadi GL25 polifenolining kalamush bosh miyasi sinaptosomalarida sitozolik Ca^{2+} dinamikasiga ta’sirini aniqlash hamda nifedipin va sinnarizin yordamida uning L-tipli Ca^{2+} kanallari bilan funksional o‘ zaro ta’sirini baholashdan iborat.

ADABIYOTLAR TAHLILI

Sinaptosomalar akson uchlaridan hosil bo‘ lgan, presinaptik membrana, sinaptik vezikulalar va metabolik apparatning muhim qismini saqlab qoladigan subhujayraviy tuzilmalardir. Ular membrana depolyarizatsiyasi, ion oqimlari va Ca^{2+} ga bog‘ liq mediator ajralishini in vitro sharoitida o‘ rganish imkonini beradi [7,8]. Presinaptik terminalga Ca^{2+} ning kirishi asosan potensialga bog‘ liq kanallar orqali sodir bo‘ ladi. Kirgan Ca^{2+} mahalliy mikrodomenlar hosil qilib, vezikulyar ekzotsitozni boshlaydi; ortiqcha Ca^{2+} esa nasoslar, almashinuvchilar va hujayra ichki depolari yordamida chiqariladi yoki sekvestrlanadi [1,4].

L-tipli Ca^{2+} kanallari $\alpha 1$ subbirligida joylashgan ion o‘ tkazuvchi pora va dori moddalarini bog‘ lovchi funksional uchastkalarga ega. Digidropiridinlar guruhiga kiruvchi nifedipin kanalning depolyarizatsiya bilan bog‘ liq inaktiv holatiga yuqori moyillik ko‘ rsatib, Ca^{2+} oqimini kamaytiradi [5,9]. Natijada Ca^{2+} ga bog‘ liq ekzotsitoz va ayrim hujayra ichki signal yo‘ llari modulyatsiyalanadi. Sinaptik plastiklik bilan bog‘ liq CaMKII, PKC va CREB kabi tizimlar ham Ca^{2+} oqimining vaqt-fazoviy xususiyatlariga sezgir [3,10].

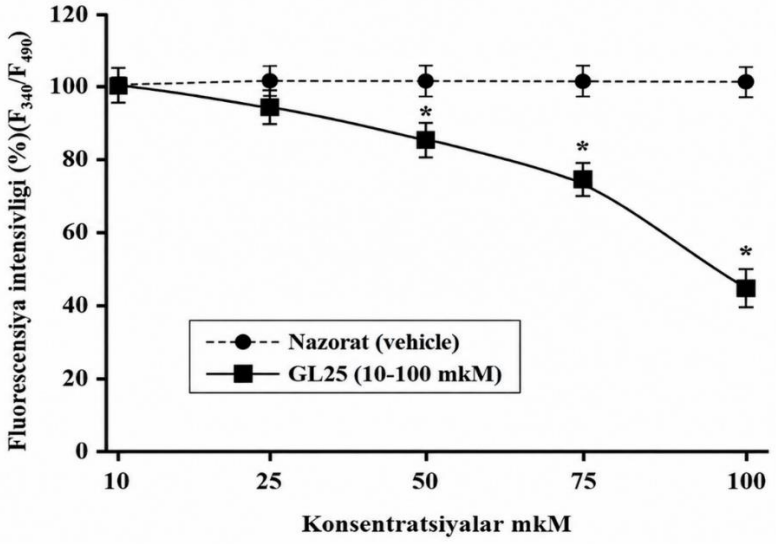
Sinnarizin ham Ca^{2+} oqimini susaytiruvchi farmakologik agent bo‘ lib, L-tipli kanallar bilan bog‘ liq jarayonlarni tormozlashi mumkin. Nifedipin va sinnarizin kabi blokatorlardan foydalanish o‘ rganilayotgan birikmaning ta’siri potensialga bog‘ liq Ca^{2+} kanallari bilan qay darajada kesishishini farmakologik profillash imkonini beradi. Bunday kombinatsion tajribada ta’sirlarning oddiy qo‘ shilishi, kuchayishi yoki aksincha yo‘ nalishda o‘ zgarishi birikmalarning bir xil yoki o‘ zaro bog‘ langan regulyator mexanizmlarga ta’sir qilishi mumkinligini ko‘ rsatadi. Biroq faqat fluorescent javob asosida to‘ g‘ ridan-to‘ g‘ ri bog‘ lanish joyini aniqlab bo‘ lmaydi; buning uchun elektrofiziologik yoki ligand-bog‘ lanish tadqiqotlari talab qilinadi.

Ish tajribalarida GL25 10–100 μM diapazonda sinaptosomal Fluo-4 AM fluorescensiyasini pasaytirgan, bu sitozolik Ca^{2+} miqdorining kamayishi bilan mos keladi. Shu bilan birga, L-tipli kanal blokatorlari fonida GL25 qo‘ shilganda aks yo‘ nalishdagi javob qayd etilgani ushbu birikmaning Ca^{2+} signaliga ta’siri bir komponentli emasligini ko‘ rsatadi. Mazkur hodisani L-tipli kanallarga bog‘ liq farmakologik o‘ zaro ta’sir, boshqa Ca^{2+} kirish/chiqish tizimlarining kompensator faollashuvi yoki sinaptosomal membrana holatining o‘ zgarishi bilan izohlash mumkin.

TADQIQOT METODOLOGIYASI

Tadqiqot obyekti sifatida kalamush bosh miyasi sinaptosomalari suspenziyasi hamda Euphorbia rigida o‘ simligidan ajratilgan 1-O-galloyl-6-bisgalloyl-2,4-valoneoyl-β-D-glucose polifenol birikmasi (GL25) qo‘ llanildi. Sinaptosomalar C.W. Cotman usuli va uning modifikatsiyalari asosida differensial sentrifugalash yo‘ li bilan ajratildi. Bosh miya to‘ qimasi muzli sharoitda 0,32 M saxaroza, 0,01 M Tris-HCl va 0,5 mM EDTA saqlagan pH 7,4 muhitda 1:10 nisbatda gomogenizatsiya qilindi [7,11].

Gomogenat 4500 ayl/min tezlikda 10 minut sentrifugalandi; supernatant 14000 ayl/min tezlikda 20 minut qayta sentrifugalandi. Keyingi bosqichlarda 11000 ayl/min da 20 minut va 14000 ayl/min da 30 minut sentrifugalash orqali sinaptosomal fraksiya olindi. Preparativ jarayonlar sovuq sharoitda bajarildi. Tajribalarda $CaCl_2$ saqlovchi va EGTA bilan Ca^{2+} dan xoli muhitlardan foydalanildi. Membranani depolyarizatsiya qilish uchun 35 mM KCl ishlatildi.



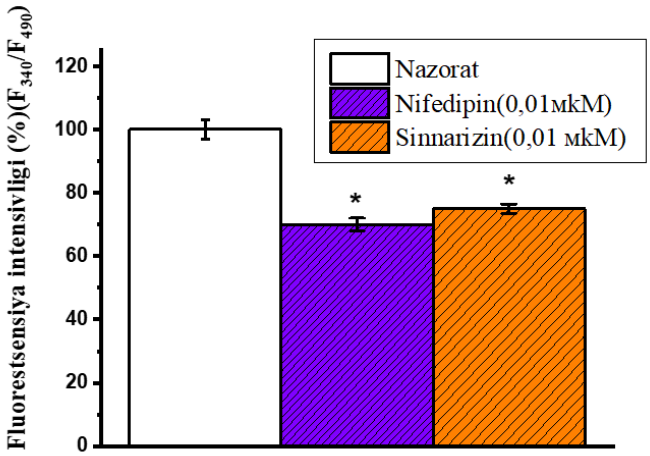
Sitozolik Ca^{2+} dinamikasi Fluo-4 AM zondi yordamida baholandi. 1 mg Fluo-4 AM 135 µl DMSO da eritilib, 1 mM boshlang‘ ich eritma tayyorlandi. 2 ml Krebs–Ringer buferiga 80 µl sinaptosoma suspenziyasi va 12 µl Fluo-4 AM qo‘ shilib, 37°C da 30 minut inkubatsiya qilindi. Inkubatsiyadan so‘ ng ortiqcha bo‘ yoq yuvish va sentrifugalash bilan chiqarildi. O‘ lchashda taxminan 5×10^6 zarracha/ml konsentratsiyadan foydalanildi. Fluorescensiya 488 nm da qo‘ zg‘ atilib, 506 nm da qayd etildi. Signal USB2000 spektrofluorimetrida (Ocean Optics, AQSh) o‘ lchandi [12].

GL25 10–100 µM konsentratsiya oralig‘ ida sinovdan o‘ tkazildi. L-tipli Ca^{2+} kanallarini farmakologik tahlil qilishda nifedipin va sinnarizin 0,01 µM konsentratsiyada qo‘ llanildi. Tajribalar blokatorlarning alohida ta’siri va blokatorlar fonida GL25 ning 10–100 µM diapazondagi ta’sirini solishtirish asosida tashkil etildi. Har bir tajriba seriyasida n=6 kuzatuv bajarilgan. Maqolada statistik ishonchlilik *P<0,05 va **P<0,01 darajalari bilan ifodalangan.

NATIJALAR VA TAHLIL

Presinaptik Ca^{2+} konsentratsiyasi neyromediator ajralish ehtimolini belgilovchi asosiy omillardan biridir. Shu sababli GL25 ning Ca^{2+} signalini pasaytirishi haddan tashqari qo‘ zg‘ alish sharoitida mediator chiqarilishini cheklovchi mexanizmga hissa qo‘ shishi mumkin. Ayni vaqtda L-tipli kanal blokadasi sharoitida javobning o‘ zgarishi GL25 ni oddiy, selektiv L-tipli kanal blokatori sifatida emas, balki Ca^{2+} gomeostazining bir nechta komponentlari bilan bog‘ liq modulyator sifatida ko‘ rib chiqish maqsadga muvofiqligini ko‘ rsatadi.

Ushbu tadqiqotning cheklovi shundaki, mavjud tajribalar fluorescensiya intensivligiga asoslangan bo‘ lib, alohida Ca^{2+} kanal oqimlarini to‘ g‘ ridan-to‘ g‘ ri elektrofiziologik qayd etmagan. Kelgusida patch-clamp usuli, selektiv CaV1.2/CaV1.3 modulyatorlari, Na^+/Ca^{2+} almashinuvchisi va hujayra ichki Ca^{2+} depolari ingibitorlari bilan kombinatsion tajribalar GL25 ning aniq molekulyar nishonini ajratishga yordam beradi



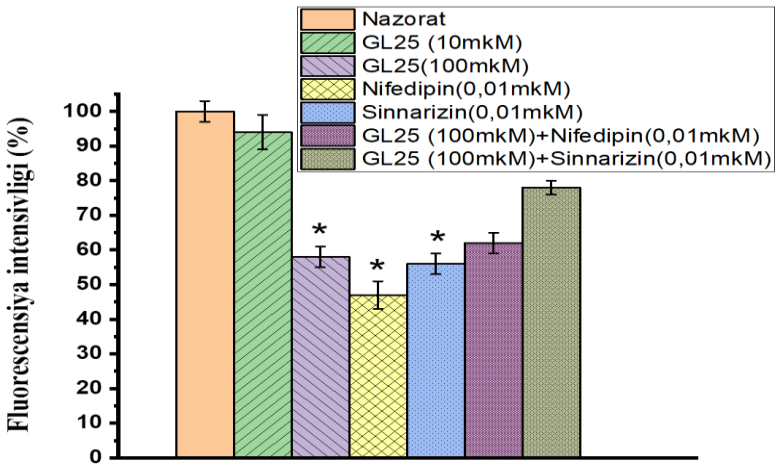
1-rasm. GL25 polifenolining 10–100 µM konsentratsiyalarda kalamush bosh miyasi Fluo-4 AM-sinaptosoma suspenziyasida fluorescensiya intensivligiga ta’siri. *P<0,05; n=6.

Tajribalarning birinchi bosqichida GL25 polifenolining 10–100 µM konsentratsiyalarda Fluo-4 AM bilan yuklangan kalamush bosh miyasi sinaptosomalariga ta’siri baholandi. Olingan natijalarda fluorescensiya intensivligi GL25 konsentratsiyasi oshishi bilan bosqichma-bosqich susayib borgan.

Fluo-4 AM hujayra ichida esterazalar ta’sirida faol fluorescent shaklga o‘ tib, erkin Ca^{2+} bilan bog‘ langanda signal intensivligini oshiradi. Shu sababli tajribada fluorescensiyaning kamayishi sinaptosomal sitozolda erkin Ca^{2+} miqdorining kamayishi bilan mos keladi. Mazkur natija GL25 ning presinaptik Ca^{2+} gomeostaziga bevosita yoki bilvosita ta’sir ko‘ rsatishini ko‘ rsatadi. Biroq ushbu tajribaning o‘ zi Ca^{2+} ning qaysi aniq transport tizimi orqali kamayganini ajratib

bermaydi. Aynan shu sababli keyingi tajribalarda selektiv va funksional Ca^{2+} kanal blokatorlari fonida GL25 ta'siri o‘ rganilgan.

Sinaptosoma modeli presinaptik terminalning membrana qo‘ zg‘ aluvchanligi, mediatorlarni qabul qilish va Ca^{2+} ga bog‘ liq sekretsiya kabi muhim xususiyatlarini saqlab qoladi. Shu nuqtai nazardan, GL25 ta'sirida $[Ca^{2+}]$in kamayishi presinaptik signal uzatilishining Ca^{2+} ga bog‘ liq bosqichlari modulyatsiya qilinayotganini ko‘ rsatishi mumkin.



2-rasm. Nifedipin va sinnarizin (0,01 μM) bilan inkubatsiya sharoitida kalamush miyasi sinaptosomalari suspenziyasida fluorescensiya intensivligi. *P<0,05; **P<0,01; n=6.

Sinnarizin ham 0,01 μM konsentratsiyada qo‘ llanib, sinaptosoma suspenziyasida fluorescensiya intensivligini va unga mos ravishda Ca^{2+} signalini kamaytirgan..Adabiyotlarda sinnarizin L-tipli Ca^{2+} kanallari orqali ionlarning membrana bo‘ ylab translokatsiyasini susaytiruvchi blokator sifatida tavsiflangan. Nifedipin va sinnarizinning bir xil yo‘ nalishdagi javobi L-tipli kanallarni farmakologik bloklash sinaptosomal Ca^{2+} gomeostaziga sezilarli ta'sir ko‘ rsatishini tasdiqlaydi.

Keyingi tajribalarda nifedipin 0,01 μM fonida GL25 ning 10–100 μM konsentratsiyalari qo‘ llanilgan. GL25 alohida qo‘ llanganda fluorescensiya kamaygan bo‘ lsa, nifedipin fonida GL25 qo‘ shilishi Ca^{2+} miqdorining sezilarli oshishi bilan kechgan. Javob yo‘ nalishining bunday almashishi tajribaning eng muhim natijalaridan biridir, chunki u GL25 ta'siri L-tipli kanalning farmakologik holatidan mustaqil emasligini ko‘ rsatadi.

Maqolada ushbu hodisa GL25 va nifedipin o‘ rtasida digidropiridin-sezgir Ca^{2+} kanallarini boshqaruvchi uchastkalar uchun konkurensiya mavjud bo‘ lishi mumkinligi bilan izohlangan. Bunday talqinda nifedipin kanalning ma'lum funksional holatini egallaganida GL25 ning odatdagi Ca^{2+} kamaytiruvchi ta'siri o‘ zgaradi va umumiy sitozolik signal boshqa yo‘ nalishga siljiydi. Bu GL25 ning ta'siri oddiy Ca^{2+} xelatlash yoki nospetsifik fluorescent so‘ nish bilan cheklanmasligi mumkinligini ko‘ rsatadigan farmakologik dalil sifatida qaraladi.

Shu bilan birga, mavjud ma'lumotlar GL25 va nifedipin aynan bir molekulyar bog‘ lanish joyiga to‘ g‘ ridan-to‘ g‘ ri raqobatlashishini qat'iy isbotlamaydi. Fluo-4 AM yordamida o‘ lchanayotgan ko‘ rsatkich umumiy sitozolik Ca^{2+} dinamikasini aks ettiradi. Shuning uchun nifedipin fonida Ca^{2+} signalining oshishi boshqa Ca^{2+} kirish yo‘ llari, Na^{+}/Ca^{2+} almashinuvchisi, Ca^{2+}-ATFaza yoki hujayra ichki depolar bilan bog‘ liq kompensator javoblarni ham o‘ z ichiga olishi mumkin. Maqolada ushbu holatni “funksional o‘ zaro ta'sir ehtimoli” sifatida ifodalash natijalarning dalillilik darajasiga mos keladi.

3-rasm. GL25 polifenolining (10–100 μM) nifedipin va sinnarizin (0,01 μM) bilan inkubatsiya sharoitida kalamush miyasi sinaptosomalari suspenziyasida fluorescensiya intensivligiga ta'siri. *P<0,05; **P<0,01; n=6.

Ushbu natijada kombinatsion tajribaning asosiy natijasini ko‘ rsatadi. GL25 100 μM alohida qo‘ llanganda signal keskin pasaygan, nifedipin va sinnarizin alohida qo‘ llanganda ham kamayish kuzatilgan. Biroq GL25 100 μM blokatorlar fonida qo‘ llanganda fluorescent GL25 100 μM ning alohida ta'siriga nisbatan yuqoriroq bo‘ lgan; sinnarizin bilan kombinatsiyada tiklanish yanada kuchli ko‘ rinadi. Bu natija GL25 va L-tipli Ca^{2+} kanal blokatorlari o‘ rtasida oddiy additiv ingibitsiyadan farq qiladigan funksional o‘ zaro ta'sir mavjudligini ko‘ rsatadi.

GL25 ning ikki xususiyatini ajratadi: birinchidan, polifenolning o‘ zi konsentratsiyaga bog‘ liq ravishda sitozolik Ca^{2+} signalini pasaytiradi; ikkinchidan, L-tipli kanal blokadasi sharoitida uning yuqori konsentratsiyadagi javobi o‘ zgaradi. Ushbu farmakologik profil GL25 ta'sirining potensialga bog‘ liq Ca^{2+} transport tizimlari bilan bog‘ liqligini qo‘ llab-quvvatlaydi.

L-tipli Ca^{2+} kanallarining tajriba tizimidagi hissasini baholash uchun nifedipin 0,01 μM konsentratsiyada qo‘ llanilgan. Nifedipin bilan inkubatsiya sharoitida sinaptosoma suspenziyasidagi Ca^{2+} miqdori sezilarli darajada kamaygan. Ushbu yo‘ nalish nifedipinning L-tipli potensialga bog‘ liq Ca^{2+} kanallarining $\alpha 1$ subbirligi bilan bog‘ lanishi va depolyarizatsiya sharoitida Ca^{2+} ning hujayraga kirishini cheklashi haqidagi mexanizm bilan mos keladi.

Presinaptik terminalda membrana depolyarizatsiyasi Ca^{2+} kanallarining ochilishiga olib keladi. Kanal orqali kirgan Ca^{2+} sinaptik vezikulalar ekzotsitozi uchun zarur bo‘ lgan mahalliy signalni hosil qiladi. Shuning uchun nifedipin fonida fluorescensiyaning pasayishi tajriba modelida potensialga bog‘ liq Ca^{2+} oqimining muhim hissasi mavjudligini ko‘ rsatadi. Mazkur natija GL25 bilan kombinatsion tajribalarni talqin qilish uchun farmakologik nazorat vazifasini bajaradi.

Sinnarizin 0,01 μM fonida GL25 10–100 μM qo‘ llanganda ham nifedipin bilan kuzatilganiga o‘ xshash ravishda Ca^{2+} signalining oshishi aniqlangan. Demak, GL25 ning blokator fonidagi paradoksal javobi faqat nifedipinga xos bo‘ lmagan va ikkinchi Ca^{2+} kanal blokatori bilan ham qayd etilgan. Ushbu takrorlanuvchi yo‘ nalish GL25 ning L-tipli Ca^{2+} transporti bilan funksional bog‘ liqligi haqidagi xulosani kuchaytiradi.

Sinnarizin fonida GL25 javobining o‘ zgarishi sinaptosomal membranada Ca^{2+} oqimini boshqaruvchi tizimlar o‘ zaro bog‘ langan holda ishlashini ko‘ rsatadi. Bir transport yo‘ li farmakologik cheklanganda, GL25 ning boshqa membranaviy yoki hujayra ichki nishonlarga ta'siri umumiy fluorescent javobda kuchliroq namoyon bo‘ lishi mumkin. Shuning uchun kombinatsion tajriba natijasi GL25 ni faqat L-tipli kanalning klassik blokatori sifatida emas, balki Ca^{2+} gomeostazini modulyatsiya qiluvchi birikma sifatida tavsiflashga ko‘ proq mos keladi.

MUALLIFLAR HISSASI, MANFAATLAR TO‘ QNASHUVI VA MOLIYALASHTIRISH

Mualliflar hissasi: barcha mualliflar tadqiqot konsepsiyasi, ma'lumotlarni tahlil qilish va maqola matnini tayyorlashda teng hissa qo‘ shgan. Manfaatlar to‘ qnashuvi: mualliflar manfaatlar to‘ qnashuvi yo‘ qligini bildiradi. Moliyalashtirish: tadqiqot tashqi moliyaviy yordamsiz amalga oshirilgan.

XULOSA

Olib borilgan tadqiqotlar GL25 polifenol birikmasining kalamush bosh miyasi sinaptosomalarida hujayra ichki Ca^{2+} gomeostaziga ta'sir ko‘ rsatishini aniqladi. GL25 ning 10–100 μM konsentratsiyalar oralig‘ ida qo‘ llanilishi Fluo-4 AM bilan yuklangan sinaptosomalarda fluorescensiya intensivligining konsentratsiyaga bog‘ liq ravishda pasayishi bilan kechdi. Bu holat sinaptosomalar sitozolidagi erkin Ca^{2+} miqdorining kamayishi bilan mos kelib, GL25 ning presinaptik Ca^{2+} signalizatsiyasini boshqaruvchi mexanizmlarga ta'sir qilishi mumkinligini ko‘ rsatdi.

GL25 ta'sirida kuzatilgan Ca^{2+} miqdorining kamayishida L-tipli potensialga bog' liq Ca^{2+} kanallarining ishtirokini aniqlash maqsadida nifedipin va sinnarizin bilan farmakologik tajribalar o' tkazildi. Ushbu blokatorlarning 0,01 μM konsentratsiyada alohida qo' llanilishi sinaptosomal fluorescensiya intensivligining sezilarli pasayishiga olib keldi. Bu natija tajriba sharoitida L-tipli Ca^{2+} kanallari sinaptosomal Ca^{2+} dinamikasining shakllanishida muhim funksional komponentlardan biri ekanligini ko' rsatdi.

Shu asosda GL25 ning ta'siri L-tipli Ca^{2+} kanallari bloklangan sharoitda baholandi. Nifedipin va sinnarizin fonida GL25 qo' shilganda fluorescensiya intensivligining GL25 alohida qo' llanilgan holatga nisbatan ortishi kuzatildi. Demak, GL25 ning Ca^{2+} gomeostaziga ta'siri kanalning farmakologik holatiga bog' liq ravishda o' zgaradi. Bunday javob GL25 ta'sir mexanizmida L-tipli, jumladan digidropiridin-sezgir Ca^{2+} transport tizimlari bilan bog' liq funksional komponent mavjud bo' lishi mumkinligini ko' rsatadi. Shu bilan birga, olingan natijalar GL25 va nifedipinning aynan bir bog' lanish markazi uchun bevosita raqobatlashishini isbotlamaydi; buning uchun qo' shimcha molekulyar va elektrofiziologik tadqiqotlar talab etiladi.

Natijalarni umumlashtirganda, GL25 ning sinaptosomal Ca^{2+} signaliga ta'siri **konsentratsiyaga bog' liq bo' lishi bilan birga, L-tipli Ca^{2+} kanallarining funksional holatiga ham bog' liq** ekanligi namoyon bo' ldi. Presinaptik Ca^{2+} dinamikasi neyromediatorlarning vezikulyar ajralishi, membrana qo' zg' aluvchanligi va sinaptik signal uzatilishining asosiy regulyatorlaridan biri bo' lganligi sababli, GL25 tomonidan ushbu jarayonning modulyatsiya qilinishi uning sinaptik faoliyatga ta'sir ko' rsatish imkoniyatini belgilaydi.

Annotatsiya. *Mazkur tadqiqotda Akuzun alkaloidining trombotsitlar agregatsiyasiga ta'siri o' rganildi. Tadqiqotning maqsadi Akuzun alkaloidining turli agonistlar bilan chaqirilgan trombotsitlar agregatsiyasiga ta'sirini baholash va uning gemostaz tizimidagi ehtimoliy antiagregatsion xususiyatlarini aniqlashdan iborat. Olingan natijalar Akuzun alkaloidining trombotsitlar agregatsiyasini cheklovchi biologik faollikka ega ekanligini ko' rsatib, uning gemostaz tizimini modulyatsiya qiluvchi potensial vosita sifatida istiqbolli ekanligini ko' rsatadi.*

Kalit so' zlar: *Akuzun alkaloidi, trombotsitlar, trombotsitlar agregatsiyasi, adenozindifosfat, ADF, kollagen, gemostaz, antiagregatsion ta'sir, trombotsitlar faollashuvi.*

ВЛИЯНИЕ АЛКАЛОИДА АКУЗУН НА АГРЕГАЦИЮ ТРОМБОЦИТОВ.

Аннотация: *В данном исследовании изучено влияние алкалоида Акузун на агрегацию тромбоцитов. Цель исследования заключалась в оценке влияния алкалоида Акузун на агрегацию тромбоцитов, индуцированную различными агонистами, а также в определении его потенциальных антиагрегационных свойств в системе гемостаза. Полученные результаты показали, что алкалоид Акузун обладает биологической активностью, ограничивающей агрегацию тромбоцитов, что свидетельствует о его перспективности в качестве потенциального средства, модулирующего систему гемостаза.*

Ключевые слова: *алкалоид Акузун, тромбоциты, агрегация тромбоцитов, аденозиндифосфат, АДФ, коллаген, гемостаз, антиагрегационное действие, активация тромбоцитов.*

EFFECT OF AKUZUN ALKALOID ON PLATELET AGGREGATION.

Abstract: *This study investigated the effect of Akuzun alkaloid on platelet aggregation. The aim of the study was to evaluate the effect of Akuzun alkaloid on platelet aggregation induced by various agonists and to determine its potential anti-aggregatory properties in the hemostatic system. The obtained results demonstrated that Akuzun alkaloid possesses biological activity that limits platelet aggregation, indicating its potential as a promising agent for modulating the hemostatic system.*

Keywords: *Akuzun alkaloid, platelets, platelet aggregation, adenosine diphosphate, ADP, collagen, hemostasis, anti-aggregatory effect, platelet activation.*

KIRISH

Gemostaz tizimi organizmda qonning suyuq holatini saqlash, qon tomirlar shikastlanganda qon ketishini to‘xtatish hamda qon tomirlar yaxlitligini ta’minlashda muhim fiziologik mexanizm hisoblanadi. Gemostazning dastlabki bosqichida trombotsitlarning qon tomir devoriga adgeziyasi, faollashuvi va agregatsiyasi sodir bo‘lib, natijada birlamchi trombotsitar tiqin shakllanadi. Shu sababli trombotsitlarning funksional faolligini o‘rganish gemostaz holatini baholashda muhim yo‘nalishlardan biri hisoblanadi.

Gemostaz reaksiyalarini amalga oshishida tomir devori muhim rol o‘ynaydi. Tomirlarning endotelial hujayralari o‘zining yuzasida tromb hosil bo‘lishini modullovchi turli biologik faol moddalarni sintezlash va/yoki ekspressiyalash xususiyatiga ega. Ularga fon Villebrand faktori, relaksatsiyaning endotelial faktori (azot oksidi), prostasiklin, trombomodulin, endotelin, to‘qima tipidagi plazminogen aktivatori, to‘qima tipidagi plazminogen aktivatorining ingibitori, to‘qima faktori (tromboplastin), to‘qima faktori yo‘lining ingibitori va boshqalar kiradi. Bundan tashqari endoteliotsitlarning membranasida retseptorlar joylashgan bo‘lib, ular ma’lum bir sharoitda qon oqimida erkin sirkulyatsiyalanadigan molekulyar ligandlar va hujayralar bilan birikadi [12; 58-67-b.].

Trombotsitlar agregatsiyasi birlamchi gemostazning muhim bosqichi bo‘lib, uning asosida trombotsitlarning qon tomir shikastlangan sohaga adgeziyasi, faollashuvi, sekretor reaksiyasi va o‘zaro agregatsiyasi yotadi. Fiziologik sharoitda ushbu jarayon qon ketishini to‘xtatishga xizmat qilsa, trombotsitlarning ortiqcha faollashuvi arterial tromboz va aterotrombotik asoratlarning rivojlanishiga sabab bo‘lishi mumkin. Shu sababli trombotsitlar agregatsiyasini boshqaruvchi molekulyar mexanizmlarni o‘rganish va yangi antiagregatsion moddalarni izlash farmakologiya va gemostaziologiyaning dolzarb yo‘nalishlaridan hisoblanadi [4; 1537776-b.].

Trombotsitlar agregatsiyasini eksperimental baholashda adenozindifosfat (ADF/ADP) va kollagen eng ko‘p qo‘llaniladigan agonistlardan hisoblanadi. ADF trombotsitlarning $P2Y_1$ va $P2Y_{12}$ purinergik retseptorlari orqali faollashuvini chaqiradi. $P2Y_1$ retseptori trombotsit shaklining o‘zgarishi va dastlabki agregatsion javobni yuzaga keltirsa, $P2Y_{12}$ retseptori agregatsiyaning kuchayishi va barqarorlashishida muhim rol o‘ynaydi. Shuningdek, $P2X_1$ retseptori orqali Ca^{2+} oqimi ham ADFga javobning dastlabki bosqichlarida ishtirok etadi [7; 1803-b.].

ADF bilan bog‘liq signalizatsiya trombotsitlarning ichki signal yo‘llarini faollashtirib, GPIIb/IIIa (integrin αIIbβ3) retseptorlarining aktivatsiyasiga olib keladi. Ushbu retseptorlar fibrinogen bilan bog‘lanib, trombotsitlarning bir-biri bilan ko‘prik hosil qilishini ta’minlaydi. Shuning uchun ADF-induksiyalangan agregatsiyaning susayishi trombotsitlarning purinergik signalizatsiyasi, fibrinogen bilan bog‘lanishi yoki ushbu jarayonning quyi bosqichlariga ta’sir qiluvchi moddalar mavjudligini ko‘rsatishi mumkin [7; 1803-b.].

Kollagen esa qon tomir devori shikastlanganda trombotsitlar bilan bevosita o‘zaro ta’sirlashuvchi kuchli agonist hisoblanadi. Kollagenning asosiy trombotsitar retseptorlaridan biri glycoprotein VI (GPVI) bo‘lib, shuningdek α2β1 integrini ham kollagen bilan bog‘lanishda ishtirok etadi. GPVI faollashuvi tirozin-kinaza va PLCγ2 orqali signal uzatilishini kuchaytiradi, natijada hujayra ichidagi Ca^{2+} miqdori ortadi va trombotsitlarning keyingi faollashuv jarayonlari yuzaga keladi [9; 1-12-b.].

Kollagen ta’sirida yuzaga kelgan trombotsitlar faollashuvi faqat GPVI signalizatsiyasi bilan cheklanmaydi. Faollashgan trombotsitlardan ADF va tromboksan A_2 ajralishi ikkilamchi signal sifatida agregatsiyani kuchaytiradi va trombotsitar tiqinning barqarorlashishiga yordam beradi. Shu sababli kollagen bilan chaqirilgan agregatsiya natijalarini talqin qilishda kollagen retseptorlari bilan bir qatorda ADFga bog‘liq ikkilamchi signalizatsiyani ham hisobga olish zarur [9; 1-12-b.].

So‘nggi yillarda tabiiy biologik faol birikmalarning trombotsitlar faolligini modulyatsiya qilish imkoniyatlariga qiziqish ortib bormoqda. Tabiiy birikmalar trombotsitlar agregatsiyasini hujayra yuzasi retseptorlari, ikkilamchi xabarchilar, Ca^{2+} almashinuvi, fosfolipaza tizimlari, araxidon kislotasi metabolizmi va tromboksan A_2 hosil bo‘lishi kabi bir nechta mexanizmlar orqali susaytirishi mumkin [4; 1537776-b.].

Tomir devorlaridagi subendotelial komponentlarning endotelial qavat buzilganda (fibrillyar va nofibrillyar kollagen, elastin, proteoglikanlar va b.) qon bilan aloqaga kirishadi va fon Villebrand faktorini bog‘lanishi uchun yuza

hosil qiladi. Ushbu faktor faqatgina plazmada faktor VIII ni stabillashtirmasdan, balki hujayra retseptorlari bilan subendotelial strukturalarni bog‘ lab trombotsit adgeziyasida muhim rol o‘ ynaydi [2; 178-195-b.].

Qon tomir devori va endoteliyning shikastlanishi natijasida trombotsitlar faollashishi oqibatida qon laxtalari xosil bo‘ lishiga olib keladi [1; 1329-1353-b.]. Qisqacha ta’rifda, faollashish bosqichida trombotsitlar membranasi yuzasida bir nechta yopishuvchi adgeziya retseptorlari to‘ g‘ ridan-to‘ g‘ ri yoki bilvosita kollagen tolalari bilan o‘ zaro ta’sir qiladi. Yuqori darajadagi kesish tezligida Ib-IX-V glikoprotein kompleksini fon Villebrand omili (VWF) bilan bog‘ lanishi kuzatiladi [5; 869-b], natijada ushbu jarayonda glikoprotein VI retseptori (GPVI) va integrin $\alpha 2\beta 1$ retseptorlari (GPIa-IIa) kollagen bilan o‘ zaro ta’sirlanishiga olib keladi. Bir vaqtning o‘ zida bir nechta integrinlar xam kollagen, laminin, fibronektin, vironektin/vWF bilan bog‘ lanadi [6; 23-57-b.]. Ushbu jarayonlar kinaz faollashuvini va trombotsitlarning morfologik o‘ zgarishlariga olib keladi, bu esa trombotsitlarni yiriklashish bosqichiga olib keladi [1; 1329-1353-b., 8; 261-273-b.]. Keyin birikkan trombotsitlar o‘ z tarkibidan α-granulalar (AGs), δ-granulalar (DGs) va lizosoma granulalarini chiqaradi [3; 1531-1539-b.].

TADQIQOT METODOLOGIYASI.

Qon tarkibidan trombotsitlarni ajratib olish uslubi

Qon tarkibidan trombotsitlarni ajratishda qonga 1:9 nisbatda 3,8% li natriy sitrat eritmasi qo‘ shildi va trombotsitlarni 1150 aylanish/minut tezlikda 15 minut davomida sentrifugalash asosida, ishlab chiqilgan standart usulida ajratib olindi [3; 1531-1539-b.]. Sentrifugalash usuli yordamida cho‘ kmaga tushirilgan plazma tarkibidagi trombotsitlar suspenziyasi 3000 aylanish/minut tezlikda 10 minut davomida qayta sentrifugalandi va NaCl (150 mM), KCl (2,7 mM), NaH_2PO_4 (0,37 mM), $MgCl_2$ (1 mM), $CaCl_2$ (1 mM), glyukoza (5 mM), Hepes–NaOH (10 mM), geparin (50 birlik/ml), zardob albumini (0,35%) va apiraza (0,15 mg/ml) tarkibli muhitda (pH=6,5) ishchi eritma suspenziyasi xosil qilindi. Trombotsitlarni ajratib olish va spesifik testlar bo‘ yicha tahlillar xona harorati (+20...+24°C) sharoitida amalga oshirildi.

Trombotsitlar agregatsiyasi uslubi

Trombotsitlar agregatsiyasi «ALAT-2 Biola» agregometri (Rossiya) yordamida, standart uslubda [2; 178-195-b.] o‘ rganildi. Bunda induktorlar – ADF (2 mkM), adrenalin (5 mkM), FAT (0,5 birlik/ml) yordamida trombotsitlar agregatsiyasi yuzaga keltirildi va suspenziyaning optik zichligi qiymati spektrofotometr yordamida o‘ lchandi. Bu qurilma uni grafikaviy qayd qilish davomida agregatsion jarayonni dinamikasini tadqiq qilishga yordam beradi. Metodning prinsipi Trombotsitlarga boy plazmani agregatsiya induktorlarining ma’lum bir miqdorini qo‘ shguncha va qo‘ shgandan keyingi vaqtda optik zichligini o‘ zgarishini qayd qilishga asoslangan. Ko‘ rsatilgan induktorlarni trombotsitlarga boy plazmaga qo‘ shishdan oldin o‘ rganilayotgan moddani qo‘ shdik va 3 min davomida inkubatsiyaladik.

Tajribalarda foydalanilgan Hepes–NaOH, ADF, adrenalin, FAT («Sigma–Aldrich», Germaniya), NaCl, KCl, NaH_2PO_4, $MgCl_2$, $CaCl_2$, glyukoza («Ximreaktivkomplekt», Rossiya) tajribalar uchun kimyoviy tozalik kvalifikatsiyasiga ega hisoblanadi.

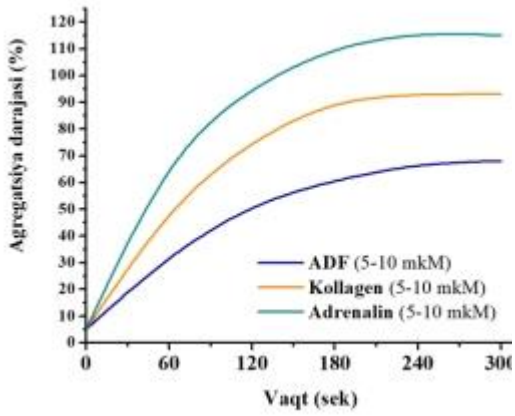
Shuningdek tajribalarda Ca^{2+}–kanali blokatori – nifedipin, GAMK–retseptori agonisti – diazepam va fenobarbital, GAMK–retseptor antagonisti – pikrotoksin, glutamat retseptori blokatori – memantin va argiolobatindan foydalanildi.

NATIJALAR VA ULARNING TAHLILI

Ma’lumki aIIbb3 integrin sifatida ham tanilgan GPIIb/IIIa retseptorlari trombotsitlar yuzasida joylashgan glikoprotein retseptorlari xisoblanadi. GPIIb/IIIa retseptorlari fibrinogen va boshqa ligandlar bilan bog‘ lanib, trombotsitlar faollashishida va agregatsiyasida asosiy rol o‘ ynaydi. Trombotsitlar faollashishi GPIIb/IIIa retseptorlarida konformatsion o‘ zgarishlarga olib keladi, natijada uning ligand-bog‘ lovchi bo‘ rtmasi paydo bo‘ ladi. Ushbu konformatsion o‘ zgarish retseptorlarga fibrinogenni xosil bo‘ lish imkonini beradi, trombotsitlar agregatsiyasi va laxta shakllanishiga yordam beradi.

ADF 1,0 mkM trombotsitlar yuzasidagi o‘ z retseptorlari bilan bog‘ lanadi. Dastlabki bog‘ lanishlar natijasida hujayra ichidan kalsiyni ajralib chiqishi orqali trombotsitlar shakli o‘ zgaradi, bu agregatsiyaning birlamchi to‘ lqinining shakllanishiga olib keladi. Ikkilamchi to‘ lqin trombotsitlar granulalari deposidan ADF ning chiqishini yuzaga keltiradi. ADF ning quyi dozasi faqat birlamchi agregatsiyani keltirib chiqaradi va uning ta’siri qayta tiklanish xususiyatiga ega. ADF - 2,5 -5,0 mkM ikki P2Y1 va P2Y12 retseptorlari G-oqsili bilan bog‘ lanadi. ADF ning P2Y1 retseptorlari bilan bog‘ lanishi va kalsiyni mobilizatsiya qilish orqali trombotsitlarni shakli o‘ zgarishiga agregatsiyasiga (birlamchi to‘ lqin) boshlanishiga olib keladi. P2Y12 retseptorlari asosiy ADF retseptorlari hisoblanadi va adenilatsiklazani ingibirlashi orqali trombotsitlarning to‘ liq agregatsiyasi uchun javobgar xisoblanadi. ADF - 10 mkM P2Y12 retseptorlari ham klopidogrel uchun nishon hisoblanadi. ADF tomonidan qo‘ zg‘ atilgan agregatsiyaning ikkinchi to‘ lqini aspirin tomonidan ingibirlanadi.

Adrenalin 5-10 mkM trombotsitlar yuzasida $\alpha 2$-adrenoenergik retseptorlari bilan bog‘ lanadi, bu adenilatsiklazaning ingibirlanishiga va kalsiy ionlarining chiqishiga olib keladi. Adrenalin bilan chaqirilgan trombotsitlar agregatsiyasisining dastlabki to‘ lqini vizual ravishda ADF bilan chaqirilgan agregatsiyasiga o‘ xshaydi, trombotsitlardan

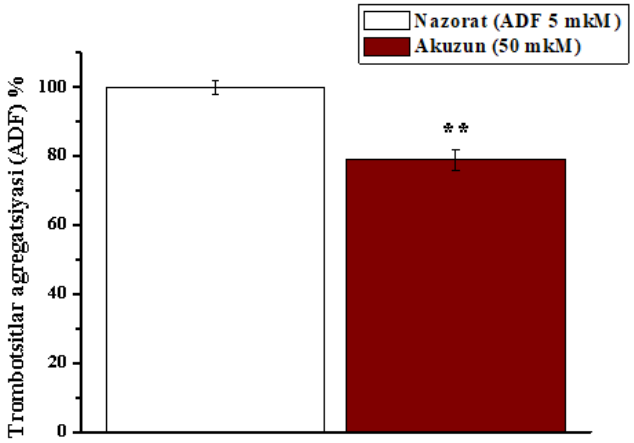


to‘ plangan ADF ajralib chiqishi va agregatsiyaning ikkinchi qaytmas to‘ lqinini xosil bo‘ lishiga olib keladi. ADF bilan bo‘ lgani kabi, agregatsiyaning bu ikkinchi to‘ lqini aspirin tomonidan ingibirlanadi. Adrenalin, ADF singari zaif agonist hisoblanadi.

Plazma tarkibiga ADF induktori qo‘ shilganida agregatsiya darajasi, (5-10 mkM) konsentratsiyalarda ikkilamchi ikki fazali egri chiziq shaklida qaytmas trombotsitlar agregatsiyasi 60-90% ekanligi kuzatildi. AK sharoitida esa ADF bilan chaqirilgan agregatsiya darajasi nazoratga nisbatan 10-15% yuqori ekanligi qayd etildi. (1-rasm)

Adrenalin induktori (5-10 mkM) konsentratsiyalarda ADF singari dozaga bog‘ liq ravishda trombotsitlar agregatsiyasini keltirib chiqaradi. Adrenalin ushbu konsentratsiyada trombotsitlarning qaytmas agregatsiyasini 45-70% keltirib chiqardi. AK sharoitida esa adrenalin bilan chaqirilgan agregatsiya darajasi nazoratga nisbatan 15-20% yuqori ekanligi qayd etildi (1-rasm).

Kollagen induktori (5-10 mkM) konsentratsiyalarda ADF singari dozaga bog‘ liq ravishda trombotsitlar agregatsiyasini 50-80% keltirib chiqaradi. Kollagen ushbu konsentratsiyada trombotsitlarning qaytmas agregatsiyasini keltirib chiqardi (1-rasm).

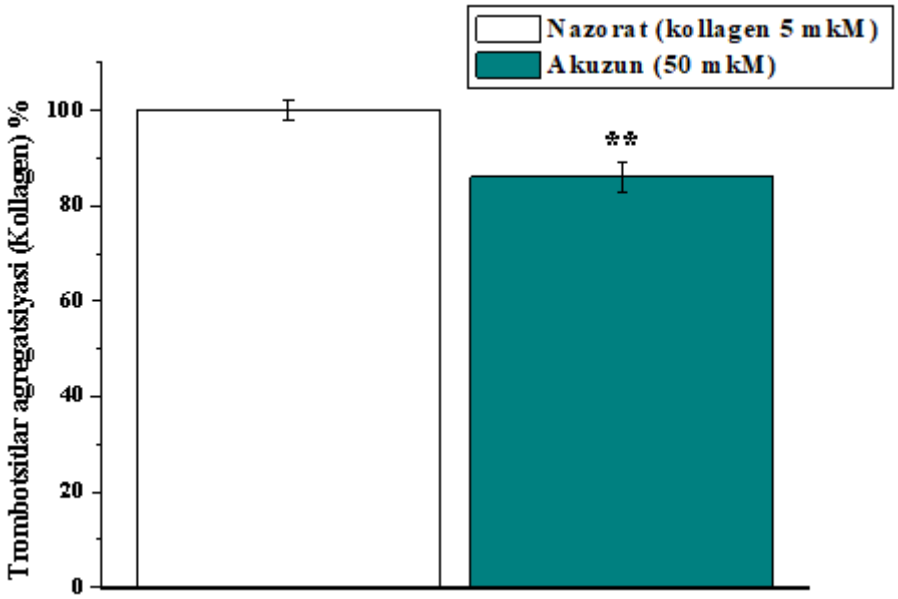


Ma’lumki kollagen 5-10 mkg/ml konsentratsiyalarda trombotsit hujayrasiga turlicha ta’sir ko‘ rsatadi. Kollagen GRVI va GRIa/IIa retseptorlari bilan bog‘ lanib, granulalar tarkibini xamda TXA2 yo‘ llarini qo‘ zg‘ atadi va keyin GPIIb-IIIa retseptorining barqaror xolatda faollashishiga olib keladi. GRIa/IIa retseptorlari trombotsitlar adgeziyasida ishtirok etadi. GRVI retseptorlari trombotsitlar signalizatsiyasi va TxA2 hosil bo‘ lishida ishtirok etadi. Kechikish bosqichi (Lag-faza) trombotsitga boy plazmaga kollagen qo‘ shilgandan so‘ ng, odatda 1 daqiqadan kamroq vaqt ichida hosil bo‘ ladi.

1-rasm. Sog‘ lom trombotsitlarining ADF, adrenalin va kollagen bilan chaqirilgan agregatsiyasining ko‘ rinishi (n=6).

Ma’lumki, trombotsitlar agregatsiyasining induktorlari (ADF, adrenalin va kollagen, trombotsitlarning faollashtiruvchi omillari) tromboksan A_2 ni hosil qilish yo‘ li bilan sitoplazmadagi Ca^{2+} miqdorini oshirib, trombotsitlarni faollashtirish xususiyatiga egadir. Xususan, ADF trombotsitlar agregatsiyasini chaqirish va erkin Ca^{2+} miqdorini oshirish xususiyatiga ega bo‘ lgan trombotsitlarning o‘ ziga xos aktivatorlaridan biri hisoblanadi.

Akuzun alkaloidi trombotsitlar agregatsiyasiga ta’sirini o‘ rganganimizda, ushbu alkaloid, trombotsitlarning agregatsiyasini qisman ingibirlashi aniqlandi (2-rasm). Rasmda ko‘ ringanidek, ADF 5 mkM bo‘ lgan sharoitda Akuzun alkaloidi 50 mkM konsentratsiyada 21%ga ADF bilan chaqirilgan trombotsitlar agregatsiyasini ingibirlashi kuzatildi (2-rasm).



2. Rasm. Akuzun alkaloidining trombotsitlarning ADF bilan indutsirlangan agregatsiyasiga ta’siri. Natijalar nazoratga nisbatan %da keltirilgan. Ishonchlilik darajasi.*- P<0,05; **- P<0,01; (*n*=6).

Ma’lumki, ADF trombotsitlar membranasi yuzasidagi P2Y1va P2Y12 retseptorlari bilan bog‘ lanib, uning shaklini o‘ zgarishiga olib kelishi orqali trombotsitlar agregatsiyasi yuzaga keladi, balkim adenilatsiklazani ingibirlashi orqali,

sAMF miqdorini susaytirishi va ichki depodan $[Ca^{2+}]_{in}$ chiqarilishini faollashtirishi orqali ta'sirga ega. Natijada sitoplazmaga Ca^{2+} ionlari chiqariladi. Akuzun alkaloidi ushbu ADF ta'sirida yuzaga keladigan trombotsitlar agregatsiyasini ingibirlanishi orqali trombotsitlar yuzasidagi P2Y1va P2Y12 retseptorlari ingibirlashi natijasida adenilatsiklazani ingibirlashini oldini olish orqali, sAMF miqdorini oshirishi va ichki depodan $[Ca^{2+}]_{in}$ chiqarilishini bloklashi mumkinligi extimolini ilgari suradi.

Keyingi tajribalarimizda Akuzun alkaloidining trombotsitlarning kollagen bilan chaqirilgan agregatsiyasiga ta'sirini o' rganganimizda, ushbu polifenollar, trombotsitlar agregatsiyasiga turlicha ta'sir etishi aniqlandi. Tajribalar davomida kollagen 5 mkM bo' lgan sharoitda Akuzun alkaloidi 50 mkM konsentratsiyada 14%ga ADF bilan chaqirilgan trombotsitlar agregatsiyasini ingibirlashi kuzatildi (3-rasm).

3. Rasm. Akuzun alkaloidini trombotsitlarning kollagen bilan indutsirlangan agregatsiyasiga ta'siri. Natijalar nazoratga nisbatan %da keltirilgan. Ishonchlilik darajasi.*- P<0,05; **- P<0,01. (*n*=6).

Yuqoridagi ma'lumotlardan ko' rinib turibdiki foydalanilgan Akuzun alkaloidi kollagen bilan chaqirilgan trombotsitlar agregatsiyasini sezilarli ingibirlashi orqali GPIa-Iib, GPVI retseptorlari bilan bog' lanishini va GPIb-V-IX retseptorlari bilan Villebrand omili orqali trombotsitlarni jadal tarzda faollashtirishini oldini olishi orqali ta'sirga ega ekanligini taxmin qilish imkonini beradi.

Akuzun alkaloidining gemostaz tizimiga ta' sirini geparin preparati bilan solishtirib o' rganganimizda ushbu alkaloid trombinga bog' liq qon ivish vaqtini 50mkM kontsentratsiyada Geparinga 130b/k kontsentratsiyada ta' sir etuvchi ivish vaqtini samarali uzaytirishiga olib keldi (1-jadval).

1-jadval.

Akuzun alkaloidi va geparinning gemostaz tizimiga solishtirma ta'siri.

№	Modda nomi	Trombin vaqti	QFTV-testi	Texplastin test	Trombotsitlar agregatsiyasi (ADF)
1	Nazoratda	25 (sek)	30 (sek)	26 (sek)	100%
2	Akuzun (50mkM)	68±2	55±3	46±4	21%
3	Geparin (130$^{b}/_{k}$)	62±5	52±4	38±3	15%

Olingan ushbu tajriba natijalari akuzun alkaloidi gemostaz tizimga ishonchli tarzda ta'sir etishini ko' rsatadi.

XULOSA

Akuzun alkaloidi ADF va kollagen tomonidan qo' zg' atilgan trombotsitlar agregatsiyasini bloklashi orqali trombotsitlar funksiyasiga sezilarli ta'sir ko' rsatadi. Bu ingibirlanish, ehtimol, trombotsitlarsiz xam Ca^{2+} darajasining pasayishi bilan bog' liq, chunki akuzun membrana bilan bog' langan Ca^{2+} konsentratsiyasini o' zgartiradi va faollashuv vaqtida sitozolik Ca^{2+} darajasining oshishiga yo' l qo' ymaydi.

ONALIK ILDIZMEVANI QISHGI SOVUQDAN SAQLAB QILISH VA UNING AXAMIYATI

Usmanov Omonali Turgunovich
Namangan davlat universiteti katta o‘ qituvchisi

Annotatsiya: *Bu maqolada qand lavlagining onalik ildizmevaning yashab qolishiga qanday omillar ta’sir qilishi to‘ g‘ risida gap boradi. Qand lavlagidan urug‘ hosili olishda onalik ildizmevani ekish muddatlari va ko‘ chat qalinligiga hamda qishga tayyorgarlik ko‘ rishga bevosita bog‘ liq bo‘ ladi. Onalik materiali olish uchun urug‘ ni erta muddatlarda (20.08) ekish qishgi sovuqda nobud bo‘ lishini eng kam (0.9 %) bo‘ lishi qishda onalik ildizmeva dalada tuproq bilan yopib saqlanganda ta’minlanadi.*

Kalit so‘ zlar: *onalik ildiz meva, urug‘ , ekish muddatlari ko‘ chat qalinligi, mineral o‘ g‘ itlar, agrotexnik tadbir, o‘ sish rivojlanishi , urug‘ xosldorligi.*

ЗАЩИТА МАТЕРИНСКОГО ДЕРЕВА ОТ ЗИМНИХ ХОЛОДОВ И ЕЁ ЗНАЧЕНИЕ

Аннотация: *В статье рассматриваются факторы, влияющие на сохранность маточных корнеплодов сахарной свёклы в зимний период. Получение семенного материала сахарной свёклы непосредственно зависит от сроков посадки маточных корнеплодов, густоты стояния растений, а также от их подготовки к зимнему периоду. Установлено, что при раннем сроке посева семян (20.08) для получения маточного материала обеспечивается наиболее высокая сохранность маточных корнеплодов в условиях зимних холодов. При этом уровень гибели растений составляет всего 0,9 %, что достигается при хранении маточных корнеплодов непосредственно в поле с укрытием их почвой в зимний период.*

Ключевые слова: *маточный корнеплод, семена, сроки посева, густота стояния растений, минеральные удобрения, агротехнические мероприятия, рост и развитие, урожайность семян.*

PRESERVING MOTHER ROOT CROPS FROM WINTER COLD AND ITS IMPORTANCE

Abstract: *This article examines the factors affecting the survival and preservation of mother root crops of sugar beet during the winter period. The production of sugar beet seed yield is directly dependent on the planting time of mother root crops, plant density, and their preparation for winter conditions. It was established that early sowing of seeds (20 August) for obtaining mother planting material ensures the highest survival rate of mother root crops under winter cold conditions. In this case, the mortality rate was only 0.9%, which was achieved by storing the mother root crops directly in the field and covering them with soil during the winter period.*

Keywords: *mother root crop, seeds, sowing dates, plant density, mineral fertilizers, agrotechnical practices, growth and development, seed yield.*

Qishloq xo‘ jaligida ekinlardan yuqori va sifatli hosil olishning bosh omili urug‘ hisoblanadi. Urug‘ qanchalik sifatli bo‘ lsa hosil olish uchun o‘ tkaziladigan agrotexnik tadbirning samarasi yuqori bo‘ lishiga erishiladi. Bugungi kunda dunyo aholi sonini ortib borishi mavjud erlardan foydalanish samaradorligini oshirishni talab etadi. Buning uchun gektar hisobidan olinayotgan hosil salmog‘ ini muttasil oshirib borish, shu bilan birgalikda ularni sifatini yuqori bo‘ lishiga erishish muhimdir. Respublikamizda ham aholi soni ortib borar ekan ularni oziq-ovqat mahsulotlariga bo‘ lgan talabi ortib boradi. YUqorida keltirilgan fikrlar asosida, hozirgi kungacha dolzarb masalalardan biri bo‘ lib kelayotgan bug‘ doydan bo‘ shagan maydonlardan samarali foydalanish ya’ni, takroriy ekinlarni ekish, ekkanda ham hosili yuqori bo‘ lganini ekishga katta ahamiyat berilmoqda. Bunday ekinlar orasida qand lavlagi ham bo‘ lib, uning hosildorligi 1000 s/ga ga etadi, shuning bilan uni sanoatda qayta ishlashi bilan ham xarakterlidir.

Qand lavlagi O‘ zbekiston sharoitida birinchi marotaba o‘ tgan asrning 40-50-yillarida ekib o‘ stirilgan bo‘ lsada ilmiy-tatqiqot ishlari (Golodkovskiy va Belousovlargina) kam olib borilgan. Ammo urug‘ chilik bilan umuman shug‘ ullanilmagan. Qand lavlagini ekish kerak bo‘ lgan maydonlarga ekiladigan urug‘ lik materiallari chetdan olib kelingan. Bugungi kunda esa qand lavlagi urug‘ ini o‘ zimizni iqlimimizga mos bo‘ lgan navlari o‘ zimizda etishtirishni

yo‘ lga qo‘ yish dolzarb bo‘ lib turibdi. Alohida ta’kidlab o‘ tish kerakki, qand lavlagi ikki yillik o‘ simlik bo‘ lganligi sababli birinchi yili ildizmeva hosili olinadi, ikkinchi yili ildizmeva ekilib urug‘ hosili olinadi.

Qand lavlagidan urug‘ hosili olish uchun dunyoda ko‘ p tadqiqotlar olib borilgan va olib orilmoqda. Hozirgi davrda dunyo miqyosida ro‘ y berayotgan global o‘ zgarishlar o‘ zining yuksak taraqqiyotiga olib kelayotgan ijobiy natijalari bilan birga tabiiy jarayon va xodisalarda ham salbiy o‘ zgarishlarni keltirib chiqarmoqda. Bu esa o‘ z navbatida yana tabiatga murojaat qilishni, undan oqilona foydalanish, tabiat boyliklarini asrab-avaylash va o‘ rganishni talab qiladi [7; 129-136-b.].

Ko‘ pgina chet ellik olimlarning [8; 3-6-b., 9; 47-56-b.] ma’lumotlariga qaraganda almashlab ekishda oziqa moddalarini energetik balansini yaratishda foydalanilgan metodlarni samarasi aniqlangan. Bu balans ularning ishlarida ijobiy bo‘ lgani aniqlangan. O‘ g‘ itlardan uzoq muddat ilmiy asosda foydalanilganda ekinlar hosili ishonarli ortgan. Bunda qizil yo‘ ng‘ ichqa arpa bilan qoplama usulda ekilgan erda qoladigan ang‘ iz va ildiz qoldig‘ i har gektarda 13,1-15,4 tonnaga teng bo‘ lganligi kuzatilgan.

P.V.Prudnikov, S.P.Prudnikov tadqiqotlarida [5; 17-b.] organik o‘ g‘ itlardan foydalanmagan holda, hosildorlik 34,5 t/ga, 24 t/ga go‘ ng solinganda - 35,2 t/ga va 1 gektarga 48 t organik o‘ g‘ it-go‘ ng dozasida 37,1 t/ga ildizmeva hosili olingan. SHunday qilib, hosilning sezilarli o‘ sishi organik o‘ g‘ it me’yorini ikki marotaba oshirilgan dozada kuzatildi.

G.N.CHerkasovning [6; 10-14-b.] ma’lumotiga ko‘ ra, tuproq unumdorligi o‘ g‘ it qo‘ llamaslik hisobiga kamayishiga va aksincha azotli, fosforli va kaliyli o‘ g‘ itlarni qo‘ llash tuproq tarkibidagi oziqa moddalar miqdorini saqlab qolishga olib keladi. SHu bilan birgalikda qand lavlagini 15 t/ga ildizmeva hosili olishni ta’minlaydi.

YUqoridagilardan kelib chiqib biz tadqiqotlarni quyidagicha 1-jadvaldagidek o‘ tkazishni rejalashtirdik.

Urug‘ lik olish uchun onalik ildizmevani o‘ stirishda har bir variant eni –4,8 m, uzunligi – 50 m, umumiy maydoni – 240 m^2. Tajriba 10 variant 4 takrorlanishda bo‘ lib, har bir variantning umumiy maydoni 960 m^2, tajribaning umumiy maydoni esa 9660 m^2ni tashkil etadi.

Tajribada mineral o‘ g‘ itlardan ammiakli selitra (34% N), mochevina (46% N), superfosfat (17-20% P_2O_5) va kaliy xloridi (51-60% K_2O) qo‘ llaniladi.

Tajriba o‘ tkazish, fenologik kuzatuv, tuproq va o‘ simlik namunalari olish «Metodika polevых opытov» (Dospexov, [4; 486-b.]), «Metodika Gosudarstvennogo sorta ispытaniya selskoxozyaystvennых kultur» [2; 24-b.] va «Dala tajribalarini o‘ tkazish uslublari» [3; 147-b.] qo‘ llanmalariga asosan o‘ tkaziladi.

Biz tajribada onalik ildizmeva olish uchun ekilgan qand lavlagi urug‘ i unib chiqishi va ko‘ chat qalinligini hisobga oldik. Unga ko‘ ra urug‘ larni unib chiqishi o‘ rganilganda eng yaxshi ko‘ rsatgich birinchi muddatda (20.08) ekilgan 2-3 variantlarda kuzatildi. Bu variantlarda unib chiqish lavlagi urug‘ i ekilgan kundan keyin 4-kuni boshlangan, unib chiqish 4 kun ichida tugab, me’yordagi ko‘ chat qalinligiga erishilgan. Keyingi muddatda (30.08) ekilganda unib chiqish oldingi ekish muddatdagidan biroz farq qildi, unga ko‘ ra unib chiqishda farq sezilmagan bo‘ lsada, unib chiqish davomiyligi oldingi muddatdan bir kun ko‘ p davom etdi. 10.09 kunda (uchinchi muddatda) ekilganda unib chiqish urug‘ ekilgan kundan keyin 5-kuni unib chiqish boshlanib, 5 kunda to‘ liq unib chiqishga erishildi. Oxirgi ekish muddatida esa unib chiqishda biroz qiyinchiliklar bo‘ ldi. Havoning keskin pasayishi urug‘ ni unib chiqish muddatiga ta’sir ko‘ rsatib, u 7 kunigina dastlabki o‘ simtalarni ko‘ rinishini ta’minladi va unib chiqish davomiyligi 7 kunga etdi. Natijada olingan o‘ simliklar nimjon, bir tekis hosil bo‘ lmadi.

1-jadval

Tajriba tizimi

Var.	Ekish usuli	Ekish muddati	Ildizmevani qishda saqlash usuli
1	Oddiy (qand lavlagi onalik ildizmevasi ekiladi)		Qishda onalik ildizmeva omborda saqlanadi
2	YAngi usul (Onalik ildizmeva olish uchun urug‘ ekiladi)	20.08	Qishda onalik ildizmeva dalada saqlanadi
3			Qishda onalik ildizmeva dalada tuproq bilan yopib saqlanadi
4		30.08	2-variantdagi kabi
5			3-variantdagi kabi
6		10.09	2-variantdagi kabi
7			3-variantdagi kabi
8		20.09	2-variantdagi kabi
9			3-variantdagi kabi

Tajriba olib borishda variantlarda ko‘ chatlarning tekis bo‘ lishiga erishishiga ekish muddatlarini ta’sirini ham o‘ rgandik. SHu bilan birgalikda o‘ simtalarni qishlovdan keyin saqlanib qolganlarini aniqladik. Bunda ularni saqlab

qolish uchun o‘ tkazilgan agrotexnik tadbirni (ildizmevani usti tuproq bilan o‘ ralganini ta’siri) ta’sirini o‘ rgandik. Bu ma’lumotlarni quyidagi 2-jadvaldan ham ko‘ rishimiz mumkin.

Ekish muddatlarini erta bo‘ lishligi ko‘ chatlarni bir tekis, baquvvat bo‘ lishini ta’minlaydi. Bu qishlov davrida o‘ simliklarni nobud bo‘ lishini kamayishiga olib keladi. Bizni tajribamizda ham qand lavlagi ildizmevasi keyingi yili urug‘ olish uchun o‘ stirilganda qishlovga kirishidan oldin ko‘ chat qalinligi aniqlandi. Unga ko‘ ra ekish muddatlari erta qilib belgilangan (20.08 va 30.08) muddatlarda hosil bo‘ lgan ko‘ chat qalinliklari nisbatan yuqori ekanligi kuzatildi. Bunda 54.0 ming donadan 54.5 ming donagacha bo‘ lganligi aniqlandi. Qolgan ekish muddatlari kech (10.09 va 20.09) bo‘ lganida bu ko‘ rsatgich mos ravishda 52.4 va 53.8 ming donani tashkil etdi.

2-jadval

Tajriba variantlarida qand lavlagining xaqiqiy ko‘ chat qalinligi, ming dona hisobida

Var.	Ekish usuli	Ekish muddati	Ildizmevani qishda saqlash usuli	Qishlovdan oldingi ko‘ chat qalinligi	Qishlovdan keyingi ko‘ chat qalinligi	Nobud bo‘ lgan ko‘ chat soni
1	Oddiy (qand lavlagi onalik ildizmevasi ekiladi)		Qishda onalik ildizmeva omborda saqlanadi			
2	YAngi usul (Onalik ildizmeva olish uchun urug‘ ekiladi)	20.08	Qishda onalik ildizmeva dalada saqlanadi	54	51.2	2.8
3			Qishda onalik ildizmeva dalada tuproq bilan yopib saqlanadi	54	53.1	0.9
4		30.08	2-var. kabi	54.5	50.1	4.4
5			3-var. kabi	54.2	53.2	1.0
6		10.09	2-var. kabi	53.8	49.2	4.6
7			3-var. kabi	53.6	52.3	1.3
8		20.09	2-var. kabi	52.3	46.8	5.5
9			3-var. kabi	52.4	48.1	4.3

Erta bahorda qishlovdan keyin dalada variantlar bo‘ yicha xaqiqiy ko‘ chat qalinligini aniqlaganimizda kech muddatda ya’ni, 20.09 da ekilgan va ildizmeva dalada oddiy usulda qoldirilganda eng ko‘ p ko‘ chat nobud bo‘ lganligini kuzatamiz. Bunda oddiy usulda qoldirilganda 5.5 ming dona, usti tuproq bilan yopilganda 4.3 ming dona ko‘ chat nobud bo‘ lgan. Eng kam ko‘ chat nobud bo‘ lgan variant 20.08 va 30.08 da ekilib, usti tuproq bilan yopilgan variantlarda erishilib, bor-yo‘ g‘ i mos ravishda 0.9 va 1.0 ming dona ko‘ chatlar nobud bo‘ lgan xolos.

Xulosa qilib shuni aytish mumkinki, Farg‘ ona vodiysi sharoitida qand lavlagidan urug‘ olish uchun tayyorlanadigan onalik ildizmevani avgust oyining yigirmanchi va o‘ ttizinchi kunlarida ekish va ularga sovuq kam ta’sir qilishi uchun tuproq bilan ko‘ mib qo‘ yish lozim. Bunda ko‘ chatlarni nisbatan kam sovuq urishiga olib keladi. Bunda bir gektar maydonda o‘ rtacha 0.9-1.0 ming dona ko‘ chat nobud bo‘ lishiga olib keldi.

Annotatsiya: *Mazkur tadqiqotda xududining shimoliy va janubiy ekspozitsiyadan olingan tuproq namunalari ularning mikromorfologik xususiyatlarida o‘ xshash va farqli jihatlar mavjudligi ko‘ rsatilgan. Har ikki ekspozitsiya tuproqlarida ignasimon va radial morfologiyali mineral agregatlar, polidispers zarrachalar hamda mikroagregatli struktura shakllanganligi aniqlangan. Ekspozitsiyalarning harorat, namlik rejimi, tuproq tarkibidagi organik moddalar bilan bog‘ liq bo‘ lib, tuproq hosil bo‘ lish jarayonlarining turlicha ekanligi sababli gumusga boy bo‘ lgan shimoliy ekspozitsiya tuproqlarida agregatlarning nisbatan yaxshi rivojlanganligi, g‘ ovaklik tizimining aniq ifodalanishi va zarrachalarning bir tekis joylashganligi kuzatilgan, kamgumusli janubiy ekspozitsiya tuproqlarida mayda dispersli zarrachalar va kam agregatlangan mikrotuzilmalar ustunlik qilishi aniqlangan. Elektron mikroskopiya SEM usuli tuproqlarning mikromorfologik holatini baholashda yuqori samarali tadqiqot usuli ekanligini ko‘ rsatdi.*

ИЗМЕНЕНИЕ МИКРОМОРФОЛОГИЧЕСКОЙ СТРУКТУРЫ ГОРНЫХ ПОЧВ В ЗАВИСИМОСТИ ОТ СЕВЕРНОЙ И ЮЖНОЙ ЭКСПОЗИЦИИ СКЛОНОВ.

Аннотация. *В данном исследовании представлены результаты изучения почвенных образцов, отобранных на северной и южной экспозициях исследуемой территории, и выявлены как сходства, так и различия в их микроморфологических характеристиках. Установлено, что почвы обеих экспозиций характеризуются наличием минеральных агрегатов игольчатой и радиально-лучистой морфологии, полидисперсных частиц и развитой микроагрегатной структуры. Выявленные различия обусловлены особенностями температурного и водного режимов экспозиций, содержанием органического вещества в почве и спецификой процессов почвообразования. В почвах северной экспозиции, отличающихся более высоким содержанием гумуса, наблюдаются лучше развитые агрегаты, более выраженная система пор и равномерное распределение частиц. В то же время для малогумусных почв южной экспозиции характерно преобладание тонкодисперсных частиц и слабо агрегированных микроструктур. Результаты исследования показали, что метод сканирующей электронной микроскопии (SEM) является высокоэффективным инструментом для оценки микроморфологического состояния и структурных особенностей почв.*

Ключевые слова: *почва, микроморфология, педогенез, генезис почв, агрегаты, пористость, минеральный состав, гумус.*

ASSESSMENT OF MICROMORPHOLOGICAL CHARACTERISTICS OF MOUNTAIN SOILS ACROSS NORTHERN AND SOUTHERN SLOPE ASPECTS

Abstract. *This study examines soil samples collected from the northern and southern slope aspects of the study area and reveals both similarities and differences in their micromorphological characteristics. The results showed that soils from both slope aspects contain needle-shaped and radially arranged mineral aggregates, polydisperse particles, and well-developed microaggregate structures. The observed differences are associated with variations in temperature and moisture regimes, as well as the content of organic matter, which influence soil-forming processes. The humus-rich soils of the northern slope aspect exhibited relatively better-developed aggregates, a more distinct pore system, and a more uniform distribution of particles. In contrast, the humus-poor soils of*

the southern slope aspect were characterized by the predominance of fine-dispersed particles and weakly aggregated microstructures. The application of Scanning Electron Microscopy (SEM) demonstrated its high efficiency as a research tool for assessing the micromorphological properties and structural features of soils.

Keywords: *soil, micromorphology, pedogenesis, soil genesis, aggregates, porosity, mineral composition, humus.*

MAVZUNING DOLZARBLIGI.

Tuproq tabiatning muhim tarkibiy qismi hisoblanib, o‘ simliklar o‘ sishi va rivojlanishi uchun asosiy muhit hisoblanadi. Tuproqning barcha xossa va xususiyatlari uning ichki tuzilishiga bevosita bog‘ liq bo‘ ladi. Tuproq tuzilishini faqat makroskopik darajada emas, balki mikroskopik darajada ham o‘ rganish muhim ahamiyatga ega. Tuproqda mikromorfologik izlanish olib borishda tuproqning shakllanish jarayonlari, tarkibi va xususiyatlarini mikroskop yordamida tadqiq qilish imkonini beradi.

Tuproqning mikromorfologik tuzilish unda kechayotgan ichki jarayonlar va tuproq qattiq fazasining tuzilishi, mineral zarrachalar, ular orasidagi g‘ ovakliklarni tuzilishi ularni organik va mineral birikmalar bilan bog‘ liqligi ko‘ rsatadi. Shu bilan birga bu izlanish tuproqning genezisi, agrofizikasi, biologik va fizik kimyoviy xossalariga tegishli xususiyatlarini o‘ zida namayon etadi.

Tuproq mikromorfologiyasi orqali tuproqning yupqa namunalarida mikroskop yordamida uning tarkibiy elementlari va pedogen jarayonlar natijasida shakllangan belgilarini kuzatish mumkin. Mazkur usul orqali tuproq hosil bo‘ lishi qonuniyatlarini o‘ rganish unda kechadigan fizik, kimyoviy va biologik jarayonlar haqida aniq ma’lumotlar olish xossalarini baholash, tuproq genezisiga baho berish va uning agroekologik holatini o‘ rganish dolzarb hisoblanadi.

O‘ RGANILGANLIK DARAJASI.

Tuproq mikromorfologiyasini o‘ rganish bo‘ yicha ilmiy tadqiqotlar XX asrning ikkinchi yarmidan boshlab rivojlangan bo‘ lib, so‘ nggi o‘ n yilliklarda skanerlovchi elektron mikroskopiya (SEM) usuli keng qo‘ llanilmoqda.

Tuproq mikromorfologiyasi bo‘ yicha xorijiy olimlardan Georges Stoops, Eric A. FitzPatrick va boshqa tadqiqotchilar tomonidan tadqiqotlar olib borilgan. G. Stoops tomonidan fundamental tadqiqotlarini belgiyalik olim olib borgan bo‘ lib, u tuproqning yupqa kesmalarini tahlil qilish orqali pedogen jarayonlarni aniqlash metodologiyasini takomillashtirgan. Uning tadqiqotlarida tuproq strukturasi, plazma va skelet elementlari, g‘ ovaklar tizimi hamda yangi hosil bo‘ lgan mineral birikmalarning morfologik xususiyatlari batafsil yoritib berilgan.Uning «Guidelines for Analysis and Description of Soil and Regolith Thin Sections» asari tuproq yupqa kesmalarini tavsiflash va tahlil qilish bo‘ yicha xalqaro standart sifatida e’tirof etilgan.

P.Castillo, M.F.Albornoz, O.Crovo, A.Atenas, C.I.Czimczik, R.Southard, F.Aburto tadqiqotlarida Chilining janubi-markaziy hududlarida mahalliy Nothofagus o‘ rmonlarining qarag‘ ay plantatsiyalariga aylantirilishi natijasida tuproqning fizik-kimyoviy va mineralogik xususiyatlari o‘ zgarishi tahlil qilingan. Tadqiqot natijalari tuproqdagi organik moddalarning barqarorlashuvi mineral tarkib bilan chambarchas bog‘ liqligini hamda o‘ rmonlarning plantatsiyalarga aylantirilishi tuproqning chuqur qatlamlarigacha salbiy ta’sir ko‘ rsatishini tasdiqlaydi. [1]

Mahalliy Nothofagus o‘ rmonlarining qarag‘ ay plantatsiyalariga aylantirilishi natijasida tuproqning fizik-kimyoviy va mineralogik xususiyatlarida sezilarli o‘ zgarishlar kuzatilgani aniqlangan [2].

Titan eritish zavodi hududidagi tuproqlarda potentsial zaharli elementlar (PTE)ning tarqalishi va geokimyoviy xususiyatlari baholangan. Natijalar titan eritish jarayoni tuproqning kuchli kislotalanishiga (pH 2,75–5,52), mineral fazalarning parchalanishiga hamda Ti bilan bog‘ liq ilmenit, barit va gips minerallarining to‘ planishiga olib kelganini ko‘ rsatdi [3].

Namibiyaning Otavi tog‘ lari etaklaridagi yarim qurg‘ oqchil tropik hudud tuproqlarida pedoxilma-xillikning shakllanish omillarini baholashga qaratilgan ish. mineralogik, mikromorfologik va geokimyoviy tahlillar natijasida tuproq xususiyatlari asosan litologiya, pedogenez davomiyligi, mikrorelyef va gidrologik rejim bilan bog‘ liqligi aniqlangan. [4].

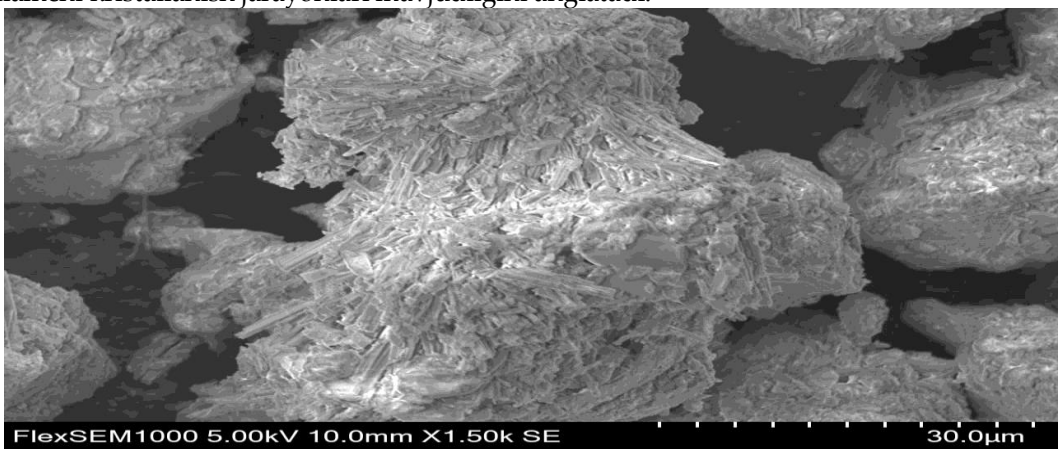
O‘ zbekistonda ham tuproqlarning mikromorfologik xususiyatlarini o‘ rganish bo‘ yicha qator ilmiy ishlar amalga oshirilgan. Bu yo‘ nalish asoschilari sifatida nemis olimi V.Kubiena, B.B.Polinov, O‘ zbekistonda P.A.Marozova, G.E.Pevushevskaya (1976), X.X.Tursunov (1970), D.R.Ismatov (1989) kabi olimlarning ishlari taqsinga loyiq hisoblanadi.

Adabiyotlar tahlili shuni ko‘ rsatadiki, tuproq mikromorfologiyasini SEM va EDS texnologiyalari asosida o‘ rganish tuproq hosil bo‘ lish jarayonlari, mikroagregatlar shakllanishi va elementlarning taqsimlanish qonuniyatlarini aniqlashda yuqori samaradorlikka ega. Shu bilan birga, O‘ zbekiston tuproqlarini mazkur zamonaviy usullar yordamida kompleks tadqiq qilish bo‘ yicha ilmiy tadqiqotlar yetarli emas. Bu esa ushbu yo‘ nalishda ayniqsa tog‘ va tog‘ oldi xududlarida shu kabi tadqiqotlar olib borish zarur hisoblanadi.

TADQIQOT OB’EKTI VA USULLARI.

Tuproqning mayda zarrachalari, g‘ ovaklari va agregatlarining mikroskopik darajadagi tuzilishini o‘ rganish muhim ahamiyatga ega. Tuproqlarning mikromorfologik tuzilishini o‘ rganish uchun tuproq namunalari olinadi va laboratoriyada preparatlar tayyorlanadi va Skanerlovchi elektron mikroskopiya (SEM) va energodispersion spektroskopiya (EDS) usullari asosida o‘ rganildi.

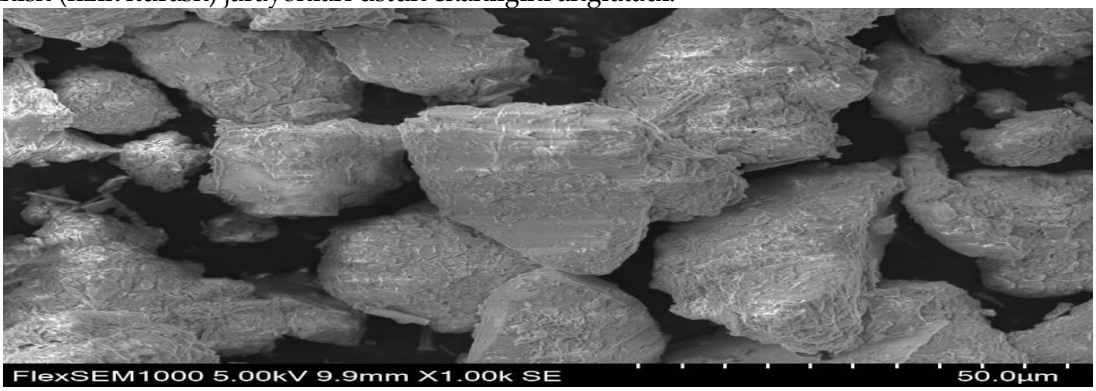
Chotqol davlat biosfera qo‘ riqxonasida tarqalgan tog‘ jigarrang tuproqlardan 2 xil bir biridan keskin farq qiluvchi shimoliy va janubiy ekspozitsiyalaridan tadqiqot uchun namunalari olindi va skanerlovchi elektron mikroskopiya (SEM) va energodispersion spektroskopiya (EDS) usullari taxlili o‘ tkazildi.



NATIJA VA MUXOKAMA.

Chotqol davlat biosfera qo‘ riqxonasinig shimoliy ekspozitsiyadan olingan tuproq namunalarida skanerlovchi elektron mikroskopiya (SEM) va energodispersion spektroskopiya (EDS) usullari yordamida morfologik va elementar tarkibi tahlil qilindi.

Olingan tasvirlar tuproq zarrachalarining yuqori darajada geterogen va agregatlangan strukturaga ega ekanligini ko‘ rsatdi. Zarrachalar turli morfologik tuzilishda — ignasimon, plastinkasimon va noaniq shaklli agregatlar ko‘ rinishida bo‘ lib, bu holat mineralogik tarkibning murakkabligini va tabiiy geologik jarayonlar ta’sirida shakllanganligini anglatadi.

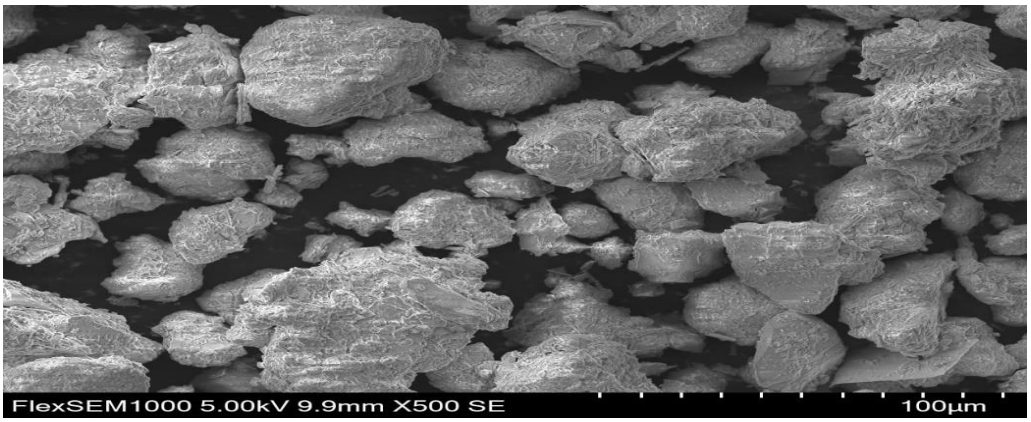


Mikromorfologik tahlil tuproqning ichki tuzilishi haqida muhim ma’lumotlar hisoblanib, tuproqning mikrostrukturasi agregatlar shakli, o‘ lchami va ularning joylashishi bilan tavsiflanadi. Agregatlarning shakllanishi gumus, loy minerallari va mikroorganizmlar faoliyati bilan bog‘ liq.

Chotqol tog‘ tizmasining shimoliy qismida olingan tuproq namunalarining SEM tahlillari ularning morfologik va geokimyoviy jihatdan murakkab, polimineral tizim ekanligini ko‘ rsatdi. SEM tasvirlarda zarrachalarning burchakli, agregatlangan va turli o‘ lchamli ekanligi aniqlanib, bu ularning asosan mexanik nurash jarayonlari ta’sirida shakllanganini tasdiqlaydi. Zarrachalar yuzasidagi yoriqlar va nohamvor tekstura tuproqning yuqori reaksion yuzaga ega ekanligini ko‘ rsatadi. Yuqori kattalashtirishda (×1.50k) kuzatilgan ignasimon va nursimon (radial) mikrostrukturalar minerallarning ikkilamchi kristallanish jarayonlari mavjudligini anglatadi.

1-rasm. Shimoliy ekspozitsiya tuproq namunasida ignasimon va radial mikrostrukturali mineral agregatlar (SEM tasvir, ×1.50k)

Chotqol tog‘ tizmasining shimoliy qismida olingan tuproq namunalarining SEM tasvirlari va EDS tahlillari ularning morfologik va geokimyoviy jihatdan ko‘ p komponentli, poligenetik tizim ekanligini ko‘ rsatdi. Turli kattalashtirishlarda olingan SEM tasvirlar zarrachalarning asosan burchakli–subburchakli, agregatlangan va nohamvor yuzali ekanligini namoyon qildi. Zarrachalar o‘ lchami keng diapazonda (taxminan 10–100 mkm) o‘ zgarib, bu tuproqda mexanik parchalanish (fizik nurash) jarayonlari ustun ekanligini anglatadi.

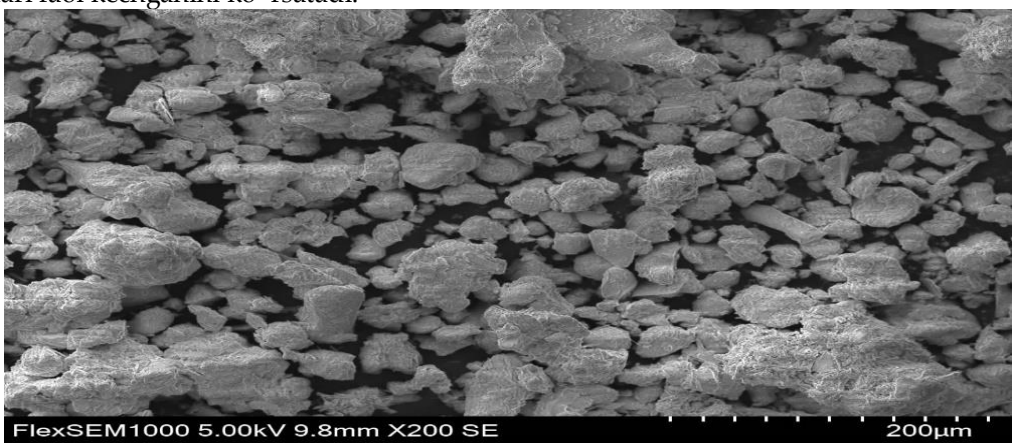


2-rasm.Shimoliy ekspozitsiya tuproq namunasida burchakli va agregatlangan zarrachalar morfologiyasi (SEM tasvir, ×1.00k)

SEM tasvirlarda zarrachalarning asosan burchakli–subburchakli, turli o‘ lchamli (10–100 mkm) va agregatlangan holatda ekanligi aniqlandi. Bu esa tuproq shakllanishida mexanik nurash jarayonlari ustunligini va materialning asosan mahalliy (avtoxton) manbaga ega ekanligini ko‘ rsatadi.

Yuqori kattalashtirishda kuzatilgan ignasimon va radial mikrostrukturalar tuproqda ikkilamchi minerallar asosan karbonat (kalsit) va ehtimolan sulfat (gips) birikmalarining shakllanganligini anglatadi. Bu holat tuproq eritmasidagi elementlarning migratsiyasi va qayta kristallanish jarayonlari mavjudligini tasdiqlaydi. Zarrachalar yuzasidagi nohamvorlik va mikroyoriqlar esa tuproqning yuqori sorbsion faolligi va reaksion yuzasi katta ekanligini ko‘ rsatadi.

Yuqori kattalashtirishda kuzatilgan ignasimon va radial mikrostrukturalar ikkilamchi minerallar (asosan kalsit va ehtimolan gips) shakllanganligini ko‘ rsatib, tuproqda qayta kristallanish va elementlar migratsiyasi jarayonlari mavjudligini anglatadi.



3-rasm. Shimoliy ekspozitsiya tuproq namunasida turli o‘ lchamli va geterogen agregatlar tuzilishi (SEM tasvir, ×500)

Chotqol tog‘ tizmasining shimoliy qismida olingan tuproq namunalarini SEM–EDS usullari orqali kompleks tahlil qilish natijalari ularning ko‘ p fraksiyali, polimineral va geterogen tuzilishga ega ekanligini ko‘ rsatdi. SEM tasvirlarda zarrachalarning keng o‘ lcham diapazonida (maydadan yirikkacha) tarqalgani, asosan burchakli–subburchakli shaklda va agregatlangan holatda ekanligi aniqlandi. Bu esa tuproq shakllanishida mexanik nurash jarayonlari ustunligini va materialning asosan mahalliy (avtoxton) manbaga ega ekanligini ko‘ rsatadi.

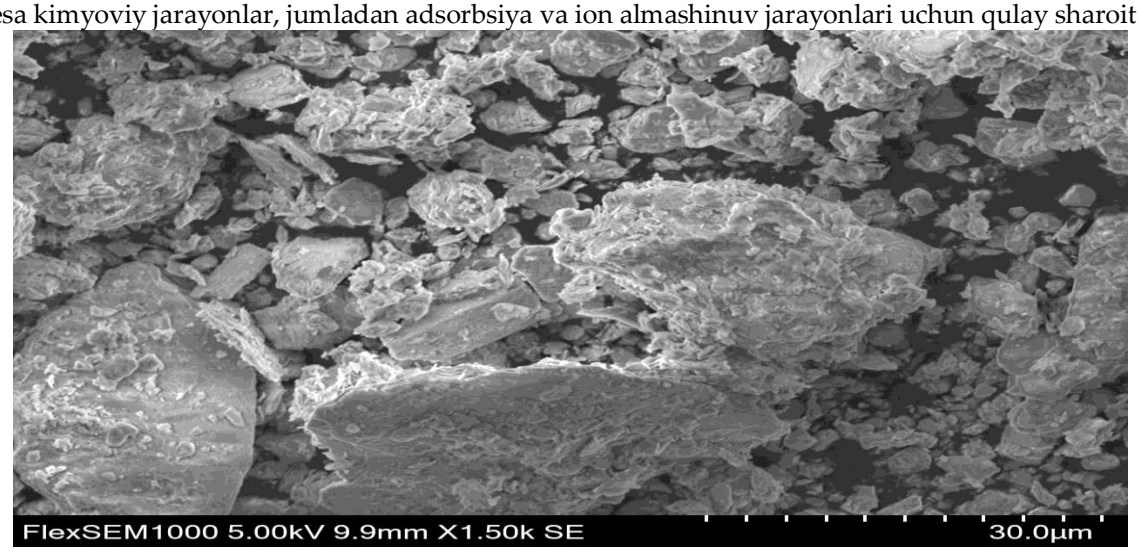
Yuqori va o‘ rta kattalashtirishlarda kuzatilgan: nohamvor va yoriqli yuzalar,

ignasimon va radial mikrostrukturalar, tuproqda ikkilamchi minerallar - asosan karbonat (kalsit) va ehtimolan sulfat (gips) birikmalarining shakllanganligini anglatadi. Bu esa tuproq eritmasida elementlar migratsiyasi va qayta kristallanish jarayonlari faol kechganini ko‘ rsatadi.

4-rasm. Shimoliy ekspozitsiya tuproq namunasida mayda fraksiyali va polidispers zarrachalar tuzilishi (SEM tasvir, ×200)

Shimoliy ekspozitsiya sharoitida namlikning nisbatan yuqori bo‘ lishi kimyoviy jarayonlarni (ayniqsa qayta kristallanish) ma’lum darajada faollashtirgan bo‘ lsada, mexanik nurash ustunligini saqlab qolgan. Natijada tuproqda: birlamchi silikat minerallar, ikkilamchi karbonat va sulfat minerallar birgalikda uchraydigan kompleks geokimyoviy tizim shakllangan. SEM tasvirlarda zarrachalarning burchakli–subburchakli, turli o‘ lchamli (maydadan yirikgacha) va agregatlangan holatda ekanligi aniqlanib, bu tuproq shakllanishida mexanik nurash jarayonlari ustunligini va

materialning avtoxton kelib chiqishga ega ekanligini tasdiqlaydi. Zarrachalar yuzasidagi nohamvorlik, mikroyoriqlar va ayrim ignasimon mikrostrukturalar ikkilamchi minerallar (asosan karbonat va ehtimolan sulfat birikmalar) shakllanganligini ko‘ rsatadi. Bu esa tuproqda qayta kristallanish va elementlar migratsiyasi jarayonlari mavjudligini anglatadi.

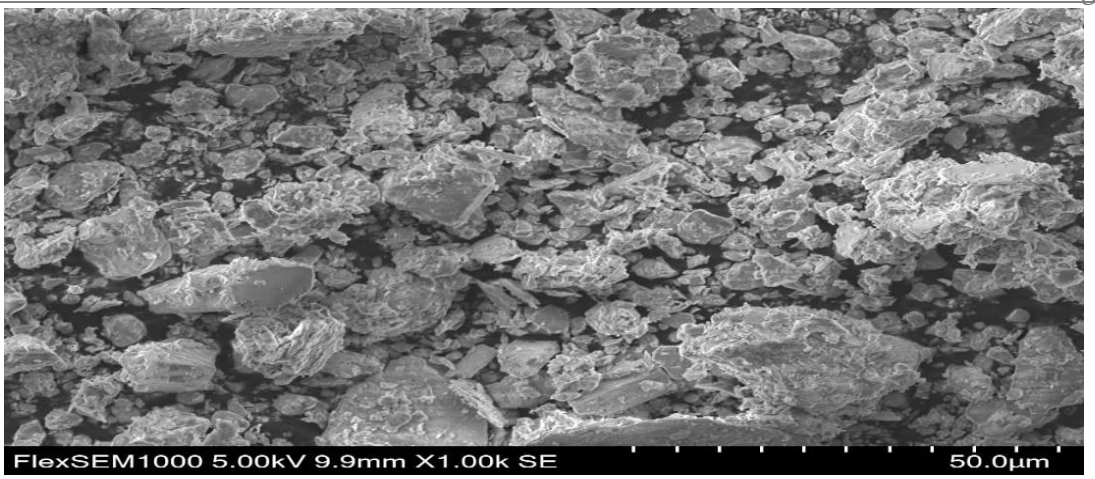


Berilgan qo‘ shimcha SEM tasvir Chotqol tog‘ tizmasining shimoliy qismidagi tuproq namunalarida kuzatilgan mikromorfologik xususiyatlarni yanada chuqurroq tasdiqlaydi. Tasvirda zich agregatlangan massa ichida keng tarqalgan ignasimon va tolasimon (fibrous) mikrostrukturalar aniq ko‘ rinadi. Bu strukturalar odatda ikkilamchi minerallar — ayniqsa karbonat (kalsit) va sulfat (gips) kristallariga xos bo‘ lib, ularning tuproq muhitida qayta kristallanish orqali shakllanganini ko‘ rsatadi

Mikrostrukturaning nursimon (radial) kristallar to‘ plami, plastinkasimon va qatlamli elementlar, hamda zich mineral matritsa bilan bog‘ langan agregatlar ko‘ rinishi tuproqda bir vaqtning o‘ zida bir necha mineralogik fazalar mavjudligini, ya’ni uning polimineral va geterogen tabiatini tasdiqlaydi. Bu holat quyidagi jarayonlarning mavjudligini ko‘ rsatadi: elementlar migratsiyasi (ayniqsa Ca, S va boshqalar), erigan moddalarning qayta cho‘ kishi (presipitatsiya), ikkilamchi minerallar kristallanishi. Shimoliy ekspozitsiya sharoitida namlikning nisbatan yuqoriligi va barqaror mikroiqlim ta’sirida ushbu kimyoviy jarayonlar faol kechadi. Shu bilan birga, avvalgi tasvirlarda kuzatilgan burchakli mineral zarrachalar mexanik nurash ustunligini ko‘ rsatgan bo‘ lsa, mazkur tasvir kimyoviy jarayonlar ham muhim rol o‘ ynayotganini aniq namoyon etadi.

Yuqoridagi natijalar asosida aytganimizda barcha SEM–EDS tahlillarini umumlashtirgan holda, Chotqol tog‘ tizmasining shimoliy qismi tuproqlari silikat–karbonat–sulfat tipga mansub, avtoxton kelib chiqishga ega, mexanik (fizik) va kimyoviy nurash jarayonlari birgalikda kechgan, ikkilamchi minerallar (kalsit, gips) faol shakllangan, yuqori sorbsion va buferlik xususiyatlarga ega.

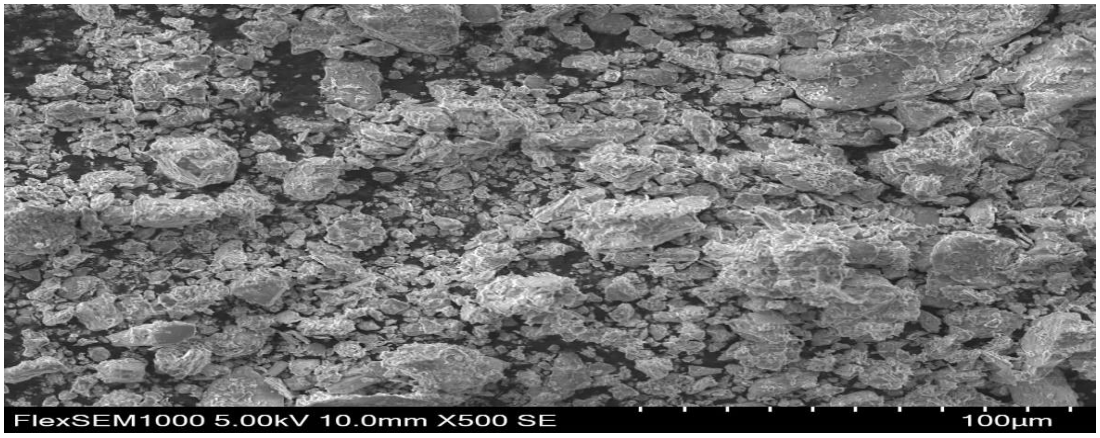
Berilgan SEM tasvir shimoliy ekspozitsiyadan olingan tuproq namunasining morfologik xususiyatlarini aniq ifodalaydi va uning geterogen hamda agregatlangan tuzilishga ega ekanligini ko‘ rsatadi. Tasvirda zarrachalar turli o‘ lcham va shakllarda — burchakli, plastinkasimon va qisman ignasimon elementlar bilan namoyon bo‘ lib, ularning bir-biri bilan bog‘ langan holda agregatlar hosil qilgani kuzatiladi. Bu holat tuproqning asosan mexanik nurash jarayonlari ta’sirida shakllanganini, ya’ni ona jinslar parchalanishi ustun bo‘ lganini ko‘ rsatadi.



Yirik agregatlar orasida mayda dispers zarrachalarning mavjudligi tuproqning polidispers tizim ekanligini anglatadi. Zarrachalar yuzasining nohamvor va g‘ ovak tuzilishi ularning yuqori reaksion yuzaga ega ekanligini ko‘ rsatadi, bu esa kimyoviy jarayonlar, jumladan adsorbsiya va ion almashinuv jarayonlari uchun qulay sharoit yaratadi.

5-rasm. Janubiy ekspozitsiya tuproq namunasida ignasimon va radial mikrostrukturali mineral agregatlar (SEM tasvir, ×1.50k)

Ayrim joylarda kuzatiladigan plastinkasimon va qatlamli strukturalar alyumosilikat (gil) minerallar mavjudligini ko‘ rsatsa, mayda ignasimon yoki tolasimon elementlar ikkilamchi minerallar (masalan, karbonat yoki sulfat fazalar) shakllanish jarayonlari bilan bog‘ liq bo‘ lishi mumkin. Bu esa tuproqda faqat mexanik nurash emas, balki kimyoviy qayta kristallanish jarayonlari ham kechganini anglatadi.



Keyingi tasvirda zarrachalar orasida turli o‘ lchamdagi fraksiyalarning mavjudligi tuproqning polidispers tizim ekanligini anglatadi. Yirik agregatlar bilan birga mayda dispers zarrachalarning ko‘ pligi tuproqning zich joylashmagan, balki g‘ ovak va ko‘ p fazali tuzilishga ega ekanligini ko‘ rsatadi. Bu esa namlikni ushlab turish, adsorbsiya va ion almashinuv jarayonlari uchun qulay sharoit yaratadi.

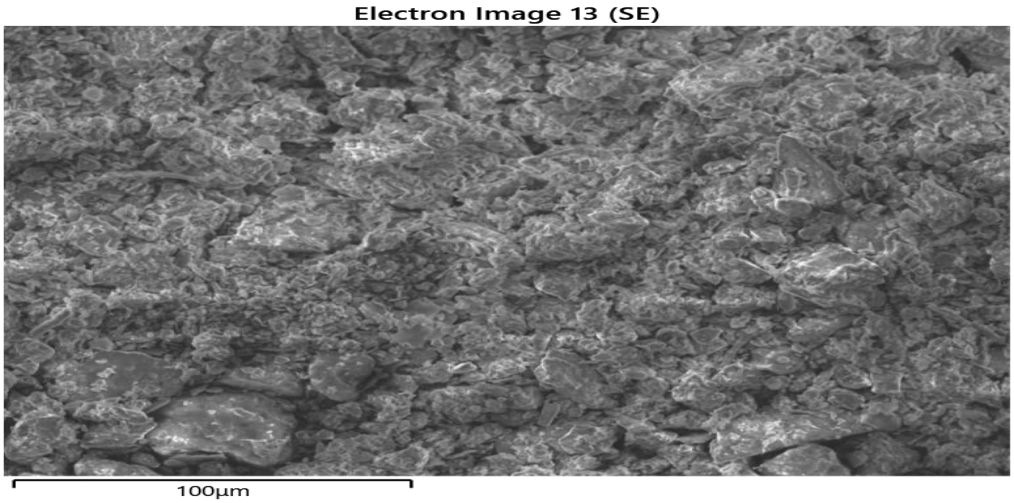
6-rasm. Janubiy ekspozitsiya tuproq namunasida ignasimon va radial mikrostrukturali mineral agregatlar (SEM tasvir, ×1.00k)

Ayrim zarrachalarda kuzatiladigan plastinkasimon va qatlamli strukturalar alyumosilikat (gil) minerallar mavjudligini ko‘ rsatadi. Shu bilan birga, ayrim nohamvor va notekis yuzalar kimyoviy nurash va qayta kristallanish jarayonlari natijasida hosil bo‘ lgan bo‘ lishi mumkin. Bu holat tuproqda bir vaqtning o‘ zida mexanik va kimyoviy jarayonlar kechganini tasdiqlaydi.

Keyingi SEM tasvir (×500) janubiy ekspozitsiyadan olingan tuproq namunasining umumiy mikrostrukturasini ko‘ rsatib, uning yuqori darajada geterogen va agregatlangan tuzilishga ega ekanligini tasdiqlaydi. Tasvirda zarrachalar turli o‘ lchamda — yirik agregatlardan tortib mayda dispers fraksiyalargacha — aralash holda joylashgan bo‘ lib, bu tuproqning polidispers tizim ekanligini ko‘ rsatadi. Zarrachalar shakli asosan burchakli va noaniq bo‘ lib, ularning yuzasi ko‘ p hollarda parchalangan holda namoyon bo‘ ladi. Bu holat mexanik nurash jarayonlari ustunligini, ya’ni ona jinslar fizik parchalanishi asosiy rol o‘ ynaganini ko‘ rsatadi. Shu bilan birga, ayrim agregatlar yuzasida kuzatiladigan mayda kristallik va qatlamli tuzilishlar kimyoviy jarayonlar, jumladan, qayta kristallanish va ikkilamchi minerallar hosil bo‘ lishining ham mavjudligini anglatadi.

7-rasm. Janubiy ekspozitsiya tuproq namunasida ignasimon va radial mikrostrukturali mineral agregatlar (SEM tasvir, ×500SE)

Yirik agregatlar orasidagi bo‘ shliqlar va mayda zarrachalarning to‘ planishi tuproqning g‘ ovak tuzilishga ega ekanligini ko‘ rsatadi. Bu xususiyat namlik saqlanishi, elementlar migratsiyasi va adsorbsion jarayonlar uchun muhim ahamiyatga ega. Shu bilan birga, bunday struktura tuproqda gaz almashinuvi va biogeokimyoviy jarayonlarning faol kechishiga sharoit yaratadi.



Keyingi SEM tasvir (×200) janubiy ekspozitsiyadan olingan tuproq namunasining umumiy mikrostrukturasini pastroq kattalashtirishda aks ettirib, uning makro- va mikroagregatlardan tashkil topgan geterogen tizim ekanligini ko‘ rsatadi. Tasvirda zarrachalar turli o‘ lchamda bo‘ lib, yirik agregatlar orasida juda ko‘ p miqdorda mayda dispers fraksiyalar joylashgani kuzatiladi, bu esa tuproqning polidispers tuzilishini tasdiqlaydi. Zarrachalar shakli asosan burchakli va noaniq bo‘ lib, ularning yuzasida parchalanish izlari va nohamvor tekstura yaqqol ko‘ rinadi. Bu holat mexanik nurash jarayonlari ustunligini, ya’ni ona jinslarning fizik parchalanishi asosiy rol o‘ ynaganini ko‘ rsatadi. Shu bilan birga, ayrim agregatlar yuzasida kuzatiladigan mayda kristallik va qatlamli strukturalar kimyoviy jarayonlar, xususan ikkilamchi minerallar hosil bo‘ lishi va qayta kristallanish jarayonlari ham kechganini anglatadi.

8-rasm. Janubiy ekspozitsiya tuproq namunasida ignasimon va radial mikrostrukturali mineral agregatlar (SEM tasvir, ×200 SE)

Tasvirda agregatlar orasidagi bo‘ shliqlar va g‘ ovak zonalarning mavjudligi tuproqning poroz tuzilishga ega ekanligini ko‘ rsatadi. Bu xususiyat namlikni saqlash, elementlar migratsiyasi va adsorbsiya jarayonlari uchun muhim ahamiyatga ega. Shuningdek, bunday struktura tuproqda gaz almashinuvi va biogeokimyoviy jarayonlarning faol kechishiga sharoit yaratadi.

Navbatdagi berilgan SEM tasvir janubiy ekspozitsiyadan olingan tuproq namunasining mikromorfologik tuzilishini ifodalab, uning yuqori darajada geterogen va agregatlangan strukturaga ega ekanligini ko‘ rsatadi. Tasvirda zarrachalar turli o‘ lcham va shakllarda — burchakli, mayda dispers va qisman plastinkasimon elementlar ko‘ rinishida namoyon bo‘ lib, ularning bir-biri bilan zich bog‘ langan holda agregatlar hosil qilgani kuzatiladi. Zarrachalarning nohamvor va parchalangan yuzasi mexanik nurash jarayonlari ustunligini ko‘ rsatadi, ya’ni ona jinslar asosan fizik ta’sirlar natijasida parchalangan. Shu bilan birga, ayrim agregatlar yuzasida

9-rasm. Janubiy ekspozitsiya tuproq namunasida mayda fraksiyali va polidispers zarrachalar tuzilishi (SEM tasvir, ×200)

kuzatiladigan mayda kristallik va qatlamli strukturalar kimyoviy jarayonlar, jumladan ikkilamchi minerallar shakllanishi va qayta kristallanish jarayonlari ham kechganini anglatadi. Tasvirda mayda zarrachalarning yirik agregatlar orasida to‘ planishi tuproqning polidispers tizim ekanligini tasdiqlaydi. Bunday tuzilish yuqori g‘ ovaklikni ta’minlab, namlikni ushlab turish, elementlar migratsiyasi va adsorbsiya jarayonlari uchun qulay sharoit yaratadi. Shuningdek, bu holat tuproqda gaz almashinuvi va biogeokimyoviy jarayonlarning faol kechishiga xizmat qiladi.

XULOSA VA TAVSIYALAR.

Tadqiqot natijalari SEM tahlili shuni ko‘ rsatadiki, shimoliy va janubiy ekspozitsiyadan olingan tuproq namunalari ularning mikromorfologik xususiyatlarida o‘ xshash va farqli jihatlar mavjudligini ko‘ rsatdi. Har ikki ekspozitsiya tuproqlarida ignasimon va radial morfologiyali mineral agregatlar, polidispers zarrachalar hamda mikroagregatli struktura shakllanganligi aniqlandi. Biroq shimoliy ekspozitsiya tuproqlarida agregatlarning nisbatan yaxshi rivojlanganligi, g‘ ovaklik tizimining aniq ifodalanishi va zarrachalarning bir tekis joylashganligi kuzatilgan bo‘ lsa, janubiy ekspozitsiya tuproqlarida mayda dispersli zarrachalar va kam agregatlangan mikrotuzilmalar ustunlik qildi. Bu holat ekspozitsiyalarning harorat, namlik rejimi, tuproq tarkibidagi organik moddalar bilan bog‘ liq bo‘ lib,

tuproq hosil bo‘ lish jarayonlarining turlicha kechganligini ko‘ rsatadi. SEM usuli tuproqlarning mikromorfologik holatini baholashda yuqori samarali tadqiqot usuli ekanligini ko‘ rsatdi.

QAND LAVLAGINI TUPROQDAN FOSFORLI OZIQA MODDALARNI O‘ ZLASHTIRISHIGA AZOTLI O‘ G‘ IT SHAKL VA ME’YORLARINING TA’SIRI

Ergashev Dilshod Tursumamatovich
Namangan davlat universiteti Biotexnoloogiya kafedrasi katta o‘ qituvchisi (PhD), q.x.f.f.d.
ergashevdilshod1989@mail.com
ORCID ID: https://orcid.org/0009-0003-8154-6645

Annotatsiya: *Ushbu maqolada takroriy ekilgan qand lavlagining tuproqdan fosforli oziqa moddalarni o‘ zlashtirishiga azotli o‘ g‘ it shakli va me’yorlarining ta’siri o‘ rganildi. Ma’lumki, qand lavlagi o‘ simligi oziqa moddalarga o‘ ta talabchan ekin hisoblanadi. Lekin fosforli oziqa moddalarini boshqa oziqa elementlariga qaraganda kamroq o‘ zlashtiradi. O‘ simlikning boshlang‘ ich fazasida o‘ zlashtirgan umumiy fosforning miqdori ildizmevaga qaraganda bargida ko‘ pligi aniqlandi. Buni sababini boshlang‘ ich davrda ildizmevani hali to‘ la shakllanmaganligi bilan izohlash mumkin. Ammo rivojlanishning keyingi davrlarida ildizmevani jadal o‘ sishi boshlanganligi sababli o‘ zlashtirilgan fosfor miqdori uning bargdagi miqdordan ortiq bo‘ lganligini, shuningdek fosforni o‘ zlashtirish oldingi oydagidan 6-6,5 barobarga ortganligini ta’kidlash lozim. Bundan tashqari, fosforni o‘ zlashtirilishiga o‘ simlimlikka qo‘ llanilgan azotli o‘ g‘ itlarni turli shakllari (masalan, natriy nitrat, ammoniy nitrat, ammoniy sulfat, karbamid) va me’yorlari ham o‘ z ta’siri ko‘ rsatadi. Tajribalar natijalari shuni ko‘ rsatdiki, azotli o‘ g‘ it shakllaridan ammoniy nitrat va karbamid shaklining* N_{200} $P_{150}K_{200}$ *me’yorda qo‘ llanilishi o‘ simlik tuproqdagi fosfor ko‘ proq o‘ zlashtirishiga olib keldi.*

Kalit so‘ zlar: *qand lavlagi, mineral o‘ g‘ it, azotli o‘ g‘ it, fosforli o‘ g‘ it, harakatchan fosfor, o‘ g‘ it shakllari, natriy nitrat, ammoniy nitrat, ammoniy sulfat, karbamid, oziqa moddalar, o‘ g‘ it me’yori, tuproq, o‘ simlik, o‘ sish-rivojlanish, hosildorlik.*

ВЛИЯНИЕ ФОРМЫ И НОРМЫ ВНЕСЕНИЯ АЗОТНЫХ УДОБРЕНИЙ НА ПОГЛОЩЕНИЕ ФОСФОРНЫХ ПИТАТЕЛЬНЫХ ВЕЩЕСТВ ИЗ ПОЧВЫ САХАРНОЙ СВЕКЛОЙ.

Аннотация: *В данной статье изучается влияние форм и норм азотных удобрений на усвоение фосфорных элементов питания из почвы повторно высаженной сахарной свеклой. Известно, что сахарная свекла является очень требовательной культурой к элементам питания. Однако фосфорные элементы питания она усваивает хуже других элементов питания. Было установлено, что общее количество фосфора, усвоенного в начальной фазе развития растения, было больше в листьях, чем в корнеплоде. Это можно объяснить тем, что корнеплод в начальный период еще не был полностью сформирован. Однако следует отметить, что на более поздних стадиях развития, в связи с быстрым ростом корнеплода, количество усвоенного фосфора превышало количество в листьях, и усвоение фосфора увеличивалось в 6-6,5 раз по сравнению с предыдущим месяцем. Кроме того, на усвоение фосфора влияют также различные формы и нормы внесения азотных удобрений (например, натриевая селитра, аммиачная селитра, сульфат аммония, мочевина). Результаты опытов показали, что внесение аммиачной селитры и мочевины в дозе* $N_{200}P_{150}K_{200}$ *способствовало большему усвоению растениями фосфора из почвы.*

Ключевые слова: *сахарная свекла, минеральное удобрение, азотное удобрение, фосфорное удобрение, подвижный фосфор, формы удобрений, натриевая селитра, аммиачная селитра, сульфат аммония, мочевина, питательные вещества, норма удобрения, почва, растение, рост и развитие, урожайность.*

THE EFFECT OF NITROGEN FERTILIZER FORMS AND RATES ON PHOSPHORUS NUTRIENT UPTAKE FROM THE SOIL BY SUGAR BEET

Abctract: *This article examines the effects of nitrogen fertilizer forms and rates on the uptake of phosphorus nutrients from the soil by replanted sugar beets. Sugar beets are known to be very demanding crops when it comes to nutrients. However, it absorbs phosphorus nutrients less effectively than other nutrients. It was found that the total amount of phosphorus absorbed during the initial phase of plant development was greater in the leaves than in the roots. This can be explained by the fact that the roots were not*

yet fully formed during this initial period. However, it should be noted that at later stages of development, due to the rapid growth of the root crop, the amount of absorbed phosphorus exceeded the amount in the leaves, and phosphorus absorption increased by 6-6.5 times compared to the previous month. Furthermore, phosphorus absorption is also affected by different forms and rates of nitrogen fertilizer application (e.g., sodium nitrate, ammonium nitrate, ammonium sulfate, urea). Experimental results showed that the application of ammonium nitrate and urea at a dose of $N_{200}P_{150}K_{200}$ promoted greater phosphorus uptake from the soil by plants.

Key words: *sugar beet, mineral fertilizer, nitrogen fertilizer, fertilizer forms, phosphorus fertilizer, mobile phosphorus, sodium nitrate, ammonium nitrate, ammonium sulfate, urea, nutrients, fertilizer rate, soil, plant, growth and development, productivity.*

Kirish. Qishloq xo‘ jalik ekinlari tuproqdan oziqa moddalarini o‘ zlashtirishi uning o‘ sish-rivojlanishidan tashqari olib borilgan agrotexnik omillarga ham bog‘ liq bo‘ ladi. Ayniqsa, ular uchun berilgan o‘ g‘ itlar me’yori bilan o‘ g‘ itlar shakli ham oziqa elementlari o‘ zlashtirilishiga ta’sir ko‘ rsatadi. Ekinlar orasida oziqa elementlariga o‘ ta talabchan bo‘ lgan ekinlar qatoriga qand lavlagi ham kiradi. Uning ildizi kuchli o‘ sadi, natijada tuproqqa 2-3 metr chuqurlikkacha va yon tomonga 1-1,2 metrga ba’zan 1,5 metrgacha tarqaladi, natijada ular shu joylardagi oziqa moddalaridan foydalanish imkonini beradi.

Material va uslublar. Qand lavlagi fosforli oziqa moddalarini boshqa oziqa elementlariga qaraganda kam o‘ zlashtiradi. Tajriba uch yil davomida (2017–2019 yy) dala sharoitida olib borildi. Tajriba 11 variant, 4 qaytariqdan iborat bo‘ lib, dalada bir yarus qilib joylashtirilgan va O‘ zbekiston reestriga qiritilgan qand lavlagining «Drena» navi ekilgan. Tajriba tizimi bo‘ yicha birinchi variantda umuman mineral o‘ g‘ it berilmagan ($N_0P_0K_0$ kg/ga - bu nazorat varianti), ikkinchi va uchinchi variantlarda faqat azotli o‘ g‘ itlar berilmagan bo‘ lib, fosforli va kaliyli o‘ g‘ itlar ikki xil me’yorda qo‘ llanilgan ($N_0P_{100}K_{150}$ va $N_0P_{150}K_{200}$ - bu azotga nazorat varianti), qolgan 4, 6, 8, 10-variantlarda barcha mineral o‘ g‘ itlar $N_{150}P_{100}K_{150}$ kg/ga miqdorida, 5, 7, 9, 11-variantlarda esa ularning me’yori $N_{200}P_{150}K_{200}$ kg/ga qilib belgilangan. Lekin barcha variantlarda azotli o‘ g‘ itni turli shakllari qo‘ llanilgan. Jumladan, 4-5 varianrtda natriy nitrat ($NaNO_3$), 6-7 varianrtda ammoniy nitrat (NH_4NO_3), 8-9 varianrtda ammoniy sulfat ($(NH_4)_2SO_4$) va 10-11 varianrtda esa karbamid ($CO(NH_2)_2$) qo‘ llanilgan.

Professor S.K.Kondrashov [1. 144-b.] ma’lumot berishicha qand lavlagi uchun rejalashtirilgan mineral o‘ g‘ itlarni uch muddatda berish maqsadga muvofiqdir: kuzgi haydov ostiga fosforli (70%) va kaliyli (100%) o‘ g‘ itlarni solish, ekishdan oldin yoki ekish bilan birga (azotlilarni 20%, fosforni qolgan 30% ammafos shaklida) va o‘ simlik vegetatsiyasi davrida azotli o‘ g‘ itlar bilan oziqlantirish o‘ tkazish yaxshi samara beradi.

A.I.Oleksiyuk [2; 52-53-b.] ning ma’lumotlariga ko‘ ra, qand lavlagi vegetatsiyasining dastlabki davrida oziqa moddalaridan azotli va fosforlilarga o‘ ta talabchan bo‘ ladi. Bu oziqa moddalar o‘ simlik tanasining shakllanishiga xizmat qilishi, kaliyli oziqalar esa o‘ simlik vegetatsiyasining barcha davrlarda zarur bo‘ lishi ta’kidlangan.

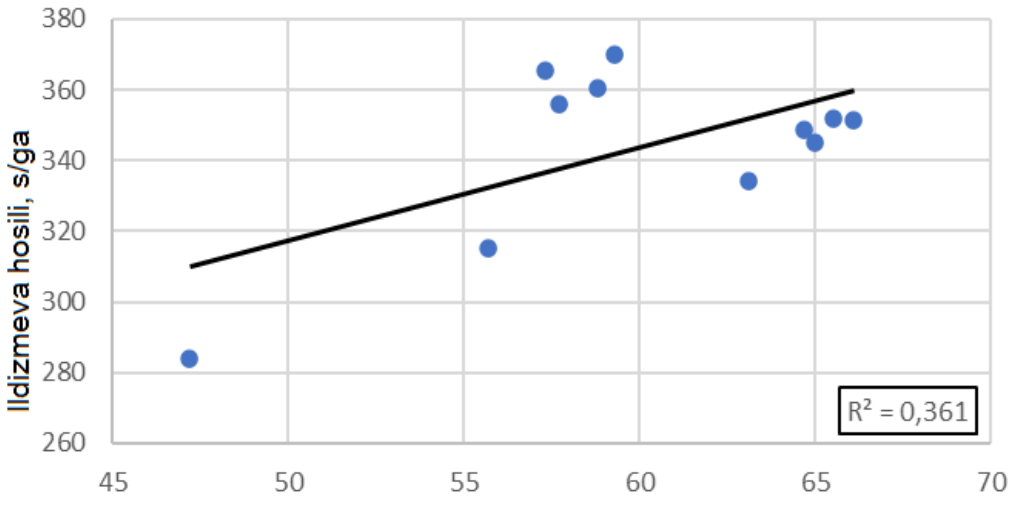
I.V.Ilyushenkoning [3; 32-36-b.] ma’lumotiga ko‘ ra, tuproqda azot va fosfor miqdorini yuqori bo‘ lishi o‘ simlikning o‘ sish-rivojlanishiga kuchli ta’sir ko‘ rsatadi. Qand lavlagini yuqori ta’minlangan tuproqlarda o‘ stirish ildizmeva hosilini kam ta’minlangan tuproqlarga qaraganda ikki barobarga ortishini ta’minlaydi. Shuningdek, u yana o‘ z tadqiqotlariga asoslangan holda fosforli o‘ g‘ itlarning samaradorligi tuproqdagi mavjud harakatchan fosfor miqdoriga bog‘ liqligini aytib o‘ tadi.

Bizning dala tajribalarimizda o‘ simlikda olib borilgan fenologik kuzatishlar «Dala tajribalarini o‘ tkazish uslublari» (Методика полевого опыта) [4] uslubiyatlari bo‘ yicha o‘ tkazilgan.

Tuproq va o‘ simlik na’munalarini olish va ularning kimyoviy tahlili «O‘ rta Osiyo tuproqlari va o‘ simliklarini agrokimyoviy tahlil qilish usullari» (Методы агрохимических анализов почв и растений Средней Азии. Издание) uslubi asosida bajarilgan [5] .

Olingan natijalarning matematik tahlili B.A.Dospexov [6] (M., 1985), hisob-kitob metodi (Доспехов Б.А. Методика полевого опыта. - М. Изд-во «Агропромиздат») asosida asosida o‘ tkazildi.

Natijalar va munozara: Qand lavlagi ildizi orqali tuproqdan fosforni boshqa oziqa moddalariga qaraganda kamroq o‘ zlashrishi ma’lum bo‘ ldi. Bizning tajriba yillarida olgan ma’lumotlarimizga ko‘ ra (1-jadval) o‘ simlikning boshlang‘ ich fazasida bargda ildizmevaga qaraganda umumiy fosfor miqdori ko‘ pligi aniqlandi. Bu vaqtga kelib o‘ simlikdagi fosfor miqdori variantlar bo‘ yicha 2,6-3,2 kg/ga oralig‘ ida bo‘ lib, bargda 1,4-1,8 kg/ga ni, ildizmevada undan biroz kam 1,2-1,4 kg/ga ni tashkil etganligi aniqlandi. Bunda mineral o‘ g‘ itlar umuman berilmagan variantlarda eng kam bo‘ lgani holda, fosforli o‘ g‘ itlarni 100 kg/ga (N0K150 o‘ g‘ it fonida) berilganida 2,8 kg/ga, 150 kg/ga fosfor berilgan (N0K200 o‘ g‘ it fonida) 3-variantda esa 3,0 kg/ga, $N_{200}K_{200}$ o‘ g‘ itlar bilan 100 kg/ga fosforli o‘ g‘ itlar berilgan 4, 6, 8 va 10-variantlarda mos ravishda 2,9; 3,1; 2,9 hamda 3,0 kg/ga ga to‘ g‘ ri kelgan.



1-jadval

Azotli o‘ g‘ itlar shakl va me’yorlarini qand lavlagi tuproqdan fosforli oziqa moddalarini o‘ zlashtirishiga ta’siri, kg/ga hisobida, 2017-2019 yillar

Var.	Avgust			Sentyabr			Oktyabr		
	Barg	Ildiz meva	Jami	Barg	Ildiz meva	Jami	Barg	Ildiz meva	Jami
1	1,4	1,2	2,6	6,4	8,5	14,9	20,4	26,8	47,2
2	1,5	1,3	2,8	7,0	9,7	16,7	25,6	30,1	55,7
3	1,6	1,4	3,0	7,4	10,4	17,8	29,7	33,4	63,1
4	1,6	1,3	2,9	7,2	9,9	17,1	26,4	31,3	57,7

10	1,7	1,3	3,0	7,2	10,0	17,2	26,9	31,9	58,8
11	1,8	1,4	3,2	7,4	10,9	18,3	30,5	35,0	65,5

Mineral o‘ g‘ itlar me’yorini $N_{200}P_{150}K_{200}$ kg/gacha oshirish bilan fosforni 150 kg/ga qilib belgilangan variantlarda (5, 7, 9 va 11-var.) o‘ simlik o‘ zlashtirgan fosfor miqdori ham ortganligini ko‘ rishimiz mumkin va u mos holda 3,1; 3,2; 3,1 hamda 3,2 kg/ga ni tashkil etgan. Shuni ham ta’kidlash lozimki, o‘ simliklar fosforni o‘ zlashtirishiga mineral o‘ g‘ itlar me’yorlaridan tashqari qo‘ llanilgan azotli o‘ g‘ itlar shakllari ham ta’sir ko‘ rsatgan. Bunda ammoniy nitrat qo‘ llanilganda eng yaxshi samara bergan.

Kuzatishlarning keyingi sentyabrdagi olingan ma’lumotlarga ko‘ ra, ildizmevani jadal o‘ sishi boshlanganligi sababli o‘ zlashtirilgan fosfor miqdori uning bargdagi miqdordan ortiq bo‘ lganligini, shuningdek fosforni o‘ zlashtirish oldingi oydagidan 6-6,5 barobarga ortganligini ta’kidlash lozim. O‘ simlikning ildizmevani jadal o‘ sishi fazasida ham oldingi oydagi qonuniyat saqlanib qolgan bo‘ lsada, variantlar orasidagi farq yanada yaqqol ko‘ rindi. Olingan bu ma’lumotlarga asoslanib shuni aytish mumkinki, qand lavlagi o‘ simligi tarkibidagi fosfor miqdori birinchi navbatda azotli o‘ g‘ itlar shakllariga hamda mineral o‘ g‘ itlar me’yorlariga bog‘ liqdir. Ayniqsa, azotli o‘ g‘ itning ammoniy nitrat shaklidagisi $N_{200}P_{150}K_{200}$ kg/ga me’yorda berilganida 66,1 kg/ga, azotni karbomid shaklidagisi shu me’yorda berilganida esa 65,5 kg/ga o‘ zlashtirishga erishgan. Shuningdek, qand lavlagi ildizmevasi hosili va biologik fosforni o‘ simlik tomonidan o‘ zlashtirishi orasida ham korrellyasion bog‘ liqlik (r=0,60) borligi aniqlandi (1 rasmga qarang).

1-rasm. Ildizmevaning biologik hosili va tuproqdan fosforli (P) oziqa elementlarini o‘ zlashtirilishi orasidagi korrelyasion bog‘ lanish. Tuproqdan forforli (P) oziqa elementining o‘ zlashtirilishi, kg/ga

Xulosa. Tajriba natijalari shuni ko‘ rsatdiki, takroriy ekilgan qand lavlagining tuproqdan fosforli oziqa moddalarini o‘ zlashtirishi uning o‘ sish-rivojlanishiga bog‘ liq holda o‘ zgarib bordi. Rivojlanishning dastlabki fazasida fosforning miqdori ildizmevaga qaraganda bargida ko‘ p to‘ plandi, keyinchalik ildizmevani jadal rivojlanishi sababli undagi fosforning miqdori bargidagi miqdoridan ma’lum darajada ortib bordi. Shu bilan birga azotli mineral o‘ g‘ itlarning qo‘ llanilishi o‘ simlikning o‘ sish-rivojlanishi yanada jadallashtirdi. Bu esa o‘ simlikni tuproqdagi fosforli oziqa moddalarni ko‘ proq o‘ zlashtirishiga olib keldi. Azotli oziqa moddalarni eng ko‘ p o‘ zlashtirilishi mineral o‘ g‘ itlardan ammoniy nitrat qo‘ llanilgan 6-7 variantlarda hamda va karbamid qo‘ llanilgan 10-11 variantlarda kuzatildi.

Mineral o‘ g‘ itlarni $N_{150}P_{100}K_{150}$ kg/ga me’yorda va azotli o‘ g‘ itlardan ammoniy nitrat ishlatilgan 6-variantda o‘ simlikdagi jami o‘ zlashtirilgan fosfor miqdori avgustda 3,1 kg/ga ni, sentyabrda 17,4 kg/ga ni, oktyabrda esa 59,3 kg/ga ni tashkil etgan bo‘ lsa, shu o‘ g‘ itlarni $N_{200}P_{150}K_{200}$ kg/ga me’yorda qo‘ llanilgan 7-variantdagi miqdori mos ravishda 3,2; 18,5 va 66,1 kg/ga ni tashkil etdi. Shuningdek, mineral o‘ g‘ itlarni $N_{150}P_{100}K_{150}$ va azotli o‘ g‘ itlardan karbamid ishlatilgan 10-11 variantlarda o‘ simlikdagi jami o‘ zlashtirilgan fosfor miqdori oylar bo‘ yicha mos ravishda 3,0; 17,2 va 58,8 kg/ga ni (10-variantda) hamda va $N_{200}P_{150}K_{200}$ kg/ga me’yorda qo‘ llanilganda esa 3,2; 18,3 va 65,5 kg/ga ni (11-variantda) tashkil etdi. Bundan ko‘ rinib turibdiki, qand lavlagining tuproqdan fosforli oziqa moddalarni ko‘ proq o‘ zlashtirishida azotli o‘ g‘ itlarning ammoniy nitrat va karbamid shakllarining qo‘ llanilishi yuqori samaradorlikni ta’minlaydi.

Annotatsiya: *Ushbu tadqiqot degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilishda noan'anaviy o' simliklardan foydalanishning ahamiyatini baholashga qaratilgan. Tadqiqot obyekti sifatida yuqori biomassa hosil qiluvchi, ko' p yillik va ekologik moslashuvchan* Silphium perfoliatum L. *o' simligi tanlandi. Dala tajribalari 2023-2025 yillarda Samarqand va Andijon viloyatlarining agroekologik sharoitlarida olib borildi. Tadqiqotda ekish muddati, ekish chuqurligi hamda qator oralig' ining o' simliklarning unishi, vegetativ rivojlanishi, generativ ko' rsatkichlari va biomassa hosildorligiga ta'siri o' rganildi. Natijalarga ko' ra, kuzgi ekish muddatlari urug' larning unib chiqishi va dastlabki rivojlanishi uchun qulay sharoit yaratib, 75,1% gacha dala unuvchanligini ta'minladi. 1,5-2,0 sm ekish chuqurligi hamda 90 × 90 sm qator oralig' ida o' simliklarning vegetativ va generativ rivojlanishi yuqori bo' ldi. Mazkur variantda urug' hosildorligi 9,7 s/ga, yashil biomassa 1237,8 s/ga gacha yetdi. Olingan natijalar* S. perfoliatum L. *ning degradatsiyalangan tuproqlarda ekologik barqaror agrotsenozlarni shakllantirish, biologik resurslardan samarali foydalanish va fitomeliorativ tadbirlarni rivojlantirish uchun istiqbolli o' simlik ekanligini ko' rsatadi.*

ЭКОЛОГИЧЕСКОЕ ЗНАЧЕНИЕ НЕТРАДИЦИОННЫХ РАСТЕНИЙ В УСЛОВИЯХ ДЕГРАДИРОВАННЫХ ПОЧВ

Аннотация: *Целью настоящего исследования является оценка экологического значения нетрадиционных растений в реабилитации деградированных почв. В качестве объекта исследования выбрано многолетнее, высокобиомассное и экологически адаптивное растение* Silphium perfoliatum L. *Полевые эксперименты проводились в 2023-2025 годах в агроэкологических условиях Самаркандской и Андижанской областей. Изучалось влияние сроков посева, глубины заделки семян и ширины междурядий на полевую всхожесть, вегетативное развитие, генеративные показатели и продуктивность биомассы растений. Установлено, что осенние сроки посева создавали благоприятные условия для прорастания семян и начального развития растений, обеспечивая полевую всхожесть до 75,1%. Оптимальная глубина посева 1,5-2,0 см и схема размещения 90 × 90 см способствовали лучшему формированию вегетативных и генеративных органов. При данной схеме урожайность семян достигала 9,7 ц/га, а продуктивность зелёной биомассы -1237,8 ц/га. Полученные результаты свидетельствуют о перспективности* S. perfoliatum L. *для формирования экологически устойчивых агроценозов на деградированных почвах, эффективного использования биологических ресурсов и развития фитореабилитационных мероприятий.*

Ключевые слова: *деградированные почвы, экологическая реабилитация, нетрадиционные растения,* Silphium perfoliatum L.*, фитомелиорация, агроэкологическая адаптация, биомасса, плодородие почвы.*

ECOLOGICAL SIGNIFICANCE OF NON-TRADITIONAL PLANTS UNDER DEGRADED SOIL CONDITIONS

Annotation: *This study aimed to evaluate the ecological significance of non-traditional plants in the rehabilitation of degraded soils. The perennial, high-biomass-producing and ecologically adaptable species* Silphium perfoliatum L. *was selected as the study object. Field experiments were conducted during 2023-2025 under the agroecological conditions of the Samarkand and Andijan*

regions of Uzbekistan. The effects of sowing time, sowing depth, and row spacing on field germination, vegetative development, generative traits, and biomass productivity were investigated. The results showed that autumn sowing created favorable conditions for seed germination and early plant development, providing field germination rates of up to 75.1%. A sowing depth of 1,5-2,0 cm and a row spacing of 90 × 90 cm promoted better vegetative and generative development of the plants. Under this spacing, seed yield reached 9,7 q ha⁻¹, while green biomass productivity reached 1237,8 q ha⁻¹. The obtained results demonstrate that S. perfoliatum L. *has considerable potential for establishing ecologically sustainable agroecosystems on degraded soils, improving the efficient use of biological resources, and developing phytoremediation practices.*

Key words: *degraded soils, ecological rehabilitation, non-traditional plants,* Silphium perfoliatum L.*, phytoremediation, agroecological adaptation, biomass, soil fertility.*

KIRISH

Bugungi kunda tuproq degradatsiyasi qishloq xo‘jaligi ishlab chiqarishining barqarorligiga, ekotizimlarning biologik mahsuldorligiga va tabiiy resurslardan samarali foydalanishga salbiy ta’sir ko‘rsatuvchi asosiy ekologik muammolardan biridir. Iqlim o‘zgarishi, suv tanqisligi, shamol va suv eroziyasi, tuproqning zichlashuvi, organik moddalarning kamayishi hamda antropogen bosimning kuchayishi degradatsiya jarayonlarini jadallashtirmoqda. Bunday sharoitda degradatsiyaga uchragan tuproqlarni faqat agrotexnik tadbirlar orqali emas, balki biologik va ekologik yondashuvlar asosida qayta tiklash muhim ahamiyat kasb etadi.

Tuproqni ekologik reabilitatsiya qilishning istiqbolli usullaridan biri degradatsiyalangan maydonlarda o‘simlik qoplamini shakllantirish va tuproqni biologik jarayonlar orqali tiklashga qodir o‘simlik turlaridan foydalanishdir. O‘simliklar ildiz tizimi orqali tuproq agregatlarining shakllanishiga, eroziya jarayonlarining kamayishiga, organik moddalarning to‘planishiga va tuproqning biologik faolligining oshishiga xizmat qiladi. Shu bilan birga, ko‘p yillik va yuqori biomassa hosil qiluvchi o‘simliklardan foydalanish tuproq yuzasini uzoq muddat davomida himoya qilish hamda agroekotizimlarning ekologik barqarorligini oshirish imkonini beradi. Zamonaviy tadqiqotlarda o‘simliklardan foydalanish degradatsiyalangan yerlarni tiklash, tuproq sog‘lomligini yaxshilash, suvni ushlab qolish, eroziyani kamaytirish va biologik xilma-xillikni qo‘llab-quvvatlashning muhim vositasi sifatida baholanmoqda.

Shu nuqtai nazardan, an‘anaviy oziq-ovqat ekinlaridan tashqari, ekologik moslashuvchanligi, yuqori biomassadorligi, kuchli ildiz tizimi va ko‘p funksionalligi bilan ajralib turadigan noan‘anaviy o‘simlik turlarini o‘rganish dolzarb hisoblanadi. Bunday o‘simliklar degradatsiyaga uchragan yoki qishloq xo‘jaligi uchun nisbatan kam mahsuldor maydonlardan samarali foydalanish, tuproq resurslarini muhofaza qilish va ekologik xizmatlarni kuchaytirish imkonini berishi mumkin.

Shunday istiqbolli turlardan biri Asteraceae oilasiga mansub ko‘p yillik *Silphium perfoliatum L.* o‘simligidir. Mazkur tur yuqori biomassa hosil qilishi, turli agroekologik sharoitlarga moslashuvchanligi, chuqur va yaxshi rivojlangan ildiz tizimiga egaligi hamda ko‘p yillikligi bilan ajralib turadi. Ilmiy manbalarda *S. perfoliatum* ning degradatsiyalangan va marginal yerlarda yetishtirish, fitoreabilitatsiya, tuproq organik uglerodini oshirish, eroziyaning oldini olish va biologik xilma-xillikni qo‘llab-quvvatlashdagi imkoniyatlari qayd etilgan[3].

S. perfoliatum ning ekologik ahamiyati uning faqat biomassa hosildorligi bilan cheklanmaydi. Ko‘p yillik vegetatsiya davri va zich yerusti qoplami tuproq yuzasining himoyalanishiga yordam beradi, ildiz tizimi esa tuproq qatlamlaridan suv va oziqa elementlaridan samarali foydalanish imkonini yaratadi. Shuningdek, uzoq davom etadigan gullash davri changlatuvchi hasharotlar uchun nektar va chang manbai bo‘lib xizmat qiladi. Shu sababli ushbu o‘simlikni ekologik barqaror agrotsenozlarni shakllantirishda ko‘p funksiyali biologik resurs sifatida baholash mumkin[1,4].

Ayrim tadqiqotlarda *S. perfoliatum* ning og‘ir metallar bilan ifloslangan tuproqlarda fitoremediatsiya va fitostabilizatsiya imkoniyatlari ham o‘rganilgan. Biroq uning ushbu yo‘nalishdagi samaradorligi tuproqdagi ifloslantiruvchi moddalar turi va konsentratsiyasiga, o‘simlikning rivojlanish bosqichiga hamda agroekologik sharoitga bog‘liq. Shu sababli *S. perfoliatum* ni degradatsiyalangan tuproqlarni reabilitatsiya qilishda qo‘llash imkoniyatlarini mahalliy tuproq-iqlim sharoitlarida ilmiy asosda baholash zarur[6,10].

O‘zbekiston sharoitida esa suv tanqisligi, yuqori yozgi harorat, tuproq unumdorligining pasayishi va ayrim hududlarda degradatsiya jarayonlarining kuchayishi ekologik jihatdan moslashuvchan ko‘p yillik o‘simliklarni tanlash masalasini yanada dolzarb etmoqda. Shu jihatdan, mahalliy agroekologik sharoitlarda *S. perfoliatum* ning o‘sishi, rivojlanishi, biomassa hosil qilishi va turli agrotexnik omillarga javob reaksiyasini o‘rganish ushbu turning degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilishdagi istiqbollarini aniqlashga xizmat qiladi.

Mazkur tadqiqotning maqsadi -degradatsiyalangan tuproq sharoitlarida noan’anaviy o‘simliklardan foydalanishning ekologik ahamiyatini baholash hamda *Silphium perfoliatum L.* ning agroekologik moslashuvi, o‘sishi,

rivojlanishi va biomassa hosildorligini aniqlash orqali uning ekologik reabilitatsiya jarayonlaridagi istiqbolini asoslashdan iborat.

ADABIYOTLAR TAHLILI

Degradatsiyalangan tuproqlarni tiklashda ko‘ p yillik o‘ simliklardan foydalanish so‘ nggi yillarda agroekologiya va tuproq ekologiyasining muhim yo‘ nalishlaridan biriga aylanmoqda. Bunday o‘ simliklar tuproqni uzoq muddat davomida o‘ simlik qoplami bilan ta’minlab, eroziya jarayonlarini kamaytirish, organik uglerodning to‘ planishini kuchaytirish, oziqa elementlarining yuvilib ketishini cheklash va tuproq biologik faolligini qo‘ llab-quvvatlash orqali degradatsiyalangan agroekotizimlarning funksional holatini yaxshilashi mumkin. Perennial ekinlarni qishloq xo‘ jaligi tizimlariga joriy etish tuproq unumdorligini tiklash va uglerod, azot hamda fosfor aylanishini yaxshilashning istiqbolli usullaridan biri sifatida baholanadi.

Tuproq reabilitatsiyasida o‘ simliklarning samaradorligi, avvalo, ularning ildiz tizimining rivojlanish xususiyatlari, vegetatsiya davomiyligi, biomassa hosil qilish qobiliyati va mahalliy agroekologik sharoitlarga moslashuvchanligi bilan belgilanadi. Ko‘ p yillik o‘ simliklar yillik ekinlarga nisbatan tuproqni kamroq mexanik bezovta qiladi va vegetatsiya davridan tashqari vaqtlarda ham tuproq yuzasini qisman qoplab turishi mumkin. Natijada eroziya xavfi pasayadi, ildiz qoldiqlari va boshqa organik materiallarning tuproqqa qaytishi esa uglerod zaxirasining shakllanishiga xizmat qiladi.

Noan’anaviy ko‘ p yillik o‘ simliklar orasida *Silphium perfoliatum L.* alohida ekologik va xo‘ jalik ahamiyatga ega tur sifatida ko‘ rib chiqilmoqda. Mazkur o‘ simlik yuqori biomassadorligi, uzoq vegetatsiya davri, yaxshi rivojlangan ildiz tizimi va nisbatan kam agrotexnik talablar bilan ajralib turadi. Tadqiqotlarda *S. perfoliatum* ning tuproq qoplamini shakllantirishi, eroziya va oziqa elementlarining yuvilishini kamaytirishi hamda tuproq ekologik holatiga ijobiy ta’sir ko‘ rsatishi mumkinligi qayd etilgan[3].

S. perfoliatum ning ekologik afzalliklaridan yana biri uning ko‘ p yillikligi va yuqori yerusti biomassasi bilan bog‘ liq. O‘ simlikning uzoq muddat bir maydonda saqlanishi tuproqning tez-tez haydalishini kamaytiradi. Bu esa tuproq agregatlari va organik moddalarning saqlanishi uchun qulay sharoit yaratishi mumkin. 2025-yilda chop etilgan tadqiqotda *S. perfoliatum* maydonlarida yer usti qoplamining shakllanishi va ildizlardan keladigan uglerod oqimi tuproq organik uglerodining to‘ planishi bilan bog‘ liqligi ko‘ rsatilgan. Mazkur tadqiqotda ko‘ p yillik silfiy ekinlari tuproq eroziyasini kamaytirish va tuproq biologik faoliyatini qo‘ llab-quvvatlash nuqtai nazaridan ham muhim ekanligi qayd etilgan[7,9].

S. perfoliatum ning degradatsiyalangan va ifloslangan tuproqlardagi imkoniyatlari ham alohida tadqiq etilgan. Ayrim tadqiqotlarda o‘ simlikning mis, rux, xrom va qo‘ rg‘ oshin kabi og‘ ir metallarni yutish va o‘ simlik organlarida to‘ plash qobiliyati baholangan. Masalan, konchilik faoliyatidan ifloslangan tuproqda o‘ tkazilgan tajribalarda *S. perfoliatum* ning ayrim og‘ ir metallarni o‘ zlashtirishi va to‘ plashi aniqlangan. Bu natijalar mazkur turning ifloslangan maydonlarda fitoremediatsiya va fitostabilizatsiya jarayonlarida foydalanish imkoniyatini ko‘ rsatadi[8].

Biroq *S. perfoliatum* ning fitoremediatsion imkoniyatlarini umumlashtirishda ehtiyotkorlik zarur. Ilgari o‘ tkazilgan ayrim tajribalarda o‘ simlik qo‘ rg‘ oshin va kadmiyni cheklangan miqdorda o‘ zlashtirgani, shuningdek, ifloslantiruvchi moddalar konsentratsiyasi oshishi bilan biomassaning kamayishi mumkinligi aniqlangan. Shu sababli *S. perfoliatum* ni barcha turdagi degradatsiyalangan yoki ifloslangan tuproqlar uchun universal reabilitatsiya vositasi sifatida emas, balki muayyan tuproq-ekologik sharoitlarda istiqbolli biologik vosita sifatida baholash maqsadga muvofiq[1].

O‘ simlikning ekologik qiymati faqat tuproq bilan bog‘ liq jarayonlar bilan chegaralanmaydi. *S. perfoliatum* ning uzoq davom etadigan gullash davri va yuqori nektar mahsuldorligi uni changlatuvchi hasharotlar uchun muhim oziqa manbaiga aylantiradi. Shu jihatdan u qishloq xo‘ jaligi landshaftlarida biologik xilma-xillikni saqlash va ekotizim xizmatlarini kuchaytirishga hissa qo‘ shishi mumkin. Tadqiqotlarda *S. perfoliatum* ning tuproq salomatligi, biologik xilma-xillik, changlanish va suv resurslarini muhofaza qilish kabi ekologik xizmatlar bilan bog‘ liq imkoniyatlari qayd etilgan[2].

Shunday qilib, mavjud ilmiy ma’lumotlar *Silphium perfoliatum L.* ni degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilishda foydalanish mumkin bo‘ lgan ko‘ p funksiyali noan’anaviy o‘ simlik sifatida baholash imkonini beradi. Biroq uning samaradorligi tuproq turi, iqlim sharoiti, namlik ta’minoti, ekish muddati, o‘ simliklar joylashish sxemasi va agrotexnik tadbirlarga bog‘ liq. Shu sababli O‘ zbekistonning turli agroekologik sharoitlarida *S. perfoliatum* ning o‘ sishi, rivojlanishi va biomassa shakllanishini o‘ rganish muhim ilmiy-amaliy ahamiyatga ega.

Adabiyotlar tahlili shuni ko‘ rsatadiki, *S. perfoliatum* bo‘ yicha xorijiy tadqiqotlarda asosan biomassa hosildorligi, bioenergetik qiymati, tuproq ekologiyasiga ta’siri va og‘ ir metallarni o‘ zlashtirish imkoniyatlari o‘ rganilgan. Shu bilan birga, O‘ zbekiston sharoitida ushbu turning degradatsiyalangan tuproqlarga moslashuvi, optimal ekish muddatlari va o‘ simliklar joylashish sxemasining ekologik va biomassa ko‘ rsatkichlariga ta’siri yetarlicha o‘ rganilmagan. Mazkur holat tadqiqotning dolzarbligini belgilaydi va ushbu ishning ilmiy yangiligini asoslaydi.

TADQIQOT METODOLOGIYASI

Tadqiqotlar 2023-2025-yillarda O‘ zbekistonning Samarqand va Andijon viloyatlarida olib borildi. Tadqiqot obyekti sifatida Asteraceae oilasiga mansub ko‘ p yillik *Silphium perfoliatum L.* o‘ simligi tanlandi. Mazkur tur yuqori biomassa hosil qilishi, uzoq vegetatsiya davri, yaxshi rivojlangan ildiz tizimi va turli agroekologik sharoitlarga moslashuvchanligi sababli degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilishda istiqbolli noan’anaviy o‘ simlik sifatida baholandi.

Tajribalarda Yevropadan sertifikatlangan manbalardan keltirilgan *S. perfoliatum* urug‘ laridan foydalanildi. Dala tajribalariga unuvchanligi 85% dan yuqori bo‘ lgan urug‘ lar ajratib olindi. Tadqiqotlarda o‘ simliklarning unib chiqishi, vegetativ va generativ rivojlanishi, biomassa hosil bo‘ lishi hamda urug‘ mahsuldorligiga ayrim agrotexnik omillarning ta’siri o‘ rganildi.

Tadqiqotning birinchi yo‘ nalishida ekish muddatining urug‘ larning unib chiqishi va dastlabki vegetativ rivojlanishiga ta’siri baholandi. Kuzgi ekish uchun 15-oktabr va 15-noyabr, bahorgi ekish uchun 15-fevral va 20-mart muddatlari olindi. Har bir ekish muddatida to‘ liq unish sanasi, o‘ simlikdagi barglar soni hamda barglarning uzunligi va eni qayd etildi. Ushbu ko‘ rsatkichlar *S. perfoliatum* ning turli ekish muddatlaridagi dastlabki rivojlanish dinamikasini baholash imkonini berdi.

Ikkinchi yo‘ nalishda o‘ simliklarning maydondagi joylashish sxemasining vegetativ va generativ rivojlanishga ta’siri o‘ rganildi. Tajribada 90 × 60, 90 × 70 va 90 × 90 sm qator oralig‘ i variantlari taqqoslandi. Ushbu variantlarda o‘ simlik zichligi, poyalar soni, o‘ simlik balandligi, poya diametri, barg morfologiyasi, gullar soni va bir guldagi urug‘ lar soni aniqlandi.

O‘ simliklarning vegetativ rivojlanishini baholashda o‘ simlik balandligi, poya diametri, poyalar soni hamda barglarning uzunligi va eni asosiy morfometrik ko‘ rsatkichlar sifatida qabul qilindi. Generativ rivojlanishni baholashda esa bir o‘ simlikdagi gullar soni va bir guldagi urug‘ lar soni hisobga olindi. Hosildorlik ko‘ rsatkichlarini aniqlashda urug‘ hosildorligi va yashil biomassa miqdori qayd etildi.

Tadqiqot natijalarini ekologik jihatdan baholashda o‘ simliklarning joylashish zichligi bilan yorug‘ lik, suv va mineral oziqa elementlari uchun raqobat o‘ rtasidagi bog‘ liqlikka alohida e’tibor qaratildi. Qator oralig‘ ining kengayishi sharoitida o‘ simliklar uchun mavjud ekologik resurslardan foydalanish imkoniyati ortishi, vegetativ massa va generativ organlarning shakllanishi yaxshilanishi nuqtai nazaridan tahlil qilindi.

Ekish muddatlarini baholashda esa urug‘ larning tabiiy stratifikatsiyadan o‘ tishi, qishki past haroratlarning urug‘ larning tinim holatiga ta’siri, bahorgi davrdagi tuproq namligi va harorat sharoitlarining nihollarning shakllanishiga ta’siri hisobga olindi. Shu asosda *S. perfoliatum* ning dastlabki rivojlanish bosqichlari va agroekologik moslashuv xususiyatlari baholandi.

Olingan natijalar degradatsiyalangan tuproqlarda noan’anaviy o‘ simliklardan foydalanishning ekologik istiqbollarini baholash nuqtai nazaridan tahlil qilindi. Bunda o‘ simliklarning yuqori biomassa hosil qilishi, uzoq muddat davomida tuproq yuzasini o‘ simlik qoplami bilan ta’minlashi, vegetativ va generativ organlarning rivojlanishi hamda agroekologik sharoitlarga moslashuvi asosiy mezonlar sifatida qaraldi.

Tadqiqotda aniqlangan ko‘ rsatkichlar jadval va grafik materiallar yordamida umumlashtirildi. Natijalar asosida *S. perfoliatum L.* ning O‘ zbekiston sharoitida yetishtirish uchun maqbul ekish muddatlari va o‘ simliklarni joylashtirish sxemalarining agroekologik samaradorligi baholandi.

Dala tajribalari davomida *Silphium perfoliatum L.* ning ekish muddatiga bog‘ liq holda unib chiqishi va dastlabki vegetativ rivojlanishida sezilarli farqlar kuzatildi. Ekish muddatlarining o‘ zgarishi o‘ simliklarning tabiiy stratifikatsiyadan o‘ tishi, tuproq namligi va harorat sharoitlaridan foydalanish imkoniyatiga ta’sir ko‘ rsatdi.

1-jadval.

Ekish muddatining urug‘ larning unib chiqishi va barg morfologiyasiga ta’siri

Ekish muddati	To‘ liq unish sanasi	Barglar soni, dona/o‘ simlik	Barg uzunligi, sm	Barg eni, sm
15-oktabr	3-mart	35	44,3	27,0
15-noyabr	3-mart	38	44,5	27,2
15-fevral	25-mart	25	39,4	25,2
20-mart	30-aprel	23	30,1	20,3

Jadval ma’lumotlaridan ko‘ rinib turibdiki, kuzgi ekish variantlarida *S. perfoliatum* ning dastlabki vegetativ rivojlanishi bahorgi ekish variantlariga nisbatan yuqori bo‘ lgan. 15-noyabrda ekilgan o‘ simliklarda barglar soni 38 dona/o‘ simlikni, barg uzunligi 44,5 sm va eni 27,2 sm ni tashkil etgan. 15-oktabr variantida ham yaqin natijalar qayd etilib, barglar soni 35 dona/o‘ simlik, barg uzunligi 44,3 sm va eni 27,0 sm bo‘ lgan.

Bahorgi ekish variantlarida esa vegetativ rivojlanish ko‘ rsatkichlari pasaygan. 20-martda ekilgan o‘ simliklarda barglar soni 23 dona/o‘ simlik, barg uzunligi 30,1 sm va eni 20,3 sm ni tashkil etgan. Bu holat o‘ simliklarning dastlabki rivojlanish davrida tuproq namligi va harorat rejimining muhim ekologik omil ekanligini ko‘ rsatadi.

Kuzgi ekishning afzalligi urug‘ larning qish davrida tabiiy stratifikatsiya jarayonidan o‘ tishi bilan izohlanishi mumkin. Past harorat ta’sirida urug‘ larning fiziologik tinim holati susayib, bahorgi qulay sharoit yuzaga kelishi bilan bir vaqtda unish jarayoni boshlanadi. Natijada o‘ simliklar vegetatsiya davrining dastlabki bosqichidanoq nisbatan yaxshi rivojlangan ildiz va barg tizimini shakllantirish imkoniyatiga ega bo‘ ladi.

Ekologik nuqtai nazardan, bunday xususiyat degradatsiyalangan tuproqlarda muhim ahamiyatga ega. Chunki o‘ simlik qoplamining tez va bir tekis shakllanishi tuproq yuzasining ochiq qolish vaqtini qisqartiradi. Bu esa shamol va suv eroziyasi xavfini kamaytirish, tuproq namligini saqlash hamda tuproq yuzasida organik qoldiqlarning to‘ planishi uchun sharoit yaratishi mumkin.

O‘ simliklarning maydonda joylashish sxemasi ularning yorug‘ lik, suv va mineral oziqa elementlaridan foydalanish darajasini belgilovchi muhim agroekologik omillardan biridir. Tadqiqotlarda 90×60, 90×70 va 90×90 sm qator oralig‘ i variantlari taqqoslandi.

2-jadval.

Qator oralig‘ ining *Silphium perfoliatum L.* ning poya shakllanishiga ta’siri

Qator oralig‘ i, sm	O‘ simlik zichligi, dona/m²	Poya soni (2023-2024)	Poya soni (2025)
90 × 60	9,1	24,5-25,6	26,9
90 × 70	11,2	25,7-26,1	27,6
90 × 90	13,1	26,8-28,2	30,7

Tajriba natijalariga ko‘ ra, qator oralig‘ ining kengayishi bilan *S. perfoliatum* ning poya shakllanishi yaxshilangan. 90×90 sm variantida 2025-yilda poyalar soni 30,7 donaga yetgan bo‘ lsa, 90×60 sm variantida bu ko‘ rsatkich 26,9 donani tashkil etdi.Keng qator oralig‘ ida o‘ simliklar o‘ rtasidagi yorug‘ lik, suv va mineral elementlar uchun raqobatning kamayishi vegetativ organlarning faolroq shakllanishiga imkon bergan. Bu holat ayniqsa degradatsiyalangan tuproqlarda muhim, chunki bunday tuproqlarda suv va oziqa elementlaridan foydalanish imkoniyati cheklangan bo‘ lishi mumkin.

S. perfoliatum L. ning yuqori biomassali ko‘ p yillik o‘ simlik ekanligi uning tuproqni biologik himoyalash imkoniyatini ham oshiradi. Kuchli vegetativ massa tuproq yuzasini qoplab, eroziya jarayonlarini susaytirishga va organik qoldiqlarning qayta tuproqqa tushishiga xizmat qilishi mumkin.

Tadqiqotlarda qator oralig‘ ining o‘ simliklarning generativ organlari shakllanishiga ham sezilarli ta’sir ko‘ rsatishi aniqlandi.

3-jadval.

Qator oralig‘ ining *Silphium perfoliatum L.* ning generativ ko‘ rsatkichlariga ta’siri

Qator oralig‘ i, sm	Gul soni, dona/o‘ simlik	Urug‘ soni, dona/gul
90 × 60	35,5 ± 0,99	22,4 ± 0,84
90 × 70	61,7 ± 1,38	30,7 ± 1,29
90 × 90	78,7 ± 1,81	38,3 ± 1,13

90×60 sm variantida bir o‘ simlikdagi gullar soni 35,5 donani tashkil etgan bo‘ lsa, 90×90 sm variantida bu ko‘ rsatkich 78,7 donaga yetgan. Shuningdek, bir guldagi urug‘ lar soni mos ravishda 22,4 va 38,3 donani tashkil etdi.

Demak, qator oralig‘ ining kengayishi nafaqat vegetativ, balki generativ rivojlanishga ham ijobiy ta’sir ko‘ rsatgan. Bunda o‘ simlikning fotosintetik yuzasi yaxshi shakllanishi, yorug‘ likdan samarali foydalanishi va assimilatsiya mahsulotlarining generativ organlarga yetarli miqdorda yo‘ naltirilishi muhim omil bo‘ lishi mumkin.

Mazkur xususiyat *S. perfoliatum* ning ekologik qiymatini ham oshiradi. O‘ simlikning ko‘ p sonli to‘ pgullar hosil qilishi uning gullash davrida changlatuvchi hasharotlar uchun oziqa bazasini kengaytiradi. Shu sababli ushbu turni degradatsiyalangan agroekotizimlarda yetishtirish nafaqat tuproqni o‘ simlik qoplami bilan ta’minlash, balki biologik xilma-xillikni qo‘ llab-quvvatlash nuqtai nazaridan ham ahamiyatlidir.

Tadqiqotlarning eng muhim natijalaridan biri qator oralig‘ ining biomassa va urug‘ hosildorligiga ta’siri bilan bog‘ liq.

4-jadval.

Qator oralig‘ ining *Silphium perfoliatum L.* ning biomassa va hosildorlik ko‘ rsatkichlariga ta’siri

Qator oralig‘ i, sm	Urug‘ hosildorligi, s/ga	Biomassa, s/ga	Balandlik, sm

90 × 60	6,6	960,9	203,9
90 × 70	7,8	1106,2	232,3
90 × 90	9,7	1237,8	284,2

Olingan natijalar qator oralig‘ i kengayishi bilan urug‘ hosildorligi va biomassa miqdori izchil oshganligini ko‘ rsatdi. 90×60 sm variantida urug‘ hosildorligi 6,6 s/ga va biomassa 960,9 s/ga bo‘ lgan bo‘ lsa, 90×90 sm variantida bu ko‘ rsatkichlar mos ravishda 9,7 va 1237,8 s/ga ga yetgan.90×90 sm variantida o‘ simlik balandligi ham eng yuqori - 284,2 sm ni tashkil etdi. Demak, mazkur joylashtirish sxemasi o‘ simlikning vegetativ va generativ imkoniyatlaridan nisbatan to‘ liq foydalanish imkonini bergan.

Yuqori biomassa hosil qiluvchi *S. perfoliatum* ning ushbu xususiyati degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilish nuqtai nazaridan alohida ahamiyatga ega. Ko‘ p miqdordagi yerusti biomassa tuproq yuzasida himoya qatlami shakllanishiga, o‘ simlik qoldiqlarining tuproqqa qaytishiga va organik moddalarning aylanishiga yordam berishi mumkin. Shu bilan birga, rivojlangan ildiz tizimi tuproqning biologik faol qatlamini shakllantirishda muhim rol o‘ ynaydi.

Biroq ushbu tadqiqotda tuproqdagi gumus, organik uglerod, umumiy azot, fosfor, kaliy, pH va boshqa agroximik ko‘ rsatkichlarning tajribadan oldingi va keyingi qiymatlari aniqlanmagan. Shu sababli olingan natijalar *S. perfoliatum* ning tuproqni bevosita reabilitatsiya qilganini emas, balki degradatsiyalangan tuproqlarda ekologik reabilitatsiya jarayonlarini qo‘ llab-quvvatlash imkoniyatiga ega ekanligini ko‘ rsatadi.

Olingan natijalar *S. perfoliatum* ni degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilishda ko‘ p funksiyali noan’anaviy o‘ simlik sifatida baholash imkonini beradi. Uning ekologik ahamiyati quyidagi asosiy yo‘ nalishlarda namoyon bo‘ lishi mumkin:

- tuproq yuzasini uzoq muddat o‘ simlik qoplami bilan ta’minlash;
- shamol va suv eroziyasi xavfini kamaytirish;
- yuqori biomassa orqali organik moddalarning aylanishini kuchaytirish;
- rivojlangan ildiz tizimi orqali tuproqning biologik faol qatlamini qo‘ llab-quvvatlash;
- agroekotizimlarda changlatuvchi hasharotlar uchun oziqa manbaini yaratish;
- kam mahsuldor va degradatsiyalangan maydonlardan samarali foydalanish.

XULOSA

Olib borilgan dala tadqiqotlari natijalari *Silphium perfoliatum L.* ning O‘ zbekistonning Samarqand va Andijon viloyatlaridagi agroekologik sharoitlarda yetishtirishga moslashuvchan, yuqori biomassa hosil qiluvchi va ekologik jihatdan istiqbolli noan’anaviy ko‘ p yillik o‘ simlik ekanligini ko‘ rsatdi.Tadqiqot natijalariga ko‘ ra, kuzgi ekish *S. perfoliatum* ning dastlabki rivojlanishi uchun nisbatan qulay sharoit yaratib, 15-noyabr variantida 38 dona/o‘ simlik barg shakllanishi, barg uzunligi 44,5 sm va eni 27,2 sm ga yetgani aniqlandi. Bu holat kuzgi ekish sharoitida urug‘ larning tabiiy stratifikatsiyadan o‘ tishi va bahorgi vegetatsiyaning nisbatan barqaror boshlanishi bilan bog‘ liq.

Qator oralig‘ ining o‘ simliklarning vegetativ va generativ rivojlanishiga sezilarli ta’siri aniqlandi. 90×90 sm sxemasida poyalar soni 30,7 dona/o‘ simlik, gullar soni 78,7 dona/o‘ simlik va bir guldagi urug‘ lar soni 38,3 donaga yetdi. Mazkur variantda urug‘ hosildorligi 9,7 s/ga, yashil biomassa hosildorligi esa 1237,8 s/ga ni tashkil etdi.

Yuqori biomassa hosil qilishi, ko‘ p yillik hayotiy shakli va rivojlangan vegetativ organlari *S. perfoliatum* ni degradatsiyalangan tuproqlarda o‘ simlik qoplamini shakllantirish uchun istiqbolli biologik resurs sifatida tavsiflaydi. O‘ simlik qoplamining shakllanishi tuproq yuzasini eroziya ta’siridan himoyalash, organik qoldiqlarning to‘ planishi va agroekotizimlarning biologik barqarorligini qo‘ llab-quvvatlash uchun sharoit yaratishi mumkin.

Shuningdek, *S. perfoliatum* ning uzoq davom etadigan gullash davri va ko‘ p sonli to‘ pgullar hosil qilishi changlatuvchi hasharotlar uchun oziqa bazasini kengaytirish orqali agroekotizimlarning biologik xilma-xilligini saqlashga xizmat qilishi mumkin.Shunday qilib, *Silphium perfoliatum L.* ni degradatsiyalangan tuproqlarni ekologik reabilitatsiya qilish tizimlariga joriy etish istiqbolli yo‘ nalishlardan biri hisoblanadi. Biroq turning tuproq unumdorligi va tuproq ekologik holatiga bevosita ta’sirini to‘ liq baholash uchun kelgusidagi tadqiqotlarda gumus, organik uglerod, pH, umumiy azot, fosfor, kaliy, tuproq namligi va biologik faollik kabi ko‘ rsatkichlarning ekishdan oldingi va keyingi o‘ zgarishlarini kompleks o‘ rganish maqsadga muvofiq.

Annotatsiya: Ushbu maqolada Farg‘ ona vodiysining tog‘ oldi va tog‘ li hududlarida 5 kenja oila va 16 avlodga mansub 27 turdagi koksinellidlar tarqalgan. Jumladan, Coccinellinae kenja oilasining 16 turi: *Adalia bipunctata, Adalia desempunctata, Adalia 14punctata, Adalia fasciatopunctata, Adalia tetraspilota, Hippodamia variegata, Hippodamia tredecimpintatata, Coccinella septempunctata, Prop. quatuordecimpunctata, Psyllobora vigintiduopunctata, Calvia SP, Calvia punctata, Calvia muiri, Oenopia conglobata, Coelophora quadrivittata, Halyzia tschitscherini*; Scymnus avlodidan 5 tur: *Stethorus pusillus, Scymnus subvillosus, Scymnus rubromaculatus, Scymnus interruptus, Scymnus frontalis*; Chilocorinae kenja oilasidan 4 tur: *Chilocorus bipustulatus, Exochomus ostosignatus, Exochomus undulatus, Parexochomus nigromaculatus*; Hyperaspidinae kenja oilasidan 1 tur: *Brachiacontha ursine*, Ortaliinae kenja oilasidan 1 tur: *Novius yemenensis* qayd etilgan.

Kalit so‘ zlar: *Calvia muiri, Coelophora quadrivittata, Brachiacontha ursine, Novius yemenensis*, landshaft, biotop, kserofil.

ФАУНА БОЖЬИХ КОРОВОК (COCLEOPTERA, COCCINELLIDAE) В ГОРНЫХ И ПЕШЕХОДНЫХ РАЙОНАХ ДОЛИНЫ ФЕРГАНА.

Аннотация: *В статье описан видовой состав и территориальное распространение жуков-кокцинеллид в предгорьях, густых лугах и сухих предгорьях Ферганской долины. На территории исследований в предгорьях и горах Долины распространены 27 видов кокцинеллид, принадлежащих к 5 подсемействам и 16 родам. Включает 16 видов подсемейства Coccinellinae: Adalia bipunctata, Adalia desempunctata, Adalia 14punctata, Adalia fasciatopunctata, Adalia tetraspilota, Hippodamia variegata, Hippodamia tredecimpintatata, Coccinella septempunctata, Prop. quatuordecimpunctata, Psyllobora vigintiduopunctata, Calvia SP, Calvia punctata, Calvia muiri, Oenopia conglobata, Coelophora quadrivittata, Halyzia tschitscherini; 5 видов из подсемейства Scymninae: Stethorus pusillus, Scymnus subvillosus, Scymnus rubromaculatus, Scymnus interruptus, Scymnus frontalis; 4 вида из подсемейства Chilocorinae: Chilocorus bipustulatus, Exochomus ostosignatus, Exochomus undulatus, Parexochomus nigromaculatus; Зарегистрирован 1 вид из подсемейства Hyperaspidinae: Brachiacontha ursine, 1 вид из подсемейства Ortaliinae: Novius yemensis.*

Ключевые слова: *Calvia muiri, Coelophora quadrivittata, Brachiacontha ursine , Novius yemenensis, ландшафт, биотоп, ксерофил.*

FAUNA OF COCCINELLIDS (COLEOPTERA, COCCINELLIDAE) IN THE MOUNTAIN AND FOOTHILL AREAS OF THE FERGANA VALLEY.

Annotation. *This article describes the species composition and territorial distribution of coccinellid beetles in the foothills, dense grasslands, and dry foothills of the Fergana Valley. In the study area, 27 species of coccinellids belonging to 5 subfamilies and 16 genera are distributed in the foothills and mountains of the Valley. Including 16 species of the Coccinellinae subfamily: Adalia bipunctata, Adalia desempunctata, Adalia 14punctata, Adalia fasciatopunctata, Adalia tetraspilota, Hippodamia variegata, Hippodamia tredecimpunctata, Coccinella septempunctata, Propylaea quatuordecimpunctata, Psyllobora vigintiduopunctata, Calvia*

SP, Calvia punctata, Calvia muiri, Oenopia conglobata, Coelophora. quadrivittata, Halyzia tschitscherini; 5 species from the Scymninae subfamily: Stethorus pusillus, Scymnus subvillosus, Scymnus rubromaculatus, Scymnus interruptus, Scymnus frontalis; 4 species from the Chilocorinae subfamily: Chilocorus bipustulatus, Exochomus ostosignatus, Exochomus undulatus, Parexochomus nigromaculatus; 1 species from the Hyperaspidinae subfamily: Brachiacontha ursine, 1 species from the Ortaliinae subfamily: Novius yemensis were recorded.

Keywords: *Calvia muiri, Coelophora quadrivittata, Brachiacontha ursine, Novius yemensis, landscape, biotope, xerophile*

Kirish. Koksinellidlar butun dunyo bo‘ ylab keng tarqalgan bo‘ lib, barcha qit’alarda (Antarktidadan tashqari) yashaydi, deyarli barcha quruqlik biotoplarida uchraydi.

Koksinellidlarning aksariyat turlari ma’lum landshaft-geografik zonalar bilan chegaralangan va har bir zona maxsus turlar majmuasi bilan tavsiflanadi, ammo ba’zi turlar barcha landshaftlarda tarqalgan turlar hisoblanadi, masalan, *Coccinella septempunctata, Hippodamia variegate, Coccinella undecimpunctata,Bulaea lechatschovi.* [Xabibullin, 2004]

Farg‘ ona vodiysining atrofini G‘ arbiy Tiyon-Shon va Hisor-Oloy tog‘ sistemalari tarkibiga kiruvchi tizmalar o‘ rab olgan. Bu tog‘ larning ayrim cho‘ qqilarining balandligi 4000 m dan ortib ketadi. Tog‘ lar vodiy markaziga tomon pasayib boradi va tekisliklar bilan tutashib ketadi.

Tog‘ oldi zonasi adirlar bilan baland tog‘ lar o‘ rtasida oraliq zonani hosil qiladi. Asosan Qurama, Chotqol, Farg‘ ona, Turkiston, Oloy tizmalarning etaklarida balandligi 2000 m gacha hududlarni egallaydi. Vodiyni o‘ rab olgan baland tog‘ lar G‘ arbiy Tiyon-Shon tog‘ sistemasining tarkibiy qismlari hisoblanadi. Farg‘ ona vodiysini Qurama va Chotqol tizmalari g‘ arb va shimoli-g‘ arbdan, Farg‘ ona va Oto‘ ynoq tizmalari shimoli-sharq va sharqdan, Oloy va Turkiston tizmalari janub va janubi-g‘ arbdan o‘ rab olgan. Bu tog‘ larning o‘ rtacha balandligi 2000-3000 m, ayrim cho‘ qqilarining balandligi 4500 m dan ortadi. [Naraliyeva ,2022]

Material va metodlar: Farg‘ ona vodiysining Farg‘ ona, Andijon, Namangan viloyatlarining tog‘ hududi koksinellidlarning faunasi va bioekologiyasini o‘ rganishdagi tadqiqot kuzatuvlarimizni 2022-2025 yillarni 4 faslida ham olib borildi.

Shuningdek, marshrutlar bo‘ ylab statsiyalar yoki biotoplardan hasharot namunalari yig‘ ilib, ular entomologik usullari bilan qayta ishlandi, matrasnik (to‘ shakcha) va entomologik qutichalarga joylandi va ularning fotosuratlari olindi.

Koksinellidlarning taksonomik guruhlarga mansubligini tur tarkibini aniqlash uchun quyidagi aniqlagichlardan foydalanilgan: “Opredelitel nasekomix Yevropeyskoy chasti SSSR” (Tom 2, chast 1) (1965), “Opredelitel jukov” [Yakobson G.G. 1927], “Opredelitel Nasekomix” [Plavilshikov H. H.1994], “Opredelitel bojiix korovok (Coleoptera, Coccinellidae) yevropeyskoy chasti Rossii i Severnogo Kavkaza” [Benkovskiy A.O.2020]. Aniqlanilgan turlar O‘ zRFA Zoologiya instituti Entomologiya laboratoriyasidagi koksinellidlarga oid kolleksiya materiallari yordamida identifikatsiya qilindi.

Natijalar. Farg‘ ona vodiysining tog‘ oldi va tog‘ hududlaridagi o‘ simliklar turli xil ekologik sharoitlarga moslashgan va o‘ simliklarning ko‘ pligi bu hududning bioxilma-xilligini ta’minlaydi.

Vodiyning tog‘ hududlari koksinellid turlarining soni, tarqalishi bo‘ yicha maьlumotlar shu paytgacha tadqiq qilinmagan. Shuning uchun ham tadqiqotlarimizda Farg‘ ona vodiysining tog‘ oldi, zich o‘ tloqli va quruq tog‘ etaklari xonqizi qo‘ ng‘ izlarining tur tarkibi, hududiy tarqalishini aniqlashni maqsad qildik.

Tadqiqot natijalariga ko‘ ra Farg‘ ona vodiysining tog‘ va tog‘ etaklarida koksinellidlarning boy va noyob kserofil faunasi yashashiga guvoh bo‘ ldik.

O‘ rganilayotgan hududda Coccinellinae kenja oilasining 16 ta turi qayd etildi: *Adalia bipunctata, Adalia desempunctata, Adalia 14punctata, Adalia fasciatopunctata, Adalia tetraspilota, Hippodamia variegata, Hippodamia tredecimpunctata,Coccinella septempunctata,Propylaea quatuordecimpunctata, Psyllobora vigintiduopunctata, Calvia sp,Calvia punctata,Calvia muiri,Oenopia conglobata,Coelophora quadrivittata,Halyzia tschitscherini;* Scymninae kenja oilasidan 5 ta tur: *Stethorus pusillus, Scymnus subvillosus, Scymnus rubromaculatus, Scymnus interruptus, Scymnus frontalis;* Chilocorinae kenja oilasidan esa 4 ta tur: *Chilocorus bipustulatus, Exochomus ostosignatus, Exochomus undulatus, Parexochomus nigromaculatus;* Hyperaspidinae kenja oilasidan 1 ta tur: *Brachiacontha ursine,* Ortaliinae kenja oilasidan 1 ta tur: *Novius yemenensis* kabi turlar keng tarqalgan (1-jadval).

Olingan ma’lumotlarga ko‘ ra, koksinellidlarning 5 ta kenja oila, 16 ta avlodga mansub 27 tur Vodiyning tog‘ oldi va tog‘ hududlarida tarqalganligi aniqlandi. Tadqiqot jarayonida shu hududda uchragan turlar ichidan hududda topilgan *Calvia muiri, Coelophora quadrivittata, Brachiacontha ursine , Novius yemenensis* kabi turlar O‘ zbekiston faunasi uchun yangi turlar hisoblandi (1-rasmga qarang).

1-jadval

Farg‘ ona vodiysi koksinellidlarning umumiy tog‘ faunasi

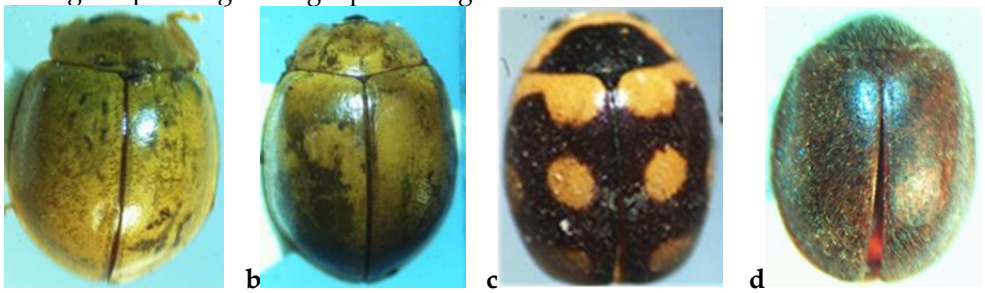
O‘ rganilgan turlardan jadvalda ko‘ rinib turganidek, *Coccinella septempunctata, Oenopia conglobata, Halyzia tschitscherini, Parexochomus nigromaculatus* kabi turlar quruq (toshloqli) tog‘ da hamda o‘ rganilgan barcha hududda tarqalganligi va bu to‘ rtta turdan boshqa turlar quruq (toshloqli) tog‘ da uchramasligi ma’lum bo‘ ldi. Tog‘ oldi va zich o‘ tloqli tog‘ hududi mo‘ tadil iqlimga ega bo‘ lib, bu hududlarda o‘ sadigan o‘ simliklarning xilma xilligi yuqori bo‘ lgani sababli koksinellidlarning umumiy tog‘ hududida tarqalgan turlarning barchasi shu hududlarda uchrashini kuzatdik.

Vodiysining tog‘ oldi hududlari bo‘ lgan Namangan viloyati Yangiqo‘ rg‘ on tumani Nanay qishlog‘ ida *Adalia bipunctata, Adalia tetraspilota, Coccinella septempunctata, Oenopia conglobata, Halyzia tschitscherini, Chilocorus bipustulatus, Exochomus undulatus* kabu turlar juda ko‘ p tarqalgan. *Brachiacontha ursine* turini esa faqat bir marotaba uchratdik xolos. 06.05.2023 yili kundagi bu hududdagi tashrifimizda *Adalia bipunctata, Oenopia conglobate* turlarini daraxtlardagi lichinkalarini, tuxumlarini, imagolarini juda ko‘ p uchratdik.

Chortoq tumani Hazratishox qishlog‘ ida tog‘ oldi hududida quyidagi koksinellid turlari yetakchilik qildi: *Adalia bipunctata, Coccinella septempunctata, Oenopia conglobata, Halyzia tschitscherini, Chilocorus bipustulatus, Calvia punctata, Adalia desempunctata* (23.04.2025).

Chust tumani G‘ ova qishlog‘ ida bir necha bor olib borgan tadqiqot ishlarimizda *Adalia bipunctata, Adalia tetraspilota, Coccinella septempunctata, Oenopia conglobata, Halyzia tschitscherini, Chilocorus bipustulatus, Calvia punctata, Adalia desempunctata, Calvia muiri, Stethorus pusillus, Hippodamia variegate, Propylaea quatuordecimpunctata, Scymnus subvillosus, Psyllobora vigintiduopunctata, kabi turlarga juda ko‘ p duch kelgan bo‘ lsak, Hippodamia tredecimpunctata va Scymnus frontalis* kabi turlarini judsa kam uchratdik. *Novius yemensis* turini esa faqatgina koksinellidlarning qishlov tiplari bo‘ yicha olib borgan tadqiqot ishimizda bu turni dengiz sathidan 925 metr balandlikdagi qari yong‘ oq va o‘ rik daraxtlarining po‘ stlog‘ I ostidan 41°07'57.19"N, 71°06'54.39"E, (25.11.2025) koordinata nuqtasidan topdik. Huddi shu turni Kosonsoy tumanida joylashgan “Nodirabegim Muhammadxon” sihatgohidan (19.06.2026) ham topildi.



Chust tumani Chodak qishlog‘ i va Pop tumani Parda-Tursun qishlog‘ idagi tarqalgan koksinellid turlari deyarli bir xil bo‘ lib, *Adalia bipunctata, Adalia tetraspilota, Coccinella septempunctata, Oenopia conglobata, Halyzia tschitscherini, Chilocorus bipustulatus, Calvia punctata, Calvia muiri, Hippodamia variegate* kabi turlarni tashkil etdi.

Andijon viloyati Xo‘ jaobod tumanidagi tog‘ oldi hududida tarqalgan koksinellidlarning xilma-xilligini yuqori bo‘ lishi may oyining birinchi dekadasiga to‘ g‘ ri keldi, ayniqsa *Adalia bipunctata, Adalia tetraspilota, Adalia desempunctata, Adalia var 14 punctata, Adalia fasciatopunctata, Coccinella septempunctata, Psyllobora vigintiduopunctata, Calvia punctata, Oenopia conglobate* kabi turlarni juda ko‘ p marotaba uchratdik. Bu davr koksinellidlarning tuxum qo‘ yish va bir yoshli lichinkalarni uchratish holati kop kuzatildi.

01.05.2026 yil kuni Xonabod tumanidagi Imom ota qishlog‘ iga va 02.05.2026 yil kuni esa Asaka tumanidagi Manaq ota qishlog‘ iga bo‘ lgan tadqiqot bo‘ yicha tashrifimizda quyidagi koksinellid turlar yetakchilik qildi: *Adalia bipunctata, Adalia tetraspilota, Adalia desempunctata, Adalia var 14 punctata, Adalia fasciatopunctata, Coccinella septempunctata, Hippodamia variegate Psyllobora vigintiduopunctata, Calvia punctata, Oenopia conglobate.* Shu hududlarda *Exochomus ostosignatus, Scymnus interruptus, Scymnus rubromaculatus* turlari esa juda kam uchradi.
